Bottom fermentation proceeds at low temperatures, viz.,  $42-51^{\circ}$  F.; top fermentation at higher stages, from  $58-68^{\circ}$  F. The designations for the two types of fermentation are derived from the fact that in bottom fermentation the yeast for the most part settles to the bottom, whereas in top fermentation it rises to the surface. Fermentation is induced in the wort by adding yeast, which operation is called 'pitching.' The wort runs from the Baudelot Cooler generally into a collecting vat, where fermentation is started. The method generally used for conducting the fermentation of lager beer is as follows: The wort is generally started at  $45-46^{\circ}$  F., about one pound of thick yeast being taken for each barrel of beer. After about 24 hours a

white frothy cover will indicate that the fermentation has started and at this stage the fermenting beer is generally brought into the fermenting vats. In all cases fermentation must be so conducted that the natural rise of temperature and the fermenting power of the yeast is not checked in any way. In the fermenting room which is kept at a temperature of  $41^{\circ}$  F. the fermenting beer is allowed to reach the temperature of  $51-55^{\circ}$  F. and artificial cooling by means of attempters is begun only after the fermentation begins to recede. The beer is cooled off gradually and uniformly, so that when the fermentation is finished the fermented beer will have a temperature of  $36-39^{\circ}$  F. The time of fermentation varies from eight to ten days for lager beer and from four to six for top fermenting beers.

The substance by the agency of which fermentation is carried on is called 'yeast.' The cause of fermentation as performed by the yeast depends upon the vitality and environment of the yeast, temperature, aeration, composition of wort, presence and absence of foreign ferments, and upon the type of yeast employed. Good yeast has a thick, stiff, pasty consistency of a yellowish to brownish color, a bitter taste and a characteristic odor. It consists of single cell organisms of the class *Saccharomyces Cerevisiæ*. The yeast, after fermentation is over, will settle to the bottom, and the fermented beer is brought into the Ruh tanks, where the beer is stored for four to eight weeks—sometimes longer. The objects of storing the beer are, to eliminate certain suspended matters like yeast, thereby securing greater clearness and greater durability. Low temperature while the beer is on storage is necessary to precipitate the proteids and to check the development of bacteria. The storage cellars should be kept as near to  $32^{\circ}$  F. as possible. When sufficiently matured in storage the beer is run into chipcasks, so-called from the method of clarifying beer by means of chips. The treatment in the chip-cellar has a twofold object: (1) to impart to the beer the necessary life, that is, a sufficient amount of carbonic acid gas so that it will foam properly when tapped; this is done either by kraeusening or by charging with carbonic acid gas; (2) to make the beer brilliant by the addition of chips and isinglass, and by filtration. Kraeusening consists in the addition of young beer in the first stage of fermentation twenty to twenty-four hours after pitching. When the fermentation in

the chipcask has proceeded for some time the cask or vat is bunged, and the carbonic acid gas which still develops is absorbed by the beer. The quantity of carbonic acid gas absorbed by the beer depends upon the temperature and the pressure; the lower the temperature and the higher the pressure, the greater the amount of carbonic acid gas which will be absorbed. The usual conditions are as follows: The temperature of the chipcask cellar should be kept at  $36^{\circ}-37^{\circ}$  F. and the beers subjected to a pressure of about five to six pounds. The pressure is regulated by bunging apparatus, which may be either simple pressure valves, one being used for each cask independent of one another, or the valves terminate in a joint-pipe connection which at its end is supplied with a pressure regulator. These bunging apparatus are so constructed, that when too much carbonic acid gas is generated, the surplus which cannot be absorbed by the beer at the prevailing temperature escapes through the valve. Under ordinary conditions 12-15 per cent. of kraeusening are used; in special cases, as much as 25 per cent. are employed. For bottle and export beer the quantity of kraeusening should be reduced to as low as 6 per cent. The quantity of kraeusening is generally influenced by the nature of the Ruh beer; long-stored, low-fermented beers need a larger addition of kraeusening than younger beers which are less fermented. As kraeusening decreases the stability of the beer, it has been found practical to charge the beer with carbonic acid gas (carbonating).

The carbonic acid gas is generally introduced into the beer on its way from the chipcask to the filter. The successful manipulation of carbonating is more difficult than kraeusening, as much depends upon the composition of the wort, the temperature of the beer, and the pressure of the gas. However, with proper precautions and care, equally good results have been obtained. For carbonating either the artificial, pure carbonic acid gas is used, or the carbonic acid gas collected from the fermenting tubs in the brewery. The latter system is the more practical; in such cases part of the fermenting tubs are closed and the fermentation goes on under a slight pressure. The carbonic acid gas which develops during fermentation is drawn off, washed and compressed and used for carbonating, or sold for other purposes. The quantity of carbonic acid gas generated in the brewery during fermentation is about

twenty times as large as the amount necessary for carbonating the beer, so that a large surplus is always at the disposal of the brewer. After the beer has absorbed the necessary amount of carbonic gas and is sufficiently bright, it is ready for racking.

Owing to the great demands of the public in regard to the brilliancy of the product, nearly every brewery employs filters. The filtering process consists in forcing the beer generally by means of air pressure applied at the chipcask through one or more layers of compressed, fibrous material called 'filtermass,' which commonly consists of wood pulp or paper pulp. Sufficient counterpressure is maintained at the racking bench, as otherwise the beer would foam strongly and too much carbonic acid gas be lost; for this reason counterpressure apparatus are employed and the small vessels are filled with compressed air before the beer enters. The beer will then enter a space which is not only under atmospheric pressure, but kept at a high pressure, and consequently foaming will be reduced to a minimum. The lager beer is now ready for consumption.

**Ale and Porter.**—Ordinary ale (present use or green ale) as well as lively ale and flat ale, are brewed with a concentration of 13-16 per cent. Balling, while the better ales have an original gravity of 16-18 per cent. Balling. Lively ale possesses a strong foaming capacity, and flat ale or still ale is almost entirely without foam. For mashing the 'downward infusion method' is generally employed. The boiled and hopped wort is cooled to about 58-60° F. and brought to fermentation at this temperature. As a rule, ale is hopped more strongly than lager beer, 1-2 lbs. being taken for every barrel; in some cases, especially for heavy ales, 2-4 lbs. are used;  $\frac{1}{2}$  lb. of yeast is taken for pitching. The temperature during fermentation should not exceed 66° F. About 48 hours after pitching the first covers are removed, and this is repeated every 8 to 12 hours until no more yeast rises to the top. The first cover, and eventually the second one also are dirt covers and are thrown away, but, as soon as the yeast is pure and thick, it is kept for future use. About four days after pitching the main fermentation is finished and the yeast ceases to work. As soon as the fermentation becomes less vigorous the temperature of the ale should be lowered, and should be about 58° F. at racking. Lively ale is generally racked before it is wholly fermented, when it shows an apparent degree of

attenuation of 55 per cent. and still contains about 3 per cent. of fermentable sugar. Flat or still ale should be wholly fermented, and is stored for some time in storage vats before it is ready for the market. The method of carbonating and filtering ale is now in use with great success, and a product known as sparkling ale is on the market which possesses the characteristic taste and odor of the ale and equals lager beer in life and brilliancy. Carbonated ales are best adapted for bottling, and keep well.

**East India Pale Ale.**—As a rule, East India pale ale is a flat ale brewed with about 17-18 per cent. Balling, and conspicuous for its particularly fine hop aroma; 2 to 3 lbs. of hops are added per barrel in the kettle and a further  $\frac{1}{2}$  to 1 lb. is added at the time of racking.

**Porter.**—Porter is brewed and fermented in the same manner as ale, and, as a rule, shows an original gravity of 15-16 per cent. About 15-20 per cent. of the material which is used represents color malt.

There are two kinds of porter—lively porter and still porter. Lively porter is racked into shipping packages immediately after fermentation; still porter is allowed to ferment completely, and it is either stored in tubs or small packages which are provided with porous bungs. The main difference between lager and ale is in the methods of mashing, the character of the yeast, and the temperatures during fermentation.

**Steam Beer.**—Steam beer is brewed in some of the Western states, especially on the Pacific coast, and is only of local interest. The characteristic properties of this beer are: very much life and a prickly, slightly acid taste. Malt only, but in some cases malt adjuncts, is used in the preparation of this beer. The beer is brewed with a gravity of about 13-14 per cent. Balling, and in the kettle about 1 lb. of hops is added per barrel. This is a bottom fermenting beer, but the fermentation is conducted at high temperatures. The temperature at pitching is from 56-62° F. (generally 58-60° F.), and  $\frac{1}{2}$  lb. of lager beer yeast is used for every barrel of wort; 24 to 32 hours after pitching, when the beer is in the state of high kraeusen, it is pumped over on the so-called clarifiers, where it remains from three to five days until the main fermentation is finished. These clarifiers are flat wooden tubs which resemble the surface coolers. Before the beer is pumped over on the clarifiers, the covers are re-

moved, and this is repeated once or twice while the beer is on the clarifiers.

After the main fermentation is finished, the beer is racked immediately into the shipping packages; from 1-6 gallons of kraeusen are added per barrel, and sometimes the beer is slightly fined before it is bunged. At the consumer's, the beer must lie for several days before it is ready for consumption. It spoils very easily, and for this reason some powerful preservative should be added.

**Weiss Beer.**—Weiss beer is a top-fermenting beer which is in a high state of strong after-fermentation, and which possesses much life and a prickly, somewhat sour taste. It is prepared from barley malt and wheat malt, usually  $\frac{1}{4}$  wheat malt, but in some cases more. The beer is brewed with about 9-10 per cent. Balling and is hopped but slightly, about  $\frac{1}{2}$  lb. of hops being taken per barrel. Weiss beer is brewed after different methods. In some cases it is prepared by the infusion method, in others by the decoction method, whereby the hops are boiled in the kettle with part of the mash. Sometimes the hops are boiled separately and the resulting liquor is added to the mash.

If much wheat is used, the mash is run over straw which has been treated with boiling water, and the wort is brought immediately upon the surface cooler where it is cooled down to 59-68° F. Only Weiss beer yeast should be taken for pitching, so that the characteristic taste of the beer will be obtained; fermentation will begin after a few hours and the dirt covers should be removed carefully. The beer is then filled into kegs and shipped. The kegs should be leaned over to one side, and after six to eight hours a foam cap will have worked out; this is the so-called 'hop-beer,' which is allowed to run out and is collected in vessels which have been placed below. Then the yeast begins to be more active, and when the main fermentation is finished, which is usually after 44 to 48 hours, the kegs are again filled up with hop-beer until the yeast has settled to the bottom. Then the beer is drawn into bottles or stone jugs, where an after-fermentation takes place until the beer is ready for consumption.

In 1904 the total output of beer in the United States was 48,208,133 barrels. The internal revenue tax on beer in the United States is one dollar per barrel.

**Brewster, BENJAMIN HARRIS** (1816-88), American lawyer, was born in Salem county, N. J., and was graduated from Princeton (1834). He was admitted to the Philadelphia bar, and became a leader in his profession. He was attorney-general of Pennsylvania in 1867-9, and Attorney-General of the United States in 1881-5, when he conducted the 'Star Route' trials with great skill and determination (see STAR ROUTE FRAUDS).

**Brewster, CHAUNCEY BUNCE** (1848), American bishop, was born at Windham, Conn., and was graduated from Yale (1868). He was ordained a priest in the Protestant Episcopal Church (1873), and was rector of churches at Rye, N. Y., Detroit, Baltimore, and Brooklyn. In 1897 he was consecrated coadjutor bishop of Connecticut, and succeeded as bishop two years later. He has published; *The Key of Life* (1894); *Aspects of Revelations* (Baldwin Lectures for 1900); *The Catholic Ideal of the Church* (1905); *The Kingdom of God and American Life* (1912).

**Brewster, SIR DAVID** (1781-1868), Scottish natural philosopher, was born at Jedburgh, and was educated at the University of Edinburgh. In 1802 he became editor of the *Edinburgh Magazine*, and in 1808 of the *Edinburgh En-*

*cyclopædia*. In 1813 he published a *Treatise on New Philosophical Instruments*; and in the following year he commenced a series of papers contributed to the Royal Society on the *Polarization of Light*, for which he was awarded the Copley medal, afterward receiving the Rumford and Royal Medals also. In 1816 the Institute of France adjudged to him the half of the prize for physics of 3,000 francs awarded for the two most important scientific discoveries which had been made in Europe during the two previous years; and in the same year he invented the kaleidoscope (q. v.), which, though patented, obtained for him more fame than remuneration. He afterward divided with Wheatstone the merit of introducing the stereoscope (q. v.), by means of his lenticular instrument.

Along with Professor Jameson Brewster founded the *Edinburgh Philosophical Journal* in 1817, and afterward the *Edinburgh Journal of Science*. His next work, *An Account of a New System of Illumination for Lighthouses* (1827), the dioptric system, was not crowned with success till 1835, with the Inchkeith lighthouse. In 1831, in conjunction with Herschel, Babbage, and other kindred minds he originated the British Association, and in the same year was knighted. He was appointed principal of the united colleges of St. Salvador and St. Leonard at St. Andrews in 1838, and was chosen president of the British Association in 1849. In the latter year he was elected one of the eight foreign associates of the French Institute. He became principal of the University of Edinburgh in 1859. Among his general works may be mentioned: *Martyrs to Science* (1841); *More Worlds than One* (1854); *Life of Newton* (1828; new ed. 1855); *Letters on Natural Magic* (1831). Consult *The Home Life of Sir David Brewster*, by his daughter, Mrs. Gordon, which contains a complete list of his writings.

**Brewster, WILLIAM** (c. 1560-1644), one of the *Mayflower* pilgrims, was born at Scrooby, England. He was educated at Cambridge and became postmaster of his native place. Strongly influenced by the Puritan doctrines of the times, he withdrew from the Established Church, and formed a society which met for worship at his house. Persecution, however, drove the members to seek a refuge in Holland, but they were seized before they could embark, and imprisoned. Obtaining his release with difficulty, and shorn of most of his means, Brewster made his way to Leyden, where he supported himself by teaching English. He sailed with the *Mayflower* in 1620, and

acted as pastor to the church at Plymouth, though he could not be persuaded to administer the sacraments. Consult Steele's *Life and Times of William Brewster*.

**Brezova, Hungary.** See ZOLYOM-BREZO.

**Brialmont, brē-âl-môn'**, HENRY ALEXIS (1821-1903), Belgian general and writer on fortification, was born at Venlo. Entering the army in 1843, he was in 1847 intrusted with the fortification of Diest. In 1859 he planned and constructed (1860-70) the strong fortifications at Antwerp. In 1877—two years after his appointment as inspector-general of Belgian fortifications—on the invitation of the Roumanian government he went to Bucharest to devise a system of fortifications for that country; and in 1885 he made a second visit. The works, begun in 1886, were completed in 1899. Meanwhile Brialmont had finished plans for the fortification of the Belgian frontier along the Meuse (1860-70). In 1883 he submitted a plan for fortifications in Greece, at the request of the Greek government, and four years later retired from active service. Among his more important books are: *Histoire du Duc de Wellington* (1856-7); *Système de Défense de l'Angleterre* (1859); *Etudes sur la Fortification des Capitales et l'Investissement des Camps Retranchés* (1873); *La Fortification du Champ de Bataille* (1879); *La Fortification du Temps Présent* (1885); *Influence du Tir Plongeant et des Obus-Torpilles sur la Fortification* (1888).

**Bri'an** (926-1014), famous king of Ireland, known as Brian Boroinhe (Boru), or 'Brian of the tribute,' defeated the Danes at Sulcoit, near Tipperary (968), fighting under his brother Mathgamhain, who had possessed himself of the kingship. After his brother's murder (976), Brian seized the kingship, allied himself with Maelsechlainn or Malachy, chief king of Ireland, defeated the Leinster men (984) and the Danes of Dublin, and finally seized Tara and subdued Maelsechlainn himself (1002). He then made a triumphal circuit of Ireland, receiving hostages from all the tribes. Thus he had become *Ard-Righ na Erenn*, chief king of Ireland, and such he remained until his death. He was slain at the Battle of Clontarf or Clontarf (April 23, 1014), where the power of the Danes, however, was effectually broken.

**Briançon, brē-ân-sôn'** (ancient *Brigantium*), capital department of Hautes-Alpes, France, on the Durance; 37 miles by rail northeast of Gap. It is a fortress of the first class, and the most elevated town (alt. 4,330 feet) in France. There are silk and Briançon chalk

industries, and coal is mined in the neighborhood. In 1788 the town withstood a three-months' siege of the allies. Pop. (1911) 7,888.

**Briand**, brē'änd', ARISTIDE (1862), French statesman, was born in Nantes of a prosperous bourgeois family, and was educated in the local schools. He studied law, became interested in politics, and entered the field of journalism, contributing to the anarchist organ *Le Peuple*, *La Lanterne*, and *Petite République*, and founding with Jean Juarez *L'Humanité*. At the Congress of Workingmen held in Nantes in 1894 he espoused the cause of labor unionism, and from that time became a recognized leader of the Socialist party. In 1902 he was elected a member of the Chamber of Deputies, where he distinguished himself by his forceful and tactful reporting of the Church and State Separation bill. In 1906 he was made Minister of Public Instruction and Worship, and was thereupon read out of the Socialist party. Two years later he became Minister of Justice. He succeeded Clémenceau as Prime Minister in 1909, and in that capacity checked the great railway strike of 1910 by ordering the strikers to join the colors for three weeks' training, and assigning them as soldiers to run the trains which as civilians they had deserted. He resigned in 1911; was again Premier for a short period in 1913, forming the first Cabinet under President Poincaré; and in October, 1915, during the European War, accepted the Premiership for the third time.

**Briansk**, brē-änsk', or BRYANSK, town, Orel government, Russia, on the Desna, an affluent of the Dnieper; 75 miles by rail northwest of Orel city. It has an arsenal (founded 1783), cannon foundry, shipbuilding yards (for river navigation), and grain, salt, and wood trade. The Cathedral, built in 1526, was restored in the seventeenth century. Pop. 24,000.

**Briare**, brē-är', town, department Loire, France, on the River Loire; 39 miles by rail southeast of Orleans. It gives its name to the canal connecting the Loire and Seine. It has important manufactures of buttons. Pop. (1911) 4,637.

**Briareus**, brī-ä'rē-us or brī-ä-rūs, or ÆGÆON, son of Uranus and Gæa, a giant with a hundred hands and fifty heads who helped Zeus conquer the Titans, and guarded them when imprisoned in Tartarus.

**Briar Root**, a fine hard wood obtained from the roots and knots of the tree heath *Erica arborea*, which abounds in countries bordering on the Mediterranean. It

is largely used for tobacco pipes (see PIPES, TOBACCO).

**Bribery** consists in making the offer of any gift or reward to one holding a public office or enjoying a public right, for the purpose of influencing his official conduct or the exercise of his right. The party to whom the offer is made does not require to accept in order to render the offerer guilty of bribery; but if he does accept, he is himself guilty of the same offence. In Oriental countries bribery of all kinds is recognized as an ordinary factor of everyday life, but European races generally have always regarded it as a serious injustice. Perhaps the most reprehensible form is judicial bribery. Bribery of jurymen is regarded in the same light as bribery of judges (see EMBRACERY). Bribery of public officials of any kind is also a crime at common law. In Great Britain an attempt was made to put a stop to commercial bribery by the Secret Commissions Act of 1906.

In international politics also, bribery was in former times extensively resorted to. Charles II., for example, received large sums from Louis XIV. of France, and the union of the Irish Parliament with that of England was accompanied by gross bribery.

Political bribery is the most insidious form which the offence takes. In Great Britain it was reduced to a regular system under Sir Robert Walpole, in the first half of the eighteenth century, and long continued a serious blot on politics, both in that country and in the United States. Much legislation has been directed in recent times toward stamping out this evil. In particular, drastic measures have been passed, limiting the expenditure of candidates and parties during elections. See ELECTIONS; CORRUPTION, POLITICAL.

**Brice**, CALVIN STEWART (1845-98), American legislator, was born in Denmark, O., and was graduated from Miami University in 1863, serving in the Union Army before and after graduation. He studied law, and was admitted to the bar. He became interested in railway finance, and acquired large interests in Middle Western railroads. He was a Democratic Party leader, was frequently a member of the National Committee, and was U. S. Senator from Ohio in 1891-7.

**Brice**, ST., bishop of Tours in the fifth century, was brought up in the monastery of St. Martin, near Tours, and succeeded the latter as bishop. His life was somewhat irregular. On his day, Nov. 13, 1002, by the orders of Ethelred II., the Unready, a great massacre of the Danes occurred, a treacherous act which cost Ethelred his throne.

**Brick**, a moulded block, usually of burned clay, extensively employed in building construction on account of its comparative cheapness, strength, durability, and ease of transportation and handling.

The use of brick dates from very ancient times, the earliest examples probably being the sundried specimens of Egypt, Assyria, and Babylonia, subsequently introduced by the Moors into Spain, and by the Spaniards into Spanish America (see ADOBE). Kiln-baked brick is also found in the chief ruins of ancient Babylonia. Most of the great Roman ruins are of brick, and the Romans seem to have introduced the art of brick making into England. All ancient bricks, whether baked by the sun or by fire, were of clay mixed with grass or straw.

**Manufacture.**—The clay from which common *building brick* is made consists essentially of hydrated silicate of alumina, with a varying proportion of other mineral matter, chiefly free silica (sand), iron, lime, magnesia, and potash. The earth, after being excavated, usually undergoes a process of weathering, which lasts for a period varying from a few days to a couple of months. In the older processes the clay is then moistened and mixed to a plastic state ('tempered'), either in the pit or in a primitive pug mill, and pressed into the moulds by hand. In more modern plants both tempering and moulding are done by machines. These are of two main types, according as they are constructed to work soft mud or stiff mud. In the soft-mud machines the clay, after being well mixed, is forced out between rollers, or by an augur or plunger device, through a die in a compact stream of the desired dimensions, and by means of wires is cut into bricks. In the case of stiff clay the material is fed into the pug mill from a mixer; is forced by knife blades into metal moulds arranged on a revolving table or the circumference of a drum; and as the table or drum revolves the roughly moulded bricks are removed and pressed into shape in a plunger press.

The green bricks, after being carefully dried in the sun or by artificial heat, are usually baked in kilns with a suitable arrangement of fires and flues. These are of four types: (1) single up-draft kilns, consisting of a rectangular space surrounded by brick walls and open at the top; (2) single down-draft kilns, circular or rectangular in shape, and enclosed with masonry on top as well as on the sides; (3) single horizontal draught kilns, in which the fires are built at one end and the hot gases travel horizontally to the chimney at the other end; and

(4) continuous kilns, which are divided into a number of chambers or compartments so built that in some the full heat from the furnace is obtained, while in others the waste gases afford sufficient heat to dry the freshly moulded bricks. The time required for firing in ordinary kilns varies from 40 to 60 hours for common red and white bricks, while for some fire bricks 150 hours are necessary.

Where kilns are not used, the bricks are burned in clamps, a quantity of ground coal sufficient to burn them being mixed with the clay in the process of tempering.

Bricks vary in size, shape, color, and texture. In the United States, the standard building brick is  $8\frac{3}{4} \times 4 \times 2\frac{1}{4}$  inches, as compared with  $8\frac{3}{4} \times 4\frac{3}{8} \times 2\frac{3}{8}$  in Great Britain. Bricks of special shape and size are made for arches, copings, and ornamental purposes. The color depends largely on the amount of iron present in the clay. Thus, clays containing less than 1 or  $1\frac{1}{2}$  per cent. of iron change in the kiln to various shades of cream color and buff, while those containing more than 2 per cent. vary from yellowish-fawn to dark red. The texture should be fine, compact, and uniform. Bricks are also classified according to their method of manufacture, material, and uses.

**Fire Brick**, which is especially adapted to resist very high temperatures, consists of almost pure clay, or pure clay and sand mixed or, rarely, of silica and clay. The amount of oxide of iron should not exceed 6 per cent., and the combined lime, soda, potash, and magnesia should not exceed 3 per cent. These bricks are used chiefly for lining stoves and furnaces. Among the most refractory of fire bricks are *bauxite* bricks, composed chiefly of alumina and oxide of iron, with a small amount of silica; and *silica* and *ganister* bricks, made chiefly from pure siliceous rock or a highly siliceous fire clay. Special bricks of a basic or neutral character, as *magnesite* and *chromic* brick, are used for furnaces in which slags rich in lime are produced.

**Sandlime Brick** is made of sand or crushed sandstone cemented together with silicate of lime. It is mixed and moulded much like dry-clay brick, and is hardened under steam pressure. (See SANDLIME BRICK.) In **cement-sand brick**, Portland or other cement is used as the binding material.

**Vitrified Brick**, sometimes known as clinkers, is prepared by burning the clay to the point of vitrification, and annealing or toughening by slow cooling. It is used chiefly for paving and in engineering construction.

**Glazed Bricks** have the surface covered with a special glaze. They are highly useful not only for decorative purposes, but for passages, stables, and other places which require frequent cleaning.

**Slate Bricks** are made from the débris of slate quarries, and are among the strongest bricks known.

**Statistics.**—According to the report of the United States Geological Survey, the value of the brick and tile products of the United States for 1923 was \$309,631,561. Common brick was valued at \$94,472,666; fire brick, including clay and silica fire brick, \$46,676,637; vitrified brick or block at \$15,569,670; enamelled brick at \$1,670,852; ornamental brick at \$252,323. Ohio, Pennsylvania, and Illinois are the leading States in brick and tile production.

See BRICKLAYING; POTTERY. Consult A. B. Searle's *Modern Brickmaking* (1911), *Cement, Concrete, and Bricks* (1913), and *Clay and Clay Products* (1915); Scrimshaw's *Bricklaying in Modern Practice* (1920).

**Bricklaying** is the art of arranging bricks, and embedding them in a mortar of lime or cement in such a way that they will form a structure of a given shape and the necessary degree of stability. A layer or stratum of bricks is known as a *course*, and the arrangement of the bricks in successive courses as the *bond*. Bricks laid with their lengths in the direction of the course, and their sides to the wall face, are called *stretchers*; those laid transversely, with their ends forming the wall face, *headers*; a layer of headers, a *heading course*; of stretchers, a *stretching course*.

Three bonds are commonly used in building construction: *English bond*, consisting of alternate courses of headers and stretchers; *Flemish bond*, of alternate headers and stretchers in the same course; and *common bond*, of from four to seven courses of stretchers to one of headers. The Flemish bond is neater in appearance, and is generally preferred for outer walls when they are not to be plastered. English bond is stronger and more compact, and gives a better transverse tie. To strengthen the bond, bands of iron are sometimes laid between the courses, especially where headers cannot be inserted.

A mortar composed of lime and sand is commonly used for brickwork employed in architectural construction, while for sewer linings, bridge piers, tunnels, reservoir walls, and similar structures a cement mortar is usually employed. The function of the mortar is not only to bind the bricks together, but by taking up inequalities in the brick to distrib-

ute the pressure equally throughout the wall, and so fill the spaces between the bricks as to prevent the conduction of heat, sound, and moisture.

The process of bricklaying is best illustrated in wall construction. Walls usually consist of two exterior courses, with one or more interior or filling courses between them. The outside courses are first laid. The mortar is spread with a trowel along a bed for the brick, and a dab of mortar is scraped against the outer vertical angle of the last brick laid. Then the brick, which should be damp or wet, is pressed into place with a sliding motion, so that the mortar is forced into the pores of the brick, and absolute adhesion is guaranteed. (See MORTAR; CEMENT.)

To obviate the constant use of the plumb and level, the bricklayer, on clearing the footings of a wall, usually builds up six or eight courses at the external angles. These he carefully plumbs and levels across. By means of a stretched string, they serve as a gauge for the intervening work.

When the outer courses have been laid to an angle or opening, the space between them is filled with a thick bed of soft mortar, and bricks are pressed into this mortar in a downward diagonal manner. This is technically known as 'shoving,' and the courses are raking courses or herring-bone work, according as the bond is common, English, or Flemish. In exceptional cases the filling courses are laid dry on a bed of mortar, and grout or liquid mortar is poured in. When the wall is completed, the projecting mortar is either scraped off flush with the brick, or 'struck,' so that it slants in order to shed any water which may fall on it.

Brick walls are frequently built hollow, the two 'skins' of brickwork having a few inches of space between them. The skins are tied together at intervals by iron band ties, bent or looped so that moisture is not conveyed to the inner skin. In common brick arches the bricks are either laid upon wedge-shaped joints of mortar, or the bricks themselves are dressed to a wedge shape, in which case the mortar joints are of uniform thickness. See ARCH; MASONRY.

**Bride, St.** See BRIGIT, ST.

**Bride'well**, parish, city of London, England; once contained a famous prison or house of correction, so named from St. Bride's Well, a spring of reputed healing power. It was burned during the great fire of 1666, and was finally demolished in 1863.

**Bridge**, or BRIDGE WHIST, a game of cards, possibly of Russian origin. It was played in the clubs of Constantinople and Egypt about 1865, and before the

end of the nineteenth century had found its way to the Riviera, Paris, Great Britain, and the United States.

Bridge is a game for four persons, two being partners against the other two. Only three persons actually engage in playing the cards, for the dealer's partner exposes his hand on the table and it is played by the dealer in partnership with his own. The game then resolves itself into one of dummy whist (see WHIST).

The dealer distributes the pack singly, without turning up the last one of the pack. The four players examine their hands and the dealer then has the privilege of saying what suit shall be trumps or of passing the selection on to his partner, who is then bound to name the trump.

As in whist, every trick over six taken by one side is scored as an overtrick, but in bridge its scoring value is regulated by the suit that is made trumps (spades 2; clubs 4; diamonds 6; hearts 8; no trumps 12). When the trump suit has been named, it is at the option of either adversary—the one to the dealer's left having priority—to double its scoring value. The dealer who declared trumps, or his partner, may now redouble, and the other side can redouble until an agreed-on limit has been reached. The player on the dealer's left leads out a card to the first trick, and the dealer's partner then (and not till then) spreads his hand face upward on the table, taking no further part in that hand.

A game consists of 30 points, made up exclusively of *trick* scoring, whether on 'doubles' or otherwise. Should a win carry the score over 30, the surplus points are taken into account when the score is settled at the end of the rubber. The side winning the *rubber*—i.e., two games out of three—scores for doing so 100 points.

There are five *honors* in bridge—ace, king, queen, jack, and ten of trump suit. In a 'no trump' declaration the four aces are the only honors, and are scored as follows: three aces held either conjointly or by one player count 30; four aces between partners score 40; four aces held in one hand score 100. When, on a trump declaration, a player has none of the trump suit, he has *chicane*. For a 'grand slam' by one side—making the whole thirteen tricks—40 points are placed to the honor score; for making a 'little slam,' or twelve tricks, 20 points. The honor score is not affected by doubling.

*Suggestions for Play.*—The declaring hand should hold not less than four reasonably certain tricks. The trump suit should be

sufficiently strong either to capture the adverse trumps, or to clear them out and still hold a last one or two trumps in reserve. With fair trick-making possibilities in three or four suits, pass the call. With three aces and other probable tricks, declare 'no trumps,' and always with four aces. Do not double unless you are practically sure of making the overtrick, or your chances of doing so are promising, and the double is necessary to put you to game. Always consider the state of the score before declaring or doubling.

*Auction Bridge*, which has almost entirely superseded simple bridge, is a development of the game, which follows the rules of the latter in general, but differs most particularly in that the declaration of trumps goes to the player who bids the highest number of tricks for the privilege. The dealer makes the first bid, or passes, and each player bids (or passes) in turn until the highest bidder is ascertained.

If the declarer is successful in making his bid, he scores all the trick points (see table) he makes. If the declarer fulfils a doubled contract, he scores the doubled value of his odd tricks and for fulfilling his contract an additional 50 points in his honor score. If he makes more than his contract he scores an additional 50 points for each extra trick. If he is unsuccessful, his adversaries add 50 points to their honor score for each trick he falls short of his bid, regardless of the suit. For winning the rubber, 250 points are added to honors.

*The Score in Auction Bridge*

*Odd Trick Values*

In No-Trump	.....	10	points
In Spade Trump	.....	9	"
In Heart Trump	.....	8	"
In Diamond Trump	.....	7	"
In Club Trump	.....	6	"

*Honor Values*

3 in one hand	0 in other	30	points
2 " " "	1 " " "	30	"
2 " " "	1 " " "	40	"
2 " " "	2 " " "	40	"
3 " " "	2 " " "	50	"
4 " " "	0 " " "	80	"
4 " " "	1 " " "	90	"
5 " " "	0 " " "	100	"

The values of honors is not changed by doubling or redoubling. Grand slam counts 100, little slam 50 in the honor score.

A recent variation in the game of Auction Bridge which has claimed more or less attention is known as *Contract Bridge*. The main point of difference between Contract and Auction Bridge is that in the former the player scores below the line only such tricks as he contracts to take. Should any excess tricks be taken

they are scored as a bonus in the honor score. Therefore if one is to make a game in Contract Bridge one must bid accordingly. In Europe, where Contract Bridge is known as *Plafond*, the trick scores are the same as in Auction Bridge, but in the American game as sponsored by New York experts the trick values are as follows: clubs 20; diamonds 20; hearts 30; spades 30; no trumps 35. Doubling doubles the trick value and the game is 100 points. The precedence of suits is no trumps, spades, hearts, diamonds, and clubs. The honor score is: four in one hand 100, five in one hand 150, 4 aces in one hand 150; each game won, 200; for winning a rubber, 300; for making a contract if doubled, 50 when not vulnerable, 100 when vulnerable (a side is *vulnerable* after winning a game); extra tricks, 50, if not doubled, 100 if doubled and not vulnerable, 200 if doubled and vulnerable; slams bid and made: little slam, 500 or 750, when not vulnerable, and vulnerable; grand slam, 1000 and 1500 when not vulnerable and vulnerable, respectively. Penalties for not making contract if undoubled, when not vulnerable, per trick 50, when vulnerable first trick 100, other tricks 200. If doubled, when not vulnerable 100 for each first four tricks, 200 for fifth trick, and 400 for each subsequent trick, all of which values are doubled if the side is vulnerable. The laws of Contract Bridge are the same as those of Auction Bridge, but it can readily be seen that the average rubber will run into much higher figures so that in the usual game the accustomed stakes are somewhat lower. Consult Irwin's *The Complete Auction Player* (1926); Lenz' *Contract Bridge* (1927).

**Bridge, SIR FREDERICK** (1844–1924), organist of Westminster Abbey (1875–1918), was born in Oldbury, Worcestershire. He studied music under Sir John Goss; was organist at Trinity Church, Windsor (1865–9); and at Manchester Cathedral (1869–75). He was subsequently professor of harmony at Owens College and Royal College of Music; Gresham professor of music; conductor of the Royal Choral Society (1896–1922); and King Edward professor of music in the University of London. His principal works are: *Counterpoint* (1877); *Musical Gestures* (1894); *Rudiments in Rhyme* (1896); *Mount Moriah* (1874); *Boadicea* (1882); *Rock of Ages* (1886); *The Inchcape Rock* (1891); *Twelve Good Musicians* (1920); and *A Westminster Pilgrim* (1919), an autobiography. He was knighted in 1897.

**Bridgehead.** See TÊTE DE PONT.

**Bridgend,** brij'end', market town, Wales, in Glamorganshire, on the Ogwr River; 20 miles west of Cardiff. It has stone quarries, iron works, and coal mines. In the vicinity stand the ruins of several ancient castles. Pop. (1921) 9,206.

**Bridgenorth.** See BRIDG-NORTH.

**Bridge of Sighs** (Italian *Ponte dei Sospiri*), a covered stone bridge in Venice (q.v.), crossing the Rio della Paglia and connecting the Doge's Palace with the criminal prisons. It is celebrated in the opening lines of the fourth canto of Byron's *Childe Harold*: 'I stood in Venice—on the Bridge of Sighs.' The name is also given to a bridge in New York City, joining the Criminal Courts Building and the Tombs Prison.

Thomas Hood's poem *The Bridge of Sighs* refers to neither of these bridges, but was inspired by the drowning of a London out-cast in the Thames.

**Bridgeport,** city, Alabama, in Jackson County, on the Tennessee River and the Nashville, Chattanooga, and St. Louis Railroad; 120 miles northeast of Birmingham. Pop. (1910) 2,125; (1920) 2,018.

**Bridgeport,** city, Connecticut, one of the county seats of Fairfield County, on Long Island Sound, and on the New York, New Haven, and Hartford Railroad; 18 miles southwest of New Haven, and 56 miles northeast of New York, with which it has steamship connection. The estuary of the Pequonnock River, which empties into the Sound at this point, and Yellow Mill Creek, a tidal inlet, furnish excellent harbor facilities. On a peninsula between the two is East Bridgeport, the manufacturing centre of the city. The business and residential districts lie opposite, on the west shore, and three miles down the Sound is the suburb of Black Rock, a popular resort for yachtsmen. A number of parks furnish recreational facilities, notably Seaside Park at the southwestern end of the city, which has a fine beach and contains a Soldiers' and Sailors' monument and monuments to Elias Howe and P. T. Barnum. Beardsley Park at the northern extremity of the city, is also noteworthy.

The principal public buildings are the Federal Building, Fairfield County Court House, Barnum Memorial Institute, Y. M. C. A. Building, and Burroughs Free Public Library. Hospitals and philanthropic institutions include the Bridgeport, St. Vincent's, and Emergency Hospitals,

Sterling Widows' Home, Burroughs Home for Aged Women, and the Protestant Orphan Asylum.

Bridgeport is an important manufacturing centre. According to the U. S. Census of Manufactures for 1927, industrial establishments numbered 331, with 28,415 wage earners, and products valued at \$158,697,415. Important products are corsets, sewing machines, typewriters, brass, iron, and steel tubing, graphophones, locomobiles, arms and munitions, torpedo boats, tools, machinery, and hardware. Among large manufacturing concerns are the Wheeler & Wilson Sewing Machine Company, the Union Metallic Cartridge Company, the American Tube and Stamping Company, Warner Brothers Corset Company, American Graphophone Company, the General Electric Company, the Crane Company, and the Remington Arms Company. The city also has shipyards and a thriving oyster industry.

The first settlement was made in 1639. The town was known as Pequonnock from 1665 to 1694, then as Fairfield village until 1701, when it was renamed Stratfield. The borough of Bridgeport was incorporated in 1800, the township in 1821, and the city in 1836. As a centre for the manufacture of war munitions, Bridgeport experienced a period of unprecedented growth during the European War. Pop. (1910) 102,054; (1920) 143,555.

**Bridgeport,** city, Illinois, in Lawrence County, on the Baltimore and Ohio Railroad; 135 miles east of St. Louis. Pop. (1910) 2,703; (1920) 2,229.

**Bridgeport,** village, Ohio, in Belmont County, on the Ohio

River, and the Baltimore and Ohio and the Pennsylvania Railroads; opposite Wheeling, W. Va., with which it is connected by bridges. It has manufactures of steel rails and structural shapes. Many coal mines are operated in the vicinity. Pop. (1910) 3,974; (1920) 3,977.

**Bridgeport,** borough, Pennsylvania, in Montgomery County, on the Schuylkill River, and the Philadelphia and Reading and Philadelphia and Western (electric) Railways; opposite Norristown, and 15 miles northwest of Philadelphia. It has paper, fibre, woollen, cotton, flour, knitting, and tubing mills, as well as structural iron works. Pop. (1910) 3,860; (1920) 4,680.

**Bridger's Pass,** a defile of the Rocky Mountains, in Southwestern Wyoming. It extends for a distance of several miles, and its precipices of red granite and metamorphic sandstone rise almost perpendicularly to a height of 1,000 to 2,500 feet. Before the opening of the Union Pacific Railroad the emigrant and mail route led through this pass.

**Bridges** are the chief of the three available means of crossing rivers: ford, ferry, and bridge. Our intensive transportation and commerce could not exist without the facilities provided by the highly developed art of bridge construction. Many different types of bridges are used, according to the conditions to be met at the crossing. The chief ones are represented in the adjoining list, which gives the most prominent bridges of their respective types, measuring magnitude by length of span, or in some instances by height.

The log and vine used by our

aboriginal ancestors were early superseded by man-made *beam* and (probably in China) *suspension* bridges. *Arches*, invented by the Etruscans, were perfected and applied by the Romans on a large scale to bridging; the elevated portions of their great aqueducts are monuments to their skill as arch builders (see ARCH). Beyond this stage, however, bridge construction ceased to develop until within the last 150 years, and thus it may be said to have remained primitive until the modern era. The marked progress since then is due partly to the progress of industry, furnishing better and cheaper materials, and partly to advance in science and technology. The growth of the railway after 1820, calling for many and strong bridges, also acted as a powerful stimulus.

FIG. 1.—*Vaughn Bridge, on Manila South Road, P. I.*

Concrete arch bridges, now built in large numbers, are well suited for remote locations. Three-fourths of the material (sand and stone) is obtained locally, and low-grade labor can be used.

The roadway platform or *floor* of the modern bridge is not essentially different from that employed by the ancients, though transformed and improved as to materials, strength, permanence, etc. The characteristic developments have been in the carrying structure, and bridges are classified according to the nature of this structure. A number of the types, however, are identical with those of primitive times: the *beam* bridge, the *arch* bridge, the *suspension* bridge, the *pontoon* bridge, and the *bascule*—the last named perhaps the leading form of the modern *movable* bridge. The most important of all present-day types, however, the *truss* bridge, is wholly new, and its development has extensively influenced that of the other types. The truss was first applied to replace the beam, and this is still its most important service. It has also found a large use in arch service, and as a necessary part of suspension bridges for modern traffic. It is a meshwork of rela-

tively slender bars, usually (considering now only the plane truss) arranged as a chain of triangles. This broad definition of the term is sometimes implied in what follows, though sometimes the narrower meaning of *simple truss*, or truss performing functions analogous to those of the beam on two supports, is to be understood.

Bridge construction has at all times been determined by the materials available. The ancients built bridges of wood, stone, and brick. Iron was costly, and could be made and shaped only in small pieces. A small brook could be spanned by a beam bridge, consisting of timbers laid across from bank to bank and covered by a plank roadway. Wider streams were crossed by beam bridges of many spans, the intermediate supports being clusters of piles (as in the bridges made memo-

rable by Cæsar) or stone-filled wooden cribs or masonry piers, spaced as close together as the available lengths of beam required. Permanent bridges were formed by a series of arches, which probably seldom exceeded 30 to 50 foot span; these had to have masonry piers as supports. The difficulty of constructing piers and their foundations in rivers, especially in soft bottom, greatly limited the application of this type. Large and deep rivers were often crossed by bridges of boats, or pontoon bridges (Darius, Xerxes), consisting of a number of boats fastened together to form a string from bank to bank, and beams with floor planking laid over the boats to form a roadway.

The mediæval bridges included as a new type the *drawbridge*, used to permit or bar access to fortified places and castles surrounded by a moat. It was simply a wooden beam bridge trunnioned at one end, while at the other end were attached chains

leading up and back to pulleys supported at a considerable height above the trunnions, and thence leading down to counterweights. By pulling down the counterweights the bridge could be raised from horizontal to vertical (open) position. Beyond a few small chain suspension bridges, the fixed bridges of that period were limited to the ancient types just mentioned, but increased constructive skill was shown by greater lengths of span, arches often reaching spans of 80 to 100 feet.

Development began late in the eighteenth century with the construction of compound wooden beams (toothed beams) to make large bridge timbers out of small ones, and the devising of primitive wooden trusses in Switzerland and Germany (though Italian engineers, like Leonardo da Vinci, had made sketches of true trusses more than a century earlier). Then, the iron industry having progressed considerably, cast iron was utilized as material for arch bridges in a few instances, first in England (at Coalbrookdale), and soon afterward in Germany. Beginning shortly before 1800, numerous forms of truss (Town, Long, Burr) were invented in the United States—some intended to be built wholly of timber (web members in close lattice arrangement, nailed or tree-nailed to the chords), and others with iron tension rods and wooden struts.

By that time the evolution of wrought-iron production and rolling began to make plates and shapes of iron available, and in the third decade of the nineteenth century some small beam bridges of wrought iron were constructed for railway use. Wood still remained the principal material for beams and trusses, while stone arches remained the standard for strong and permanent bridges. But *combination truss bridges*, with timber struts and iron tension rods, developed in the thirties and forties; and in the latter part of that period iron rolled beams and plate girders came into some use for short spans, and truss bridges with cast iron struts and wrought-iron tie-rods for longer spans. Robert Stephenson's tubular wrought-iron plate-girder spans of the Menai Straits bridge in England (1847), a remarkable work of engineering, represented one of the stages in the development of the plate girder, shortly before the construction of wrought-iron trusses. A few suspension bridges also found use in that period and earlier (by Finley in America, Telford and others in England), with chains as suspension members, for long spans; later, wire rope was used.

About 1850 the first trusses

TUNKHANNOCK CREEK BRIDGE OF THE D. L. AND W. RAILROAD, FIFTEEN MILES WEST OF SCRANTON, PA. It is built of concrete, 2,230 feet long, and 240 feet high above creek bed. It comprises twelve semicircular arches, ten of which span 180 feet, and two 100 feet. The whole bridge contains nearly 175,000 cubic yards of concrete, and over 1,100 tons of reinforced steel.

built wholly of wrought iron appeared, and from that time onward there has been steady progress in wrought-iron bridge construction, as to both trusses and plate girders. Tubular plate girders quickly became obsolete. Suspension bridges saw great development for very long spans, reaching their climax for boldness in the erection of the Brooklyn Bridge at New York in the seventies and early eighties. Wrought iron was displaced by the very similar but stronger material *soft steel* about 1890. Higher-strength steel, as nickel steel and silicon steel, has been used for some very large bridges since 1903. Wood continues in use for small beam bridges of low cost, and in very minor degree for truss bridges; while one or two truss bridges of reinforced concrete have also been built, and concrete beam or girder construction has seen considerable development for short spans.

Stone arches continued in extensive favor long after the popularization of Portland cement, invented early in the nineteenth century. About 1890, however, cement concrete began to be used for arches, and soon afterward the development of reinforced concrete (concrete with embedded steel rods to give tensile strength in the required directions) led to the present-day extensive use of this material in beam and arch construction.

The great strength of wrought iron and steel, the facility of producing them in forms and sizes suited to bridge work, their lightness when used in beams and struts as compared with stone and timber, the easy and perfect connection of iron parts by bolts and rivets (chiefly the latter), and the absence of decay and fire danger, were vital factors in the rise of iron bridges. Advances in foundation construction were also important. The rapid spread of concrete construction, in spite of the fact that this material is very heavy, is due to the permanence of concrete, its ease of shaping, and the cheapening of high-grade cement.

**Strength of Bridge Materials.**—The strength characteristics of bridge materials may be summarized as follows: *Wood* breaks in compression at 3,000 to 6,000 lbs. per square inch pressure in the direction of the grain, and at about 10,000 lbs. per square inch tension. Its cross-grain strength is hardly one-tenth as great. Its tendency to split and shear along the grain, and the difficulty of attaching a wooden tension member to other parts, limit its application largely to struts and beams. Stresses of 800 to 1,600 lbs. per square inch along the grain are safe. *Cast iron* is very

strong in compression—about 100,000 lbs. per square inch; but in tension it is only about twice as strong as wood, while it is brittle and liable to cracks and internal defects. It is excluded from bridge service nowadays except for such parts as bearing blocks. *Wrought iron* and *soft steel* are of high strength in both tension and compression (50,000 to 70,000 lbs. per square inch), and are also malleable and tough, so that holes can be punched and pieces bent; stresses of 15,000 to 20,000 lbs. per square inch are safe. *Nickel steel* and other high-strength steels may be stressed to 20,000 to 30,000 lbs. per square inch, as in the St. Louis Arch Bridge, which was the first steel bridge built anywhere (1875). *Stone* and *concrete* (artificial stone) are weak in tension, but in concrete this deficiency can be compensated for by steel reinforcement moulded in. Stone in bridge construction is limited to compressive service, for which it may be stressed to from 200 to 800 lbs. per square inch (15 to 55 tons per square foot). Concrete is rarely loaded higher than 650 lbs. per square inch in compression; in reinforced concrete the steel, if suitably arranged, may be stressed to 12,000 to 24,000 lbs. per square inch tension.

**Recent Notable Bridges.**—Views of typical recent bridges are shown in the accompanying illustrations. Concrete arches are widely used for city bridges and on important country roads, but frequently also for railways. The famous *Tunkhannock Viaduct* of the Delaware, Lackawanna, and Western Railroad in North-eastern Pennsylvania is perhaps the largest in the world as to volume of concrete. The longest span of modern Truss Bridges is at present the *Metropolis* 720-foot span (Fig. 2), which in comparison with plate-girder spans as shown in Fig. 3 is equal to nine or ten such spans. How a large truss bridge is erected may be seen from the illustration of the *St. Louis Municipal Bridge* across the Mississippi, Fig. 5. (Note the temporary *falsework*, and the erecting crane.) Cantilever Bridges are erected without falsework, by overhanging from the piers, pieces being added successively at the forward end to closure at the middle (see illustration of *Quebec Bridge* over the St. Lawrence River).

*Steel arch bridges* of long span over wide and deep spaces present the boldest examples of modern steel bridge construction because of the balancing and fitting of great masses of steel in erection without falseworks before the arches are closed and self-supporting. The first structure erected in this way was the steel

arch bridge over the Mississippi River at St. Louis in 1874. The *Zambesi Bridge* in Africa (500 ft., see Fig. 9) and the two Niagara arches, the upper (840 ft. span) for roadway and the lower (550 ft. span) for double-track railroad, are most remarkable for their locations over very deep canyons. The Hell Gate arch of 1,000 ft., over the East River at New York City, has the distinction, besides being a part of the longest railroad bridge (including approaches, 17,260 ft. long,—see full page illustration—consisting of a series of concrete arches, riveted deck trusses, and plate girders, bascule spans, and 4 spans of the heaviest pin-connected trusses of parabolic form), of being designed for the heaviest live load of any bridge—it represents 4 trains of locomotives on 4 railroad tracks, laid in stone ballast throughout, with capacity and room for a 5-lane speedway boulevard on a second deck when desired for roadway traffic. A tremendous outward thrust is exerted by the steel arch against the piers or abutments, just as by stone or concrete arch, as may be appreciated from the position of the parts in this view. There are now under construction two great steel arch bridges of still longer span but for only half the live load of the Hell Gate Bridge: one is the bridge for roadway and rapid transit over the Kill van Kull in New York City (1,675 ft. span) and the other for roadway, 2 street tracks, and 2 railroad tracks, the Sydney Harbor Bridge in Australia, (1,650 ft. span). The completion of each is expected in 1932.

In the Suspension Bridge, the pull of the cables produces an action on the anchorage the opposite of the thrust of the arch, which is provided for in some cases by tying the cables back to the rock, and in some by the stability of a huge masonry anchorage block (*Brooklyn Bridge* and *Williamsburg Bridge* in New York City). Because steel wire can be made enormously strong (over 200,000 lbs. per square inch tensile strength), very long suspension spans are possible.

A suspension bridge of 3,500 feet span is now under construction over the Hudson River at 178th Street, New York City. This is intended for roadway and, ultimately, for rapid transit traffic. Another span of the same length is planned at 57th Street for railroad, passenger, and freight traffic on lower deck and roadway traffic on upper deck. Two other notable suspension bridges for roadway traffic have been built, one from Philadelphia, Pa., to Camden, N. J. (1,750 feet), and the other over the Detroit River at Detroit, Mich.

*Photo by B. Helmitch, N. Y.*

**HELL GATE ARCH, CROSSING THE EAST RIVER AT NEW YORK. A FOUR-TRACK RAILWAY BRIDGE SPANNING NEARLY 1,000 FEET**  
The span between centres of skewbacks is 977½ feet; the distance between pier faces is over 1,000 feet. The deck is about 150 feet above river level. The arch intrados rises 260 feet above water, or 220 feet above skewbacks. The steel of the arch weighs 19,000 tons, and with the concrete floor, ballast, and track, nearly 27,000 tons. The towers are 103 feet wide, and 240 feet high.

**VOL. II.—Mar. '31**

**Vol. II—Page 291**

(1,850 feet). Where a very wide river is so deep or has unfavorable bottom for erecting false-work, the suspension bridge type is the most suitable and economical for a bridge of long span.

A fundamental difference in bridge types arises from the fact that beam and truss bridges bear on their supports with direct vertical pressure only, while suspension and arch types exert large sidewise forces. Because vertical loads are most easily provided for, the beam and truss types are by far most frequently used except for very long spans. Ordinarily, the reactions or pressures at the supports are easily found, for any particular distribution of loads on the structure,

bridge be proportioned to their maximum service. The construction of any bridge must therefore be preceded by complete design of the structure in all its details, and the first step in the designing, after the bridge engineer has selected or laid out the general type and arrangement of parts, and determined what loads it will have to carry, is the calculation of the stresses. The general principles and elements of the methods are outlined here as a means of explaining the peculiarities of the various types of bridges.

#### *Mechanics of the Beam Bridge.*

—The beam or girder is exemplified by a stick laid across the opening between two chairs, or by the floor joist of a house or of

beam of symmetrical section lies at mid-height. Integrating this action (expressed as a turning moment about the neutral axis of the cross section of the beam), it is calculated that the strength of a rectangular beam to resist bending is measured by one-sixth the product of breadth by square of depth, or  $\frac{1}{6} bd^2$ , multiplied by the greatest tensile or compressive stress (in pounds per square inch) which the material will safely bear.

The bending effect of the load, the *bending moment*, increases with the span length, and is greatest at or near mid-span. If a beam is  $L$  feet long, and carries 1,000 lbs. uniformly distributed along its length, the greatest

FIG. 2.—Metropolis 720-Foot Span, the Longest Simple Truss Ever Built

A railway crossing over the Ohio River near Paducah, Ky. It has also four spans of 550 feet. The span was built on timber false-work, one 'bent' at each panel point, just being removed when the picture was taken. This bridge is of high-strength steel: the tension members of nickel steel and the compression members of silicon steel. (See drawing, page 294.)

by the principles of lever action, without regard to the internal construction of the bridge. But in certain types the internal structure modifies the amounts of the several reactions; for example, in a beam which extends without break or joint over three or more supports, and in arches (except the three-hinged type). The analysis and safe design of such bridges call for special and rather intricate methods of calculation. Every part of a bridge must be made of sufficient strength for the stresses which may be produced in it by any loads that can come on the bridge, in any possible positions of those loads. So also must the connections by which this part is attached to other members of the

a bridge. The beam deflects under a load, so that its straight shape becomes slightly curved. In this process the upper portions of the beam are shortened or *compressed* longitudinally, while its lower parts are lengthened or *extended*. The resistance of the material to this shortening and stretching, or the *bending resistance* of the beam, opposes and limits the deflection, and thereby holds up the load. Those parts of the beam nearest the upper surface experience the greatest compression, and those nearest the lower surface the greatest extension; while intermediate parts are strained less, in proportion to their distance from an intermediate position called the neutral axis, which in a wooden or steel

bending moment is  $\frac{1}{8} 1,000 L$ ; if the 1,000-lb. load is concentrated at the centre, the greatest moment is  $\frac{1}{4} 1,000 L$ . For wood, if the allowable compressive or tensile stress is 1,200 lbs. per square inch, the proportions of the beam must be such that the bending resistance equals or exceeds the bending moment, or  $\frac{1}{6} bd^2$  times 1,200 inch-pounds =  $\frac{1}{8} 1,000 L$  foot-pounds times 12. Suppose this beam must span 20 feet ( $L = 20$  ft.); then  $bd^2$  must be at least equal to 150. This would require a beam  $1\frac{1}{2}$  inches wide by 10 inches deep, or one 3 inches wide by 7 inches deep.

The use of beams to form a single-span bridge over a brook is obvious; stone supports (abutments) built on the banks, a num-

ber of beams laid across, and a floor of planks laid crosswise over the beams, are the essential elements. While there are many beam bridges of this kind, an equally important use is made of similar assemblages to form the floor of a truss bridge spanning a much longer distance. Large transverse beams (*floor beams*) carried by the trusses at intervals of 15 to 50 feet along the span form the supports for longitudinal beams (*stringers*), which as in the simple beam bridge carry the flooring.

Other stresses than the flexural tension and compression exist in a beam bridge. Short, heavily loaded beams require analysis for shearing stress (transverse and longitudinal). Side-grain pressure at the ends of a wooden beam where it is supported must be limited to about 200 lbs. per square inch to avoid crushing. The several beams may require to be braced and stayed laterally unless the flooring (solid planking or concrete) performs this service.

**Action of the Plate Girder.**—A remarkable invention, the I-beam (A, Fig. 4), first produced in the iron-rolling mill less than a century ago, realized the possibilities of wrought iron for beam service almost ideally. Today I-beams, as well as all other bridge material, are made of steel. In the I-beam the metal is concentrated in top and bottom *flanges*, where it is most effective to oppose bending by its tensile and compressive strength; only a thin *web* connects the flanges, and by its internal shears, horizontal and vertical, applies the longitudinal stresses to the flanges. Without the web the flanges would have very small strength in bending. Such I-beams, rolled in depths up to 30 inches (most commonly 8 to 24 inches), are used for short bridge spans. The bending strength of an I-beam is measured by its *section modulus*, given in civil engineers' handbooks, which corresponds to the quantity  $\frac{1}{6}bd^2$  of the rectangular beam. But steel may be stressed safely to 15,000 or 18,000 lbs. per square inch against less than one-tenth as much for wood. On this account a 24-inch I-beam weighing 80 lbs. per lineal foot is as strong (in bending) as an oak beam 18 inches wide and 24 deep, weighing 150 lbs. per foot.

The plate girder extends the I-beam principle to much larger dimensions. A common form is shown by its cross section in Fig. 4 B. The web is a plate, the flanges are angle-shaped bars (*angles*), often supplemented by *cover plates*, all held together by rivets. Plate girders 48 to 60 inches deep and 30 to 60 feet long are common in bridge construction, but many have been built of a depth

of 120 inches and in length from 100 to 130 feet—three such girders supporting a double-track railway line for the heaviest modern train loading. By the box-girder construction (Fig. 4, C) still greater strength can be obtained, but for practical reasons this form is less often applied in bridges than in steel frames of buildings. The bending resistance of the plate girder is most readily conceived of as represented by the total compressive or tensile strength of one flange (cross-sectional area of one flange multiplied by the safe strength of the

to resist lateral bending from wind pressure and the like, and by *sway bracing* in the transverse vertical planes (to hold the girders from tipping); the track ties usually rest directly on the girders. If the floor is in the plane of the lower flanges the girders must be farther apart, steel beams must be riveted from girder to girder to support longitudinal stringers to carry the ties, and the structure is thus more costly. Top lateral bracing cannot be used, as it would block the passage of vehicles on the roadway; the upper flange of each girder may be

FIG. 3.—Railway Plate-Girder Viaduct Under Erection

The plate-girder span, comprising two girders and their lateral and sway bracing, being set in place as one piece by the derrick car standing on the completed viaduct.

steel per square inch) multiplied by the depth between centres of flanges; this *resisting moment* must be equal to the bending moment of the loads and reactions on the girder. The shearing stresses in the web also need consideration, especially to insure sufficient strength of the riveting between web and flange.

A plate-girder bridge in its simplest arrangement is the *deck bridge* (with roadway above), as shown diagrammatically by sketch D in Fig. 4. For a single-track railway bridge only two girders would be used, braced together by *lateral bracing* in the planes of upper and lower flanges

stayed against lateral buckling by sloping braces attached at the lower end to the beams of the floor.

**The Truss.**—A number of separate slender sticks pinned together at their ends to form a meshwork of triangles, as in E and F, Fig. 4, constitute a rigid assemblage resisting distortion (provided it is so stayed that it cannot be forced out of its plane). Such a meshwork is called an *articulated frame*, or more simply a *truss*. It has the property of the beam—namely, resistance to bending—though the individual sticks (*truss members*) may be quite slender and possess very

little individual bending strength. Comparing the trusses Figs. *E* and *F* with a plate girder, the members forming upper and lower boundaries of the truss (*chords*) are equivalent to the flanges of the plate girder, while the intermediate *web members* take the place of the web plate. A small truss is therefore often called a *lattice girder*. The *lattice truss* (*G*), invented by Town in the United States in 1804, was one of the earliest truss forms invented. In modern truss analysis the Town truss is classed as one having *multiple web system* or a *multiple-intersection truss*, because when compared with the most simple truss (*E*) it appears as though made of several such trusses overlapped, the chords coalescing. Multiple-intersection trusses are practically obsolete.

**Truss Analysis.**—The typical truss bridge consists of two trusses, spaced 15 to 30 and more feet apart, and braces connecting them so as to hold them upright.

FIG. 4.—Girders and Trusses for Bridges  
(For description of diagrams see text.)

The beams of the floor are attached to the truss at angle points of the truss meshwork; thus the trusses are loaded at these points only. In studying the action of the loads, it is enough to consider one of the trusses. The loads exert forces on all the individual truss members; these forces are readily determined by the rules of simple statics. We can see that removing any one member would cause the truss to collapse, since a deformable quadrilateral would result from the two adjoining triangles; therefore each member is subjected to a force, and as the force is transmitted to adjacent members at its ends, the two ends of the member must exert equal and opposite forces, directed along the axis of the member. Thus, the stress in the member is either direct compression or direct tension. Such of the truss members as experience tension may be made of ropes or of slender iron tension rods; the others must be stiff, to avoid buckling, but do not need to be proportioned to have a large lateral bending strength. Each member has its full cross section acting at full efficiency in resisting

stress, because it is stressed axially, while in a beam only the outer portions get highest stress and the interior is not fully utilized. Herein lies the economy or weight-efficiency of the truss.

The truss *E*, Fig. 4, resting on supports at its ends and carrying loads at its intermediate angle points (*panel points*), can be analyzed completely by the simple principle of the *triangle of forces* (see MECHANICS). To begin with, the reaction of the left-hand support can be resolved into two components, acting along the lines of the two end members; these component forces are the stresses in these two members. The stress in the inclined *end post* must be balanced at its upper end or *hip joint* by the stresses in the other two members meeting at that joint, which again allows of drawing a triangle of forces to determine the amounts of these two stresses. The same procedure may be carried through the whole truss, and thereby all the stresses

part now lacks the forces that were exerted upon it by the stresses in the three cut members, it will fall down, due to the loads on it; but if we supply three forces exactly equal to these three stresses, the part will stay in place, since it is in just the same condition as to forces as before the truss was cut apart. Now take as imaginary fulcrum the point where the cut web member and the cut lower chord (prolonged) meet. The leverage of the left-hand truss reaction and of all the loads on the part about this fulcrum can now be computed, and, as will be recognized, the opposing leverage of the top-chord member—*i.e.*, of the force applied to this member—must be equal and opposite to the other leverage, in order to account for the existing perfect balance and immobility of the part of the truss. This calculation obviously gives the amount of the unknown top-chord stress by direct arithmetical division. The same method, only taking the intersection of web member with top chord as fulcrum (*centre of moments*), gives the bottom-chord stress. As to the stress in the web member, the fact is utilized that the vertical components of all forces acting on the part must balance; or, since in this case the reaction and the loads are all vertical, the difference between (upward) reaction and (downward) loads on the part will be equal to the vertical component of the stress in the web member. This difference, the *shear* in the truss at the point where it was cut apart, is to be multiplied by the secant of the angle between web member and a vertical line to give the stress sought (since the shear is the projection of the web stress on the vertical).

This method applied throughout the truss suffices to give all the stresses in the members under the particular amount and distribution of loads then considered. It may be applied in the same way to any type of *simple truss*, which has no supernumerary members and permits of cutting the truss by a series of sections which cut each only three members, so that the procedure above outlined is feasible. In many commonly used forms of truss, however, certain sections will cut four members without vitiating the above method. It is possible in such cases to determine the stress in one of the four members by the calculation of local equilibrium at a panel point where two of three meeting members are in a straight line, or by other auxiliary relations. When a truss departs sufficiently from the simplicity of internal structure of the truss in *E*—*i.e.*, when it contains more members than will just suf-

determined. It then remains only to proportion each member to suit the stress it carries.

In the process just described, the force triangles need not be drawn separately, but may be joined (saving one-half the number of lines), and thus they form a Cremona or Maxwell diagram, sometimes called simply a *stress diagram*. This figure has peculiar properties; it has a vertex point corresponding to each open area or mesh of the truss, and a mesh corresponding to each vertex of the truss, and for this reason is called a *reciprocal figure*. By Bow's notation, placing letters or numbers one in each mesh of the truss, these letters or numbers will then designate the vertices of the stress diagram, and each will occur only once, if the diagram is drawn correctly.

Arithmetical calculation is often most convenient for truss analysis. The lever principle in elementary form suffices for this purpose, if skillfully applied. Cut the truss *E* in two by a vertical cut, which will sever three members, and discard one of the two pieces, retaining and studying, say, the left-hand part. Since this

face to preserve its shape—it is said to have *redundant members*, and is *statically indeterminate*. Such a truss must be analyzed by more abstruse methods, noted further on.

While the truss shown has *parallel chords*, the common design for large truss spans is like that of Fig. 2 and Fig. 5, with *inclined* or so-called *curved chords*. The methods of analysis for these depart a little in detail from the above outline, but are in essence the same. Before proceeding further, with the calculation of stresses, however, the character of loading must be noticed. A bridge is affected by:

**Dead Load and Live Load.**—The weight of the bridge itself

agonals this live-load compression may exceed the dead-load tension, causing *stress reversal*. Because of this effect such trusses as the sketch shows are fitted with a second diagonal in each of the panels near mid-span, this second being inclined in the direction opposite to the first one, hence called a *counter*.

Since the live load increases and decreases the prior stresses according to its position, its greatest effect in both directions must be examined if the bridge is to be safe. For the web members in particular the greatest effects occur under partial loading. Therefore the positions of loading which produce the greatest stress in a particular member of the

ilar to a beam resting on two supports. In the case of arch, cantilever, and continuous bridges, a special analysis must be made to find the maximum positions of loading.

A widely used modern device for this purpose, useful alike for continuous load and for wheel loads (train loading), and for all types of bridge, is the *influence line*. An influence line for a given member of the truss is a diagram whose base is the entire span of the bridge, and whose ordinate at each point represents the stress in the member when a load of one pound is placed at that point. Thus, the influence line for the web member of a simple truss has part of its length above the

FIG. 5.—Erecting a Large Truss Bridge on Falsework by Travelling Derrick and Gantry Cranes

A 668-foot span of the St. Louis Municipal Bridge, Mississippi River. The derrick traveller in the foreground is setting the plate-girder floor beams and stringers. The gantry back of it is engaged in truss erection. The hoisting tackle hung from the upper part of the gantry must handle very heavy loads, as the single members weigh 20 to 30 tons each.

and of any fixed attachments is called the *dead load*. This being immovable, only one kind and amount of stress exists in a particular member due to it. But the loads imposed by traffic, the *live load*, cause different stresses depending on their position on the bridge. Thus, in the truss *F*, Fig. 4, the diagonals are stressed in tension by the dead load; when a heavy wagon or a steam roller enters on the bridge at the end farthest from the diagonal, it increases the tensile stress until the time when it passes the diagonal, when in a few seconds its effect changes and it throws a high compressive stress on the diagonal, or rather suddenly decreases the dead-load tension. In certain di-

truss must first be found. This operation involves an important branch of the science of truss analysis. In general, the greatest chord stresses are produced by a load covering the whole bridge, while the greatest web stresses are produced by loads covering all of the bridge to one side of the particular web member under consideration. This statement, however, is far from adequate in case of loading like that produced by a railway train, comprising a sequence of concentrations at fixed spacing apart. Various intricate methods, both analytical and graphical, have been devised to deal with this problem. Further, the statement applies only to simple spans—*i. e.*, those sim-

base (representing tension) and sloping up from the end of the span, and part below the base (compression) sloping downward from the other end of the span, and a sharply sloping line within the panel of that web member connecting the two lines. Such a line shows at a glance that the greatest possible tension in the member occurs when that part of the span is loaded that lies under the upper portion of the influence line. In bridges of complex make-up it is often convenient to draw the influence line of each member by computing the stress produced in it by a 1-lb. load placed successively at the first panel point, the second, and so on. Then the load positions for maximum stress

are perceived at once, or (for wheel loads) can be found by a few simple trials; and then the stress may be obtained from the influence line by scaling off the ordinates of the influence line under each load, multiplying by the amount of that load, and adding these quantities.

#### Wind and Centrifugal Stresses.

—The transverse bracing which connects and holds upright the two (or more) trusses of a bridge must be strong enough to resist the side pressure of wind, forces due to centrifugal action of trains (if the track is on a curve), and lateral shock and vibration tendencies. The amounts of these forces being known or estimated, the lateral bracing is arranged and proportioned to resist them,

of the upper lateral system down to the supports; but similar bracing of lighter character is placed at the intermediate posts of the trusses (*sway bracing*), in order to make the structure stiffer and less subject to vibration.

Stresses caused by the drag of a train when the brakes are applied have to be considered in railway bridges. They have little importance for the members of an ordinary truss bridge, but affect the fastening at the supports. In high bridges and viaducts used for elevated railways, as well as in arch bridges, cantilevers, and suspension bridges, they are of primary importance.

**Truss Types.**—The Howe, Warren, and Pratt trusses are the most important main or basal

the chords; also they provide in the simplest way for sway bracing. The Howe truss is in a sense the opposite of the Pratt, its diagonals rising toward mid-span, which makes them compression members while the verticals are in tension and in fact are always made of iron tie rods. When built of timber the Howe truss is nearly always made with crossed diagonals in each panel, and the tie rods can then be cinched up tight, which guards against derangement or sagging of the bridge from shrinkage of the wood.

In all these types the most economical proportions are secured when the diagonals slope not far from 45 degrees, which requires the panel length to be

Copyright by Ewing Galloway, N. Y.

FIG. 6.—Firth of Forth Bridge, Scotland; 1,700 Foot Cantilever Spans

by methods quite similar to those used in analyzing the trusses themselves. There is usually a set of braces in the plane of each chord (upper and lower *lateral system*). With rare exceptions a lateral system consists of two crossed diagonal members in each panel length of the trusses, and transverse members at the panel points running direct from truss to truss. In the plane of the floor the main transverse beams serve also as lateral struts, so that only the diagonals have to be added. Such a lateral system constitutes a horizontal truss, and is analyzed as such.

Diagonal bracing in vertical transverse planes is also provided. It is essential at the ends of a bridge, where this bracing, the *portal*, transfers the wind stress

forms of truss, and of these the Howe is practically out of use since wooden bridges have become largely obsolete. Fig. 4, *E* shows a Warren truss; the successive web members are of equal inclination in opposite direction. One of them is a tension member, the next a compression member, and so on alternately. In the Pratt truss (*F*), there is a vertical post at each panel point, and in each panel a diagonal sloping downward toward mid-span; the diagonals all are tension members, except for possible live-load stress reversal, which is taken care of by diagonals in the middle panels, as mentioned earlier. The advantage of the Pratt truss is that the compression members are of minimum length and have the fewest oblique connections to

nearly equal to the truss depth. In long spans, whose trusses must be very deep (some exceed 100 feet), this would make the floor construction very costly, on account of the long panels, and the panels are therefore subdivided by auxiliary trussing. In the great Firth of Forth cantilever (Fig. 6), spanning 1,700 feet, this was accomplished by building an internal bridge inside the main structure, carrying the floor from panel point to panel point. The common practice, however, is to insert an intermediate floor beam at the middle of each panel, support it by a hanger from the middle of the diagonal above, and brace this latter point either by a sub-tie to the adjoining top-chord panel point or by a sub-post (Fig. 2) to the adjoining bottom-

chord point. The truss is then said to have a subdivided web system. Baltimore and Petit trusses are subdivided Pratt trusses, the latter having curved top chord. In the new Quebec Bridge, the effect of panel subdivision is attained by the arrangement of the main web members, for which the truss has been named the K-truss.

minate stress distribution has been often charged against it, unjustly. Whipple has the credit of publishing the first explanation of truss analysis and calculation.

The bowstring truss, having one chord in a parabolic curve and the other a straight line connecting its ends, was once much used, though now it is rare. The double parabolic or lenticular

put in the middle panels, it is not usually possible to adjust the two opposed diagonals so perfectly during erection that both will be just taut at the same time, so that one can go into action the moment the other goes out of action (during stress reversal); for this reason the counter diagonal is made adjustable—*i. e.*, fitted with a screw turnbuckle so that it can

FIG. 6A.—Beaver Cantilever Bridge, across the Ohio River (769 Feet Channel Span)

FIG. 6B.—Sciotoville Continuous Girder Bridge across the Ohio River, Two Spans of 775 Feet Each

Shortly after 1840 Squire Whipple of Utica invented a truss which is similar to the Pratt, having vertical posts and tension diagonals, but has the posts spaced twice as close, and each diagonal crossing the next post at mid-height and connecting to the foot of the second post. This gives the advantage of short panels in simple manner, and the truss was used very extensively until after 1890, since when it has no longer been built. Indeter-

truss also was in common use in the latter part of the nineteenth century for small spans. A number of other truss forms exist, some of them still occasionally employed; but the Pratt and Warren forms with their modifications are predominant and typical. Simplicity of web system is one of the *desiderata* in selection of truss form. It is desirable also, for practical reasons, to avoid adjustable members. In the Pratt truss, *F*, Fig. 4, where counters are

be drawn up tight. Rods of this kind are apt to rattle, become loose, and contribute to shortening the life of a bridge. But, except in the longest and heaviest bridges, the only way to avoid adjustable members is by allowing stress reversal in some web members, which is also subject to objection. The respective advantages of the Pratt and Warren types are therefore fairly evenly balanced, from the service standpoint; the greater ease of connec-

tion in the Pratt type has made it the more widely used.

**Cantilever and Continuous Bridges.**—A beam resting on ordinary supports at its ends, so that under vertical loads it puts only vertical pressures on the supports, is a *simple beam*, and a truss bridge similarly supported is a *simple span*, by far the commonest type. When one end of the beam projects beyond the

chor arm of 459 feet. This structure, however, departs from the internal simplicity of the ordinary cantilever bridge. The stresses from dead load are determined as in ordinary cantilevers, but stresses from live load require more complex methods for analysis.

A continuous beam or girder is one that without break or articulation extends across two or more

can be fixed as to location the structure becomes statically determinate and free from the above-noted liability to derangement. This effect is attained by cutting the girder at one point (in case of a two-span girder), and reuniting the adjoining ends by a pin or hinge. This transforms the bridge into a cantilever structure. It will be obvious that in this latter any loads on the suspended span produce definite reactions on the ends of the cantilevers, calculated by the lever principle and not dependent on the internal makeup of the girder. And similarly all loads on the cantilevers produce reactions on the supports that are just as simply computed and allow all stresses in the structure to be determined. In contrast, the continuous girder exerts different reactions when its depth or shape of cross section is modified at any point, and therefore the true stresses cannot be found until after the whole structure has been fully proportioned.

The accompanying diagram, illustrating the procedure of hoisting the great 640-foot suspended span of the second Quebec Bridge into place, will serve to make clear the relations of parts in a cantilever bridge. The stress calculations for all loadings are quite the same for a cantilever as for a simple bridge. The type is applicable alike to short and long spans, but for short spans its specific advantages do not usually suffice to outweigh the extra complication of the joints, as well

FIG. 7.—Lifting the Suspended Span of the Quebec Bridge from Scows to the Ends of the Cantilever Arms

Suspended span, 640 feet; whole span between piers, 1,800 feet.

support, the extension is a *cantilever*, which when loaded bends so as to be convex upward. When the cantilever ends of two beam spans are brought near together, another beam may be hung with its two ends to the ends of the cantilevers, and this arrangement constitutes a *cantilever bridge*. The intermediate beam hung from the cantilever ends is the *suspended span*. Various arrangements of beams with cantilever projections, with or without suspended spans, can be made, without affecting the type classification or the nature of the structure's action. Nearly all cantilever bridges have a suspended span, but a very prominent exception is the great *Blackwell's*

spans (three or more supports). When carrying load it bends convex downward between supports, while at and near the supports its curvature is convex upward. The point where the one curvature changes to the other is the point of no moment, or of contraflexure.

The cantilever and the continuous bridge are related, yet the former is much used while the other is rare. The practical objection to the continuous bridge is the fact that its pressures on its several supports are changed by any vertical shift of one of the supports, and thereby the stresses in the truss members are altered, which means that the bridge is weakened, or becomes less safe. Yet the continuous beam is more

FIG. 8.—A Reinforced Concrete Arch Span for a Country Road

The arch has two ribs, each 3 1/2 feet square at the crown, 16 1/2 feet apart. Columns resting on these ribs at intervals carry, at the top, transverse beams on which the floor slab is supported. The whole is of concrete. Dash lines in the right-hand half indicate the location of steel reinforcing rods; the left-hand half shows the finished side view.

**Island or Queensboro Bridge** across the East River at New York, whose spans are: a west anchor arm of 469 1/2 feet; a projecting cantilever arm of 591 feet meeting another one of the same length, and thus making a span of 1,182 feet; an anchor span of 630 feet across Blackwell's Island; another channel span of two equal meeting cantilevers aggregating 984 feet, and an east an-

economical of material than the simple beam, for the same lengths of span, and it is desirable to utilize this advantage, either to save material or to obtain greater strength with the same material.

Due to the constraint or indeterminateness of the continuous girder, there is a shifting of the contraflexure point as the position of loads on the girder changes; and if the contraflexure

as certain other disadvantages. The prime field of the cantilever is in very long spans. Such a bridge as the Beaver cantilever (see Fig. 6A) across the Ohio in Pennsylvania (769 feet channel span) or the Sukkur bridge in India (820 feet span), is a relatively small cantilever, though exceeding by far the longest simple truss spans ever achieved (St. Louis Municipal, 668 feet; Metropolis,

720 feet). The prodigious cantilever bridges across the Firth of Forth in Scotland (1,700 feet span); the St. Lawrence at Quebec, Canada (1,800 feet); and the Queensboro, noted above, represent sizes that the simple truss shows no promise of being able to reach. One factor in the superiority of the cantilever is its concentration of the heaviest members near the supports, whereas the simple truss has its heaviest members at the middle, where

Continuous bridges have been used to some extent on the Continent of Europe, but practically not at all elsewhere. The Fades Viaduct in France (spans 378, 472, and 378 feet) is a striking example. A very large-scale application of the continuous principle was made in America in 1916-17, however, in the Sciotoville bridge across the Ohio, which has two spans of 775 feet each (see Fig. 6B). The foundations being on rock, there is no

ports. It is difficult to attain the precision of shop manufacture and erection necessary to reach this result.

*Arches* in modern bridge practice are of several types, the most complex of which is that represented by the classical stone arch, the *fixed-end* type (see Fig. 8). If made of concrete, cast iron, or steel, there is opportunity for introducing hinges at the crown or at the springing lines, or at both crown and springing. The latter

FIG. 9.—The 500-Foot Zambezi Arch in South-Central Africa

Cantilever arch erection is characteristically shown here. The upper end of the heel of either half must be anchored back by temporary anchorages strong enough to withstand the enormous tipping moment of the projecting mass of steel and the erection cranes working at the outer end. The rock walls of the gorge here furnished good locations for anchorage. In other cases huge triangular backstay frames loaded with enormous counterweights at the rear end have been used, as in erecting the Hell Gate arch. (See article ZAMBEZI.)

they require the largest amount of material to carry their weight. But probably the main factor is the possibility of free cantilever erection, without falsework supports, a process that is only in rare cases practicable with the simple truss, and then only at the cost of serious sacrifice of strength.

The cost of very long spans is indicated by the fact that in the largest existing cantilever bridges each pound of traffic weight capacity demands 3 to 4 pounds of bridge weight to hold it up, whereas in ordinary truss bridges of considerable size the ratio is only 1 to 1½ pounds bridge weight per pound of live load.

danger of pier settlement that might derange the stress distribution. A peculiar feature of all constrained-type bridges, including the continuous type, is the necessity of making special provision during erection to insure that the structure as built will agree with the presupposed conditions. The setting of the last piece (closure) must be made in such manner as to bring a definite amount of stress into the member, in order that the truss will have such shape, that if it were lifted off its supports and laid down on its side (unstressed condition), its supports would be exactly in line, fitted to the position of the sup-

arrangement produces the *three-hinged arch*, whose action is similar to that of two rafters resting against wall plates at the heel and butted together at the peak. Like the rafters, the three-hinged arch can be analyzed by simple statics (the lever principle). But if the two rafters are lapped at the peak and rigidly spiked together, so that as one bends it makes the other bend also, we have the *two-hinged arch*, having hinges only at the springing lines. This is slightly more efficient—*i.e.*, requires slightly less material—than the three-hinged. Arches with a single hinge are not used, but arches without hinges, or

fixed-end arches, are common in steel as well as stone and concrete. A few stone arches have been built with hinges.

The correct analysis of two-hinged and no-hinged arches requires methods whose nature is indicated below under *Elastic Analysis*. For masonry arches, however, it is customary to apply a simplified semi-empirical method of analysis, using a graphical process. The arch may conveniently be regarded as a suspension cable turned upside down, with compression in place of tension in the curved member. Just as the cable changes shape as the load on it is shifted, and is an *equilibrium polygon* or *funicular polygon* for the system of forces consisting of the loads and the support and anchorage reactions, so the ideal or *linear arch* is also a funicular polygon. The masonry arch must be so shaped and adjusted in ring thickness that the linear arch or *line of pressure* remains everywhere within the middle third of the ring thickness. From a force diagram a trial funicular polygon is drawn, and its pole distance so modified as to bring the polygon inside the middle third at arch crown and abutment. Thereupon the ring thickness or the arch curve or both are modified to fit the polygon. If separate polygons are drawn for full load, one side loaded, and centre half loaded, and all three have their pressure lines within the middle third, the design is sufficient, as the great strength of stone makes edge crushing of the voussoirs unlikely.

The correct elastic method of analyzing stone and massive concrete arches is usually applied by graphical means due chiefly to Greene.

The *rib arch* differs from the ordinary barrel-vault arch in having the ring composed of separate narrow ribs, on which rest columns carrying the roadway slab or deck. This form is often built in steel and concrete, rarely in stone. Steel arches are also built with ribs composed of truss meshwork (arch frames or braced arches). In hingeless and two-hinged arches the vertical reaction, the horizontal thrust, and the bending moment of the abutment vary independently, so that there are three unknowns. Three physical phenomena correspond—namely, that the supports do not yield vertically, or horizontally, or rotatively (by tipping); and translating these into mathematical terms, equated to the elastic distortions of the arch, permits of computing the three reactions. Then the stresses in all parts can be found by the methods used for simple beams and trusses.

A few very large rib arches of

steel have been built, but the largest are braced arches. The *Hell Gate Bridge* (see illustration), the St. Louis arch bridge of 3 spans (500—520—500), and the *Zambezi Bridge* (see illustration) are good examples. All three were built by cantilever erection, which requires strong anchoring of the rear end of the upper chord until the arch is joined.

*Suspension Bridges* consist of a pair of chains or cables draped over towers and anchored at the extreme end, supporting a roadway platform by hanger rods or ropes. For given loads on the roadway, the greater the sag the less is the tension produced in the cable. When carrying a local load the cable is pulled down at the point of loading and rises elsewhere, exerting a greater lifting effect at the load, and thereby holding it up. This is the action in an unstiffened suspension bridge, as sometimes used for a light foot bridge. For more important traffic and with heavier loads, the resulting undulatory movements of the bridge floor would be objectionable, however, and the local kinking of the cable at loaded points would be injurious. Stiffening trusses are therefore attached to the roadway, the full length of the span. Their effect with regard to the cables is that a local load pulls almost equally on a number of hangers; instead of on one, thus approximating the condition of uniform load. The trusses are usually hinged at one or more points in their length.

Calculation of the cable stresses is simple, as the greatest stress occurs under full load. The tension at mid-span is the quotient of the moment of all loads on a half span about the tower support as fulcrum, divided by the sag; that at the tower is greater in ratio of the secant of the cable slope. The stresses in the stiffening trusses are statically indeterminate in complex manner, and approximate methods are employed for their calculation.

Small suspension bridges are built with stranded steel cable. The earliest suspension bridges of long spans were built in England and on the European Continent, with chains of eyebars, that is, bars or plates connected with pins. Because stiffening-truss members can be attached to these pins, the eybar-chain construction was at first contemplated for the *Manhattan Suspension Bridge* in New York (1,470 feet). Wire cables were finally adopted, however. This bridge with two others nearby constitutes the most remarkable series of suspension bridges in existence. The earliest, the *Brooklyn Bridge*, spans 1,595½ feet and has stone towers. The *Williamsburg Bridge* (1,600

feet) has steel towers of open trussing; while the Manhattan Bridge towers are of solid steel-plate tubular makeup. All have parallel-wire cables, made by drawing thousands of single wires across the span from tower to tower, pulling them up to exactly equal tensions, tying them together, and casing the whole in a weatherproof jacket. In the last built of the three, for example, there are four cables 20¾ inches in diameter; each contains 9,472 wires of about 3/16-inch diameter. The specific strength of the wire is slightly over 200,000 lbs. per square inch; one entire cable has a breaking strength of about 28,000 tons. The working stress is taken at 60,000 lbs. per square inch, or about 33,000 tons for all cables.

The wire cables for the Philadelphia-Camden Bridge have a diameter of 30" and consist of 18,666 wires; those of the Detroit bridge are of 19" diameter and have 7,622 wires. The Hudson River Bridge at Fort Lee (now under construction) will have cables 36" in diameter with 26,474 wires in each. The largest wire-cable span (1033.5 ft.) in Europe was built (1928) at Cologne, Germany, for roadway traffic. In this bridge, however, the cables are not anchored into masses of masonry to resist the pull of the cables, but this pull is taken up by heavy compression members in the plane of the floor, carrying the thrust from one end of each cable to the other, so that only vertical anchorages are required at each end. The same principle of construction was used for three suspension bridges over the Alleghany River at Pittsburgh, in which, however, the load is carried by eybar-chains. They have a middle span of 442 ft. The same construction was used in the wide and beautiful roadway bridge, the Kiyosu bridge in Tokio, Japan. The earlier suspension bridges were built with eybar-chains. The most notable example of this kind was the beautiful bridge over the Danube at Buda Pest, built in 1844.

The working stress in eybar-chains is less than in wire cables, because of their smaller tensile strength. But eybar-chains stiffened with rigid frames directly attached to them have the advantage of greater rigidity under passing loads. A notable example is the Grand Avenue bridge in St. Louis, which is as rigid as an upright arch bridge.

*Movable Bridges*.—When a river must be kept open for vessels, bridges over it must either be high enough to pass the highest masts or smokestacks (125 to 160 feet), or must be movable bridges that can be swung aside or up to

clear the channel. For such service the swing bridge was exclusively used in former years. It consists of a plate-girder or truss bridge mounted on a single support that can turn on a pivot or circular roller turn-table. Railway swing bridges have been built to lengths of over 500 feet (giving two channel openings of about 240 feet each), but bascule and vertical-lift bridges, whose nature is illustrated in the accompanying figures (10 and 12) were introduced after 1880, and came into wide use. Lift bridges are simple spans hung from cables passing over great sheaves at the tops of high steel towers at either bank, within which are counterweights attached to the ends of the cables to balance exactly the weight of the bridge. Auxiliary ropes serve for pulling the span up or down. Several different types of bascule bridges have been built, the Scherzer rocking on a curved heel resting on a horizontal track, the Strauss, Rall, and others having trunnions; all of them employ counterweights that balance the span in every position, so that the operating machinery has to overcome only the friction. Steam engines were formerly used to operate large movable bridges, but now oil engines and electric motors are preferred. Winches for operating the bridge by hand are always provided. Both lift and bascule bridges have been applied to channel openings over 225 feet wide, about the largest navigation width required. The lift deck of the Missouri River bridge at Kansas City spans 425½ feet, but there is a truss above it, from which the lower deck is lifted at every panel point. Bascules may be single leaf (opening from one side) or double leaf; the latter type may be arranged to act as an arch when closed, the two leaves butting together at a crown hinge.

In the wide range of conditions presented to the bridge engineer, miscellaneous bridge types are occasionally required. The *pontoon bridge* is one of these; only a few are in existence, the most modern being the *Golden Horn Bridge* in Constantinople, built by German engineers. The *ferry bridge*, of which six or seven have been built, comprises a fixed bridge high enough above the river to clear all vessels, and a truck or car running along this truss, carrying by hangers a platform not far above river level, at the height of the banks. This arrangement serves precisely like a ferry, but is not dependent on water conditions. In some of these structures (in France) the bridge is of suspension type, in others (Duluth, Minn.) of rigid truss type. The latest, at Bordeaux, spans 1,312 feet.

**Deflections** of bridges must often be computed. An ingenious graphical device for this purpose is the Williot diagram, which is of the same general nature as the stress diagram of a truss, but is laid off with sides equal to the respective length changes of the members and in directions at right angles. Indirectly the deflections are involved in the calculation of internally constrained structures by

**Elastic Analysis**, which is a calculation of the deformations of two separate parts or component systems of a structure, and a subsequent calculation based on equating the two distortions computed for the same point. This is also required in structures that are externally constrained. If in

loading. Next the amount is calculated by which a horizontal pull of one pound from abutment to abutment would pull the arch truss together; if this is found to be  $\frac{1}{10,000}$  inch, for instance, and the first-computed yield was 2 inches, then by applying a horizontal pull of 20,000 lbs. to the truss ends we would pull the structure back into its original position. Since the actual arch is in just this position, it must experience an abutment reaction of the precise amount of 20,000 lbs., so that this is the arch thrust which was the unknown at the start of the calculation. Further development of this general method is capable of dealing with all problems in constrained structures.

FIG. 10.—Vertical Lift Bridge Over the Arkansas River

The movable span is supported by chains passing over sheaves at the tower tops to the heavy concrete counterweights seen part way down. Electric motors in the machinery house on the middle of the span wind up operating ropes that pass from the ends of the span up and down along the towers, thereby lifting or lowering the span.

the truss Fig. 4, *E*, a new member be added, not essential to keeping the truss rigidly in shape, this member is strained whenever the truss is loaded, and thus it relieves the truss of part of its former stresses. The division of stress between the new member and the others is bound to be such that the new piece stretches or shortens just as much as the corresponding distance in the original truss. Expressing this fact mathematically furnishes a condition from which the share of stress taken by the added member can be computed. The most obvious case of external constraint is that of a two-hinged arch. Here, if the abutment at one end be removed and a simple flat bed plate substituted, the arch is transformed into a simple truss. The horizontal yielding or deflection of the end on the bed plate can be calculated for a particular

The *least work* method is another form of procedure. It bases on the theorem that in a constrained elastic system the constraints will adjust themselves to such deformation amounts that the total work of the system is a minimum, consistent with the governing static equilibrium conditions. It can be derived, however, from the deflection-equation method above noted, and is equivalent to it, though applied by other procedure (calculus differentiation). Either form of calculation becomes very intricate when there are many unknowns. The hingeless arch has three: the vertical reaction, the thrust, and the end moment, which require three simultaneous equations to be solved. One physical interpretation of this mathematical relation is that movements or defects in three different directions can vibrate or alter the stresses existing in

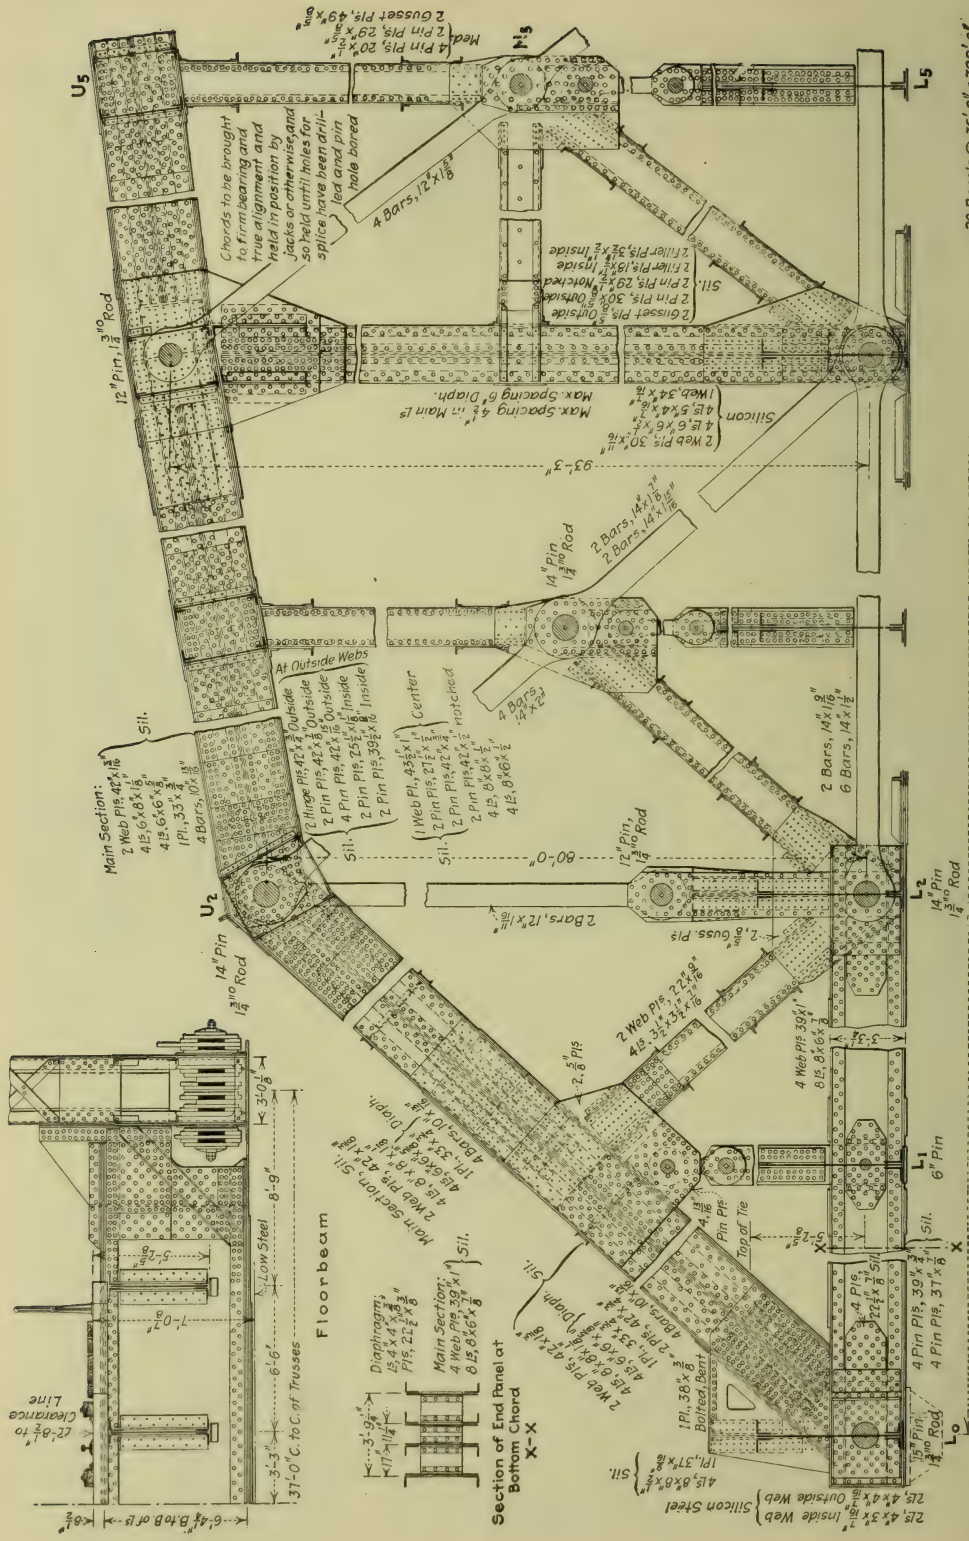

FIG. 11.—PART OF DETAIL DRAWING FOR 720-FOOT SPAN OF METROPOLIS BRIDGE OVER OHIO RIVER—A TYPICAL PIN-CONNECTED STEEL TRUSS BRIDGE

the hingeless arch. Being thus sensitive to mechanical derangement, constrained structures are usually avoided in bridge work. With rock foundations and accurate workmanship in construction, the objection loses force, and the superior economy of the type is then a decisive advantage.

As a truss deflects when loaded, and even under its own weight the shape of every part of the meshwork changes slightly, and this means that the angle between any two adjacent members becomes a trifle larger or smaller. The connection of one member to its neighbors is rigid, however, and does not permit this change of angle; in consequence the members must bend a little as the truss deflects. Though the bending is extremely slight, yet it suffices to set up very considerable

tions must be taken in bridge structures to guard against expansion effects. Arches that are fixed rigidly between their abutments cannot expand endways, but a three-hinged arch can rise at the crown as it expands, without any stress effects. In two-hinged and hingeless arches, however, large *temperature stresses* result, which have to be computed and allowed for by adding extra material to resist them. Masonry structures undergo much smaller variations of temperature than steel, but on the other hand, the effect of a given expansion movement is much more serious, and more difficult to neutralize.

**Bridge Loads.**—Highway bridges are usually designed for distributed loads of 100 to 150 lbs. per square foot of floor, besides the weight of the bridge and

on the span of the bridge, the service of the particular member, etc. It is greatest for short spans and for those members that receive full stress at each passage of a train, and in this case is as high as 100 per cent. (*i.e.*, the live load stress is doubled). It becomes practically zero for the chords of a bridge over 300 feet in span.

**Bridge Details,** in the case of steel bridges, involve a high degree of complexity and many design principles that cannot be set forth in brief form. The full-page drawing, Fig. 11, shows part of the detail for a large modern bridge. Its compression members are hollow (box-shaped) assemblages of plates and angles riveted together at their edges. The tension members in this structure are *eyebars*, thick flat steel bars

FIG. 12.—Scherzer Rolling Lift Bridge (Open), Crossing Chicago River  
Movable span in two leaves, giving clear waterway of 140 feet in width. Width of bridge, 63 feet 3½ inches.

extra stresses in the members, which reduce the ability of the material to bear the normal service stresses (direct stresses). Numerous computations of these *secondary stresses* in representative truss bridges show that they are often as large as 25 or 40 per cent. of the direct stresses, and in some instances may be 75 to 100 per cent.; *i.e.*, they nearly or quite double the tax on the member, and thus cut its available strength in half.

**Expansion Effects** occur in all bridges, due to the large variations of atmospheric temperature to which they are exposed. For a steel bridge the full range of 100° F. may be assumed in ordinary climates. A 200-foot span will change in length about 1½ inches due to this range. Beam and simple truss spans are mounted on a sliding or (in spans of 80 feet and over) on a roller bearing at one end. Various other precau-

floor; and for concentrated loads represented by a road roller or a motor truck weighing 10 to 20 tons. Railway bridges are designed for traffic loads of about 4,500 to 6,000 lbs. per lineal foot of track; but in most cases the actual wheel distribution and wheel loads of the heaviest trains used on the railroad are taken as the basis of stress calculation. Two locomotives having driver-axle loads of 50,000 to over 75,000 lbs. spaced 5 feet apart, and a uniformly distributed load of 6,000 lbs. per foot, to represent the cars, are a widely used design loading. Wind loads are taken as 20 to 30 lbs. per vertical square foot of bridge and train, or as 300 to 500 lbs. per lineal foot of bridge.

In railroad bridges an *impact addition* is made to the traffic load or *live load*, in recognition of the pounding and vibration which trains produce. For steel bridges the amount of addition depends

forged at the ends to form large round eye-holes receiving a *pin* or round steel bar which may be as much as 16 inches in diameter, connecting it to the other members. This bridge is *pin connected*, as are most long-span bridges. In short spans it is better to make all connections by riveting. Rivets, which are the essence of steel bridge construction, are pieces of round steel rod ⅝ to 1¼ inch in diameter passing through holes punched or drilled in the parts to be connected. Both ends of the rivet are headed over by hammer forging (or by pressure), one head being made before the rivet is used, and the other after inserting the red hot rivet in its hole. The frictional grip of the rivet on the plates which it connects is due to its contracting while cooling after the 'point' is headed up. This grip is the main element of strength in a riveted connection, although rivet joints are propor-

tioned as though the shearing and side-bearing resistance of the rivet were brought into play.

The field construction or erection of bridges is illustrated by means of photographs shown with this article. Stone and concrete arch bridges are built on a supporting frame, the centring, shaped to the arch curve, on which stone arch blocks can be laid directly; or for a concrete bridge, suitable moulds (*forms*) are set up. Erection of steel bridges demands the use of powerful and often highly elaborate hoisting machinery. The procedure varies with the particular piece of work—plate-girder spans are commonly set up in place as fully assembled spans,

the deflections is current in some European countries.

**Permanence.**—The life of well-built and well-maintained bridges is very great, but definite figures cannot be stated. Stone bridges have lasted for many hundred or even several thousand years. They are subject to deterioration of the mortar joints, calling for occasional pointing up; but beyond this, with good foundations, the bridge will be as enduring as the stone, and may be considered everlasting in most cases. Concrete bridges will doubtless prove to have very long life, but experience with them is as yet too short for certain prediction. Iron bridges have in a few instances remained in service for nearly

viding ample margin for future growth of bridge loads.

**Bibliography.**—Consult Waddell's *Bridge Engineering*; Johnson, Bryan and Turneure's *Modern Framed Structures*; Merriam and Jacoby's *Roofs and Bridges*; Kunz's *Design of Steel Bridges* (1914); Burr's *Suspension Bridges, Arch Ribs and Cantilevers* (1913); and *The Design and Construction of Metallic Bridges* (1912); Swain's *Structural Engineering* (1927). The works of Cain and Howe on *Arches*, those of Hudson and Moore on *Plate Girders*, and that of Steinman on *Suspension Bridges* may also be noted.

**Bridges, ROBERT** (1858– ), American editor and author, was

FIG. 13.—The New Sixth Street Chain Bridge over the Allegheny River in Pittsburgh, Pennsylvania, Span 442 feet

while truss bridges are erected either on falsework (Fig. 5) or by free-projection or cantilever method. The erection problem is in many cases the most serious and difficult part of the construction of a bridge.

**Public Supervision** of bridge construction has developed since 1900, in recognition of its relation to public safety. In the United States most States maintain bureaus for supervising highway bridge work, and the public utilities commissions (q.v.) of many States inspect and approve railway bridge construction. The governmental inspection in some cases extends to the matter of maintenance, railway bridges being inspected at frequent intervals by the public utilities engineers in some of the States. A system of acceptance testing by putting full load on the bridge after completion and observing

fifty years; and except that they had become too light for the increased modern traffic loads, they might have continued in use indefinitely. They should be kept well painted, as deterioration from rust is very rapid. Wooden bridges have endured as long as one hundred years, but this must be regarded as fortuitous in view of the ever-present risk of decay and fire. In general, modern bridge experience may be summarized by the statement that bridges have become obsolete from increase of traffic loads or through other causes before any natural limit to their length of life appeared. Railway bridges, particularly, have in the last forty years rarely continued in service longer than twenty-five years, when replacement by a bridge designed for heavier loads was demanded. Present-day practice recognizes the desirability of pro-

born in Shippensburg, P. He was graduated from Princeton in 1879 (A.M., 1882) and became a reporter for the *Rochester Democrat and Chronicle* (1880). He has been assistant news editor of the *New York Evening Post* (1881–7), and assistant editor (1887–1914) and editor (since 1914) of *Scribner's Magazine*. Under the pseudonym 'Droch' he was literary reviewer for *Life* from 1883 to 1900. He is a member of the National Institute of Arts and Letters. His published works include *Overheard in Arcady* (1894); *Suppressed Chapters* (1895); *Bramble Brae* (verse, 1902); *The Roosevelt Book* (1904). He has received several honorary degrees.

**Bridges, ROBERT SEYMOUR** (1844– ), English poet and critic, was born in Walmer, Kent. He was educated at Oxford and studied medicine at St. Barthol-

died Apr. 21,  
1930

omew's, London, and practised in London until 1882. While in London, Mr. Bridges had become known to a small circle as a fine writer of delicate lyric poems with an Elizabethan ring. Since 1882 he has devoted himself seriously to literature; writing, besides lyrics, narrative poems, sonnets, and a series of interesting plays in various experimental manners. The following are some of his works:—Poems: *The Growth of Love* (1876; enlarged 1890); *Eros and Psyche* (1885; revised 1894); *Eden: an Oratorio* (1891); *Purcell Commemorative Ode*, etc. (1896); Plays: *Prometheus the Fire-giver* (1883, 1884); *Nero* (two parts, 1885); *Feast of Bacchus* (1889); *Christian Captives* (1890); *Humors of the Court* (1893). Poetical works: Complete ed. in progress (1903); *Criticism*, etc.; *Milton's Prosody* (new ed. 1893); *John Keats* (1895, 1896), in Muses' Library.

**Bridget**, ST. (1302-73), was born near Upsala, Sweden; after a pilgrimage to St. James of Compostela in Spain, retired (1344) to a convent, where, in answer to her prayers, the rule of 'the Saviour's Order after the reformed rule of Augustine' was revealed to her, and she built the first monastery of the order on her own estate of Vadstena, in E. Gothland—a monastery which continued to flourish until its suppression in 1595. Bridget repaired in the jubilee year 1350 to Rome, where she lived till her death—a residence only interrupted by a pilgrimage to Jerusalem in 1372. On her death her body was conveyed to the monastery of Vadstena. She was canonized in 1391. Her day is October 8.

**Bridget**, ST., of Ireland. See BRIGIT.

**Bridgeton**, city, N. J., the co. seat of Cumberland co., 37 m. s. of Philadelphia, on both sides of the Cohansey R., and on the Central of New Jersey and other R. Rs. It is the seat of the West Jersey Academy, South Jersey Institute, for both sexes, and Ivy Hall Seminary for Girls. It is a port of entry, being at the head of navigation and of the tidal waters of the river, and carries on a large trade in pig iron and ore, lumber, lime, and coal. Considerable shipments of grain are made. The manufactures include nails, glass, woollen goods, flour and canned goods. Pop. (1910) 14,209.

**Bridgetown**, sept. and cap. of Barbados, W. Indies, on the n.e. shore of Carlisle Bay, a fine spacious roadstead affording safe anchorage for the largest ships, and situated on the w. coast of the island. It is a port of call for steamers, and the headquarters of the Royal Mail Steamship Company. The exports include sugar,

molasses, aloes, and mineral oil. The total trade is valued at about \$10,000,000 annually. It is the seat of the bishop of Barbados. Pop. over 21,000.

**Bridgewater**, tn., Plymouth co., Mass., 26 m. s. by r. of Boston, on the N. Y., N. H. and H. R. R. It is the seat of a state normal school and of a state almshouse. The town has a public library and diversified manufactures, including cotton-gin, cotton, shoe, and tack factories, iron works, brickyards, paper mill, etc. It was settled in 1645. Pop. (1910) 7,688.

**Bridgewater**, FRANCIS EGERTON, THIRD DUKE OF (1736-1803), succeeded to the title on the death of his elder brother (1748). On the advice of James Brindley, he constructed a canal (1758-71) which was 77½ m. long, and spanned the Irewell from Worsley to Manchester (afterward extended to the Mersey), at an expenditure of £220,000. In 1887 the canal was sold to the Manchester Ship Canal Company.

**Bridgewater**, FRANCIS HENRY EGERTON, EIGHTH EARL OF (1756-1829), son of John Egerton, bishop of Durham (1721-87), succeeded his brother in 1823. He lived for years at Paris, where the Hôtel Egerton was notorious for its swarm of cats and dogs dressed as human beings, and its flocks of birds with clipped wings in its gardens. In addition to bequeathing £12,000 to the British Museum to buy mss., he left £8,000 to be given for the best work 'On the Power, Wisdom, and Goodness of God, as manifested in the Creation,' to be awarded at the discretion of the president of the Royal Society, and by him allocated to—(1) Dr Chalmers, *The Adaptation of External Nature to the Moral and Intellectual Constitution of Man*, 1834; (2) Dr. William Prout, *Chemistry, Meteorology, and the Function of Digestion, considered with reference to Natural Theology*, 1833; (3) Rev. William Kirby, *On the History, Habits, and Instincts of Animals*, 1833; (4) Dr. Kidd, *The Adaptation of External Nature to the Physical Condition of Man*, 1833; (5) Sir Charles Bell, *The Hand, its Mechanism and Vital Endowments, as evincing Design*, 1834; (6) Dean Buckland, *On Geology and Mineralogy*, 1836; (7) Dr. Whewell, *Astronomy and General Physics, considered with reference to Natural Theology*, 1833; (8) Dr. P. M. Roget, *Animal and Vegetable Physiology, considered with reference to Natural Theology*, 1834. These form the *Bridgewater Treatises*.

**Bridgman**, ELIJAH COLEMAN (1801-61), American missionary, was born in Mass., and graduated (1826) at Amherst. He graduated

at Andover theological seminary, 1829, and went to Canton, China, the same year as assistant to Dr. Morrison. He acted as interpreter for both Chinese and American officials, and prepared a *Chrestomathy*, or manual of the Cantonese dialect, the first of its kind. Mr. Bridgman founded a mission station at Shanghai, and printed his version of the Bible there. He also founded the *Chinese Repository*.

**Bridgman**, FREDERICK ARTHUR (1847), American painter, was born at Tuskegee, Ala., and developed talent as an artist at a very early age. He went to New York at the age of sixteen, and after working for an engraving company studied at the National Academy schools, and subsequently at the Ecole des Beaux Arts in Paris for five years, adopting Gérôme as his master. He exhibited pictures of Breton life at the Salon, and painted in Algiers, Spain, and Egypt. Mr. Bridgman paid a visit to New York in 1880, and was made an Academician the following year, but located his studio in Paris, at whose exhibitions, and elsewhere on the Continent, he received several medals. Some of his paintings are *The Breton Children in Carnival Time*, *The Funeral of a Mummy*, *A Moorish Interior*, *Summer on the Bosphorus*, *Romanian Lady*, and *Diligence in the Pyrenees*.

**Bridgman**, HERBERT LAWRENCE (1844), American journalist, was born at Amherst, Mass., and graduated (1866) at Amherst. After some years of newspaper work he became associate editor of the Brooklyn *Standard-Union*. Mr. Bridgman accompanied the Peary auxiliary expedition of 1894, and was in command of the expedition of 1899, and he took part with Prof. Libbey of Princeton in the scaling of the *Mesa Encantada* in New Mexico, 1899.

**Bridgman**, LAURA DEWEY (1829-89), a native of Hanover, N. H. At the age of two, as the result of an attack of fever, she lost sight, hearing, smell, and (partly) taste, and, along with these, the power of speech. From the age of eight years and onwards, under the tuition of Dr. Howe of Boston, she acquired the power of reading and speaking with her fingers; and subsequently she learned geography, history, algebra, and even acquired proficiency in needle-work and household duties; while she was an adept at teaching others similarly afflicted. An analogous case is that of Helen Keller (q.v.). See *Life and Education of Laura Dewey Bridgman*, by Miss Lampson (1878).

**Bridgnorth**, munic. bor. and mrkt. tn., Shropshire, England,

on Severn; has industries of carpet weaving, worsted spinning, tanning, and matting. Thomas Percy, author of *Reliques of Ancient English Poetry*, was born here in 1728. Pop. (1911) 5,768.

**Bridgton**, tn., Cumberland co., Me., on the Bridgton and Saco River R. R., 40 m. N.W. of Portland. It has an iron foundry, tannery, woollen mills. Pop., 3,000.

**Bridgwater**, munic. bor., seapt., and mrkt. tn., Somersetshire, England, on the Parret; trades with the U. S., W. Indies, Canada, etc.; exports earthenware, cement, and bricks. Monmouth was proclaimed king in the old castle in 1685. Admiral Blake was born here in 1598. Pop. (1911) 16,802.

**Bridle**, the head harness of a horse or other beast of burden. Bridle bits are of three kinds—snaffles, curb bits, and stiff bits. The snaffle has two bars, jointed together in the middle, with rings at the ends for the reins. It sometimes has cheek-pieces to prevent the ring pulling into the horse's mouth. The curb bit comprises cheek-pieces or branches with eyes for the cheek-straps and the reins, and holes for the curb-chain; a mouth-piece, uniting the cheek-pieces and forming the bit proper, sometimes a bar uniting the lower ends of the branches; and a curb-chain. The elastic

Parts of Bridle.

bit consists of a chain covered by closely-coiled wire between the bit rings. Another form of elastic bit is made of twisted wire with a soft rubber covering.

A double-ringed snaffle will suit almost any horse; and if a little extra power is needed, a jointed or twisted snaffle may be used. In particular cases, the sliding mouth bits and those having small ports may be resorted to; but they are frequently used when there is no need for them, and when the simple bits, if properly placed on the bridle, would be sufficient. If a bit is very tight, a horse cannot be expected to

obey his driver, as it deprives the mouth of feeling.

Bearing reins—to which many are opposed—are used for supporting the horse's head, and in the simple form are attached to a loop in the bit, from which they are carried through a loop or swivel attached to the throat, and then to the tenet on the pad. In its more powerful form the bearing rein is known as the gag. In this case it is attached to a billet stitched to the head-piece, and is passed through a swivel on the end of the gag, and then to the tenet. Two bits are used at once with the gag, one being the ordinary driving bit and the other a bridoon bit, which is usually jointed in the centre and fitted with a ring or swivel at each end for attaching the bearing rein.

**Bridlington**, or BURLINGTON, par. (12,562 ac.) and mrkt. tn., Yorkshire, England; 11 m. N.E. of Driffield. One mile to the S.E., on Bridlington Bay, is the popular watering-place Bridlington Quay. The harbor has two stone piers, and the bay, protected by Flamborough Head and the Smithwick Sand during northerly gales, forms the only safe anchorage on the east coast of Britain between Harwich and Leith. Pop. (1911) 14,334.

**Brief**. In the judicial procedure of the United States, the abstract or outline of his argument which a lawyer submits to the court on appeal. It should contain a brief statement of the judicial history of the case and of the facts elicited at the trial, followed by an enumeration of the legal 'points' to be argued and supported, with a citation of authorities under each. Such a 'brief on appeal' is usually printed for the use of the court and opposing counsel. The term, brief, is sometimes employed by lawyers also to describe the memorandum of facts to be proven and law involved in a case, which is prepared to aid them on the trial. This is known as a 'trial brief.' In England, a brief is the memorandum of instructions drawn up by an attorney for the guidance of the barrister, containing a statement of the facts, points of law, etc., to be developed and expanded before the court, or to be used in the cross-examination of witnesses. As soon as counsel is 'briefed' he has authority to act as his client's representative in all matters involved in the litigation. The brief is always endorsed with the title of the court and of the action, and with the names of the counsel and of the solicitor who delivers it.

**Brief**, PAPAL, a state document from the Pope to an individual or to a religious community, giving advice or exhortation upon

matters of difficulty or of discipline. It is dated *A die Nativitatis* and sealed with the Pope's signet ring, the seal of the fisherman; while a bull is dated *A die Incarnationis*, and is signed by the functionaries of the papal chancery. A brief also differs from a papal bull in being of a less formal and weighty character.

**Brieg**. (1.) Town, prov. Silesia, Prussia, on high ground on the l. bk. of the Oder, 26 m. by rail S.W. of Breslau, cap. of the former duchy of Brieg (1348-1675). The castle (1544) of the former dukes, with a fine façade, is now a storehouse. Pop. (1900) 24,090. (2.) Also called BRIG and BRIGUE, small and picturesque tn., canton Valais, Switzerland, at beginning of ascent to the Simplon Pass, and at Swiss mouth of the tunnel, 90½ m. by rail from Lausanne, and 15 m. below the hospice on the summit of the Simplon. Alt. 2,244 ft. Pop. (1900) 2,182.

**Briel**, or BRIELLE, fort., seapt., tn., prov. S. Holland, Netherlands, at the mouth (S. bank) of the New Maas, and on the island of Voorne. It is the birthplace of Admiral M. Tromp. Its capture by the patriotic Beggars of the Sea (Gueux) in 1572 marked the beginning of the war of independence against Spain. Pop. of comm. (1899) 4,162.

**Brienne**, JOHN I., COUNT OF (1148-1237), king of Jerusalem and emperor of the Latin empire of Constantinople, in 1212 became king-regent for his daughter Yolande. In 1218 he took part in the fifth crusade, led by Andrew, king of Hungary, and besieged Damietta, which capitulated in 1219. In 1225 he married his daughter to the German emperor Frederick II., with the condition that he should remain king of Jerusalem for life. But as Frederick did not observe this condition, John was driven to seek refuge at the papal court. In the quarrel between Pope Gregory IX. and the Emperor Frederick, John commanded the papal forces, but was defeated in 1229. In the same year the barons of Constantinople elected him emperor, during the minority of Baldwin II. In this capacity he defeated the united forces of the Greeks and Bulgarians (1238) (See E. Georges' *Jean de Brienne* (1858)).

**Brienne le Château**, or BRIENNE NAPOLÉON, dist. tn., dep. of Aube, France, 26 m. by rail E.N.E. of Troyes. At its military school Bonaparte was educated. There are breweries and candle factories. Pop. (1901) 1,753.

**Brienz**, a considerable village in the Swiss canton of Bern, and the centre of the wood-carving industry. It is the starting-point of the railway up the Brienz Rothorn. Brienz is built at the N.E.

extremity of the lake of the same name (11½ sq. m. in area, 1,857 ft. above the sea-level, and 853 ft. in depth), opposite Giessbach waterfall. Pop. (1900) 2,580.

**Brierley**, BENJAMIN (1825-96), writer and poet in the Lancashire dialect, was born at Failsworth, near Manchester, England. In 1863 he became sub-editor of the *Oldham Times*, and in 1864 his first story, *The Layrock of Langley-side*, appeared. In 1869 he started the publication of *Ben Brierley's Journal*, first as a monthly and then as a weekly magazine, and continued to edit it until 1891. He also published *Irkdale* (1865), *Marlocks of Merriton* (1867), *Red Windows Hall* (1867), *Ab-o'-th'-Yate in London* (1868), *Cotters of Mossburn* (1871), *Home Memories* (1886), *Cast upon the World* (1887), and *Spring Blossoms and Autumn Leaves* (1893).

**Brierley Hill**, eccles., par. and mkt. tn., Staffordshire, England, on Stour R., 2½ m. N.E. of Stour-bridge; has coal and ironstone mines, and deposits of fireclay, which have been worked for centuries. The industries are glass-bottle-making, brick and earthenware manufacturing, chain, nail, and spade making. Pop. (1911) 12,264.

**Brieux**, EUGÈNE (1858), French dramatic author, born at Paris. He wrote his first play, *Bernard Palissy*, in 1880, but only became known in 1890, when his *Ménages d'Artistes* was represented at the Théâtre Libre in Paris; two years later he won even greater success with *Blanchette* at the same theatre. Since then he has produced several plays, mostly dealing with some social injustice or abuse, which have given rise to heated discussions, while some have been interdicted by the authorities. Brieux's characters are drawn with power and dramatic effect. Among his latest pieces are *Les Bienfaiteurs* (1896); *L'Évasion* (Comédie Française, 1896); *Les Remplaçantes* (1901); *Les Avariés* (1901); *La Robe Rouge* (1900), produced at the Garrick Theatre, London (1904), as *The Arm of the Law*, which called attention to abuses (now altered) connected with the preliminary inquiry of the *judge d'instruction*, and stirred up a violent controversy; and *Petite Amie* (1902).

**Brig**, a sailing vessel with two masts, both square-rigged. An *hermaphrodite brig* has also two masts, but has square sails on the foremast only, the mainmast being fore- and -aft rigged. A brigantine differs from a brig in having no square mainsail.

**Brigade**, a tactical body of troops organized only in time of war in the United States Army, the regiment being the largest per-

manent unit in time of peace. An infantry brigade consists normally of three, but sometimes of two or four regiments. A cavalry brigade consists of two or three regiments and, when acting alone, has two batteries of horse artillery attached. Separate brigades are organized from time to time for special purposes, and detached from their divisions, in which case they are supplied with a due proportion of the auxiliary arms and services depending upon the nature of the special service expected. The brigade organization originated with Turenne, Condé, and others in France and Marlborough in England, and was soon adopted in all European armies. A brigadier-general is the normal commander of a brigade, but his duties frequently devolve upon the senior colonel. See ARMY; ARMY IN THE FIELD; *Field Service Regulations, U. S. Army* (1905).

**Brigadier - General**, in the U. S. army, is the grade next above colonel and next below major-general. The appropriate command of a brigadier-general of the line is a brigade (q.v.). The chiefs of the several administrative bureaus of the War Department also hold this rank, with the exception of the military secretary, who is a major-general. There are twenty-five officers of this grade on the active list of the U. S. army at the present time.

**Brigandine** (Low Lat. *brigans*, 'a light-armed soldier'), a mediæval (15th-16th century) coat of mail composed of light, thin, jointed scales, or a coat of thin, pliant plate armor. The term is also applied to a jacket quilted with iron, worn by archers in the reigns of Elizabeth and James I.

**Brigands**, organized bands who practise general robbery, making their headquarters in fastnesses in forests or mountains, from which they sally forth to plunder travellers of their property, or seize and hold them until a ransom is paid for their liberation. Brigandage had its origin in Greece and Italy, and soon spread to France and Germany, the former country being responsible for two famous representatives in Cartouche (1693-1721) and Mandrin (1724-55). Perhaps the most noted brigand in history was Fra Diavolo, who played an important part in the revolution of Naples in 1799, and was received with extraordinary favor at the court of Queen Caroline. Spain, also, has been one of the happy hunting-grounds of the brigand, and in that country, as in Italy, popular sympathy has been frequently extended to the robbers rather than the robbed. Sicilian, Turkish, and Bulgarian brigands are now the chief adepts at the game.

A recent case was the seizure of Miss Ellen M. Stone, an American missionary, and Mrs. Tsilka, a Bulgarian nurse, who were captured by Macedonian brigands on Sept. 3, 1901, and kept for six months, when they were released on the payment by the United States of a ransom of 25,000 Turkish pounds. See Sir R. Church's *Chapters in an Adventurous Life in Italy and Greece* (1895).

**Brigantes**, ancient British tribe who inhabited most of Yorkshire, Lancashire, Durham, Westmoreland, and Cumberland.

**Brigantine**. See BRIG.

**Briggs**, CHARLES AUGUSTUS (1841-1913), American theologian, born in New York city, and graduated (1860) at the University of Virginia. He studied theology at the Union Theological Seminary and at the University of Berlin, and was ordained at Elizabeth, N. J., 1870, becoming pastor of the Presbyterian church of Roselle, N. J. He was appointed Davenport professor of Hebrew at Union Theological seminary in 1874, and was transferred to the professorship of Biblical theology at the same institution in 1891, his address at this time on 'The Authority of Holy Scriptures' causing Dr. Briggs's trial for heresy as being contrary to the Presbyterian Confession of Faith. Dr. Briggs was acquitted by the N. Y. presbytery, but the decision was reversed by the General Assembly at Washington, who suspended him in 1893. He took orders in the Protestant Episcopal Church in 1899. Some of his many theological works are *American Presbyterianism* (1885), *Messianic Prophecy* (1886), *The Case against Dr. Briggs* (3 vols., 1893), *The Higher Criticism of the Hexateuch* (1893), and *The Messiah of the Gospels* (1894).

**Briggs**, CHARLES FREDERICK (1804-77), American author, was born at Nantucket, Mass., and removed to New York early in life where he established the *Broadway Journal*, 1844. Author of *Harry Franco: A Tale of the Great Panic* (1839); *Working a Passage; or, Life on a Liner* (1844); and *Trippings of Tom Pepper* (1847).

**Briggs**, FRANK OBADIAH (1851), American legislator; born at Concord, N. H.; graduated at the U. S. Military Academy in 1872; served in the army till 1877, then engaged in business in Trenton, N. J. He was mayor of that city, member of the State board of education, and State treasurer; elected U. S. senator (Rep.) for the term 1907-13.

**Briggs**, HENRY (1561 1630), English mathematician, was professor of geometry at Gresham

Dietrich

College, London (1596-1619), and Savilian professor of astronomy at Oxford, in succession to the founder, Sir Henry Savile. He was among the first to recognize the importance of Napier's discovery of logarithms, and originated the use of the number 10 as the best base for tables. Chief works: *Arithmetica Logarithmica* (1624); *Trigonometrica Britannica* (1633).

**Brigham**, city, Utah, co. seat of Box Elder co., 52 m. N. by W. of

where he published brochures in opposition to infant schools and the religious revivals then in vogue. He was superintendent of the Hartford insane asylum, 1840-2, and of a similar institution at Utica, N. Y., from 1842 until his death. His work as a manager of psychopathic establishments was very widely recognized.

**Brigham Young College.** A coeducational institution of the Mormon Church at Logan, Utah,

tricks, and plot, but leaves the execution of his plots to Arlecchino, another comic character. His livery is white, with green trimmings.

**Brighouse**, munic. bor., incorporated in 1893 with Brighouse Rastrick and Hove Edge, on the riv. Calder, W. Riding, Yorkshire, England, 4½ m. N.W. of Halifax, It has woollen and cotton factories, flour mills, and flagstone quarries. Pop. (1911) 20,845.

**Bright**, SIR CHARLES TILSTON (1832-88), English telegraph engineer, was born at Wanstead, in Essex. As engineer of the Magnetic Company (1852-60) he erected lines in various parts of Great Britain, and laid (1853) the first deep-water cable between Portpatrick, Scotland, and Donaghadee, Ireland. His experiments in long-distance electric signalling resulted in the formation, with Brett and Cyrus W. Field, of the Atlantic Cable Company, of which Bright was appointed engineer-in-chief. The first cable (1857-58), after working sixty-eight days, proved a failure. Bright subsequently laid cables in the Mediterranean, the Persian Gulf (1864) and the W. Indies (1871). See *Life* by his brother, E. B. Bright, and his son, Charles Bright (1898).

**Bright**, JESSE D. (1812-75), American senator, was born at Norwich, Chenango co., N. Y., and was taken as a child to Indiana, where he was admitted to the bar in 1831, practising at Madison in the same state. After filling several important state offices, he was elected U. S. senator from Indiana as a Democrat, 1845, and was twice reelected, voting in the senate with the Southern Democrats in all matters relating to the abolition of slavery. His second reelection was unsuccessfully contested, but in 1862, on the evidence of a letter addressed to Jefferson Davis, he was expelled from the Senate by a vote of 32 to 14. He subsequently lived in Carrollton Ky., and in Baltimore.

**Bright**, JOHN (1811-89), English orator and statesman, the son of Jacob Bright, a Quaker cotton-spinner and manufacturer, was born at Greenbank, near Rochdale, in Lancashire. His friendship with Richard Cobden began over the question of national education; but it was in 1839 that they were drawn closely together, on the formation of the National Anti-Corn-Law League, when Bright began to devote himself heart and soul to the movement for the repeal of the Corn Laws, and from this time forward was the most eloquent advocate of the cause. In 1843 he was returned to the House of Commons for the city of Durham, and

John Bright.

(Photo by Elliot & Fry.)

Salt Lake City, near the N. shore of Great Salt Lake, and on the S. Pac. and the Oregon Short Line R. Rs. The city has a public library. The chief industries are agricultural. Lumber, leather, worsted and woollen goods, flour and canned goods are manufactured. Pop. (1910) 3,685.

**Brigham**, AMARIAH (1798-1849), American physician, was born at New Marlborough, Mass., was left an orphan, educated himself, and gained considerable reputation as a physician at Greenfield, Mass., before his removal to Hartford, Conn., 1831,

established in 1877 by a gift of 9,642 acres of land from Brigham Young. The special aim of the college is to make of the students sincere Latter-Day Saints. It offers courses in arts, engineering, agriculture, theology, medicine, music, and domestic arts, with preparatory and high school departments. The attendance in 1905 was 823, with a faculty of 46. The library contained 5,000 volumes and the income was \$35,400.

**Brighella**, a personage in the Italian popular comedy. He is represented as a servant who is always ready to lie, to play

speedily made his mark; and at length, in 1846, Sir Robert Peel's measure for repealing the obnoxious laws was carried. Bright incurred considerable unpopularity for his resistance to Lord Ashley's factory legislation, which he opposed on the ground that workmen and employers should be left free to regulate their mutual relations. In 1847 he was returned for Manchester, and again in 1852. He advocated remedial legislation for Ireland, including disestablishment of the church, free trade in land, and a liberal policy towards India.

The Crimean War found a strong opponent in Bright, and some of his finest speeches in Parliament were delivered in connec-

tion with this subject — e. g. that on Feb. 23, 1855. At the spring election of 1857 he lost his seat for Manchester, owing to his attitude on China and the Crimean War; but in the following August he was returned for Birmingham, and he ever afterward remained one of the representatives of that city.

Bright supported the bill (1853) carried by Lord Derby's government for the abolition of the E. India Company and the transfer of the government of India to the crown. In 1859-60 he was one of the principal leaders in the great reform agitation; and when the Civil War broke out in the U. S. he ardently supported the cause of the North, though his own trade was most seriously affected by the continuance of the war. The Russell-Gladstone Re-

form Bill of 1866 he also supported, and when it was defeated by a combination of discontented Liberals ('Adullamites') and the Tories, he took the foremost part in the reform campaign in London, Birmingham, Leeds, Edinburgh, and Glasgow.

When Gladstone came into office in 1868, Bright accepted the presidency of the Board of Trade. He gave powerful support at all stages to the Irish Church Disestablishment Act, the Irish Land Act, and the Elementary Education Act. Resigning office in December, 1870, in consequence of ill-health, he did not appear again in Parliament until April, 1872. He was appointed Chancellor of the Duchy of Lancaster in

just in his political contests, and with a power of simple, nervous eloquence which placed him in the front rank of parliamentary orators. See Bright's *Life and Speeches*, by G. Barnett Smith (2 vols. 1881); Robertson's *Life* (new ed. 1884); *Speeches* (published in 1868); *Public Letters* (ed. by H. J. Leech, 1895); and John Morley's *Life of Cobden* (Jubilee ed. 1896).

**Bright, RICHARD** (1789-1858), English physician, was born at Bristol, and received his medical education in Edinburgh and London. In 1820 he settled in London. His *Reports of Medical Cases* (1827), studies in morbid anatomy, contain the first statement of the association of general dropsy and

Brighton from the West Pier.  
(Photo by Frith.)

albuminuria with a morbid condition of the kidneys, and the name 'Bright's disease' has been given to non-suppurative nephritis. He was physician-extraordinary to Queen Victoria (1837).

**Bright, WILLIAM** (1824-1901), canon of Christ Church, Oxford, born at Doncaster; theological tutor in Trinity College, Glenalmond (1850-9), and tutor of University College, Oxford (1859-68), when he was made regius professor of ecclesiastical history at Oxford, and canon of Christ Church. Canon Bright was a voluminous writer, his works including *Ancient Collects and Prayers* (1857), *Hist. of the Church* (1860), *Faith and Life* (1864), *Chapters of Early Eng. Church Hist.* (1878), and *Iona and other Verses* (1895). He also edited Eusebius's *Eccles. Hist.* (1872), St. Athanasius's

August, 1873, and held this office until the resignation of the Gladstone ministry in February, 1874. In 1879 he declined an invitation from President Hayes to visit the U. S., where he was held in high honor. When the Liberals returned to office in May, 1880, Bright again became Chancellor of the Duchy of Lancaster, but he retired from the cabinet in 1882, on the ground that he could not support the policy of his colleagues in Egypt—a policy which led to the bombardment of Alexandria. When Gladstone introduced the Home Rule Bill for Ireland in 1886, Bright separated himself with pain from his old leader. From May, 1888, Bright suffered almost continuously from illness until his death in the following March. He was a strong, manly Englishman, fearless but

*Against the Arians* (1873) and *Historical Writings* (1878), and St. Augustine's *Anti-Pelagian Treatises* (1880).

**Brightly**, FREDERICK CHARLES (1812-88), American lawyer, was born at Bungay, Suffolk, England, came to the U. S. in 1831, and was admitted to the bar of Philadelphia, 1839. He gained an extensive reputation as a reference lawyer, and was consulted so often upon points of law that he abandoned practice in 1870 and devoted himself to the preparation of digests, of which he published a large number, chiefly concerned with the laws, cases, and decisions of Pennsylvania and its courts.

**Brighton**, formerly BRIGHTHELMSTONE, parl. (1832), munic. (1854), co. bor. (1888), and wat-pl., Sussex, England, on English Channel, 50½ m. S.E. of London. Brighton's great popularity as a fashionable resort arose from the writings of Dr. Russell in the 18th century, the discovery of a chalybeate spring, the residence of George IV., and the facilities afforded to Londoners, especially by the opening in 1841 of railway communication. The corporation has constructed a massive sea front 3 m. long (protected against the sea by a system of groynes), the West Pier (1,115 ft.), and the New Pier (1,700 ft.). The old Chain Pier was washed away in 1896. The Royal Pavilion, acquired in 1850 at a cost of \$260,000, is a fine though bizarre structure of Oriental aspect. The Dome, formerly the royal stables, is now an assembly-room accommodating 3,000 people. In connection with this property there are pleasure grounds, a library, a reading-room, an art gallery, and a museum. Among the other fine parks are the Preston (72 ac.), and the Queen's (17 ac.), presented to the corporation by the race-stand trustees. There are well-equipped public baths; and the Aquarium, purchased in 1901, is now converted into a concert hall and winter garden.

The munic. bor. of TOVE, or W. Brighton (1,521 ac.; pop., 1911, 42,173), adjoins Brighton, and the par. of Hove forms part of the parl. bor. Preston, to the N., has, since 1873, been included in the munic. and parl. bor. of Brighton.

Brighton has always been connected with the fishing industry, and its boats still bring in large numbers of herring and mackerel. Pop. (1911) of parl. bor. 162,793; munic. bor. 131,250.

**Bright's Disease.** See NEPHRITIS.

**Brigit**, BRIDGET, or BRIDE, ST. (453-523), of Kildare, founded the church of Kildare. Her day is February 1. From the frequent references to fire in her history,

it has been suggested that the saint has been partly confounded with Brigit, the old goddess of smiths. See Todd's *St. Patrick* (1844).

**Brignoli**, PASQUALE (1824-84), Italian singer, was born in Naples, Italy, and early devoted himself to music, composing an opera at the age of fifteen. He began the training of his surpassingly fine tenor voice when twenty-one, and sang with success in opera at London and Paris. He was brought to the U. S. by Strakosch in 1855, and made this country his home, gaining a popularity that brought him great wealth, which, however, was scattered as it was received. He sang in grand opera with all the leading sopranos of his time.

**Brigoe.** See BRIEG.

**Bril**, MATTIJS (1550-84), Flemish painter, born in Antwerp, went while a youth to Rome, where he executed frescoes at the Vatican for Pope Gregory XIII. His *Jesus Healing the Paralytic* is in the Naples Museum, and his *Virgin and The Infant Jesus and the Two Angels* are in the Dresden Gallery.

**Bril**, PAULUS (1554-1626), the earliest of the great 17th century Flemish landscape painters. He went to Rome with his brother Mattijs, and created a style at once grand, simple, and poetic. Annibale Carracci occasionally painted the figures in his pictures. His works include *Martyrdom of St. Clement* (Vatican), and landscapes in most European galleries. See F. T. Kugler's *Handbook of Painting: German, Flemish, and Dutch Schools* (1879); and Lübke, *History of Art* (1881).

**Brill**, a European fish closely related to the turbot, from which it is distinguished by its smooth skin, smaller size, and glistening spots.

**Brillat-Savarin**, ANTHELME (1755-1826), French writer and magistrate, born at Belley, is known by his *Physiologie du Goût* (1825; Eng. trans. 1884, as *A Handbook of Gastronomy*), the code of gastronomers, written in a vein of amusing pleasantry. He resided in Switzerland and America (1793-6), and after his return became a member of the Court of Cassation.

**Brimstone.** See SULPHUR.

**Brin**, BENEDETTO (1833-98), an Italian naval engineer and administrator, was born at Turin, and after service as an engineer in the navy, he was appointed under-secretary of state to the Italian minister of marine in 1873. In 1876 he was promoted to be minister of marine, an office he held with short interruptions down to 1891, and during that time distinguished himself by the rapid manner in which he de-

veloped the Italian navy, especially by the construction of the armored cruisers *Dandolo*, 12,265 tons (built 1878, reconstructed 1897), and the *Italia*, 15,654 tons (built 1880), both designed by himself, and the establishment of shipyards and shops for the construction of engines and munitions of war. In 1892 Brin became minister for foreign affairs, but in 1896 returned to his old position as minister of marine.

**Brindaban**, munic. tn. on the r. bk. of the Jumna, 6 m. N. of Muttra, United Provs., India; one of the holy cities of the Hindus, visited by large numbers of pilgrims. Pop. (1901) 22,717.

**Brindisi** (anc. *Brundisium*), seap. tn. and archiepisc. see, prov. Lecce, Italy, the only really good harbor between Venice and the S.E. extremity of Italy, stands on the Adriatic, 472 m. by rail S.E. of Bologna. It acquired renewed importance after the opening of the Suez Canal, as the land terminus of the 'overland' route to India. But in 1898 the Peninsula and Oriental main line steamers made Marseilles their base instead of Brindisi, though a branch line of boats for the mails still runs from the last-named to Port Said. Brindisi is also the shipping port for mails to Turkey, Greece, and Albania. The harbor encloses the town with two arms, and is reached by a channel from the outer harbor, which is itself sheltered by some small islands. Vessels of 525 to 550 ft., drawing 25 ft., can now enter and turn without hindrance. The trade aggregates nearly \$5,000,000 annually, and is about equally divided between exports (chiefly figs, wine, olive oil, coral, and silk) and imports (mostly coal). This town was an important shipping centre under the Romans, when, being the sea terminus of the Appian Way, it was the chief port for Greece (Dyrrhachium was only 70 m. distant across the Adriatic); and again in the period of the crusades. The town has a cathedral, rebuilt in 1100; a castle, built by the Emperor Frederick II., and now used as a prison; and a museum, in the ancient 11th-century baptistry of St. John. Here the Roman poet Pacuvius was born, and here the poet Virgil died in 19 B.C. The town was besieged by Caesar in 49 A.D., was destroyed by King Louis of Hungary in 1348, and suffered from an earthquake in 1458. Pop. (1860) 8,000; (1901) 23,106.

**Brindley**, JAMES (1716-72), English engineer, planned (1758) a canal from Worsley to Manchester for the Duke of Bridgewater—the commencement of English inland navigation. In all he superintended the construc-

tion of more than 365 miles of canal, the most important being the Grand Trunk, between the Trent and the Mersey.

**Brine Shrimps** (*Artemia*), small crustaceans found in the water of salt lakes, and of interest because the naturalist Schmanke-witsch succeeded in transforming

Brine shrimp

one so-called species into another by altering the salinity of the water. For discussions of the significance of the experiment, consult Wallace's *Darwinism*.

**Brink**, BERNARD TEN (1811-92), German philologist, was born in Amsterdam. He studied at Münster and Bonn, and was professor of modern languages at Marburg (1870-73) and at Strassburg (1873-92). He especially distinguished himself as a student of English literature, his principal books being a history of English literature and studies of Chaucer, Beowulf, and Shakespeare.

**Brink**, JAN TEN (1834-1901), Dutch critic and novelist, was born in Appingedam. After studying theology and literature at Utrecht, he taught for a time (1860) at Batavia, Java, then at The Hague (1862-84), and in 1884 became professor of Dutch literature at Leyden. In the field of criticism he wrote (in Dutch) *History of North Dutch Letters in the Nineteenth Century* (new ed. 1902); *Talks about Modern Novels* (1884); studies of Bulwer-Lytton (1873); Zola (1879), and others. Of his novels it may suffice to mention *Het verloren Kind* (1879); *De Schoonzoon van Mevrouw de Roggeveen* (1872-73); *De Brederos* (1891). His *Literary Sketches* (Dutch) were collected in 17 volumes (1882-8), and his *Novels* in 13 volumes (1885).

**Brin'kerhoff**, ROELIFF (1828-1911), American banker and penologist, was born in Owasco, N. Y. He engaged in teaching until his admission to the bar at Mansfield, O., in 1852. During the Civil War he served in the Union army, and at its conclusion was brevetted brigadier-general. Returning to his law practice in Mansfield, he helped organize the Mansfield Savings Bank, of which institution he eventually became president. He was president of the American National Prison Congress and of the Ohio Archaeological and Historical Society (1893-1907), and was an advocate of

the cottage plan for asylums, and of other reforms in the administration of public charities and prisons. He wrote *The Volunteer Quartermaster: Recollections of a Lifetime* (1900).

**Brinkley**, FRANK (1844-1912), British editor and authority on Japan, entered the British army and in 1867 went to Japan with the Royal Artillery. In 1871 he became principal instructor in the Marine College at Tokio and later professor of mathematics in the Imperial College of Engineering. In 1881 he founded the *Japan Mail*, of which he was editor and proprietor for thirty years. He prepared a Japanese-English dictionary and wrote *Japan* (1901) and *Japan and China*. He was Tokio correspondent of the *London Times* and was widely known as a student of Japanese history and politics.

**Brinton**, DANIEL GARRISON (1837-99), American anthropologist, was born in Thornbury, Pa. He was graduated from Yale (1858), studied medicine, travelled abroad, and served as surgeon in the Civil War from 1862 to 1865, when he was brevetted lieutenant-colonel of volunteers. In 1884 he was made professor of ethnology and archaeology in the Philadelphia Academy of Natural Sciences, and in 1886 became professor of American linguistics and archaeology in the University of Pennsylvania. From 1867 to 1887 he was editor of the *Medical and Surgical Reporter*. Professor Brinton's researches in American archaeology placed him among

FIG. 1.

the foremost anthropologists of the world. He published and edited a *Library of American Aboriginal Literature* (8 vols., 1882-90), and wrote *Myths of the New World* (1868); *Religious Sentiment* (1876); *Races and Peoples* (1890); *The American Race* (1891); *Religions of Primitive*

*Peoples* (1897); *The Basis of Social Relations* (1902). Consult American Philosophical Society's *Proceedings* (1900).

**Brinvilliers**, brañ-vē-yá', MARIE MADELEINE DREUX D'AUBRAY, MARQUISE DE (c. 1630-76), French poisoner, was married to the Marquis de Brinvilliers in 1651. Conceiving a passion for a young officer, Jean Baptiste Sainte-Croix, and having learned from him the secrets of poisoning, she in 1670 poisoned her father, two brothers, and sisters. Her guilt was discovered on the sudden death of Sainte-Croix (1672). She fled, but was arrested in a convent at Liège, and beheaded and burned at Paris (July 16, 1676). Consult Bauplein's *La Marquise de Brinvilliers*; Stokes' *Madame de Brinvilliers and Her Times*.

**Brian**, FRIEDERIKE. See GOETHE.

**Brio'nian Islands**, in the Adriatic, opposite the harbor of Pola in Istria. Here are sandstone quarries whence the stone was obtained for building the palaces of Venice, and here the Genoese defeated the Venetians in a naval battle in 1379. The islands, formerly an Austrian possession, now belong to Italy.

**Brioude**, brē-ōöd', town, France, department of Haute-Loire, near the River Allier; 30 miles by rail northwest of Le Puy. The church of St. Julien,

FIG. 2.

founded in the fourth century and finished in the twelfth and fourteenth, is a fine example of Auvergnat-Romanesque style. Pop. (1921) 4,754.

**Briquette**, bri-ket'. (1.) A small, press-moulded lump of coal dust, fine ore, or similar material. See BRIQUETTING.

(2.) A small moulded block of hydraulic cement or mortar, of special shape, made for testing the tensile strength of the cement. As all large purchases of cement are subjected to tensile test of frequent samples to verify their meeting the specified strength requirements, the details of the test have much industrial importance, and the shape of the test briquette has therefore been standardized. The American standard briquette form is shown by Fig. 1; the standard clips which engage it, with cement briquette held therein for tensile test, by Fig. 2—both in accordance with the 1912 standards fixed by a committee of the American Society of Civil Engineers. The briquette is uniformly one inch thick, and its breaking load thus expresses directly the tensile strength of the cement in pounds per square inch. Briquettes are moulded in brass moulds, the mortar being pressed in with the fingers and trowelled off. Slightly different briquette shapes and moulding methods are used in Europe. See CEMENT.

**Briquetting**, the process of consolidating fine coal, ore dust, or similar matter by pressing in moulds to form small lumps (*briquettes*) for subsequent treatment or utilization. Binding substances, such as pitch, lime, etc., are usually employed. Briquettes vary in size, according to their use, from small egg to half-brick size. The process makes it possible to utilize efficiently fine material which would otherwise be impossible or difficult of utilization. It has been applied extensively to coal, and to some extent to fine iron ores and the flue dust accumulated in smelting iron, copper, and other ores.

*Coal briquetting* is an important industry in Europe. In America it has found less use because of the comparatively low price of coal and the high price of binders. The principal binders are pitch, tar, asphaltic or other bituminous material; heavy petroleum residue, starch, and sulphite-mill waste liquor. Gas pitch is most commonly used, 6 to 7 per cent. of the coal weight being employed. Anthracite is briquetted to stove sizes; bituminous and lignites to larger sizes—up to 3 or 4 lbs. in weight. Briquetted coal gives a clean, smokeless fire; burns regularly and under good control, and gives little ash. These qualities make it a popular household fuel in Europe, where anthracite is costly.

*Ore briquetting* has acquired some importance as a means of utilizing the flue dust of furnaces and smelters, slimes, roasted sulphide ores, etc. The principal

binders are lime, lime and clay, and a mixture of lime with soda ash and salt. Cylindrical briquettes of 3 to 4 lbs. are convenient. The briquetting is done by rotary or plunger presses. Certain ores may be agglomerated by sintering (baking or partly fusing into small lumps or concretions); and this method has in some instances proved preferable to briquetting.

**Brisbane**, capital of Queensland, Commonwealth of Australia, is situated on the river of same name, 16 miles from Moreton Bay; 500 miles north of Sydney. It is connected by rail with the interior, and by the main coast line with Rockhampton on the north and the Tweed on the south. It is served by the Canadian-Australian mail steamers, running monthly between Sydney and Vancouver, and by several British lines. The mean temperature is 69°, and the rainfall annually averages 48.36 inches. The University of Queensland, established by law of 1909, was opened here in March, 1911; and the technical colleges of Brisbane, South Brisbane, and West End have been consolidated, and are affiliated with the university. There are over 42 miles of tramway. The water supply is obtained from the upper Brisbane River, and from the Enoggera and Gold Creek reservoirs.

Brisbane is a great trading and manufacturing centre. Wine, bananas, and pineapples are produced; and preserved and frozen meats, hides and skins, wool, tallow, butter, and other pastoral produce are the chief lines of export. The harbor has two main entrances, having at low water depths of 24 and 30 feet respectively. There is a complete system of wharves and docks connecting directly with the railroads.

Brisbane was settled as a penal station in 1825 by Sir T. M. Brisbane, governor of New South Wales. The era of progress began in 1842, when the colony was opened to free settlers. Pop. (1921) 42,629.

**SOUTH BRISBANE** lies on the south side of the Brisbane River. It has an important shipping trade, and has a dry dock which will accommodate vessels up to 420 feet in length. Pop. (1921) 37,151.

**Brisbane**, ARTHUR (1864—), American journalist, was born in Buffalo, N. Y., received his early education in American public schools, and studied for five years in France and Germany. He began newspaper work in 1883 on the staff of the *New York Sun*, was London correspondent and editor of the *Evening Sun*; for seven years

managing editor of different editions of the *World*; and editor of the *New York Evening Journal* (1897–1926). He purchased the *Washington Times* in 1917, the *Milwaukee Evening Wisconsin* in 1918, and the following year sold both papers to William Randolph Hearst.

**Brisbane**, SIR T. MAKDOUGALL (1773–1860), British astronomer and colonial governor, was born near Largs in Ayrshire. He entered the army, served in Flanders, the West Indies, and the Peninsula, and was governor of New South Wales from 1821 to 1825. He founded three observatories: two in Scotland—at Brisbane, near Largs, and at Makerstoun—and one at Parramatta, near Sydney, Australia, where important work was done in cataloguing the stars of the Southern Hemisphere.

**Briseis**, brī-sē'is, daughter of Briseus of Lyrnessus, was taken captive by Achilles during the Siege of Troy. When Agamemnon had to give up Chryseis to her father Chryseus, he took Briseis from Achilles. Hence 'the wrath' of Achilles and the *Iliad*.

**Brisson**, brē-sōn', EUGÈNE HENRI (1835–1912), French lawyer and legislator, was born in Bourges, studied law in Paris, and was called to the bar in 1859. He was deputy mayor of Paris (1870); member of the assembly (1871), its vice-president (1879), and president (1881); Prime Minister of France (1885), and an unsuccessful candidate for the Presidency (1895 and 1899). He gained distinction as president of the Panama Commission, and for his unbiased administration, at the time of the Dreyfus case, as president of the Chamber of Deputies (1894–9). He was connected with several newspapers and founded the *Révue politique*. He wrote *Souvenirs: Affaire Dreyfus* (1908).

**Brissot de Warville**, brē'sō' de vār'vèl', JEAN (JACQUES) PIERRE (1754–93), French revolutionist, was born near Chartres. He was trained for the law, but turned to journalism and authorship, and published *Théorie des lois criminelles* (1780) and *Bibliothèque philosophique du législateur* (1782–6). He was imprisoned for four months in the Bastille for publishing the pamphlet *Le diable dans un bénitier* (1784), directed against the ministry. After a journey to the United States to study the problems of slavery and emancipation, he was elected to the National Assembly. He established *Le patriote français*, the Girondist organ, and became the leader of the Girondists, who were at first named Brissotins. Their leader warmly advocated

the spread of republican principles in Europe; was in favor of war against Austria and Britain, and had much to do with the downfall of the monarchy. But opposing the trial and condemnation of the king, he incurred the enmity of Robespierre. He was arrested in June, 1793, and in October following perished on the scaffold with twenty of his Girondist friends. He seems to have acted from conviction, though he has been accused of self-seeking. He exercised great influence on the periodical press as well as on the foreign policy of France. His *Memoirs* were edited by his son, in 4 vols. Consult also Carlyle's *French Revolution*; Aulard's *French Revolution* (1910).

**Bristles**, the long, stiff hairs growing on the back and sides of the hog and wild boar. There are black, gray, yellow, silvery, and white bristles, the last named being the most valuable. The best are obtained from pigs inhabiting cold countries, and from lean, wiry animals such as the Russian hog. Bristles are used chiefly in the manufacture of brushes, and constitute a valuable article of commerce, the principal supply coming from Russia, Manchuria, and Germany. They are also obtained from France and Belgium, and from China.

**Bristol**, county, borough, and city, once the second town in England, stands on the River Avon, at the borders of Gloucestershire and Somerset, and on the Great Western and Midland Railways; 118 miles west of London. It has a famous Cathedral, which retains the site and part of the building of an Augustinian monastery founded by Robert Fitzharding, who began the erection of the Abbey in 1142. The present nave and west towers were completed in 1888. The Church of St. Mary Redcliffe is even more beautiful, and there are many other fine old churches. Other important buildings are Colston Hall, Cabot Memorial Tower, the Hospital and Infirmary, the two theatres, the Museum, Art Gallery, Grammar School, Merchant Venturers' schools, Muller's orphanages on Ashley Down, and 70 artisans' dwellings. The University of Bristol, founded in 1909, has faculties of Arts, Theology, Science, Medicine, and Engineering. There are many parks and recreation grounds.

The city is well provided with docks to handle its increasing trade—the city docks, Avonmouth docks (opened by King Edward VII. in 1908), and the Portishead dock have a combined area of nearly 50 acres; the floating dock 85 acres. The rail-

road station on the south pier provides through transportation facilities. Much trade is carried on in cotton, cocoa, boots, corrugated iron, chemicals, timber, sugar, soap, tobacco, wool, and Irish provisions. The trade in 1921 amounted to £36,231,628 (imports) and £488,335 (exports). Imports from Canada and Jamaica are particularly large. The city limits have been extended since 1901. Pop. (1921) 337,061.

*History*.—There are plentiful traces of British and Roman

ton, Southey, and Hannah More. Consult Harvey's *Bristol*, and Stone's *Bristol* (1909).

**Bristol**, city, Connecticut, Hartford county, on the New York, New Haven, and Hartford Railroad; 16 miles southwest of Hartford. It has a public library, foundries and machine shops, and manufactures of clocks, brass goods, and engines. According to the Federal Census of 1919 industrial establishments number 68, with \$30,354,716 capital, and products valued at \$30,689,970. Bristol became a city in 1911.

Bristol Cathedral

occupation about Bristol, and silver pennies were struck here (978-1016) in the reign of Ethelred the Unready. The town was early infamous as a slave market. Yielding easily at the Conquest, it was fortified by Bishop Geoffrey of Coutances, its castle surviving till 1665. Notable events are the insurrection of 1313-14; the Black Death in 1349; the sailing of John Cabot, in 1497, on the voyage that resulted in the discovery of the mainland of North America; two sieges during the Civil War; the 'Bridge' riots of 1793; the opening of docks in 1809; the serious reform riots of 1831; and the sailing of the *Great Western* in 1838. Bristol is the birthplace of Chatter-

It has commission government. Pop. (1900) 6,268; (1910) 9,527; (1920) 20,620.

**Bristol**, borough, Pennsylvania, Bucks county, on the Delaware River, at the terminus of the Delaware and Lehigh Canal, and on the Pennsylvania Railroad; 20 miles northeast of Philadelphia. There is a well known mineral spring here. Industrial establishments include cotton and woollen mills, a foundry, rolling and planing mills, and factories for the manufacture of carpets, patent leather, and stockings. According to the Federal Census of 1919, industrial establishments number 34, with \$5,707,503 capital, and products valued at \$5,697,607.

Pop. (1900) 7,105; (1910) 9,256; (1920) 10,273.

**Bristol**, town, Rhode Island, county seat of Bristol county, on Narragansett Bay, and on the New York, New Haven, and Hartford Railroad: 16 miles southeast of Providence. The township occupies a narrow peninsula which is separated by a small bay from Fall River on the east. It has a public library, the Colt Memorial high school, a home for destitute children, and homes for aged men and women. The city has rubber works and woollen mills and a shipyard famous for yacht building. According to the Federal Census for 1919, industrial establishments number 28, with \$24,922,005 capital, and products valued at \$17,841,557. The peninsula has been suggested as the Vinland (q. v.) of the Norsemen. Mount Hope, on the east side, was the seat of Massasoit and King Philip, the Narragansett chiefs. Bristol was burned by the British in 1778. Pop. (1900) 6,901; (1910) 8,565; (1920) 11,375.

**Bristol**, town, Tennessee, Sullivan county, and city, Washington county, Virginia, in the eastern part of the former State and the western part of the latter (the boundary running east and west along the main street). It is on the Norfolk and Western, and the Southern Railroads; 100 miles northeast of Knoxville. It is the seat of King (Presb.) and Sullins (M. E. South) Colleges, Virginia' Interment College (Bapt.), and a public school for negroes. The industrial establishments include flour, lumber, and pulp mills, and tobacco, furniture, leather, and ice factories. The town is the centre of the iron ore, timber, and coal deposits of the South. Bristol, Tennessee, has the commission form of government; Bristol, Virginia, the city manager form. Bristol, Virginia, was originally called Goodson. Pop.: Bristol, Tenn. (1910) 7,148; (1920) 8,047; Bristol, Va. (1910) 6,247; (1920) 6,729.

**Bristol Bay**, an arm of Bering Sea, between the southern headlands of the Yukon Land District and the Alaska Peninsula. Communication with the interior is opened for a considerable distance by Lakes Illiamna and Clark, which empty into the bay.

**Bristol Board**, a fine pasteboard with a smooth and sometimes glazed surface, originally manufactured in Bristol, England. It is composed of thick, stiff paper, and is used chiefly by artists and draughtsmen.

**Bristol Brick**. See BATH BRICK.

**Bristol Channel**, an arm of the Atlantic Ocean, on the west

coast of England, separating South Wales from Devon and Somerset, and extending from the mouth of the Severn to St. George's Channel (80 miles). It is the largest inlet of Great Britain, having an irregular coast line of 220 miles. It includes the bays of Carmarthen and Swansea and Milford Haven on the north, and Bridgwater, Minehead, Porlock, Ilfracombe, and Barnstaple on the south. It receives the rivers Towy, Taff, Usk, Wye, Severn, Avon, Parret, Tone, Taw, and Torridge. The rapid tides, meeting the waters of the Severn, cause the upheaval known as 'the Bore.'

**Bristow**, city, Oklahoma, Creek county, on the Oklahoma Southwestern, and the St. Louis-San Francisco Railroads; 75 miles northeast of Oklahoma City. Pop. (1910) 1,667; (1920) 3,460.

**Bristow**, BENJAMIN HELM (1832-96), American executive, was born in Elkton, Ky. He was graduated (1851) from Jefferson College, Pa.; practised law; served in the Union army through the Civil War, and was U. S. district attorney for the Louisville district (1865-70). He was solicitor-general of the United States (1870-2) and Secretary of the Treasury (1874-6). During this term he conducted prosecutions against the notorious 'Whiskey Ring' (q. v.).

**Bristow**, JOSEPH LITTLE (1861-), American legislator, was born in Wolfe county, Ky. He was graduated from Baker University, Kansas, in 1886. He became clerk of the district court of Douglas county (1886-90); was editor and proprietor of newspapers in Salina and Ottawa, Kans.; secretary of the Republican State Committee (1894-8), and fourth assistant postmaster-general (1897-1905). He became prominent by his investigation of alleged postal frauds in Cuba after the Spanish-American War, and later by his investigation of charges of fraud and corruption in the government service. In 1905 he was appointed a Panama Railroad commissioner, and in 1909 was elected U. S. Senator from Kansas for the term ending in 1915. He served as chairman of the public utilities commission, 1915-18, after which he became owner and editor of the *Salina Evening Journal*.

**Britain**, the ancient name for the British Isles. It is of uncertain origin, but is usually ascribed to a Celtic source, still undetermined. Professor Rhys suggests that it is derived from the Celtic *brethyn*, 'cloth'—the inhabitants being 'cloth clad,' while the Celts wore skins. It is also conjectured that the Phœnicians, who first discovered

the islands Albion (England and Scotland) and Ieren (Ireland), named them the land of tin—*Bratannac*—the word gradually becoming softened, through the Greeks and Romans, to *Britannicæ* and *Britannia*. The latter term came into use when the Romans occupied the islands, the divisions being *Britannia Romana* and *Britannia Barbaræ*. Sverus (beginning of third century) divided Britain into two provinces, *Britannia Superior* and *Britannia Inferior*. The term later dropped out of use, to be revived on the union of England and Scotland (1707). See GREAT BRITAIN; ENGLAND AND WALES; SCOTLAND.

**Britan'nia Metal**, an alloy consisting of 80 to 90 parts of tin, 8 to 20 of antimony, and sometimes small quantities of copper, zinc, lead, or bismuth. It is harder than tin, takes a good polish, and is capable of being silver-plated. The metal may be cast or worked into vessels of the required shape by pressing and rolling, and articles made of it acquire a metallic ring by heating in oil to the temperature at which the metal fuses. It is used for making spoons and teapots.

**Britannia Secunda**, the Roman name for Wales.

**Britannia Tubular Bridge**. See BRIDGE.

**Britan'nicus** (42-55 A.D.), son of the Emperor Claudius and Messalina, obtained his name from the victories which his father was held to have won in Britain. After the degradation of his mother, Agrippina, Claudius' second wife, prevailed on Claudius to make her son Nero his heir. She then sought to control her son by threatening to uphold Britannicus as the lawful heir and Nero had him poisoned in 55 A.D.

**British Academy**. See ACAD-EMY.

**British Association for the Advancement of Science**, the chief scientific association in Great Britain. The first meeting was held in York on Sept. 27, 1831. Sir David Brewster was the practical founder of the association, which now numbers about 5,000 members. Annual meetings are held, on invitation, in various towns (London excepted), usually in the United Kingdom, though the association has also met in Montreal, Toronto, Winnipeg, Cape Town, Johannesburg, and Sydney. It is divided into the following sections: A. Mathematics and Physics; B. Chemistry and Mineralogy; C. Geology; D. Zoology; E. Geography and Ethnology; F. Economic Science and Statistics; G. Engineering; H. Anthropology; I. Physiology; K. Botany; L. Educational

Science; *M. Agriculture* (created 1911). A volume is published in connection with each meeting, giving the reports, addresses, and papers which are submitted to the members. A large income yields a surplus, which is devoted to grants—\$5,000 to \$10,000 annually—for special researches conducted by committees of the association.

**British Astronomical Association**, founded in October, 1890, to encourage popular interest in astronomy, to associate and organize amateur observers, and to circulate current astronomical information. The association numbers more than 1,000 members, and has twelve 'observing sections.' There are branches in Glasgow, Sydney, and Melbourne. The association publishes a *Journal* and *Memoirs*.

**British Central Africa Protectorate** (Nyasaland), territory under British protection in South Central Africa, bounded on the east by Lake Nyasa, on the east, south, and southwest by Portuguese East Africa, on the north by Tanganyika Territory, and on the west by Northern Rhodesia. It is about 520 miles long and 50 to 100 miles wide, and has an area of 39,573 square miles. In physical configuration the Protectorate is a plateau, diversified with mountain ridges, the highest known elevation being the volcanic Mlanje (9,683 feet), south of Lake Chilwa. On the western versant of Lake Nyasa the tableland occasionally reaches 7,000 to 8,000 feet. The most important district of the Protectorate is the Shiré Highlands, consisting of a mountainous country in the southeastern part, with a fertile well-watered soil. The principle rivers are affluents of the Zambezi, the most notable being the Shiré.

In the Shiré valley the climate is fairly cool in winter, but tropical in summer; the rainfall averages 35 inches. In the Shiré Highlands the temperature ranges from 96° to 40°, and the rainfall from 40 to 100 inches. The country is comparatively healthful; but malarial and black-water fevers occur, parasitic diseases are common, and cases of sleeping sickness have been reported on the southwest shores of Lake Nyasa.

The flora is fairly abundant, and in places becomes tropically luxuriant, with nearly all the characteristic plants and trees of tropical Africa. The fauna includes the antelope, hippopotamus, rhinoceros, elephant, impalla, eland, zebra, lion, leopard, and buffalo. Gold, silver, iron, copper, coal, mica, asbestos and graphite are found, but not in

sufficient quantity to be commercially valuable.

Agriculture is the chief occupation, and cotton, tobacco, tea, maize, rice, coffee, rubber, fibre plants, and many varieties of fruit are raised. The lakes and rivers contain good fish, but fishing is mostly carried on by the natives for their own use. There are no manufactures of importance, but there are a few flour mills, tobacco factories, and native industries, such as basket weaving and pottery making.

The Protectorate having no seacoast, trade is carried on by means of the Shiré and Zambezi Rivers. At Chinde (q. v.), at the mouth of the Zambezi, a tract of Portuguese territory is leased by Great Britain, where goods may be transhipped free of duty. The chief articles of export are cotton, coffee, tobacco, chillies, tea, rubber, strophanthus, ivory, maize, beeswax, groundnuts, and oil seeds. The imports are chiefly cottons and other textiles, provisions, and hardware. Exports for 1921 were valued at \$2,080,000, imports at \$3,185,000. Port Herald and Chiromo are the important ports on the Shiré. The former is connected by the only railroad in the Protectorate (113 miles) with Blantyre in the Shiré Highlands, the chief commercial town and centre of the European planting region. In 1915 an extension of the railroad from Port Herald to Chinde (60 miles) was completed. A highway, metalled from Blantyre to Zomba (44 miles), runs 500 miles north to the northern end of Lake Nyasa. The usual means of transportation is the machilla (hammock); but carts and rickshaws are also common.

The most important indigenous stock is the Anyasa, and the most important non-indigenous the Yaos. The native languages are Ki-Nyanja and Ki-Yao. Many of the inhabitants are Mohammedans. There are 11 Christian missions and 2,191 schools, with 135 European teachers and 124,000 pupils. The chief towns are Blantyre, Zomba, Port Herald, Fort Johnston and Kota-Kota. Pop. (1921) 1,199,934 natives, 563 Asiatics, and 1,486 Europeans.

Consult Johnston's *British Central Africa*; Colville's *One Thousand Miles in a Machilla*; *Peace Handbook No. 95* (Great Britain's Foreign Office, 1920).

**British Columbia**, the most westerly province of the Dominion of Canada, is bounded on the west by the Pacific Ocean and a narrow projection of Alaska; on the north by the 60th parallel; on the east by Alberta; and on the south by the straits of Juan de Fuca and the 49th parallel of

north latitude which mark the international boundary between Canada and the United States. Together with the former crown colony of Vancouver Island (area 16,400 square miles), it has an area of 338,263 square miles. The southerly half of the province forms a large and regular rhomboid of elevated land, which is supported on each side by ranges of mountains. On the east are the Rockies and Selkirks, and on the west the Coast and Island ranges, the last partly submerged, Vancouver and Queen Charlotte Islands being the most prominent features. Most of the mainland scenery is wild and picturesque, while the coast line, approximately 4,400 miles, is deeply indented by a succession of extensive fiords and long narrow inlets comparable to the fiords of Norway. The most important rivers are the Columbia or Oregon on the south, debouching through American territory into the Pacific Ocean; the Fraser (750 miles long), the Skeena (300 miles), and the Stikine on the west; the Liard (300 miles in B. C.) on the north, and the Peace (300 miles in B. C.) on the east. These rivers are of great size and volume, and the first four are sufficiently navigable in stretches to be of great service in the development of the country.

The geological formations of the country consist chiefly of the Cambrian, Silurian, Devonian, and Carboniferous groups, with some sections of Cretaceous strata, containing coal, and some Tertiary beds; while the several mountain ranges are the result of violent volcanic upheavals. The highest point is Mount Fairweather, in the Rockies, with a height of 15,287 feet. Mount Robson, on the line of the Grand Trunk Pacific Railway, is 13,068 feet high. The climate varies greatly, being milder in the south than that of regions in the same latitude on the Atlantic coast. The interior plateau, an elevated tract of hilly country, is generally dry and rainless; but the rainfall on certain parts of the coast is often heavy. The average annual precipitation at Victoria is 27.5 inches; at Vancouver 59 inches; and at Prince Rupert 107 inches.

**Fauna.**—Characteristic of the north country, the fauna includes a large number of wild animals and game. Among the quadrupeds may be named the white, grizzly, and black bear, moose, wapiti, caribou, mule deer, white-tailed and Columbian deer, mountain goat, bighorn or mountain sheep, cougar, wolf, coyote, wildcat, polecat, skunk, black, silver, and cross fox, raccoon, beaver, marten, mink, wolver-

ine, Northern hare, Baird's hare, and muskrat. Marine animals include the sea lion, fur seal, hair seal, and sea otter. The bird life includes the blue and ruffed grouse, ducks, geese, snipe, pheasants, European partridges, quail, prairie chicken, ptarmigan, black brant, teal, mallard, widgeon, merganser, crane, curlew, plover, American magpie, and oriole.

**Forests.**—A large part of the land is densely wooded, many of the trees—e.g., Douglas pine,

the forest products in 1918 was \$54,162,523, of which pulp represented \$10,517,250.

**Fisheries.**—The annual fishery output of British Columbia is 45 per cent. of the total for the Dominion. The fur seal fishery, once important, declined during a period of years in consequence of the indiscriminate killing of seals in Bering Sea, and the disputes that arose with Russia, Japan, and the United States. The Pelagic Sealing Treaty of 1911, between these three coun-

tries and Great Britain, prohibited the killing of fur seals at sea, except by Indians or other aborigines along the coast, using canoes, for a term of at least fifteen years, during which period Canada was to receive 15 per cent. gross in number and quality of the seal-skins taken on the United States and Russian seal islands, and 10 per cent of those taken on the Japanese islands. Commercial killing, which was discontinued by both the United States and Russia on their islands

for five years following the treaty, was resumed by both countries in 1918. The increase during that period was very satisfactory, and during the season of 1918, there were 34,890 skins taken on the United States islands and 550 on the lesser islands of Japan. In the unsettled condition of Russia it was not possible to ascertain how many seals, if any, were killed on their islands during 1918. By an arrangement entered into with the United States for the

Menzies fir, Sitka spruce, giant cedar, red cedar, yellow cypress, white pine, black pine, Engelmann spruce, hemlock, white oak, and broad-leaved maple—being extensively used throughout Canada, besides being exported in large quantities to South America, Africa, and Australia. The wood of the Douglas fir, which sometimes attains a height of 300 feet with a base circumference of thirty to forty feet, is in great demand for shipbuilding. The value of

tries and Great Britain, prohibited the killing of fur seals at sea, except by Indians or other aborigines along the coast, using canoes, for a term of at least fifteen years, during which period Canada was to receive 15 per cent. gross in number and quality of the seal-skins taken on the United States and Russian seal islands, and 10 per cent of those taken on the Japanese islands. Commercial killing, which was discontinued by both the United States and Russia on their islands

disposal of Canada's share of skins, the U. S. government conveys to market all the skins taken from the islands. They are dressed and dyed and then sold at public auction, the United States accounting to Canada for 15 per cent. of the net proceeds. This plan has proved eminently satisfactory to the Dominion.

The principal fish obtained are the salmon, which includes the varieties known as sockeye, quinnat, humpback or pink, chum or dog salmon; trout, shad

VOL. II.—Oct. '23

halibut, flounder, sturgeon, cod, bass, oolachan, and candle fish, anchovy, and smelt. Trolling for salmon as a commercial pursuit is steadily increasing. There are numerous hatcheries in the province for the propagation of fry. The factories in which salmon, cod, and other fish are canned show a steady annual increase in business. There are four whaling stations on the British Columbia coast. The average catch is about 500 whales, which bring in an estimated revenue of \$500,000 annually to the province. The value of the fishery products of British Columbia for the year 1920 was \$22,329,161.

**Mining.**—Based upon yearly production, mining is by far the most important industry although the mineral resources of the country have been only partially developed. Among the minerals known to occur in immense quantities are gold, silver, lead, iron, copper, zinc, and coal. During recent years, British Columbia's proportion of mineral wealth has risen to more than 20 per cent. of the total production of the Dominion. The value of the mine products in 1921 was \$28,066,641, a decrease of 21 per cent. from that of the previous year, due to a decline both in the quantity and value of silver, copper, and zinc production.

The production of coal for the year 1921 amounted to 2,483,995 long tons, valued at \$12,419,975; coke, 59,434 long tons, valued at \$416,038. The Nanaimo and Comox coal fields are the most important in the province. Next in rank are the collieries of the Cassian district, East and West Kootenay boundary, Yale, Cariboo, and Lillooet.

Copper is the principal metal produced in British Columbia. The production for 1921 amounted to 39,036,993 pounds valued at \$4,879,624. The value of the gold produced from lode mining in 1921 was \$2,804,154; from placer mining \$233,000. In the same year, 41,402,288 pounds of lead were mined, valued at \$1,693,354, and 49,419,372 pounds of zinc, valued at \$1,952,065. The silver output was 2,673,389 ounces, valued at \$1,591,201, the Slocan district being the largest producer.

**Manufactures.**—The manufacturing industries of British Columbia are the third most important in the Dominion. According to the Census of Manufactures for 1919 the number of industrial establishments that year was 2,064 (651 in 1910); capital \$268,319,281 (\$123,027,521 in 1910); employees 49,671 (33,312 in 1910); salaries and wages \$60,794,272 (\$17,240,679

in 1910); gross value of products \$239,794,988 (\$65,204,236 in 1910). Lumber is the chief product, although the paper industry is making rapid strides. Four companies in 1919 produced 112,206 tons of newsprint, 8,277 tons of wrapping paper, 78,242 tons of pulp, and 91,145 tons of ground work. The principal markets are the U. S. Pacific Coast cities, Japan, Australia, and New Zealand.

Shipbuilding is one of the important industries of the province. The output of British Columbia's steel and wooden shipbuilding yards for 1919 totalled ten steel ships and forty-six wooden vessels, aggregating 170,500 tons. The majority of steel ships are built for the Dominion Government, the wooden vessels being constructed for French, Norwegian and Greek interests.

**Agriculture.**—British Columbia is steadily advancing as an agricultural province. The rich valleys and lowlands in the interior offer favorable facilities for fruit growing and dairying. Of these the Okanagan Valley contains the largest area of fruit lands in the province. Apples of excellent quality are exported in large quantities to Eastern Canada and England, and peaches, nectarines, apricots, and grapes are successfully cultivated. Agricultural products in 1921 were 1,178,700 bushels of wheat, 2,756,000 bushels of oats, 307,000 bushels of barley, and 126,000 bushels of rye. Hay and clover to the value of \$7,478,000 and alfalfa, \$1,121,000, were produced the same year. The province also has extensive fruit regions. The value of all fruits produced in 1921 was \$165,791.58, one third (33.14 per cent.) of the value of all fruits produced by Canada in that year. The cheese and butter output for 1921 was valued at \$1,307,950. The number of livestock in 1921 was 1,911,927.

**Railroads.**—The total railway mileage in operation in the province in 1918 was 4,152, as follows: Canadian Pacific 1,812, Grand Trunk Pacific 703, Canadian National 525, Great Northern and controlled lines 420, Pacific Great Eastern 180, British Columbia Electric 281, Esquimalt and Nanaimo 198, White Pass and Yukon 33.

**Education.**—In 1921 the total enrollment in the high and public schools of the province was 85,950, the number of teachers employed being 2,557. An Act was passed by the provincial government in 1908 providing for the establishment of the University of British Columbia. Its control is vested in the Chancellor Board of Governors and Senate. The total number of

students enrolled in 1920-21 was 1,159. Permanent university buildings have been erected on Point Grey peninsula, five miles from Vancouver.

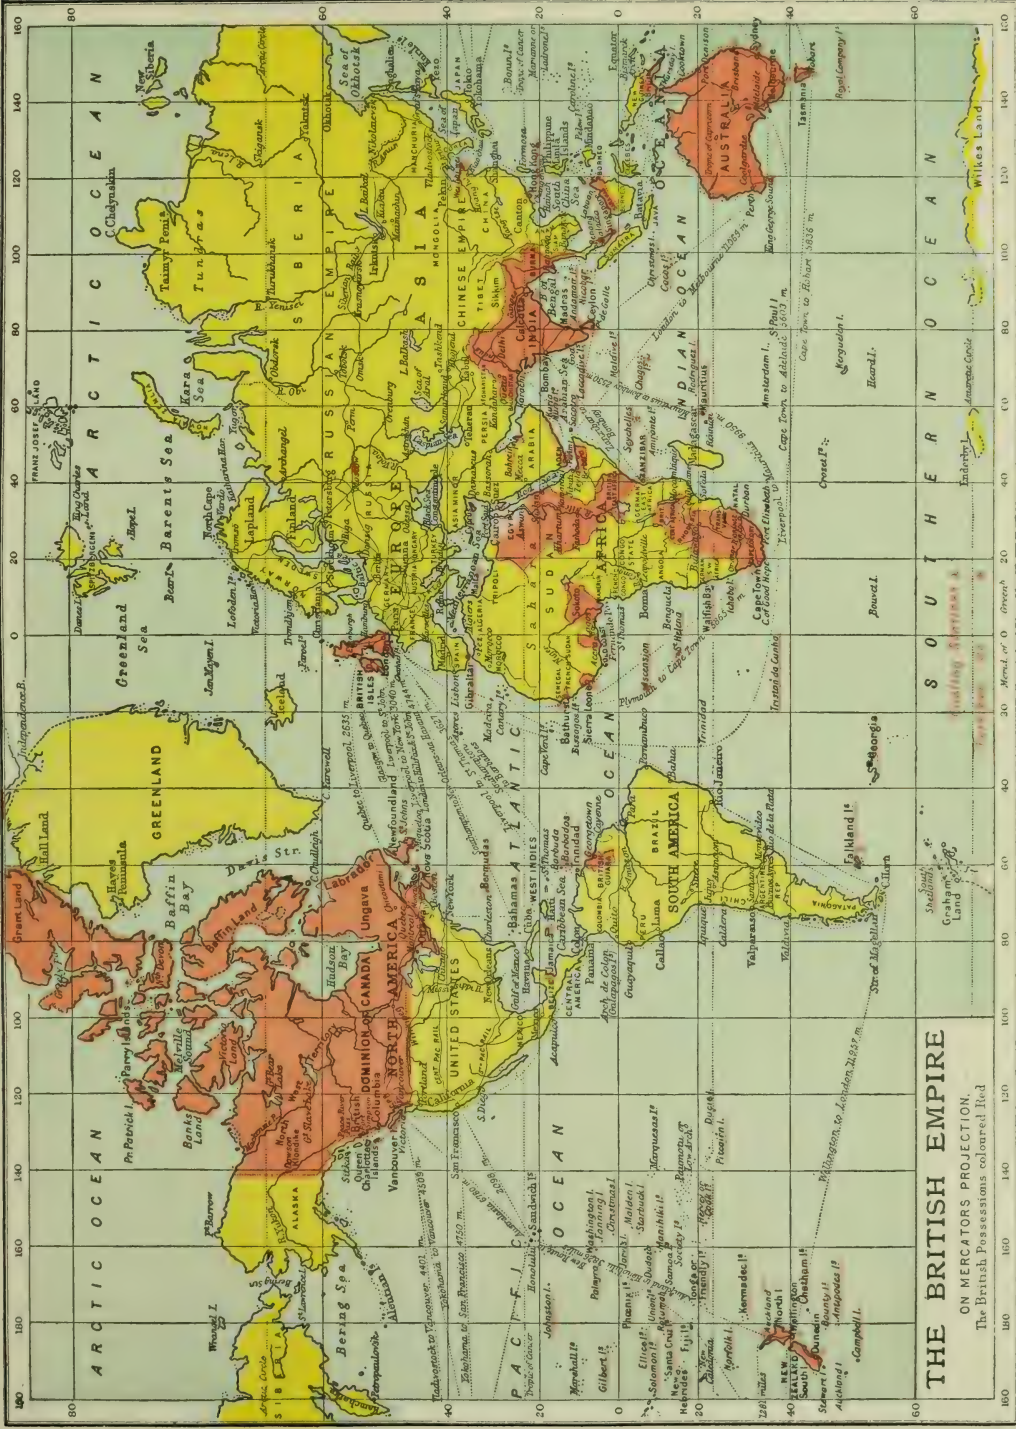

**Government and Finance.**—British Columbia is administered by a lieutenant-governor, with executive council, and a legislative assembly of 47 members. The province is represented in the Dominion Senate by six members and in the House of Commons by thirteen members. The net revenue for the fiscal year ending March 31, 1920, was \$13,861,603; net expenditure \$11,568,003; surplus \$2,293,600; the excess of assets over liabilities was \$2,059,788.

**Population.**—The population in 1921 was 524,582, an increase of 33 per cent over that of 1911. The chief cities are Victoria, the capital, at the southern end of Vancouver Island (pop. 38,727); Vancouver (pop. 117,217); New Westminster, the former capital (pop. 14,495); and Nanaimo with suburbs (pop. 9,088). In the interior several towns are flourishing, notably Kamloops (pop. 4,501); Fernie (pop. 4,343); Nelson (pop. 5,230); and Trail (pop. 3,020). Prince Rupert (pop. 6,393), the western terminal of the Grand Trunk Pacific, is experiencing steady development.

**History.**—The first authenticated visits to the country were made by Bodega and Heceta in 1775, and by Captain Cook three years later. In 1782 Captain Meares, an English sailor in the service of Portugal, established a fur-trading station at Nootka, which was soon afterwards plundered by the Spaniards. After Capt. George Vancouver had surveyed the coast, Spain concluded a treaty with England, ceding Nootka and paying an indemnity. In 1918 a treaty was made between England and the United States defining the limits of the two territories; and the Alaska Boundary Commission definitely settled the frontier with Alaska in 1903. Vancouver Island was proclaimed a British colony in 1849, and the mainland received the name of British Columbia by imperial edict in 1858. In 1866 the two colonies were constituted a single province, and in 1871 British Columbia became a province of the Dominion of Canada.

**Bibliography.**—Consult official publications of the Province; *Reports* of the Department of Mines, Ottawa; R. E. Gosnell's *Year Book of British Columbia* (Coronation Edition, 1911); Ernest Heaton's *Handbook* (Toronto); Begg's *History of British Columbia*.

Equatorial Africa consists of a large area on the mainland and the islands of Zanzibar and Pemba. It extends from some 400 miles of coast on the Indian Ocean to the Belgian Congo and the western watershed of the basin of the Upper Nile on the west. The southern boundary runs from Umba in a north-westerly direction to the intersection of the Victoria Nyanza with the first parallel of north latitude, skirts the northern shore of the lake, and thence strikes west to the boundary of

of Zanzibar, with a combined area of about 323,500 square miles. Consult Playne and Gale's *British East Africa* (1910); Ward and Milligan's *Handbook of British East Africa* (1912).

**British Empire**, the complex association of political communities united under a common allegiance to the British Crown, comprising Great Britain and North Ireland, the self-governing Dominions, India, the Colonies, Protectorates, and Dependencies. Territories administered under mandate of the

The greater part of the British Empire has, however, accrued in comparatively recent times. During the 17th century the North American colonies were established along the Atlantic seaboard and the Dutch were driven from New Amsterdam. William Penn secured the grant of Pennsylvania in 1681, and by the middle of the 18th century the British colonial possessions stretched from New England to Georgia. These colonies, breaking away in the Revolution of 1776, led to the foundation of

the Belgian Congo. The northern boundary begins at the mouth of the Juba River, which it follows to the intersection of the stream with the sixth parallel of north latitude, then runs to the 35th meridian east longitude, and follows that to its intersection with the Blue Nile (Anglo-German agreements, 1886 and 1890). In 1905 British East Africa was taken over from the Foreign Office by the Colonial Office. In 1920 the Kenya Colony became a 'Crown Colony.'

British East Africa consists of Kenya Colony and Protectorate, formerly known as East Africa Protectorate, the Uganda Protectorate (q.v.), and the island

League of Nations are also usually included.

The total area of the British Empire, including mandated territories, is 13,377,284 square miles. Of this, approximately 30 per cent. is in North and South America and adjacent waters; 24 per cent. in Australasia and the Pacific; 29 per cent. in Africa; 16 per cent. in Asia and only 1 per cent. in Europe.

**Historical.**—The earliest efforts to establish colonies took place along the shores of North America. The first of these was made by Sir Humphrey Gilbert in Newfoundland, in 1583, followed shortly by a small English settlement on the coast of Virginia.

the United States of America. In addition to the New England Colonies, the Treaty of Utrecht (1713), terminating the War of the Spanish Succession, left Great Britain in possession of Newfoundland, New Brunswick, Nova Scotia, St. Helena, two trade stations at Gambia and the Gold Coast, the Bermudas, Jamaica, Barbados, the Bahamas, St. Kitts, Nevis, Antigua, Montserrat, the Virgin Islands, and Gibraltar.

Little progress in territorial acquisition took place until the great wars which marked the second half of the 18th century. By the Treaty of Paris (1763), which concluded the Seven Years' War, the remainder of

Canada and Dominica, St. Vincent, Granada, the Grenadines, and Tobago were added to the Empire. In 1788, the beginnings of the Colony of Sierra Leone, in Africa, were established. In 1802, under the Treaty of Amiens, Ceylon and Trinidad were acquired from the Dutch. In 1814 and 1815, the two Treaties of Paris, closing the Napoleonic Wars, ceded the Cape of Good Hope, British Guiana, Malta, Mauritius, Seychelles, St. Lucia, and Tobago, the last having been given back to France in 1783. The supremacy of British interests in India and the Pacific was also recognized.

Towards the end of the 19th century, Natal, Rhodesia, Bechuanaland, Basutoland and the Transkei and Zululand, all in Africa, were occupied. British Columbia and the North West Territories were added to Canada. Australia, New Zealand, British New Guinea, and North Borneo were occupied. By cession, Hong Kong, Labuan, Lagos, and the greater part of the Gold Coast and the Fiji Islands were secured, and the Island of Cyprus and the basin of the lower Niger were acquired by arrangement with the other powers. In 1890, by agreement with Germany, France, and Portugal, the possessions and spheres of interest of those powers in the African continent were limited, resulting in large additions to the Empire. In consequence, British jurisdiction has been established over the territories now known as Kenya, Zanzibar, Uganda, Nyasaland, British Somaliland, the Protectorate of Nigeria, the Northern Territories of the Gold Coast, and the Protectorate of Sierra Leone. Amatongaland came under a Protectorate in 1895 and is now part of Natal. Wei-hai-wei and an extension of British Kowloon were obtained on lease from China in 1898. In 1899, certain of the Solomon Islands in the Pacific were transferred by Germany to Great Britain. After the Boer War in 1900, the South African Republics were annexed to the Empire, paving the way to the union of the chief British colonies in South Africa. The same year, in the West Pacific, Tonga, the Cook Islands, the Savage Islands, and a number of other smaller islands were annexed. The Malay Peninsula, except that part belonging to Siam, is now also under the British Crown, partly as protectorate and partly as crown colony.

During the World War (1914-18), Great Britain and the dominions undertook the seizure of many of the German colonies. The first to fall was Togoland, which surrendered to British and

French troops in 1914. German New Guinea, the Bismarck Archipelago, the Solomon Islands, and Nauru were occupied by the Australian forces, and German Samoa by New Zealand forces in the same year. German South West Africa was occupied by the Union of South Africa. In 1915 British, French, and Belgian forces captured the German protectorate of the Kamerun, after operations lasting nearly eighteen months. German East Africa was the most difficult of the German colonies to reduce, the German leader surrendering to British, Belgian, and Portuguese troops only when the war ended. Kiaochau was taken by Japanese and British forces in 1914. Under the Treaty of Versailles, the principle of international mandates was established to deal with these colonies, most of which were placed under the control of Great Britain and the dominions.

**Government.**—The British Constitution does not lend itself to definition. It is, in the first place, unwritten, and secondly it is liable to constant development. Under it the power of legislation is supreme, so that the Constitution itself may be amended by ordinary Act of Parliament. There are three parties to legislation, namely the King and two Houses of Parliament, though if the upper house reject a money bill, legislation may be effected by the King and the House of Commons alone.

These characteristics appear in differing forms in the constitutions of the dominions, but it is the Crown which is the constitutional element that persists throughout the Empire, and all British subjects share a common citizenship by virtue of their allegiance to it.

In addition to the Crown there are other constitutional links between Great Britain and the rest of the Empire. There is the right of appeal to the Privy Council, a right which, however, is circumscribed within narrow limits. There are also spheres of action in which some legislatures are subordinated to the Crown or to the British Parliament, including provisions which aim at reconciling the conflict of laws.

The constitutional development of the Empire as a whole can best be indicated by classifying its component units in nine political groups.

In the first group is Great Britain, the home and centre of the British Constitution, which is the model, both in form and tradition, upon which all advanced political institutions within the Empire have been, or are being, fashioned. (Northern Ireland possesses local self-government, but is also represented in

the Parliament of Great Britain, and is included here.)

In the second group are the self-governing dominions, viz, Canada, Australia, South Africa, New Zealand, and the Irish Free State. These possess the fullest rights of self-government within the Empire, under constitutions closely following the British Constitution in fundamentals. At the Imperial Conference of 1926 they were declared to be equal in status and in no way subordinate to one another or to Great Britain in any aspect of their domestic or external affairs.

Thirdly, comes India, which though a member of the League of Nations, is not wholly self-governing. It is in itself an empire, composed of (1) provinces under a complex form of constitution which divides the functions of government between responsible and representative institutions and an executive appointed by the Crown; (2) districts governed without representative institutions; (3) quasi-independent states, governed by native princes, the whole united by allegiance to the Crown and subject to its control in such matters as defence and external affairs.

Newfoundland constitutes a fourth group, its position being midway between that of the dominions and the Colonies in the fifth group. Though in many respects of full dominion status, Newfoundland does not enjoy separate representation in the League of Nations and does not exercise independence in foreign affairs.

Malta and Southern Rhodesia make up the fifth group; they have responsible government in internal affairs, but are subject to certain constitutional limitations.

The sixth group consists of Colonies with local legislatures in which the Executive is appointed by the Crown and is not responsible to the country, and in which (a) one House is wholly elected and the other nominated by the Crown, namely, the Bahama Islands, Barbados, and Bermuda, (b) there is one House only, partly elected, partly nominated, with a majority of elected members, viz, British Guiana, Ceylon, Cyprus, (c) there is one House only, partly elected, partly nominated, in which the elected members are a minority, viz, Fiji, Granada, Jamaica, Kenya, the Leeward Islands, Mauritius, Nigeria, St. Lucia, St. Vincent, Sierra Leone, the Straits Settlements and Trinidad, (d) the House is wholly nominated, (1) with unofficial majority, as in British Honduras and (2) with official majority, as in Falkland Islands, Gambia, Gold Coast, Hong Kong, Northern Rhodesia, Nyasaland, Seychelles, Uganda,

The seventh group is composed of colonies and protectorates governed directly or indirectly by the Crown, without representative institutions in the European sense, but with native advisory councils in some cases. These are Ashanti, Basutoland; Bechuanaland Protectorate, Gibraltar, Northern Territories of the Gold Coast, St. Helena and Ascension, Somaliland, Swaziland, Wei-hai-wei, islands included under the Western Pacific High Commissioner, British North Borneo (by chartered company). There are also islands and territories which are governed directly by the great self-governing dominions, e.g., Papua, a territory under the Commonwealth of Australia. This and the preceding group are often called 'Crown Colonies.'

Eighth is the Sudan, which is under British administration without representative institutions, and whose political status is the subject of a condominium agreement with Egypt (1899).

Ninth, and last, there are the territories administered or protected by virtue of International Mandates, viz., mandatory Great Britain: Palestine, Trans-jordan, Irak (now an independent kingdom), Kamerun, Tanganyika, Togoland; mandatory Union of South Africa; South West Africa; mandatory New Zealand: Samoa; mandatory Australia: former German Pacific Islands South of Equator; mandatory the British Empire (joint arrangement between Great Britain, Australia, and New Zealand): Nauru. These for the most part are still without advanced political institutions.

**The Imperial Conference.**—The Imperial Conference was constituted under a resolution of the Colonial Conference in 1907, for the purpose of discussing questions of common interest as between the British Government and the governments of the self-governing dominions. It is purely advisory and consultative in character. Its resolutions can be made effective only by legislation of the several legislatures represented.

The first officially styled Imperial Conference was held in May and June, 1911, composed of the Prime Minister of Great Britain, presiding, and the Prime Ministers of the dominions. At the proposal of the British Government it was agreed that in future the dominions should be given the opportunity to confer on the instructions given to British delegates to The Hague Conference, that conventions affecting the dominions, provisionally agreed to at that Conference, should be circulated to the dominion governments before they were signed, and that similar procedure should be used in con-

nection with other international agreements affecting the dominions. It was also agreed that liberty should be secured for the dominions to withdraw from treaty obligations under the 'most favored nation' clause. An agreement was reached on the main principles on which naturalization in one of the dominions should be recognized in other parts of the Empire. The development of cable communications and British immigration to the dominions was also furthered, and steps were taken to secure uniformity in the development of the resources of the Empire and in securing uniformity of laws and procedure with regard to shipping. The principle was also laid down that, while it was an undoubted right of the self-governing dominions to determine in what manner their communities should be composed and, therefore, to restrict immigration as they thought fit, this should be done in a way compatible with the comity due to the other peoples of the Empire.

Owing to the War the Imperial Conference could not meet in May, 1915, as had been planned. The War period, however, saw the creation of the Imperial War Cabinet, a system under which overseas representatives became temporary members of the British War Cabinet.

In 1917, the Imperial War Conference took place and devoted its attention to the question of preparedness and the development of the resources of the Empire. It established the Imperial Mineral Resources Bureau and dealt with the difficulties arising from double income taxation within the Empire. It was also agreed that India should be fully represented at future Imperial Conferences.

During the Peace Conference at Paris, in 1919, co-ordination of British imperial interests was secured through a delegation representing the whole Empire. Representatives of the dominions signed the Treaty of Versailles and became original members of the League of Nations. Important treaties arising out of the Peace Settlement were also signed by representatives of the great dominions.

From 1919 to 1925 subsidiary conferences were held as follows: Imperial Statistical Conference, Imperial Entomological Conference, Imperial Forestry Conference, Imperial Customs Conference, and a Conference on Patent Laws of the Empire. The Imperial Shipping Committee was appointed in 1920 to deal with bills of lading and various shipping problems.

In 1921, a conference of Prime Ministers and representatives was held in London, the proceed-

ings of which related chiefly to the foreign policy of the Empire, though major imperial questions, such as communications and Empire settlement, were discussed. The Conference also expressed the opinion that, in the interests of the solidarity of the British Empire, the rights of Indians, already domiciled in other parts of the Empire, should be recognized.

The next regular Imperial Conference took place in 1923. Questions of foreign affairs and defence were discussed; the position of British Indians in the Empire was also dealt with, and it was agreed, by all except South Africa, to give effect to the principle laid down in 1911. Concurrently with the regular Imperial Conference of 1923, an Imperial Economic Conference took place, at which the Irish Free State was represented for the first time. Among the most important matters discussed was the offer of the United States Government to take part in the International Enquiry on the European Reparation Problem which led, in due course, to the Dawes Report.

The next regular meeting of the Imperial Conference was held in October, 1926, when, in addition to the usual main questions, the whole problem of the relations between Great Britain and the dominions, as well as the conduct of foreign relations, was discussed. The result of this Conference was to define a situation, the existence of which had in fact been long recognized. Of the Empire it was declared, 'free institutions are its life blood, free co-operation is its instrument.' No attempt was made to lay down a constitution for the Empire, but it was declared that the dominions were autonomous communities within the British Empire, with absolute equality of status, though united by common allegiance to the Crown and freely associated as members of the British commonwealth of nations. The Conference recognized the peculiar position of India as defined by the Government of India Act. It recommended that the title of the King should be changed to 'George V., by the Grace of God, of the United Kingdom of Great Britain, Ireland, and the British Dominions Beyond the Seas, King, Defender of the Faith, Emperor of India.' It defined the Governor-General of a dominion as the representative of the King and not of the British Cabinet. It advised the establishment of an expert committee to deal with the operation of dominion legislation. With regard to foreign relations, a sub-committee reported on the procedure with regard to the nego-

tiation, form, and signature of treaties, and the powers to be given to plenipotentiaries. It also advised on such questions as the representation of dominions at international conferences and the position of the foreign consuls in the dominions.

In the general conduct of foreign policy it was recognized that the major share of responsibility rests now and must for some time continue to rest with the Government of Great Britain. At the same time, it was declared, neither Great Britain nor the dominions can be committed to the acceptance of active obligations, except with the definite consent of their own governments. The Conference anticipated the most fruitful results from the co-operation of the recently appointed representatives of Canada and the Irish Free State to the United States. It was recognized that where no dominion ministers had been accredited in foreign states, existing diplomatic channels should continue to be used. An Inter-imperial Committee, it was declared, should be developed to assist personal contact to supplement existing channels of inter-communication on a plan to be worked out. It was also understood that none of the governments represented would take action accepting compulsory jurisdiction of the World Court without further discussion. Finally, the policy inaugurated by the Treaty of Locarno received complete approval from the dominions and India, and the British Government was congratulated on its success.

**Defence.**—The troops of the self-governing dominions have gradually taken over from Great Britain the work of local defence. Certain of the colonies, such as Gibraltar, Malta, the Straits Settlements and Hong Kong, still have British garrisons. The defence of the Empire, however, rests primarily on the British navy, with substantial assistance from the self-governing dominions. The chief naval stations of the Empire are Simon's Town (South Africa), Bermuda, Malta, Gibraltar, and Hong Kong. A naval base is also in course of construction at Singapore.

The question of defence has always occupied much attention at the Imperial Conferences and at special conferences of dominion representatives. Thus, prior to the Imperial Conference of 1911 there had been a special Defence Conference in 1909, the main results of which were contributions to the British navy by New Zealand, Australia, and Canada, and a provision for a plan for organization of the forces of the Crown, wherever they might be.

**British Empire Exposition**, an exposition held at Wembley, just outside of London, in April-October, 1924, its primary purpose being to furnish to British subjects in particular, and to the world in general, an idea of the economic resources of the British Empire in raw materials and manufactures, to open up new markets for both dominion and world trade, and to stimulate trade within the Empire. The exposition grounds covered an area of nearly 240 acres; the great main buildings included the Royal Pavilion, the Stadium, Palace of Engineering, Palace of Industry, Palace of Art, and the pavilions of the different colonies. The Royal Pavilion, symbolizing the power and dignity of the British Government as the centre of the Empire, housed exhibits illustrating the functions of the Home Government. The post office, mint, ordinance survey, and other branches of government were represented, and there was a theatre with its stage in the form of a water tank for the presentation of historic naval spectacles. The Stadium covered an area of 10 acres and accommodated over 125,000 people. The Palace of Engineering, said to be the largest concrete building in the world, contained a fine display of engineering products, over 300 British firms having contributed toward the collection. The exhibits comprised shipbuilding, marine, mechanical, and general engineering products; a giant electrical power station was open to public inspection, and all British makes of motor cars and sea transport stock were displayed. The Palace of Industry was devoted to the display of British industry other than that connected with engineering. The chemical industry had the largest single exhibit, cotton and woollen textiles being next in importance. The Palace of Art housed a notable collection of pictures and sculpture; a lofty basilica exemplified ecclesiastical art, and two galleries were devoted to the art of the theatre. The beautiful pavilions erected by the Indian Dominion and Colonial Governments contained magnificent exhibitions of the

Empire's wealth of raw materials and the development of colonial industry.

Several important conferences were held during the course of the Exhibition, chief of which were the Empire Mining and Metallurgical Congress, the World Power Conference, the Textiles Conference, and the International Advertising Convention of the Associated Advertising Clubs of the World.

**British Guiana**, the only British possession on the continent of South America, lies on the north coast, having Dutch Guiana, Brazil, and Venezuela on the east, south, and west respectively. It has an area of about 89,480 square miles. The colony may be roughly divided into three belts: a low-lying, flat, and swampy portion on the north, bordering the coast; a second more elevated tract composed of sand and clay, in the centre; and a still more elevated portion in the south, containing the principal mountain chains in its western part. The chief rivers are the Essequibo, the Corentyne (obstructed by rapids 150 miles from its mouth), the Demerara and Berbice, the Barima (navigable for 80 miles), and the Amacuro, all flowing into the Atlantic Ocean. The climate is hot, but the range of temperature is slight: average maximum, 90°; minimum, 76° F. The rainfall amounts to 120 to 140 inches annually on the coast, and is heavier in the forest region.

The flora is that common to tropical South America. On the southern border, and between the Essequibo and Corentyne, are grassy plains. The centre is clothed with forests yielding valuable timber, of which mora and greenheart and a kind of gutta-percha (balata) are important.

British Guiana is rich in gold; it is washed in all the river valleys, from the Barima in the west to the Berbice; while the mountains are more or less auriferous. From 1886, when mining commenced, to 1924 the total output was valued at £9,642,161; in 1924, 7,187 oz. were mined, valued at £26,940. There are promising diamond fields, principally in the Mazaruni district; diamonds produced in 1924 amounted to 185,586 carats, valued at £858,322. Iron ore, manganese, and bauxite are also found.

The sugar industry is the most important in the colony, and sugar and its by-products, rum, molasses, and molascuit, constitute the major part of its exports. In 1924 exports were valued at £3,393,529 and imports were valued at £2,744,145. Trade is chiefly with Great Britain and Canada. Exports to the United

States in 1922 amounted to about \$450,000; imports to about \$4,070,000. The total tonnage entered and cleared in that year was 916,007, mainly British and Dutch. The ports are Georgetown (q. v.), the capital, and New Amsterdam.

The settled part of the country is about one-tenth of the whole,

and New Amsterdam, with 800 subscribers; and 57 savings banks. In 1921 there were 224 schools, with 36,865 pupils, that received government aid amounting to \$150,000.

The inhabitants are chiefly Portuguese from Madeira, Negroes, East Indians, and Chinese (settlement, Hopetown). The

cludes, besides the above, 6 financial representatives elected by the voters. The Combined Court has charge of the finances of the colony. In 1921 the revenues amounted to \$4,650,945, and the expenditures to \$5,740,284.

**History**—The Dutch first settled on the Pomeroon River early in the seventeenth century. In the following century colonization began in earnest, and Essequibo, Demerara, and Berbice were established. In 1781 the British captured these settlements, occupying them until 1783, and again from 1803 to 1814, when the present colony was formed, except that Berbice was administered separately down to 1831. British Guiana has had many frontier disputes with Brazil and Venezuela.

In 1840 a British agent, Sir R. Schomburgk, undertook to define the Venezuelan boundary and mapped out a line, known as the Schomburgk line, giving most of the territory in dispute to British Guiana. In 1850 Great Britain and Venezuela agreed that neither country should occupy the disputed territory, but after mutual accusations of bad faith, Great Britain eventually established a fortified position at the mouth of the Orinoco. Venezuela thereupon occupied the forbidden area, Great Britain demanded reparation, and the United States intervened. Before definite action was taken by the United States, however, a treaty was concluded between Great Britain and Venezuela by which the dispute was submitted to arbitration. According to the award (Oct. 3, 1899), the boundary was fixed mainly according to the Schomburgk line, but certain specified areas were reserved to Venezuela (see **VENEZUELA**). The Brazil frontier question was submitted to arbitration in 1901, and settled by the award of the king of Italy in 1904.

colony from the Guatemalan boundary. South of these mountains, hilly country nearly 2,000 feet high connects them with the ranges of Central Guatemala. The more accessible forests having been well worked, the quality of the timber is declining; but the cultivation of chicle, fruit, cacao, sugar, and india rubber is being extended. The climate generally is damp and hot, but not unhealthy. The temperature ranges from 50° to 98° F. The average lies between 75° and 80°, but this is considerably tempered by the prevailing sea breezes.

For the fiscal year 1912-13 the exports were valued at \$2,935,000, the principal items being mahogany (\$1,065,000), chicle gum (\$960,000), cedar, coconuts, bananas, and logwood; while the imports were valued at \$3,594,000, the chief items being gum, cotton goods, provisions and clothing, and machinery. In 1912 trade with the United States amounted to \$2,310,000 in exports and \$1,365,000 in imports. Telegraph and telephone lines connect Belize with Corozal, Consejo, El Cayo, and Punta Gorda. The population is composed chiefly of Indians, only 1 per cent. being Europeans. The capital and chief port is Belize (q.v.). Area, 8,600 square miles. Pop. (1901) 37,489; (1913) 41,000. Consult Gibbs' *History of British Honduras*; Bristowe and Wright's *Handbook of British Honduras*.

**British Isles**, THE, an extensive archipelago west of the Continent of Europe, from which it is separated by the North Sea, the Strait of Dover, and the English Channel. The whole archipelago consists of the two large islands of (a) Great Britain, comprising England, Wales, and Scotland; (b) Ireland; together with (c) about 5,000 small islands lying in groups to the north (Orkney and Shetland), to the west (Hebrides, Isle of Man, the small coast islands of Ireland, and the Scilly Islands), and to the south (Isle of Wight and the Channel Islands, the last named belonging geographically to France). Total area, 121,390 square miles. Pop. (1911) 45,365,599. See ENGLAND AND WALES; SCOTLAND; IRELAND; etc.

**British India**. See INDIA.

**British Museum**. In 1753, under the will of Sir Hans Sloane, his books, MSS., natural history collections, and curiosities were offered to the British nation for the sum of \$100,000, on condition that they should be kept together in a museum. An Act of

Parliament was passed the same year, providing for the acceptance of this offer; for the purchase, for \$50,000, of the collection of MSS. formed by Robert Harley, Earl of Oxford; and for the proper housing of the earlier collection of MSS. formed by Sir Robert Cotton in the reign of James I., and given to the nation by his grandson in 1700, but so badly cared for that a fire in 1727 destroyed or damaged a considerable part of them. Montague House, Bloomsbury, was purchased for \$51,250, and opened (in 1759) under the title of the British Museum, the three collections already named having been previously augmented (in 1757) by George II.'s gift of the royal library formed by successive kings and queens of England, from Henry VII. to Charles II.

When the museum was opened, its means were so limited that for a long time the trustees could not spend as much as \$500 on purchases in any single year. The regulations at this time only allowed a maximum of thirty visitors in any one day, and the use of the reading room was similarly restricted. In 1772, however, the vases, antiquities, and drawings of Sir William Hamilton were purchased by parliamentary vote for \$42,000; in 1799 the Rev. Clayton M. Cracherode bequeathed to the museum his fine collections of books and prints; the Egyptian antiquities obtained under the capitulation of Alexandria were presented by George III. in 1802; the Towneley marbles, coins, and drawings were bought between 1805 and 1814 for \$141,000, the Lansdowne manuscripts in 1807 for \$24,625, the Phigalian marbles in 1815 for \$75,000, the Elgin marbles in 1816 for \$175,000, and the Burney library in 1818 for \$67,500. Lastly, in 1823, by an arrangement with his successor, the magnificent library formed by George III. was transferred to the museum.

These large additions, with the more liberal regulations adopted in 1810, by which the public were admitted freely between ten and four on three days in each week, demanded an increase of space far in excess of the accommodation offered by Montague House. A new wing was first erected on the west side of the building for the reception of the Towneley and Elgin marbles; next a fine gallery was opened on the east side in 1827 for the king's library (books collected by George III.); and these wings were finally joined by galleries on the north side, and by an imposing façade in the Ionic style, from the de-

signs of Sir Robert Smirke, the whole building being complete in 1847.

Meanwhile, however, under the vigorous administration of Anthony Panizzi (an Italian refugee, who became keeper of the printed books in 1837), the library had been growing by leaps and bounds. Panizzi obtained from the government an annual grant of \$50,000 to make good its deficiencies; vigorously enforced the copyright act, by which a copy of every book printed in the United Kingdom must be delivered to the museum within one month of publication; and, by his influence with the Right Hon. Thomas Grenville, procured the bequest (in 1847) of the magnificent Grenville library, a collection of 20,240 volumes.

As the books multiplied readers multiplied also; and to provide room for both, in 1854 a plan of Panizzi's was accepted by which the quadrangle round which the galleries of the museum were built was to be occupied by a great circular reading room, with a diameter of 140 feet and a height of 106 feet, surrounded by galleries constructed entirely of iron, containing twenty-five miles of shelving, and accommodating about a million books. This building was opened in 1857, and both the circular reading room and the iron 'bookstack' (in which the light admitted from a glass roof penetrates through the gaps between the railings which form the floors) have served as models for many similar constructions. By the subsequent invention of 'sliding' bookcases, which run forward from the face of the fixed ones, the miles of shelving (including those in the older parts of the library) were increased to about fifty, though the method of counting pamphlets only according to the volumes in which they are bound has restricted the official estimate to between 2,000,000 and 3,000,000 volumes.

Meanwhile other departments of the museum also grew rapidly, and as early as 1860 it was determined to move the natural history collections to South Kensington, where the site of the exhibition of 1862 was purchased the year after it closed. A new terra-cotta building, from the designs of Alfred Waterhouse, was begun in 1873, finished in 1880 (the main contract having been for \$1,750,000), and opened the following year. The style is that known as Early Romanesque, modelled on that which obtained in Lombardy and the Rhineland from the tenth to the

twelfth century. The frontage is 675 feet, the dimensions of the splendid hall, which forms the chief feature of the building, being 170 feet long, 97 feet wide, 72 feet high, and the exhibition galleries 278 feet by 50 feet.

The removal of the natural history collections from Bloomsbury left space there for the display of the ethnographical collections given by Henry Christy in 1865, and, with a bequest of \$325,000 by William White (which, though made in 1823, only accrued on the death of his widow in 1879), the White Wing was built, jutting out from the southeast angle, and

sington (including 61,465 on Sundays) was 535,116, of whom 20,068 were students. Both museums are opened free to the public every week day except Good Friday and Christmas Day, and on Sundays from 2 P.M. till dusk. Admission to the reading rooms and studies is granted to students over twenty-one years of age, on the written recommendation of a householder, sent at least two days previously. The recommendations of lodging-house keepers and hotel proprietors are not accepted.

Among the more notable of the special collections at the

articles illustrating the different religions of the world; the collections of tools, weapons, ornaments, and dress of races in all the earlier stages of civilization in every continent; the mediæval antiquities, Roman remains in Great Britain, collection of gold ornaments, of coins and medals, and ancient Greek vases; lastly, the collections illustrating the history of books in manuscript and print, including autographs of many famous men and women.

Since 1909 important acquisitions have been added to the collection of MSS., coins, and antiquities. In the department of

*The British Museum.*

providing fine rooms for the display of pottery and glass, and prints and drawings. During the tenure of the chancellorship of the Exchequer by Sir William Harcourt (1892-4) the ground at the back of the museum was purchased on terms liberally offered by the Duke of Bedford, and the new annex built thereon was formally opened in 1911.

The total annual grant in 1909-10, including that of the British Museum of Natural History, amounted to \$992,000. The number of visitors to the parent museum in Bloomsbury in 1909 was 708,836, of whom 276,040 were students in the reading room or other departments. The number of visitors to the Natural History Museum at South Ken-

British Museum itself are the sculptures from the Parthenon at Athens (fifth century B.C.), known as the Elgin Marbles, removed to England by Lord Elgin in 1801-3, and purchased in 1816; the sculptures of the mausoleum at Halicarnassus, excavated in 1857; the Assyrian sculpture from the palace of Assur-nasir-pal (B.C. 885-860) at Nimrud; the bas-reliefs from Nineveh of the reigns of Tiglath-pileser III. (B.C. 745-737), Sennacherib (B.C. 705-681), and Assur-bani-pal (B.C. 668-626), and the cuneiform inscribed slabs which formed Assyrian books; the series of Egyptian sculptures ranging from B.C. 4000, and of mummies and objects found in their tombs; the exhibition of

printed books eighty old English books have been added to the library, and include works from the presses of Julian Notary, Richard Pynson, Wynkyn de Worde, and Thomas Berthelet.

At the natural history museum the great hall is occupied by an 'introductory' collection illustrating the variation of animals under domestication; the adaptation of their color to environment; the phenomena of albinism, melanism, etc. The western galleries are devoted to stuffed specimens of animals and to their skeletons, the eastern galleries to minerals and botany. Among other collections are the birds' eggs and the butterflies, and the Gould collection of humming birds.

While the usefulness of the museum must always be gauged by the help it renders to real students, much of late years has been done to increase its popularity with casual visitors. To every article exhibited is attached a label, giving its name, and where needful, something of its history. In departments, the bulk of whose treasures cannot be displayed, selections are placed in show cases, among the most interesting of which are those containing autographs of celebrated personages, ancient, Oriental, and illuminated manuscripts, books illustrating the history of printing in various countries, rare bindings, etc. During the last few years also exhibitions have been given in the King's Library in connection with the centenaries of Luther, Wyclif, etc. Consult Shelley's *The British Museum: Its History and Treasures* (1911).

**British New Guinea.** See NEW GUINEA.

**British North America Act,** passed by the British Parliament (March 29, 1867) to provide for the union of Canada, Nova Scotia, and New Brunswick into a federation with the title of 'The Dominion of Canada.' By the British North America Act of June 29, 1891, the Canadian Parliament was empowered to create new provinces, and has since done so. The Dominion now includes the whole of British North America, except Newfoundland and the Bermudas.

**British North Borneo.** See BORNEO.

**British South Africa.** See SOUTH AFRICAN UNION; RHODESIA; BECHUANALAND; BASUTOLAND.

**British South Africa Company, THE,** was chartered on Oct. 29, 1889, through the efforts of Cecil Rhodes (q.v.), its animating spirit until his death. The company had great administrative powers in the region known as Rhodesia, being authorized to promote trade and commerce, and to work and develop mineral and other concessions over an area of 750,000 square miles. Dr. Jameson (q.v.) was the administrator of the company's territories till the Transvaal Raid (1895-6), when he was succeeded by Earl Grey.

**British West Africa.** See GAMBIA; GOLD COAST; LAGOS; NIGERIA; SIERRA LEONE.

**British West Indies.** See WEST INDIES.

**Britomartis,** brit-ō-mār'tis, a Cretan divinity, daughter of Zeus and Carme; like Artemis, a virgin huntress. Minos loved and pursued her; to escape from

him she threw herself into the sea, but was saved by Artemis, who made her a goddess. In Crete she had the surname Dictynna. Clearly she is Artemis under another form.

**Brit'ou Ferry,** seaport, Glamorgan, Wales, at the mouth of the River Neath; 2 miles southwest of Neath. The docks are in direct communication with Merthyr-Tydvil and Aberdare and the Rhondda Valley. There are coal mines and iron works. Pop. (1911) 8,474.

**Brit'tany** (French *Bretagne*), the great northwest peninsula of France, extending in triangular form into the sea, its base resting on Normandy, Maine, Anjou, and Poitou, its sides washed by the Channel and the Atlantic Ocean. In earlier times it formed, with the name of duchy, one of the provinces of France; now it forms the five departments of Finistère, Côtes-du-Nord, Morbihan, Ille-et-Vilaine, and Loire-Inférieure, with a total area of 13,640 square miles, and a population of 3,260,000. Before the Revolution this district fell into the nine dioceses of Rennes, Dol, Nantes, St. Malo, and St. Brieuç, Tréguier, Vannes, Quimper, and St. Pol-de-Léon; of which the first five made up the two popular divisions, the names of which are still in general use—Upper Brittany (*Haute-Bretagne*); the last four, Lower Brittany (*Basse-Bretagne*).

Though the height of its mountains nowhere exceeds 1,150 feet, their structure gives to the peninsula a wild and savage aspect. Clay slate forms the centre of the country, and masses of granite rise in the north and the south. The climate is often foggy, and subject to violent storms of wind. Large tracts of land lie uncultivated; but in the well-watered valleys vegetation is luxuriant.

The peculiar shut-in situation and the characteristics of soil and climate in Brittany seem to have had a powerful effect on the character of its people. The Breton has generally a tinge of melancholy in his disposition; and often conceals, under a dull and indifferent exterior, a lively imagination and strong feelings. He is passionately attached to his country and his customs, and is strongly averse to change. A bold seaman and steady soldier, he is devoted in his loyalty to time-honored authority in church and state, and is capable of extraordinary devotion and sacrifice of self for his ideal. The Bretons would be ignorant and uncivilized but for a quite extraordinary wealth of traditional song and story, that serves effec-

tively all the purposes of a national culture. Perhaps nowhere in the world has folklore reached such a high development, and this not less in quality than in quantity; for no traditional stories come near the Breton folk tales, no popular poetry the Breton folk songs. It must not be forgotten that there has long existed a fairly abundant literature, at least in religious subjects, in the Breton language, and that even in our day many natives are capable of reading this who do not read, and need not even speak, French. No part of Europe contains so many megalithic monuments as Brittany.

In ancient times, Brittany, under the name of *Armorica*, was the centre of the confederated Armorican tribes, who were of Celtic origin. Later it was known as *Provincia Lugdunensis Tertia*, but it never was more than nominally under Roman sway. Already entirely liberated in the fourth century, it became divided into several allied republican states, which afterward passed into petty monarchies. Brittany became subject to the Franks in the reign of Charlemagne, and was handed over by Charles the Simple to the Normen in the tenth century. After fierce struggles the Bretons at length acknowledged the suzerainty of the Norman dukes. Geoffroi, count of Rennes, was the first to assume the title of duke of Bretagne, in 992. The duchy of Brittany was incorporated with France in 1532 by Francis I., to whom it had come by marriage; and subsequently it shared in the general fortunes of the kingdom.

See BRETON LANGUAGE AND LITERATURE.

Consult Le Saint's *La Bretagne Ancienne et Moderne*; Joanne's *Bretagne*; Gourcuff's *Gens de Bretagne*; La Monneraye's *Géographie Ancienne et Historique de la Bretagne*; De Laborrier's *Histoire de Bretagne*; Dean Church's essay in his *Miscellanies*; and books on Brittany by Baring-Gould, Menes (1905), and Le Breiz (Eng. trans. 1906).

**Brittle-stars** (Ophiuroidea), one of the classes of Echinodermata, not far removed from starfishes, but differing in their more centralized body, more sharply defined arms, and more active habits. Compared further with starfishes, the brittle-stars are more muscular and less limy; the brittle arms do not contain digestive cæca from the gut nor reproductive organs, and are supported by an axis of central limy bodies like vertebrae;

the tube feet are smaller, probably simply tactile, and locomotion is effected by the muscular wriggling of the arms; the groove on the ventral surface of the starfish arm is here closed in by

*Brittle-star.*

limy plates; the alimentary canal is blind—that is, without anus; the entrances to the water-vascular system (madreporic plates) are ventral; and the larval form is quite different. *O. aculeata* is common in tide pools along the Atlantic Coast. See ECHINODERMATA.

**Britz**, village, Potsdam district, province Brandenburg, Prussia; 4 miles south of Berlin. Pop. (1910) 11,503.

**Brive**, or BRIVE-LA-GAILLARDE, brēv'la-gā'yārd' (ancient *Briva Curretia*), town, department Corrèze, France, on the River Corrèze; 16 miles by rail southwest of Tulle. It has manufactures of carpets, paper, and candles; trades in preserves, *pâté-de-foie gras*, geese, truffles, wine, and nuts. Pop. (1901) 19,496; (1911) 21,486.

**Brix'en**, town, episcopal see, and summer resort in Tyrol, Austria, in the Puster valley; 24 miles by rail northeast of Bozen. Its cathedral, with two copper-roofed towers, dates from the fifteenth century. The bishopric was founded in the fourth century, and from 1179 to 1803 its bishop was a prince of the empire. Pop. (1901) 5,767; (1911) 6,551.

**Brixham**, briks'am, seaport, Devonshire, England, on the Torbay, opposite Torquay; 25 miles south of Exeter. It is the headquarters of the Torbay fishing industry, and great quantities of fresh fish are sent to London, Bath, and Bristol. There are iron mines, limestone quarries, and mineral-paint works. A cavern 600 feet long on Windmill Hill, discovered in 1858, con-

tained bones of the mammoth, rhinoceros, horse, reindeer, hyena, bear, etc., besides palæolithic flint implements. William of Orange landed here in 1688. Pop. (1901) 8,090; (1911) 7,954.

**Brixlegg**, village, Tyrol, Austria, near the River Inn; 20 miles by rail northeast of Innsbruck. It has important smelting works for silver and copper ores found in the neighborhood, as at Rattenberg. Alt. 1,750 feet. The village stands in a beautiful position, which makes it a favorite summer resort. Passion plays were represented here with great success in 1868, 1873, and 1883. Pop. 1,200.

**Brix'ton**, district, Lambeth parish, London, England. See LONDON.

**Briz'za**, or QUAKING GRASSES, a small genus of plants belonging to the order Gramineæ, characterized by their short, broad, flat, several-flowered spikelets, hanging at the extremities of slender branches, and thus in constant motion in the slightest breeze. See GRASSES.

**Brizures**, brē-zūr', in heraldry, variations on the original arms of a family, introduced to distinguish cadets from the head of the family and from each other. See HERALDRY.

**Broach**, BAROACH, or BHARUCH, town, Gujarat, Bombay Presidency, India, on the River Narbada; 228 miles north of Bombay by rail. Eighteen hundred years ago Broach was one of the chief ports of West India, and its foreign commerce did not absolutely disappear until the end of the eighteenth century. English and Dutch factories were established here during the sixteenth century. It has an export trade in raw cotton, grain, and seeds. Broach was taken by the British in 1772, ceded to Sindhia in 1783, and again stormed by a British force in 1803, since which date it has remained a British possession. Pop. 43,000.

The district of Broach has an area of 1,467 square miles, and a population of 300,000.

**Broad Arrow**, the cognizance of Viscount Sydney, earl of Romney, who was master-general of the ordnance in Great Britain (1693-1702); first used in his day as the royal mark on government stores. To deface or obliterate this mark is felony; while unlawful possession of goods so marked is punishable with forfeiture and a penalty of \$100.

**Broad Arrow**, mining town, West Australia; 24 miles northwest of Kalgoorlie. Pop. (district) 3,000.

**Broadbent**, SIR WILLIAM HENRY (1835-1907), English physician, was born in Huddersfield, and studied medicine at Owens College, Manchester, and in Paris. He was physician-in-ordinary to the Prince of Wales (1892), physician-extraordinary to Queen Victoria (1898-1901), and physician-in-ordinary to King Edward VII. He was created a baronet in 1893, and was chief of the civil medical

*Briza.*

A, *Briza minor*; B, *Briza media*; 1, root; 2, spikelet.

staff in South Africa in 1899. He was author of *An Index of Diseases* (3d ed. 1883); *The Pulse* (1890); *The Heart* (1897).

**Broadbill**, a popular name for certain birds. See SCAUP; SHOW-ELLER; SPOONBILL.

**Broad'head**, GARLAND CARR (1827-1912), American geologist, was born in Albemarle county, Va. He studied at the University of Missouri and after several years' service as a civil engineer became assistant State geologist of Missouri (1857-61). After filling various public positions, among them that of assistant geologist of Illinois (1868), he was State geologist of Missouri (1873-5) and professor of geology at the University of Missouri (1887-97). He was a special agent of the Tenth Census on the quarry industry in Missouri and Kansas, and a member of the Missouri River Commission (1884-1902).

**Broad'hurst**, HENRY (1840-1911), English labor leader, was a blacksmith and a stonemason, who became secretary of the Labor Representation League in 1875. He was M.P. for Stoke-on-Trent (1880-5), for Bordesley (1885-6), for Nottingham (1886-92), and for Leicester (1894-1906). He was appointed Under-Secretary of State for the Home Department (1886), and served on a number of royal commissions (Housing of the Working Classes, Condition of Aged Poor, etc.). He promoted the Leasehold Enfranchisement Bill, and wrote a *Handy Book on Leasehold Enfranchisement* with Sir R. T. Reid (1885), and *The Story of my Life*, an autobiography (1901).

**Broad River**, a river of the Southeastern United States which joins the Saluda at Columbia, S. C., to form the Congaree River. It rises in the south-western part of North Carolina, in the Blue Ridge, passes into South Carolina, and flows in a general southeasterly direction through a course of about 220 miles, more than half of which is navigable.

**Broads**, THE, a series of picturesque shallow fresh-water lakes in Norfolk and Suffolk, England, but mainly in the former county, some in the course of rivers, others connected with rivers by artificial channels.

**Broadsides**. See CHAPBOOKS.

**Broad'stairs**, town, England, Isle of Thanet, Kent, less than two miles northeast of Rams-gate. It was a favorite resort of Charles Dickens, whose residence there has been named Bleak House, although it has no connection with his novel of that name. The North Foreland lighthouse, visible from the cliffs, is said to have suggested to Wilkie Collins the title of his novel, *The Woman in White*. Sand for filters is exported. Pop. (1921) 15,465.

**Broadsword**. See FENCING.

**Broad-winged Hawk**. See BUZZARD.

**Broadwood**, ROBERT GEORGE

(1862-1917), British soldier, took part (1897) in command of the Egyptian cavalry, in the engagement at Abu Hamed and the occupation of Berber, and in 1898 fought in the battles of the Atbara and Khartoum. He commanded the 2nd Cavalry Brigade in the South African War and was cleverly ambushed by General deWet at Sanna's Post (Koonr Spruit). He was engaged in the 'sweeping' operations in the northeastern portions of the Orange Free State in 1901, and on July 13, as the result of a clever manoeuvre, he surprised the town of Reitz. He also captured Gen. A. Cronje, General Wessels (Steyn's brother-in-law), and many other prisoners. In 1904 Broadwood was appointed brigadier-general on the staff to command the Bloemfontein district. In 1906 he was in command in China and when the Great War broke out was in command of troops in East Anglia. He died of wounds received in action.

**Broca**, brō-ká', PIERRE PAUL (1824-80), French anthropologist, was born in Sainte-Foy-la-Grande, Gironde. In 1863 he became professor of surgical pathology at Paris and surgeon to the four great hospitals. He founded the Anthropological Society of Paris (1859), established *La Revue d'Anthropologie* (1872), and opened the famous Ecole d'Anthropologie in Paris (1876). He was especially interested in craniology, and it was he who located the seat of articulate speech in the left frontal lobe of the brain (the convolution of Broca). Broca published many scientific works, including *Des anévrismes et de leur traitement* (1856); *Instructions générales pour les recherches anthropologiques* (1865; 2nd ed. 1879); *Mémoires sur les caractères physiques de l'homme préhistorique* (1869); *Mémoires d'anthropologie* (1871-83, 1888). He was made a member of the Legion of Honor in 1868 and in 1872 founded the Association Française pour l'Avancement des Sciences.

**Brocade'**, a silken fabric with a pattern of raised figures. Oriental brocades date from a remote period, but there were probably no European stuffs of this nature earlier than the 13th or 14th century, when they were made in Italy and Spain. Except for those woven in modern times, brocades are very generally composed in part of gold, silver, or gilt silver threads.

**Broccoli**, brok'ō-li, a hardy variety of cauliflower (q. v.).

**Broch**, brok, a term etymologically the same as borough, burgh, and borg, applied in Northeastern Scotland to an archaic round tower of a peculiar

type. Brochs had no exterior windows, and the only aperture in the outer wall was a small doorway at the base. They were probably erected as places of refuge in the first three centuries of the Christian Era. Some four or five hundred are in existence. They are found only in Scotland. **Brochure**, a French term equivalent to the English pamphlet (q. v.).

**Brock**, SIR ISAAC (1769-1812), British soldier, the 'hero of Upper Canada,' was born on the Isle of Guernsey, and entered the British army as an ensign in 1784. He served in the West Indies, Holland, Denmark, and the Baltic, and was a lieutenant-colonel when he went to Canada in 1802. In 1803 he put down a formidable rising of rebellious troops, and in 1810 he was commissioned lieutenant-governor of Upper Canada, and began preparations for war with the United States. On Aug. 16, 1812, he received the surrender of Gen. William Hull (q. v.) at Detroit, and as a reward for his services, he was made a Knight of the Bath. He was killed while leading his men against the Americans at the battle of Queenston, Ont., on the Niagara frontier, Oct. 13, 1812. The British House of Commons erected a monument to his memory in St. Paul's cathedral, London, and later a splendid monument was erected on the heights of Queenston, under which Brock was buried on the 12th anniversary of his death. Consult *Tupper's Life and Correspondence*.

**Brock**, SIR THOMAS (1847- ), English sculptor, was born in Worcester. He was a pupil of J. H. Foley, R.A., the leading opponent of the then prevailing formalism in sculpture, and afterwards his assistant. On his master's death in 1874, Brock was commissioned to complete his O'Connell monument for Dublin, his statue of Lord Gough, also for Dublin, and his statue of Lord Canning for Calcutta. Among his other works may be mentioned the equestrian statue of the Black Prince, in Leeds; a bronze bust of Lord Leighton; a marble bust of Queen Victoria; the Longfellow bust in Westminster Abbey; and *A Moment of Peril* in the Tate Gallery, London. Probably his finest work is the Queen Victoria Memorial before Buckingham Palace, on which he spent nine years.

**Brock'en**, or BLOCKSBERG (anc. *Mons Bructerus*), the central summit of the Harz Mountains, Germany, 3,747 ft. high, 20 miles southwest of Halberstadt. The Brocken was one of the last strongholds of the heathen faith of the ancient Germanic peoples, and here on the night of the first of May (Walpurgis night) the

witches were said to hold their unholy revels (the Witches' Sabbath). The mountain is also interesting for the 'spectre of the Brocken,' caused by shadows falling upon a wall of mist at sunrise.

**Brockes**, brok'es, BARTHOLOMEUS HEINRICH (1680-1747), German poet, was born in Hamburg. He studied at Halle and Leyden, and after some time spent in travel was elected to the Hamburg Senate. He carried out several missions—as to Vienna (1721), and to Copenhagen (1724)—and was in 1735 appointed for a period of six years bailiff at Ritzebüttel, where he composed *Prinleben zu Ritzebüttel*. His principal work is *Irdisches Vernügen in Gott* (9 vols. 1721-48), a collection of poetical and religious meditations. He also translated into German Pope's *Essay on Man* (1740) and Thomson's *Seasons* (1745).

**Brockhaus**, brok'hous, FRIEDRICH ARNOLD (1772-1823), German publisher, founder of the house which bears his name, was born in Dortmund in Westphalia. He started business in 1802, but removed to Altenburg in 1810, before which date he had purchased the *Konversations-Lexikon* of Löbel. He issued a new (2d) edition of that work in 1812, which made both his reputation and his fortune. The 14th edition was published in 1904. In 1817 Brockhaus removed to Leipzig, and added to his publishing trade that of bookseller, in which he was equally successful. In his enterprise he was ably assisted by his son HEINRICH (1804-74), who, in conjunction with Friedlein and Avenarius, in 1837, established, at Paris and Leipzig, a publisher's shop or book-store of German and foreign literature, which was carried on till 1844. HERMANN (1806-77), another son, became a learned Oriental scholar, studying Indian literature in the German colleges, as well as at Copenhagen, Paris, London, and Oxford, and subsequently occupying the chair of Indian literature at Jena (1839) and at Leipzig (from 1841). He edited and translated many Sanskrit works.

**Brockram** ('broken rock'), a term locally applied to certain breccias belonging to the Permian system, and found at Penrith, Appleby, and elsewhere in that part of England. They appear to have been originally angular broken material which accumulated on the shores of the New Red Sandstone lakes, and are often full of limestone fragments, and sometimes dolomitic.

**Brockton**, city, Massachusetts, Plymouth county, on the New York, New Haven and Hartford Railroad; 20 miles

south of Boston. It is a flourishing industrial city, being especially known for its boot and shoe interests. Shoe tools, woollens, rubber goods, paper boxes, pianos, furniture, and sewing machines are also important articles of manufacture. According to the Federal Census for 1919, industrial establishments number 217, with a capital of \$54,715,520, and products valued at \$117,855,025. Brockton was not incorporated under its present name until 1874, having before that time formed part of Bridgewater, as North Bridgewater. Its growth has been rapid. Pop. (1900) 40,063; (1910) 56,878; (1920) 66,254.

**Brockville**, port, Ontario, Canada, county seat of Leeds and Grenville counties, on the St. Lawrence River, and on the Grand Trunk, the Canadian Pacific, and the Canadian National Railroads and steamboat lines leading to all ports on the Great Lakes. It is connected by ferry with Morristown, New York, and is 70 miles south of Ottawa. There is a U. S. consular agency here. Manufactured products include farming implements, milking machines and separators, engines, edge-tools, gloves, white lead, pumps, leather belting, grinding wheels, copper rods and electrical transmission cable, office furniture, felt hats, breakfast foods, and condensed milk. Pop. (1911) 9,374; (1921) 10,043.

**Brockway**, HOWARD (1870- ), American pianist and composer, was born in Brooklyn, N. Y., and studied music and composition in that city, and in Berlin. He began composing at an early age, and his *Sylvan Suite* was given by the Boston Symphony Orchestra in 1901. From 1903 to 1909 he was a member of the faculty of the Peabody Institute of Baltimore, Md. While in Berlin, Professor Brockway gave, with the assistance of the Berlin Philharmonic Orchestra, a concert of his own works, which comprise a large number of pieces for the piano, orchestra, and voice. He is a member of the National Institute of Arts and Letters.

**Brockway**, ZEBULON REED (1827-1920), American penologist, was born in Lyme, Conn. He gained his first experience in penal work as clerk of the Connecticut State Prison (1848), was made deputy superintendent of the Albany (N. Y.) Penitentiary in 1851, and from 1861 to 1873 took charge of the Detroit House of Correction. He organized the Reformatory at Elmira, N. Y., of which he was superintendent from 1876 to 1900, and there introduced the indeterminate sentence which has had so great an influence in

matters of prison reform. He was mayor of Elmira in 1906-7. Consult his *Fifty Years of Prison Service* (autobiographical).

**Broderick**, brō'de-rik, DAVID COLBRETH (c. 1819-59), American political leader, was born in Washington, D. C., the son of a stonecutter. For many years he was a prominent Tammany leader, being identified with the rough and turbulent element of the party. His personal habits, however, were above reproach, and in his spare hours he was an assiduous student, though his early educational opportunities were slight. He was a member of the California constitutional convention (1849), and afterward of the State senate (1850-1), being president of that body in 1851, and was the leader of the anti-Lecompton, anti-slavery, anti-aristocracy faction of the Democratic party in the State. In 1857 he was elected to the U. S. Senate. In 1859 he took part in the bitter campaign between the two Democratic factions in California, and at its close was killed in a duel (Sept. 13, 1859) by Judge Terry.

**Brodeur**, brō'der, LOUIS PHILIPPE (1862- ), Canadian jurist, was born in Belœil, Que. He was educated at the college of Ste. Hyacinthe and at Laval University, was called to the bar in 1884, and was created king's counsel in 1889. He was elected to the Canadian Parliament in 1891, appointed its Deputy Speaker in 1896, and Speaker in 1901. In 1904 he became Minister of Inland Revenue, and in 1906 Minister of Marine and Fisheries. He was a Canadian delegate to the Imperial Conferences at London in 1907 and 1911, and one of two plenipotentiaries that negotiated the Franco-Canadian treaty in 1907. He represented Canada at the Imperial Defence Conference in 1909, was put in charge of the newly organized Department of Naval Service in 1910, and was appointed a judge of the Supreme Court of Canada in 1911.

**Brodhead**, JOHN ROMEYN (1814-73), American historian, was born in Philadelphia, Pa. He was graduated from Rutgers College in 1831, was admitted to the bar in 1835, and practised for a short time in New York, became secretary of the U. S. legation at The Hague in 1839 and in London in 1846 (George Bancroft then being minister). In 1853-7 he was naval officer of the port of New York. He is remembered chiefly as a historian. His *History of the State of New York* (2 vols. 1853-71) is the standard work on the period covered (1609-91). From 1841 to 1845, as the agent of New York, he collected in the archives of Europe historical

material of great value, which was published, under the editorship of O'Callaghan (11 vols.) and Fernow (4 vols.), as *Documents Relating to the Colonial History of the State of New York* (15 vols., 1853-83).

**Brodie**, brŏ'di, ALEXANDER OSWALD (1849-1918), American army officer, was born in St. Lawrence county, N. Y. He was graduated from the U. S. Military Academy in 1865, and became second lieutenant of cavalry in 1870. He resigned from the army in 1877, but re-entered it and served against the Apaches in 1883-4. From 1887 to 1898 he was engaged in mining and civil engineering in the West. During the Spanish-American War he was a member of Roosevelt's 'Rough Riders,' becoming lieutenant-colonel. He was made assistant chief of the Record and Pension Office, with the rank of major, in 1905, and in 1907 was promoted to adjutant-general.

**Brodie**, SIR BENJAMIN COLLINS (1783-1862), British surgeon, was born in Winterslow, Wiltshire. At the age of eighteen he went to London to study medicine, devoting himself particularly to the study of anatomy. Having entered St. George's Hospital in 1803, he was assistant surgeon there in 1808-22, and surgeon in 1822-32. In 1832 William IV. made him sergeant-surgeon and two years later he was created baronet. He also maintained a large and lucrative private practice and was the recipient of many honors, being a fellow of the Royal Society, winner of the Copley medal, and president of the Royal Society and of the Royal College of Surgeons. He was a successful operator, calm and cool, but he was particularly interested in preventive medicine and in diagnosis. His published works include *Diseases of the Joints* (1818) and *Psychological Inquiries* (1854).

**Brodie**, SIR BENJAMIN COLLINS (1817-80), English chemist, son of the eminent surgeon of that name, became professor of chemistry at Oxford (1855), and was president of the Chemical Society (1859-60). His name is associated with researches into the nature of graphite, and of that modified form of carbon present in graphite for which he proposed the name *graphon*.

**Brod'rick**, ST. JOHN, FIRST EARL OF MIDDLETON (1856- ), British statesman, was educated at Oxford. In 1880 he represented West Surrey as a Conservative and in 1885-1906 was member for Guildford in the same county. In Lord Salisbury's second administration (1886-92) he was financial secretary to the War Office, and in the Union government (1895-1900), was succes-

sively under-secretary for war and for foreign affairs. He was secretary of state for war, 1900-02, secretary of state for India, 1903-05, and alderman in the London Council, 1907-13. He was created Earl of Middleton in 1920.

**Brod'y**, town, Ukraine, 53 miles by rail northeast of Lemberg. It was a free commercial city from 1779 to 1879. In the Great War it was headquarters of the Second Austro-Hungarian Army from Aug. 14, 1914, to July, 1916, when it was retaken by the Russians. At the Russian revolution it was seized by the Germans. Pop. 18,000, chiefly Jewish.

**Brodzinski**, brod-zin'ski, KAZIMIERZ (1791-1835), Polish poet, was born in Krolowka, Galicia. He joined the French army (1809), fought in the Russian campaign (1812-13), and was taken prisoner at Leipzig. He was afterward professor of aesthetics at Warsaw University (1822-31) until its suppression. His most important work is the Polish idyll *Wieslaw* (1820). A collected edition of his writings was published in 8 volumes in 1872-4.

**Broggerite**. See CLEVEITE.

**Broglie**, brŏ'ĕ-y', the name of a French noble family, originally from Piedmont, among the founders of the city and republic of Chiari, in Lombardy.

FRANÇOIS MARIE, DUC DE (1671-1745), marshal of France, was born in Paris, and between 1689 and 1714 distinguished himself in divers campaigns in Flanders, on the Rhine, and in Italy. From 1724 to 1731 he was ambassador in London. He was created a marshal in 1734, conducted the campaign of Italy (1733), and was commander-in-chief of the French army in Bohemia (1741). In 1742 he was created duke.

VICTOR FRANÇOIS (1718-1804), son of François Marie, was born at Münster, in Westphalia. At an early age he took part in the campaign of Italy under his father, and afterwards fought in Bohemia. In the Seven Years' War he greatly distinguished himself as a French general, took part in the battles of Rossbach (1757), Sondershausen (1758), and Bergen (1759), and for this last victory was made a prince of the empire and marshal of France, as well as commander-in-chief of the French army in Germany. Although victorious at Korbach (1760), he was defeated at Willingshausen (1761). At the beginning of the Revolution Louis XVI. made him minister of war; but he was forced to emigrate to Germany, and commanded the emigrants in Champagne (1792). Afterwards he entered into the service of

England (1794) and of Russia (1797).

CHARLES FRANÇOIS, COMTE DE (1719-81), brother of the preceding, was sent as ambassador to Warsaw in 1752. He combated the growing Russian influence in Poland, and at the same time endeavored to pave the way for the election of the Prince of Conti as king of Poland. He took part in the Seven Years' War under his brother, and distinguished himself at Cassel (1761). After the war he became the head of the so-called secret cabinet of Louis XV. Broglie's activity centred around the prevention of the partition of Poland.

ACHILLE CHARLES LÉONCE VICTOR, DUC DE (1785-1870), statesman and author, was born in Paris. In 1809 he was appointed by Napoleon to the Council of State, in which quality he served on several diplomatic missions. In 1816 he married the daughter of Madame de Staël. In 1830 he was a member of the first cabinet of Louis Philippe, in 1832 minister of foreign affairs, and in 1835 premier, negotiating with England the abolition of slavery. After the fall of his government in 1836 he was for a short time (1847-8) ambassador in London. He retired from political life in 1851 and devoted himself to literature, becoming a member of the Academy in 1856. He wrote *Vues sur le gouvernement de la France* (1861), *Ecrits et discours* (3 vols., 1863), *Le libre échange et l'impôt* (1879), and *Souvenirs* (4 vols., 1885-8).

JACQUES VICTOR ALBERT, DUC DE (1821-1901), French statesman and author, eldest son of Louis Philippe's minister of that name. During the Second Empire he produced *Études morales et littéraires* (1853), a history of *L'église et l'empire romain au IV. siècle* (1856-69), a searching pamphlet on *The Maladministration of Algeria* (1860), *Souveraineté pontificale et la liberté* (1861), and *La liberté divine et humaine* (1865). In 1871 he was elected to the National Assembly by the department of the Eure, and in the same year was appointed ambassador to London, a post which he resigned in 1872. As leader of the Conservative right centre, he moved the order of the day which led to the resignation of Thiers and the acceptance by Marshal MacMahon of the presidency of the republic. The duke then became minister of foreign affairs and president of the council; but his policy being strongly condemned by Gambetta, he resigned in May, 1874. He was elected to the Senate in 1876, and in the following year formed a royalist and imperialist cabinet in which he became president of the coun-

cil and minister of justice. By various reactionary measures he again sought to overthrow the republic; but Gambetta forced him to resign. The last twenty-five years of his life were chiefly occupied in historical writing, his more important works being notably *Le secret du roi* (1878), a valuable collection of state papers relating to the reign of Louis XV., and memoirs of Frederick II. (1882-4), Maria Theresa (1882-8), his father (1886), and Talleyrand (1891).

**Broiling.** See COOKERY.

**Broke, Sir Philip Bowes Vere** (1776-1841), British naval officer, was born in Broke Hall, near Ipswich. He entered the navy at the age of twelve and in 1792 was appointed to the *Bulldog* sloop under Captain Hope. Having participated in the siege of Bastia, the actions off Toulon, the action off Cape St. Vincent, and in convoy service with the North Sea Fleet, he was appointed in 1806 to the *Shannon*. In this command he patrolled the coast of Spitzbergen, cruised about in the Bay of Biscay, and in 1813 was sent to the United States, where he fought a successful battle with the American frigate *Chesapeake*. He was so severely wounded that further active service was inadvisable. He was created baronet in 1813 and K.C.B. in 1815, attaining the rank of rear-admiral in 1830.

**Broken Hill,** town, New South Wales, Australia, 925 miles west of Sydney. It has the most prolific silver mines in the world (the Proprietary). Pop. (1924) 23,140.

**Broken Wind.** See HORSE: Diseases.

**Broker,** primarily an agent employed to negotiate purchases or sales of goods or other property. Unlike a factor, a broker does not have possession of the property to which his employment relates, but acts only as a middleman between the real parties to the transaction. For this reason he can neither sue nor be sued with respect to the contracts into which, as broker, he enters. Where he acts for a named principal, no personal liability attaches to him; and even where his principal is unnamed, he is only liable if there is a custom in the particular trade imposing this liability upon him. If, however, a broker, although in reality acting as an agent, does not purport to do so, personal liability attaches to him. He has an implied authority to buy and sell according to the custom of the market in which he deals. He is entitled to the customary remuneration for the work he performs, and to be indemnified by his principal against all liability properly in-

curred by him. The term broker is employed in a secondary sense and by analogy to describe persons employed in certain negotiations which do not involve the sale of property, as insurance brokers, who are employed as agents by persons who desire to procure insurance; ship brokers, who, in addition to the buying and selling of ships or shares or interests therein, also carry on the business of chartering vessels or of procuring contracts of freightage. See PRINCIPAL AND AGENT; PAWNBROKER.

**Bromberg** (Pol. *Bydgoszcz*), brom'berch, town, Poland, in Posen, about 7 miles from the Vistula; 140 miles northwest of Warsaw. The town owes its importance to the canal constructed by Frederick the Great in 1773-4, which connects the Oder and the Elbe with the Vistula. It has an active trade in coal, wool, leather, and flour, and there are manufactures of paper, machinery, vehicles, soap, and beer.

Bromberg became part of Prussia at the division of Poland in 1772, but was restored to Poland at the close of the Great War. Pop. (1921) 87,643.

**Brome, Richard** (d. 1652), British dramatist, was probably of humble birth. In 1614 he was 'man' or servant to Ben Jonson. He took to dramatic writing, collaborating with the younger Jonson in a lost comedy, *A Fault in Friendship* (1623), and with Thomas Heywood in *The Late Lancashire Witches* (1634). Of his independent plays, which include romantic and real life comedies, *The Northern Lass* (1632), *The Antipodes* (1640), and *A Jovial Crew* (1652), are the best known. His *Collected Works* were edited by Pearson (1873).

**Brome Grass,** a genus of annual or perennial grasses found chiefly in the north temperate zone. They grow to from 2 to 5 feet in height, bearing panicles of large spikelets. The genus contains a few forage grasses and many troublesome weeds. Among the more important of the forage species are *Bromus inermis*, an erect annual used as a meadow and pasture grass in the Northwestern States; it is quite resistant to drought and is especially valuable in semiarid regions; and *B. unioloides* grown in the Southern States for forage. The weedy annual species include *B. secalinus*, or cheat; *B. commutatus*, *B. mollis*, and *B. rubens*. *B. madritensis*, a native of Europe, is sometimes cultivated for ornamental purposes.

**Bromellaceæ**, brō-mel-i-ā'si-e, the PINEAPPLE FAMILY. A natural order of monocotyledonous plants, entirely confined to America, and abounding chiefly in the tropical and southern portions of

that continent. Nearly all of the numerous species are herbaceous plants, with short stems crowned by rosettes of long, leathery leaves, which not infrequently exhibit a grayish appearance, owing to the small hairs with which they are clothed. The flowers are borne on terminal spikes, and are often large and brightly colored, though without scent. Many of the species are epiphytic, and attach themselves to tall trees by means of aerial roots, without, however, obtaining from them any food material. Such, for example, is the Spanish moss of the warmer portions of America (*Tillandsia usneoides*), widely known for its trailing gray stems, especially luxuriant on the live-oaks. It is frequently employed as a substitute for horse-hair in stuffing cushions. A number of species also grow in clefts on rock faces, where there is little or no soil; while others, like the pineapple (*Ananas sativa*), root in the usual manner. Several fibres, as the pineapple and pita, are derived from plants of this family.

**Bromide.** See BROMINE.

**Bro'mine** (Br, 79.92) is an element of the halogen group, and has been known since 1826, but was not prepared in any quantity until 1860. It is present in traces in sea-water, but is usually obtained from the mother liquor of the Stassfurt potash beds, in which it is present as magnesium bromide, or from American brines, particularly in Michigan and West Virginia. The bromine, which is present to the extent of about 0.25 per cent. in the liquor, is displaced by chlorine, either produced separately and added to the bromide solution, or prepared along with bromine electrolytically, or by the action of sulphuric acid and manganese dioxide on the chloride of magnesium present. The former plan is the better, as it can be worked continuously, and is carried out by making the liquor trickle down a tower packed with earthenware balls, where it meets a mixture of steam and chlorine that is passed up. As a consequence bromine is displaced ( $MgBr_2 + Cl_2 = MgCl_2 + Br_2$ ), and passes out in vapor at the top of the tower into a worm surrounded by cold water, by which it is condensed to the liquid form and collected.

Bromine is a heavy (sp. gr. 3.2), mobile, reddish-brown liquid; it is the only liquid non-metallic element. It boils at 59° C., and gives off a dark-red gas; also readily volatilizing at ordinary temperatures. The gas has a strong, disagreeable odor, similar to that of chlorine, and has a most irritating effect on the eyes. It is somewhat soluble in water, and readily so in carbon disul-

phide, forming in both cases a red solution.

Chemically, bromine is less active than chlorine, but more so than iodine. Thus, it unites with hydrogen to form hydrogen bromide when the mixture of gases is set on fire, or if heated and exposed to light, forming a fuming gas (see HYDROBROMIC ACID). It also unites vigorously with most metals, phosphorus, sulphur, etc., and has some bleaching action. It produces painful sores if spilled on the skin, and has been used—though not to a great extent on account of expense—as a disinfectant. It is chiefly employed for the preparation of its compounds, which are largely used in photography and medicine, in the manufacture of coal-tar dyes, etc.

During the World War large quantities of bromine were used in the preparation of chemical warfare gases, particularly tear gas, and since that time large quantities are being required in the manufacture of tetraethyl lead for use in motor fuel. For this last use, a method of recovering it from sea water was devised, but details of this process have not yet been made public.

The production of bromine in the United States in 1925 amounted to 1,566,130 pounds, valued at \$488,406.

The bromides chiefly used in medicine are those of potassium, sodium, and ammonium. The average dose of each is from five to thirty grains. Bromides are powerful depressants of the nervous system, and hypnotics. They affect the circulation by lessening the force and frequency of the heart-beat. Toxic doses produce a fall of temperature. They are largely used in nervous diseases for their sedative and hypnotic effect, and are among the most valuable drugs known for the treatment of epilepsy. Large doses are used, in combination with chloral, for delirium tremens. If bromides are taken for too long a time, symptoms of poisoning, called 'bromism,' may appear. The first symptom is a rash of red acne-like papules on the face and back, next a lowering of the sensitiveness of the skin, then a diminution of sexual power. The individual becomes low-spirited; his intellect is dulled, and in bad cases dementia, melancholia, and other mental disorders may develop.

**Bromley**, brum'li, town, England, in Kent, 10 miles southeast of London. It is the home of Bromley College, an almshouse for clergymen's widows, founded in 1666. In the nave of the parish church lies the body of Samuel Johnson's wife. Bromley was for centuries the residence of the Bishops of Roches-

ter. Pop. (1911) 33,649; (1921) 35,070.

**Bro'moform** (CHBr<sub>3</sub>) is the bromine analogue of chloroform. It is prepared by similar methods to chloroform, and is a very heavy liquid (sp. gr. 2.8), which is insoluble in water, and turns red in the light from separation of bromine. It is used as a heavy liquid, for separating and determining the density of minerals, and also to a slight extent in medicine.

**Bromsgrove**, brumz'grōv, town, England, in Worcestershire, 13 miles southwest of Birmingham. There are many quaint gabled houses and a fine Perpendicular church. The chief industries are the manufacture of nails, cloth, and buttons, and the Midland Railway Company works. Pop. (1911) 8,928; (1921) 9,449.

**Bromwich**. See WEST BROMWICH.

**Bronchi**, bronz'kī, the two primary divisions of the trachea (q.v.) or windpipe, leading to the right and left lung respectively. The right bronchus is about one inch in length, and the left nearly two inches long. The bronchi are tubes of fibro-elastic membrane, within the layers of which are embedded series of cartilaginous rings, which go around about two-thirds of their circumference, the interval between the rings being bridged over by the fibrous membrane in

The Bronchi

which they are enclosed. Within the tube, at the back, is a layer of unstriped muscular fibres, which extend transversely between the cartilaginous rings to which they are attached. Outside these are a few longitudinal bundles; and beneath the mucous membrane is a distinct layer of unstriped muscle, the *muscularis mucosæ*. Lining the tube is the mucous membrane, covered with ciliated epithelium. On entering the lungs the bronchi divide and subdivide into smaller branches or bronchioles, which penetrate into every part, until at length they end in the small subdivisions of the lungs called lobules. As the subdivisions become smaller and their walls thinner, the cartilaginous rings become scarcer and more irregular, until

they are represented only by minute and scattered cartilaginous flakes.

Foreign bodies sometimes lodge in the bronchi producing more or less complete obstruction. They may be located and removed by means of the bronchoscope, similar in principle to the speculum.

For diseases of the bronchi, see BRONCHIECTASIS; BRONCHITIS. See also LUNGS.

**Bronchiecta'sis**, dilatation of the bronchial tubes associated with inflammatory changes in the mucous membrane and thickening or thinning of the bronchial walls. If the condition occurs in the dependent parts of the lungs, there is excessive secretion which tends to accumulate in the dilated portions and may be of a very fetid odor. Various bacterial organisms are associated with the condition, notably *B. influenzae* and *Streptococcus hemolyticus*. The disease may also follow the inhalation of irritant gases. Acute, chronic, and congenital forms occur. The chronic type, which is by far the most frequent, is permanent, and recovery seldom occurs, though death may be postponed for years. Treatment is purely symptomatic, being directed chiefly toward reducing the sputum, facilitating its expulsion (by drugs and posture), and removing the foul odor. The inhalation of medicated vapor is recommended.

**Bronchi'tis**, inflammation of the mucous membrane of the bronchial tubes, may be acute or chronic.

*Acute bronchitis* is one of the commonest of respiratory diseases. It may occur independently or as an accompaniment of some other acute infectious disease. It is particularly prevalent in the changeable weather encountered during the spring and late fall. The principal symptoms are cough, slight fever, and in the later stages profuse mucopurulent or purulent sputum. The disease is usually comparatively harmless, but in the aged and in very young children the inflammation may extend into the finer bronchi, producing broncho-pneumonia. Treatment includes such simple measures as a hot foot bath, Dover's powder or hot lemonade, counter irritation to the chest (mustard plasters), and the use of expectorants.

*Chronic bronchitis* is usually associated with some pulmonary condition. It occurs most frequently in persons beyond middle life and is seen more often in the winter than in the summer. Removal to a favorable climate is advisable.

Special forms of bronchitis are spirochætal bronchitis, a markedly contagious condition seen

in the tropics, in which spirchetes appear in the sputum in large numbers, and fibrinous, plastic, croupous, or pseudo-membranous bronchitis characterized by the formation in the bronchi of casts moulded to the shape of the tubes. The prognosis is favorable in both conditions.

**Bronchocele.** See GOITRE.

**Bronchophony,** the sound of the voice when heard through the stethoscope, applied over a healthy bronchus. Heard elsewhere it indicates consolidation of lung tissue — *i. e.* pneumonia. The sound is as if the patient were speaking directly into the stethoscope.

**Bronchopneumonia.** See PNEUMONIA.

**Bronsted,** brún'sted, PETER OLAF (1780–1842), Danish archaeologist and traveller, was born in Fruering, Aarhus. He was educated in the University of Copenhagen and in 1806, in company with his friend Dr. Koes went to Paris in order to prepare for a trip to Greece to explore its treasures. The trip was undertaken in 1810 and excavations in Ægina and in Phigalia provided substantial aid for classical study. He returned to Copenhagen in 1813 and was appointed professor in philology. In 1818 he visited Rome as envoy to the Vatican and in 1820 went to Sicily, Malta, and the Ionian Islands. He was professor of philology and archæology at the University of Copenhagen in 1832–41 and in the latter year became its rector. His principal work was *Travels and Researches in Greece* (1826–30); other works include *Contribution to Danish History from Foreign MS Collections* (1817–8); *An Account of Some Greek Vases found near Vulci* (1832); *On the Bronzes from Siris* (1836–7); a metrical translation of the *Agamemnon* of Æschylus (1837).

**Brongniart,** brôn'-nyâr', ADOLPHE THEOPHILE (1801–76), French botanist, son of Alexandre Brongniart, studied medicine but devoted himself to the study of botany, particularly vegetable fossils, and the development of pollen. He was professor of botany at the Jardin des Plantes. His principal work is *Histoire des végétaux fossiles* (1828–37).

**Brongniart,** ALEXANDRE (1770–1847), French naturalist, mineralogist, and geologist, the friend of Cuvier, was born in Paris. After serving as druggist in the army, and as mining engineer, in 1800 he became director of the Sèvres porcelain manufactory, where he perfected the art of painting on glass. In 1822 he was appointed professor of mineralogy in the Paris Museum of Natural History. Among his numerous works were studies on the geology of the environs

of Paris (with Cuvier, 1811; 3d ed. 1835); on the geology of the Apennines and Alps (1821–2), and of Sweden (1828); *Tableau des terrains qui composent l'écorce du globe* (1829); and *Traité des arts céramiques et des poteries* (1844; 2d ed. 1854).

**Bronn,** HEINRICH GEORG (1800–62), German naturalist and botanist, was born in Ziegelhausen, near Heidelberg, and in 1828 became professor of natural history and director of the zoological collections of Heidelberg University. Of his numerous writings, which are mainly geological, the chief are *Lethæ Geognostica* (1836–8; new ed. 1876), *Geschichte der Natur* (1841–9), and *Allgemeine Zoologie* (1850).

**Bronte,** bron-tā', town, Sicily, in the province of Catania, on the west slope (2,600 ft.) of Mt. Etna, 32 miles northwest of Catania, is surrounded by chilled lava-flows. It gave its name to the dukedom bestowed on Nelson by Ferdinand iv. Pop. (1921) 16,655.

**Brontë,** CHARLOTTE (1816–55), celebrated English novelist, daughter of Patrick Brontë, rector of Haworth, near Keighley, was born in Thornton, April 21, 1816. Her mother died when Charlotte was about six years old, and she, her brother Branwell, and her sisters Emily and Anne were cared for by their father, a somewhat solitary and eccentric man, and their aunt,

Charlotte Brontë

Miss Branwell. In 1824 the girls were sent for a short time to the Clergy Daughters' School at Cowan Bridge, but an epidemic of typhus fever caused their withdrawal. After an interval of seven years spent at home, roaming the moors, and engaging in household duties, Charlotte went

in 1831 to Miss Wooler's school in Roe Head, where two years later she became a teacher. She followed the school on its removal to Dewsbury Moor and later found employment as a governess, first at Stonegappe, then at Rawdon. She was, however, quite unfitted by temperament for such environment, and in 1842 persuaded her aunt to advance the money to allow her and Emily to study at Madame Héger's school in Brussels, thus better fitting themselves for teaching. In 1844 Charlotte returned to Haworth, Emily having preceded her two years earlier, after only a few months abroad.

The remainder of her life Charlotte spent at Haworth, engaged in family duties and in writing. Many griefs saddened these years. Her brother Branwell, who had become an inebriate, died in September, 1848, and in December of the same year Emily passed away, to be followed in the spring of 1849 by Anne. In 1854 Charlotte married Rev. Arthur Nicholls, her father's curate, and after a brief period of happiness, died March 31, 1855.

The first of Charlotte Brontë's literary work to be published was included in a collection of *Poems* by the three sisters, which appeared under the pseudonym Currer, Ellis, and Acton Bell, in 1846. This Charlotte followed by *The Professor*, which could find no publisher, but was the occasion of a request for a longer novel, forthcoming in 1847 as *Jane Eyre*. *Jane Eyre* was an instant success, and completely altered the trend of its author's life, for it brought her into correspondence with Smith Williams, George Smith, Thackeray, Miss Martineau, and other people well known in the literary world.

In September, 1849, Charlotte completed *Shirley*, which was published in the following month. Personal reputation and association with her literary equals now came to the novelist. She met Thackeray in London, visited Harriet Martineau at Ambleside, corresponded with George Henry Lewes and others, and sat for her portrait to Richmond. In the following year she was again in London for the Great Exhibition. In 1852 she was occupied with *Villette*, her last novel, which appeared the following year. *The Professor*, her first novel, was published after her death, with a brief introductory note by her husband.

The Brontë family were all extremely gifted. BRANWELL (1817–48) was an artist of ability and left a few poems evincing some little talent, but his life was a tragedy and he met an early death. ANNE (1820–49),

the youngest of the family, was a gentle soul, without the fire of genius which burned in the breast of Charlotte and Emily, though her two stories *Agnes Grey* (1847) and *The Tenant of Wildfell Hall* (1848) show unmistakable evidence of talent and imagination. For EMILY, see BRONTË, EMILY.

A list of the various books that have been published on the Brontës is given in the Haworth edition of Mrs. Gaskell's *Life of Charlotte Brontë* (1857), an acknowledged classic, particularly valuable for its footnotes. Supplemental biographical material may be found in *Charlotte Brontë and her Circle* by Clement Shorter; *The Father of the Brontës* by W. W. Yates; *The Three Brontës* by May Sinclair (1912). Madame Duclaux, under her maiden name of A. M. F. Robinson, contributed a biography of Emily Brontë to the 'Eminent Women Series' (1883).

**Brontë, EMILY** (1818-48), the fifth child of Patrick and Maria Brontë, was born in Haworth. She was only four years old when her mother died and in 1824 was sent with her sisters to the Clergy Daughters' School at Cowan Bridge where she remained but a short time. In 1835 she was for a brief period at Miss Wooler's school at Roe Head, where Charlotte was a teacher, and in 1842 spent a few months with Charlotte at Madame Héger's school in Brussels. The few remaining years of her life were passed in Haworth. Aside from her poems, published with those of her sisters in the collection of *Poems* by Currer, Ellis, and Acton Bell, her only work is *Wuthering Heights* (1847), a novel extraordinary in its portrayal of vehement passion and grief. The story itself is badly constructed but the drawing of the characters is masterly, the style is faultless, and the author's dramatic instinct never fails. In her lifetime the supreme genius of Emily Brontë was unrecognized and her book was even believed to be an earlier work of Charlotte's, but after many years it has been accorded recognition as the supreme work of these gifted sisters.

**Brontosaurus**, a huge dinosaur belonging to the order *Sauropoda*. Fossil remains have been found in the Upper Jurassic strata of Wyoming and indicate a creature 60 feet long and about 10 feet high, with an extremely small head. The trunk was short and thick and its neck long and slender, probably enabling the animal to feed on the upper parts of aquatic plants among which it lived. The equal length of the limbs show that the creature walked on all fours.

**Brontotheriidae**, bron-tō-the-rī'i-dē, gigantic extinct ungulate animals, the remains of which have been found principally in North America. They occur in Eocene and Miocene strata, and indicate an animal intermediate in size between an elephant and a rhinoceros. From the shape of the skull it is probable that they had a long, flexible nose, though not a true prehensile proboscis. The type genus of the family is known as *Titanotherium*. Consult Hutchinson's *Extinct Monsters*; Woodward's *Vertebrate Palaeontology*.

**Bronx**, THE, since 1898 one of the five boroughs of New York City. It lies north of Manhattan, between the East River and Long Island Sound on the east and southeast, and the Harlem River and Hudson River on the west and southwest; area, 26,524 acres; pop. (1926) 900,198. It takes its name from the Bronx River, a small stream emptying into the East River. Bronx Park contains important botanical and zoological gardens. See New York.

**Bronze**, an alloy of copper. Usually, it contains copper, 80 to 90 per cent., and tin, 20 to 10 per cent.; the tin may be partly replaced by lead and zinc. Bronze was one of the chief metals of antiquity. In modern times it has been used for the manufacture of cannon, though for this purpose it is now superseded by steel; for coins; as bell metal, on account of its resonance; and for casts of statues, busts, etc., because of its fine color both when clean and when oxidized by the weather.

The term bronze has been broadened in modern practice to apply to a large class of metals consisting essentially of copper which by the absorption of other metals has become stronger and harder and capable of being cast. Thus there are now the important aluminum and manganese bronzes and a number of other alloys whose chief constituent is copper. *Phosphor bronze*, much used for the working parts of machines and for telephone wires, contains about one-fifth per cent. of phosphorus, which greatly increases its hardness and tenacity. The use of the term bronze without qualification refers to the copper-tin alloy; when it applies to other alloys the name of the constituent replacing tin is invariably prefixed.

**Bronze Age**, a term applied to the second of three periods, i.e. Stone Age, Bronze Age, Iron Age, into which it has been convenient to divide the history of early man. This division holds good to a certain extent for both time and culture, though there is, of course,

no fixed moment when any race ceased to use stone, and learned to use bronze, implements. The dates generally assigned to the period are 2500 to 1800 B.C., but these cannot be accepted as definite, for in some areas this stage of culture may have been reached earlier, in others later, while in some it may have been prolonged, and in others brief, or even, as in the Polynesian area, non-existent in consequence of the people passing directly from the use of stone to that of iron. A Bronze-Age people in one region may thus have been contemporary with a Stone-Age people in another, and with an Iron-Age people in a third; that is to say, the succession of the three ages was not necessarily synchronous, either in contiguous or in widely separated areas. The Homeric poems depict the culture of a people passing from the use of bronze to that of iron. The Mexicans and Peruvians, on the other hand, were still in their bronze age in recent times.

In Europe, Bronze-Age culture falls into two divisions, the north and the south. The Bronze Age of Northern Europe may be divided into four periods, in the first of which bronze occurs but copper is often used, and in the last three of which bronze is common and tools and objects fashioned of bronze show great excellence. In Southern Europe the Bronze-Age degree of culture is best classified by means of its pottery, more carefully prepared and more ornate than that of the Stone Age.

The commonest and most characteristic objects belonging to the Bronze Age are the 'celts,' probably used for hoes, chisels, war-axes, and similar purposes (see CELT). Other common objects are spears, swords, knives, shields, daggers, and articles of personal adornment. The forms of each class differ in different areas, and vary with advancing time. Blades and axes, which were at first made with tangs to be inserted in the handles, became socketed for the insertion of the handles; and articles which it was at first the custom to finish in the mould were finished with the hammer, while shields, and vessels made of hammered plates were ornamented with chasing and repoussé work. The ornamentation of the Bronze Age consists chiefly of concentric circles, spirals, and bosses. The workmanship is of a high order, the shapes graceful, and the finish fine. The moulds used for casting were of stone or bronze or clay. The system of coring was carried to great perfection, and many of the more difficult castings were turned out in a manner that would do credit to the

most expert of modern workmen.

Various theories have been advanced as to the origin of the Bronze Age. Some authorities attribute the introduction of bronze as due to Roman influence, others to the Etruscans, still others to the Phœnicians and, perhaps the largest number

thousand years, known as the Bronze Age (q.v.), man's tools and other implements were made of bronze, a fact which plays an important part in the dating of prehistoric tombs. Bronze was also a favorite material with Greek sculptors, at least until the 4th century B.C., and in the

The difference between the bronzes of classical period and those of the Renaissance and modern times is chiefly one of conception and style. Greek work is impersonal, while in Renaissance and modern sculpture there is often an element of individuality and intimacy. The earliest Greek statues in bronze were apparently made by hammering the metal into thin plates which were joined by rivets, but this method was soon abandoned in favor of casting (q.v.).

The Renaissance witnessed a marvellous revival of art in bronze as exemplified in the works of Donatello, Ghiberti, Cellini, Brunelleschi, Verrocchio, and others. Among the most celebrated specimens of their work are the bronze doors of the Baptistery in Florence, the Perseus in the Loggio dei Lanzi in Florence, John the Baptist, in the Ashmolean Museum, Oxford, and Donatello's David. Notable artists in bronze in Germany were members of the Vischer family, Peter, Paul, and Hans; in the Netherlands, Duquesnay, de Vries, and Ruysbrack; in France, Pilon, Goujou, Girardon, Houdon, Keller, and Rodin; in England, Gibbons, Prest, Francis Bird, and P. J. Mene. Prominent among American workers in bronze are MacMonies, Bartlett, and Saint Gaudens.

Besides sculptural works, collections of bronzes, of which there are many, both public and private, contain implements and utensils of all periods. The Metropolitan Museum in New York City possesses one of the best collections of ancient bronzes in the world. Among its most conspicuous treasures is an Etruscan chariot found at Monteleone, dating from the middle of the 6th century B.C. It is the only complete ancient bronze chariot so far known. A statuette of a standing girl is one of the finest Etruscan figures in existence.

The East Indians, Chinese, and Japanese have handed down many fine examples of bronze work, notably statues of Buddha. The famous bronze *Wolf of the Capitol* at Rome is ascribed to an Etruscan artist and the bronze horses of St. Mark's, Venice, are said to have been brought from Corinth.

Consult Bode's *The Italian Bronze Statuettes of the Renaissance*; Litchfield's *Antiques: Genuine and Spurious* (1921).

**Bronzing**, a name applied to certain Australian ground-pigeons in which the wings show metallic spots and patches. The best-known species is *Phaps chalcoptera*. See PIGEON.

**Bronzing**, the process of giving a metallic or iridescent ap-

of all, to the Indo-Europeans, who overran Europe from the East.

Consult Avebury's *Prehistoric Times*; Evans' *Ancient Bronze Implements of Great Britain*; Quennell's *The New Stone, Bronze and Early Iron Age* (1923); Burkett's *Prehistory* (1925).

**Bronzes**, representations of objects and figures produced in bronze. This form of art has existed from very early times. During a period of several

5th century A.D. the number of bronze statues in Rome was said to exceed 3,500. The great majority of these Greek and Roman bronze statues have disappeared, for the obvious reason that they were of intrinsic value and comparatively easy of transportation. The Romans despoiled Greece to beautify their own cities, and the barbarians, sweeping down on Italy, melted the bronze statues for the metal.

pearance to metal and other articles either by the application of a chemical bronzing solution or by dusting bronze powder on a surface previously prepared by coating with linseed-oil varnish. There are several bronzing solutions in use. The article to be bronzed must be first cleaned by washing with strong acids or potash before immersing in the chemical solution or otherwise applying it. Bronzing-machines are used for varnishing, dusting with bronze powder, and finishing the surfaces of wall-papers, fabrics, labels, etc.

**Bronzino**, IL (1502-72), the name given to ANGELO DI COSIMO, Italian painter of the Florentine school in its decline, was the favorite pupil of Pontorno and friend of Vasari. His reputation rests on his careful portraits of prominent Florentines of his day. Perhaps his best-known work, *Christ's Descent into Hell* (Uffizi, Florence), influenced by Michael Angelo's *Last Judgment*, is artificial and crowded in arrangement. The portraits of Piero and Cosimo di Medici, of a boy, of a lady, and of a knight of St. Stephen, as well as the allegory *Venus, Cupid, Folly, and Time*, are in the National Gallery, London, and a fine portrait of Eleonora di Toledo is in the Wallace Collection, London. See Ruskin's *Modern Painters*; Sir E. J. Poynter's *Classic and Italian Painting* (1880).

**Bronzite**, so called from its sub-metallic lustre resembling tarnished bronze, is one of the pyroxenes, belonging to the subdivision which crystallize in the orthorhombic system. It is a fairly common ingredient of igneous rocks. (See HYPERSTHENE.) Its lustre is due to the reflection of light from the surface of minute metallic enclosures.

**Brooch**, an ornament fastened to clothing by a safety-pin. Several types are distinguished: the Roman bow-shaped *fibula* of various metals; the Celtic, usually of bronze, exhibiting extraordinary knowledge of metal-work, and rare taste in the application of zoomorphic decoration and enamelling; the Viking type, an oval, bowl-shaped brooch with vaguely zoomorphic decoration, cut out of the solid bronze; the Scottish Highland, consisting of large flat bands of metal ornamented with grouped designs of interlaced and scroll patterns; and the Luckenbooth, usually small, heart-shaped, in copper, silver, and gold fancifully set with gems. Of more general mediæval forms may be mentioned the great clasp brooches of precious metals set with crystal spheres and jewels, and the small gold brooches frequently in-

scribed with mottoes in French black-letter. See J. Anderson's *Scotland in Pagan Times* (1881), and *Scotland in Early Christian Times* (1881).

**Brooke**, HENRY (?1703-83), Irish author, published his first work—*Universal Beauty*, a poem—in 1735. He wrote several tragedies—e. g. *Gustavus Vasa* (1739), suppressed on account of political allusions in London, but afterwards given in Dublin as *The Patriot*, the *Earl of Westmoreland* (1745), and the *Earl of Essex* (1749). Though anti-Catholic in his views, Brooke wrote a *Trial of the Cause of the Roman Catholics* (1761), advocating a mitigation of the penal laws. A project of his, about 1743, to publish a work entitled *Oxygion Tales*, concerned with old Irish legends, resulted in the fragment *Conrade*, written in a style closely resembling Macpherson's *Ossian*. Brooke's novel, *The Fool of Quality*, was highly thought of by Charles Kingsley, who republished it in 1859.

**Brooke**, SIR JAMES (1803-68), the son of a Devonshire gentleman, but best known as the Rajah of Sarawak, was born at Benares. In 1819 he entered the E. India Company's army, and was seriously wounded in the Burmese War of 1826. Proceeding to Borneo in 1838, he aided the sultan of Brunei to reduce the marauding Dyak tribes of Sarawak, and with such success that the sultan created him rajah of the province of Sarawak in 1841. The island of Labuan, near Sarawak, having been purchased from Borneo by the British government, Brooke, who had been knighted in 1847, was appointed governor of the island and consul-general to Borneo. His subsequent suppression of the pirates was so severe that he was attacked in the House of Commons in 1857, but exonerated; and finally the independence of Sarawak was recognized (1847) by the British government. Brooke died at Burrator, Devonshire—an estate purchased for him by public subscription—June 11, 1868. He was a fine specimen of the old type of Elizabethan adventurers, so far as that type can be reproduced in a later age. See Temple's *Private Letters of Sir James Brooke* (1853); Mundy's (1843) and Keppel's (1845) *Journals*; Jacob's *Raja of Sarawak* (1876); and St. John's *Life of Sir James Brooke* (1879). James Brooke was succeeded by his nephew, SIR CHARLES JOHNSON BROOKE (b. 1829), who rules over a larger territory than his uncle—the Limbang River district having been annexed in 1890, and an earlier accession having been made in 1885.

**Brooke**, JOHN RUTER (1838),

American soldier, was born in Pottsville, Montgomery co., Pa., and began his service in the Army of the Potomac, April, 1861, as captain in the 4th Pennsylvania infantry. He participated in all the army's leading battles during the Civil War, except when disabled by wounds, and was brevetted brigadier-general of volunteers for gallantry. He entered the regular army (July, 1866), in which he was appointed brigadier-general (1888), and saw general service until the beginning of the Spanish War, in which he had command of a separate portion of the Porto Rico expedition, having been made major-general (May, 1898). Gen. Brooke captured Guayama, Aug. 5, 1898, occupied smaller towns, and had formed his troops in line for a battle with the Spaniards when he received notice of the signing of the peace protocol. He was military governor of Porto Rico, and subsequently governor-general of Cuba; and was in command of the department of the East from 1900 until his retirement in 1902.

**Brooke**, STOPFORD AUGUSTUS (1832), Irish man of letters, became minister of St. James's Chapel, York Street, London, in 1866, and was appointed a chaplain-in-ordinary to Queen Victoria (1872); but in 1880 he seceded from the English Church, owing to his scepticism in regard to the doctrine of the incarnation, and became a Unitarian. He has written *Life and Letters of the late Frederick W. Robertson* (1865); *Sermons*, collected in 4 vols. (1868-77); *Theology in the Eng. Poets* (1874); *Primer of Eng. Lit.* (1876), a wonderful little book; *Riquet of the Tuil: a Love Drama* (1880); *Poems* (1888); *Hist. of Early Eng. Lit.* (1892); *Study of Tennyson* (1894); *Life and Writings of Milton* (Primers of Eng. Lit., 1898); *Early Eng. Lit.*, in Macmillan's series, uniform with Sainsbury's *Elizabethan Lit.* (1899); *Study of Browning* (1901).

**Brook Farm**, a farm in West Roxbury, Mass., about 10 m. S.W. of Boston, the scene of the most famous of American socialistic experiments, originally an outgrowth or expression of the philosophical and humanitarian movement in New England known as Transcendentalism. A little colony of idealists, under the leadership of George Ripley, was established here in 1841, its official name being 'The Brook Farm Institute for Agriculture and Education,' whose objects, as officially expressed, were 'To more effectually promote the great purposes of human culture; to establish the external relations of life on a basis of wisdom and purity; to apply the principles of justice and love to our social or-

ganization in accordance with the laws of Divine Providence; to substitute a system of brotherly co-operation for one of selfish competition; to secure for our children, and for those who may be entrusted to our care, the benefits of the highest physical, intellectual, and moral education which, in the present state of human knowledge, the resources at our command will permit; to institute an attractive, efficient, and productive system of industry; to prevent the exercise of worldly anxiety by the competent supply of our necessary wants; to diminish the desire of excessive accumulation by making the acquisition of individual property subservient to upright and disinterested uses; to guarantee to each other the means of physical support and of spiritual progress, and thus to impart a greater freedom, truthfulness, refinement, and moral dignity to our mode of life.' The employment of the members was to be determined by their respective aptitudes and capacities, and all kinds of labor were to be paid for equally.

The experiment, as at first organized, met with moderate financial success; the membership had increased by 1844 to seventy; and the school was particularly successful, attracting as students men who later became well known, as George William Curtis and his brother James Burrill Curtis, Francis C. Barlow, and Isaac T. Hecker. Among the members, besides Ripley, were Nathaniel Hawthorne (for a short time), Charles A. Dana, and John S. Dwight; and among the visitors who took an active interest in the experiment were Ralph Waldo Emerson, Theodore Parker, Orestes A. Brownson, William Henry Channing, Amos Bronson Alcott, and Margaret Fuller.

In 1844 the organization of Brook Farm was somewhat changed: a modified form of Fourierism was introduced (see *FOURIER*, F. M.), and *The Harbinger*, the official Fourierist organ, to which many well known writers contributed, was founded. In the next few years, however, the interest in Fourierism declined; in 1846, the 'phalanstery' then under construction, was destroyed by fire, causing a heavy loss, and in 1847 the society disbanded.

Consult Swift's *Brook Farm, Its Members, Scholars, and Visitors*; Codman's *Historic and Personal Memoirs*.

**Brookfield**, city, Missouri, Linn county, on the Chicago, Burlington and Quincy Railroad; 122 miles northeast of Kansas City. Large car and engine repair shops are located here,

and there are grain elevators, roller mills, and a large shoe factory. The city is surrounded by rich agricultural country and is a centre for the shipment of live-stock and coal. Pop. (1910) 5,749; (1920) 6,304.

**Brook'hav'en**, city, Mississippi, county seat of Lincoln county, on the Illinois Central Railroad; 52 miles south of Jackson. It is the seat of Whitworth Female College, (M. E., S.). The surrounding country is a rich agricultural and lumber region, and the city is the centre of an extensive trucking industry. It has a large creamery, cotton and lumber mills, foundries, and machine shops. Pop. (1910) 5,293; (1920) 4,706.

**Brook'ings**, city, South Dakota, county seat of Brookings county, on the Chicago and Northwestern Railroad; 54 miles north of Sioux Falls. It is the seat of the South Dakota Agricultural College, and has manufactures of cigars and cement blocks. Pop. (1910) 2,971; (1920) 3,924.

**Brook'lime**, a small creeping plant (*Veronica beccabunga*) belonging to the Scrophulariaceae, growing in mud or shallow water in Europe. The small, bright-blue blossoms are borne in axillary racemes; the leaves are opposite.

**Brook'line**, town, Massachusetts, Norfolk county, a residential suburb of Boston, on the Charles River, 4 miles southwest of the State House, and on the Boston and Albany Railroad. It includes the villages of Longwood, Cottage Farm, Coolidge Corner, and Reservoir. It has handsome residences, a large public library, and a number of hospitals. Electrical supplies and screens are manufactured. Pop. (1900) 19,935; (1910) 27,792; (1920) 37,748.

**Brooklyn**, borough of New York City (since Jan. 1, 1898), formerly capital of Kings county, N. Y., with which it is coextensive, is situated at the western extremity of Long Island, on East River and New York Bay. It is separated from Manhattan Island by the East River, which connects Upper New York Bay with Long Island Sound, and which, at a distance of about three-fourths of a mile north of Brooklyn Bridge, expands into Wallabout Bay, on the shores of which is the U. S. Navy Yard, occupying over 100 acres of ground. The city has an area of 77.62 square miles, a shoreline of 201 miles, and an improved water front of 25 miles. Brooklyn is often spoken of as a residential city ('New York's bedroom'), as the City of Churches, and the City of Homes. All three descriptions are to a cer-

tain extent justified; but the borough has also immense mercantile, manufacturing, and shipping interests, as well as a history and civic life which give it a distinctive and important character. 'The Heights,' an elevation of the East River shore opposite the lower part of Manhattan, is a fashionable residential section. Clinton, St. Marks, Washington, New York, and Brooklyn avenues are also fine residential streets, while the Shore Road section, north of Coney Island has many beautiful homes.

Brooklyn's park system includes Prospect, Fort Greene, Forest, Tompkins, Winthrop, and Bedford Parks. Of these, Prospect Park is the finest, and is said to be unsurpassed in the United States. Connected with it are the splendid Eastern and Ocean Parkways, the latter extending to the beach at Coney Island. The Brooklyn Botanic Garden, opened in 1911, is under the direction of the Brooklyn Institute of Arts and Sciences (q. v.). Greenwood, Evergreen, and Cypress Hills Cemeteries are also notable.

Brooklyn is connected with New York by three great bridges, the Brooklyn, the Williamsburg, and the Manhattan, and three tunnels. Several lines of ferries ply to and from New York and Jersey City. The Long Island Railroad has a terminal at Atlantic Avenue which handles about 35,000,000 passengers annually. There are nearly 225 miles of subway, and 500 miles of surface car lines in operation.

Notable buildings and institutions are the Court House and Borough Hall, Pratt Institute, Adelphi College, Brooklyn Institute, Academy of Music, Brooklyn Museum, Brooklyn Public Library, Long Island Historical Society, Packer Collegiate Institute, and the Polytechnic Institute. Brooklyn has nearly 600 churches, of which the most widely famed are Plymouth Church, whose pulpit was occupied by Henry Ward Beecher for forty years, and the Church of the Pilgrims. There are numerous charitable institutions and over 30 hospitals.

Manufacturing interests are varied and important. Chemical works, shipbuilding, glass works, paint works, bookbinding and printing, and the manufacture of boots and shoes, clothing, foundry and machine shop products, and tobacco products, are among the leading industries. According to the Federal Census of 1919, there were 6,738 industrial establishments with 166,724 wage earners, an invested capital of \$704,158,000, and products valued at \$1,184,973,000.

Docking and shipping facilities

are extensive. Erie, Brooklyn, and Atlantic Basins, comprising some 140 acres, afford shelter to an annual tonnage of nearly 8,000,000. There is an annual trade of over \$1,000,000,000.

**History.**—Brooklyn was settled by Walloons about 1636, and was joined with four other hamlets into one village in 1646. In 1653 it received a Dutch charter, and in 1655, after the English conquest of New Amsterdam, it received an English charter. Its share in the Revolution was notable. At the western end of Long Island, on Aug. 27, 1776, was fought the memorable battle of that name (q. v.), in which, after a gallant and determined resistance, the comparatively undisciplined American troops were defeated by the British under Lord Howe. Part of this battle was fought within the limits of what is now Prospect Park. In Wallabout Bay were stationed the British prison ships on board which nearly 12,000 prisoners are said to have died within a period of six years.

Brooklyn became a city in 1834. The city of Williamsburg and that of Bushwick were incorporated with it in 1855; New Lots was added in 1866, and, within the next ten years Gravesend, Flatbush, New Utrecht, and Flatlands were annexed. By State legislation in 1897 the city of Brooklyn became, on Jan. 1, 1898, the Borough of Brooklyn in the City of Greater New York.

Brooklyn's population (1920) is 2,018,356. It was 4,402 in 1810; 7,175 in 1820; 15,395 in 1830; 36,233 in 1840; 96,838 in 1850; 266,661 in 1860; 396,099 in 1870; 566,663 in 1880; 806,343 in 1890; 1,166,582 in 1900; 1,634,351 in 1910.

**Brooklyn Bridge.** See NEW YORK CITY.

**Brooklyn Institute of Arts and Sciences**, a scientific and educational organization in Brooklyn, New York, incorporated in 1824 as the Brooklyn Apprentices' Library Association and rechartered in 1843 as the Brooklyn Institute. It was reorganized in 1862 and again in 1890. It includes four general departments: the Department of Education, the Department of Museums, the Botanic Gardens, and the Biological Laboratories. The active work of the Department of Education is conducted by several sub-departments, under whose direction addresses, lectures, courses of instruction, concerts, and dramatic readings are arranged for members. The Central Museum, a commodious structure on Eastern Parkway, near the entrance to Prospect Park, is devoted to art, archæology, and natural science. A

Children's Museum is also maintained, with historical and natural history exhibits. The Botanic Gardens opened in 1911 rank with the finest in the United States. The Biological Laboratories are at Cold Spring Harbor, Long Island.

**Brooks, CHARLES WILLIAM SHIRLEY** (1816-74), editor of *Punch*, was for a time parliamentary reporter for the *Morning Chronicle*, leader writer to the *Illustrated London News*, and contributor to several other journals. He was the author of a number of plays, of the novels *Aspen Court* (1855), *The Gordian Knot* (1860), *The Silver Cord* (1861) and *Sooner or Later* (1868), and of a book of travels, *The Russians of the South* (1856). From 1851 he contributed to *Punch* under the signature 'Episcurus Rotundus,' and in 1870 became editor. He initiated the articles headed 'The Essence of Parliament.'

**Brooks, JAMES** (1810-73), American journalist, was born in Portland, Me. Having graduated (1831) from Waterville College, he formed a connection with the *Portland Advertiser*, and acted as its correspondent in Washington and in the South, his letters setting a new standard for newspaper correspondence. Subsequently he travelled in Europe, and in 1836 established the *Express* in New York City, where he became prominent in politics. He was a member of Congress in 1849-53 as a Whig, and in 1863-73 as a Democrat. He was censured by Congress for his participation in the Cr dit Mobilier affair (1873). Some of his newspaper correspondence was later published as *A Seven Months' Run, Up and Down and Around the World* (1872).

**Brooks, JOHN** (1752-1825), American soldier and political leader, was born in Medford, Mass. He served in the American army throughout the Revolutionary War, rising to the rank of lieutenant-colonel (1778), distinguished himself particularly in the Saratoga campaign, and subsequently was a brigadier-general in the U. S. Army (1792-6). He was a member of the Massachusetts convention (1788) which ratified the Federal Constitution, and from 1816 to 1823 was governor of Massachusetts.

**Brooks, MARIA**, known as 'Maria del Occidente' (c. 1795-1845), American poet, was born (Gowen) in Medford, Mass., and was early married to a Boston merchant who had been her guardian. Her first efforts in verse were not published, but her *Judith, Esther, and Other Poems* appeared in 1820. She is best known for *Zophiel, or the*

*Bride of Seven*, the first canto of which was published in 1825. The complete poem appeared in London in 1833, under the supervision of Robert Southey, a great admirer of the work. In 1843 Mrs. Brooks published a partly autobiographical romance, *Idomen, or the Vale of Yamuri*.

**Brooks, NOAH** (1830-1903), American author and journalist, was born in Castine, Me., and began work as a newspaper man in Boston in 1850. He was war correspondent of the *Sacramento Union* (1862-5), was on the staff of the *N. Y. Tribune* (1871-5), and of the *N. Y. Times* (1875-84), and in 1884 became editor of the *Newark, N. J., Daily Advertiser*. He retired from newspaper work in 1892. He was a favorite writer for boys. Among his books are *The Boy Emigrants* (1876), *The Fairport Nine* (1880), *Tales of the Maine Coast* (1894), *Abraham Lincoln and the Downfall of American Slavery* (1894); also *Short Studies in American Party Politics* (1896), *The Story of Marco Polo* (1896), *Abraham Lincoln: His Youth and Early Manhood* (1901).

**Brooks, PHILLIPS** (1835-93), American divine and author, was born in Boston, of Puritan descent, received his early education in the Boston public schools, and was graduated (1855) from Harvard. He studied divinity at the Protestant Episcopal Theological Seminary, at Alexandria, Va., and was ordained deacon in 1859, accepting the rectorship of the Church of the Advent in Philadelphia the same year. In 1862 he became rector of the Church of the Holy Trinity in Philadelphia, where he remained until his acceptance of the rectorship of Trinity Church, Boston, in 1869. Dr. Brooks obtained a considerable reputation as a preacher before leaving Philadelphia, his eloquence being enhanced by his lofty stature and impressive personality. During this period he made the first of the several trips abroad, which extended his personal influence to other countries. At Boston he quickly came in close contact with the leading spiritual and secular powers of the community, and during his rectorship and after his consecration (1891) as fifth bishop of the Protestant Episcopal Church in Massachusetts, he was a dominating force in all matters relating to the social, intellectual, and religious improvement of his city and State. In 1872, the burning of Holy Trinity gave opportunity for the building of its new structure, designed by Richardson with La Farge as decorator, which was completed in 1877. Among

Dr. Brooks's numerous works are *Yale Lectures on Preaching* (1877), *The Influence of Jesus* (1879), *Sermons Preached in English Churches* (1882), and *Literature and Life* (1886). He wrote several Christmas and Easter carols, of which a favorite is that entitled 'O Little Town of Bethlehem!' See *Life*, by A. V. G. Allen (1901).

**Brooks, PRESTON SMITH** (1819-57), American politician, born in Edgefield district, S. C. He graduated from the College of South Carolina in 1839, became prominent as a lawyer and politician in the state, and served, as a captain of volunteers, in the Mexican War. From 1853 to 1857 he was a representative, as a State's Rights Democrat, in Congress. He is remembered chiefly for his assault (May 22, 1856) on Senator Charles Sumner, who in a recent speech on the 'Crime Against Kansas' had bitterly arraigned South Carolina and one of that state's senators, Andrew P. Butler, then absent, a relative of Brooks. Finding Sumner writing at his desk in the Senate chamber, Brooks beat him into insensibility with a large cane, Sumner being penned to his seat by his chair and unable to defend himself. Sumner was disabled for several years and never fully recovered. The assault caused intense excitement throughout the country; in the North it was regarded with horror and anger; in the South it was generally applauded and approved, and many canes were presented to Brooks as testimonials. A motion to expel him received 121 votes in the House of Representatives, a majority of 26, but not the necessary two-thirds; Brooks thereupon resigned, and was immediately re-elected, almost unanimously, by his district.

**Brooks, WILLIAM KEITH** (1848), American zoologist, was born in Cleveland, O., and graduated (1870) at Williams, taking his Ph.D. (1874) at Harvard. In 1874, also, he was appointed assistant at the Boston Society of Natural History, and after 1876 he was associate professor and professor of zoology at Johns Hopkins University, where he organized the Chesapeake zoological laboratory. Prof. Brooks took a large part in the artificial development of the American oyster. Among his extensive scientific writings are *Handbook of Invertebrate Zoology* (1882), *The Development and Protection of the Oyster in Maryland* (1884), *Report on the Stomatopoda Collected by H. M. S. Challenger* (1886), and *The Foundations of Zoology* (1898).

**Brooks, WILLIAM ROBERT** (1844), American astronomer, was born in Maidstone, England, and was brought to Darien, N. Y., by

his parents (1857). The following year he constructed a telescope on his own account, and he was giving astronomical lectures at the age of eighteen. After working as a mechanical draughtsman and inventing many appliances for astronomical and other scientific apparatus, he established at Phelps, N. Y., his Red House Observatory (1874), where he surprised the astronomical world by the number of comets he discovered with the telescope, etc., made by himself—eleven in all up to 1888, when he removed to Geneva, N. Y., afterward remaining in charge of the Smith Observatory at that place. Here he made a new record in the matter of discovering comets, announcing thirteen more by 1906, making an unprecedented total for any one observer up to his time. Some of these discoveries were made possible by his own inventions in photography. He became professor of astronomy at Hobart College, and member of learned societies, American and foreign.

**Brookville.** (1.) Bor., Pa., co. seat of Jefferson co., 67 m. N.E. of Pittsburg, on Red Bank Creek and on the Pa. and the Brookville R. Rs. It has foundries, saw and planing mills, etc., a furniture factory, roller mills, breweries, glass-works, and brick-yards. Pop. (1910) 3,003. (2.) Tn., Ind., co. seat of Franklin co., 34 m. N.W. of Cincinnati, O., on the White Water R., and on the White Water div. of the Cle., Cin., Chi., and St. Louis R. R. It has pulp, paper, saw and roller mills, furniture, factories, and machine shops. Pop. (1910) 2,169.

**Brookweed** (*Samolus Valerandi*), a small, herbaceous plant, belonging to the Primulacæ. It abounds in marshes near the sea. Small white flowers are borne in racemes on a slender stem springing from the centre of a rosette of bright green leaves.

**Broom.** The common broom (*Sarothamnus scoparius*, *Cytisus scoparius*) is an evergreen shrub about three feet or more in height, with numerous straight twiggy branches, small ternate leaves, and large yellow papilionaceous flowers, followed by dark-brown pods. It thrives everywhere in dry sandy soil, no matter how poor it be. The *Planta genista*, which gave its name to the line of Plantagineæ, was the broom. *Scoparii acumina*, or broom tops, have long held high place as a drug, and the decoction prepared therefrom is still used as a safe and effective diuretic in certain conditions. Besides *C. scoparius*, the yellow-flowered *Cytisus nigricans*, which blooms at midsummer, *C. capillatus* and *C. leucanthus* are hardy, while *C. canariensis* and *C. racemosus* are specially worth grow-

ing as greenhouse plants, being the yellow-flowered 'genistas' sold by florists. Propagation is best effected by cuttings of the young wood taken in spring and placed in heat. The use of broom twigs for the making of brooms or besoms is very old; they have also been used for thatching houses; and the flower-buds are said to have some virtue as a pickle. See *Hulme's Wild Fruits of the Countryside* (1902).

Broom.  
1, Stamens and pistil; 2, pod.

**Broom.** See BRUSHES.

**Broom Corn** (*Sorghum* [*Andropogon*] *vulgare*), an E. Indian reedlike grass cultivated in the United States, and used for making brooms; the seeds afford a food for cattle.

**Broome, SIR FREDERICK NAPIER** (1842-96), British colonial statesman, born in Canada, but went to New Zealand (1857-69) in early youth. He was colonial secretary of Natal (1875) and of Mauritius (1877), governor of W. Australia (1882), and of Barbados (1890), and of Trinidad (1891). His wife, Mary A. Stewart, a native of Jamaica, has written *Station Life in New Zealand* (1869).

**Broome, WILLIAM** (1689-1745), English translator, was the son of a poor farmer of Haslington, Cheshire. In 1712 he collaborated in a prose translation of the *Iliad*, and was employed by Pope in annotating his own translation. In 1722 Pope proposed to Broome and his friend Elijah Fenton to

Died 1908

join him in translating the *Odyssey*. Broome did the 8th, 11th, 12th, 16th, 18th, and 23d books, and all the notes. See Johnson's *Lives of the Poets* (1779-81). For his quarrel with Pope, see Elwin and Courthope's *Correspondence of Pope* (1871-89).

**Broom Rape** (*Orobanchæ*), about 180 species, belonging chiefly to the temperate regions, all parasitic on the roots of other plants. They are brightly-colored plants, but bear no green leaves, having scales instead. *O. minor* has been naturalized from Europe; is yellowish brown, and parasitic on the roots of clover. The naked broom rape of America is *Thalesia uniflora*, a delicate, leafless plant, sending up groups of gray, pubescent peduncles, bearing lilac-tinted flowers.

*European Broom Rape (Orobanchæ major).*

1, Calyx (opened), with stamens; 2, scale; 3, pistil.

**Brosboll, KARL.** See CARIT ET LAR.

**Broschi, CARLO.** See FARNELLI.

**Brothel**, a house of prostitution; also known as a bawdy-house or disorderly house. Such a house is a common nuisance at the common law and may be abated by the public authorities on information of any private person, as an infringement of public order and decency, and the keeping of such a house is a misdemeanor.

**Brotherhoods**, associations of men of the same profession, society, fraternity, or religious

order. The chief earlier religious brotherhoods of the Roman Catholic Church were the fraternities known as the Brothers of Mary, of the Scapular, of the Rosary, of the Sacred Heart, and of Francis Xavier. These were followed by the Frates Pontifices (whose duties were mainly confined to looking after travellers in the neighborhood of bridges and ferries), and the Familiars and Cross-bearers, identified with the Spanish Inquisition. The later brotherhoods were founded in the Netherlands and N. Germany, and they spread over the Continent rapidly, till, in the middle of the 15th century, their number was reckoned at over 150. During the last two centuries there has been a large growth of brotherhoods (generally called confraternities) in connection with the Roman Catholic Church. There are also several brotherhoods in connection with the Church of England.

**Brothers, RICHARD** (1757-1824), a British naval officer, born in Newfoundland. About 1793 he began to describe himself as the 'nephew of the Almighty,' prophesied his own 'revelation,' on Nov. 19, 1795, as prince of the Hebrews and ruler of the world, and the rebuilding of Jerusalem in 1798. He was arrested and confined in a lunatic asylum in 1795. Nathaniel Brassey Halhed, M.P. for Lymington, to whom Brothers had promised the government of India, attempted to raise his case in Parliament. In 1806 Brothers was released, and was taken charge of by John Finlayson, a Scottish writer, who had given up a lucrative practice at the bar to follow him. In 1794 he published a book of 'prophecy,' *A Revealed Knowledge of the Prophecies and the Times*, which led many to believe in him.

**Brough, JOHN** (1811-65), American political leader and journalist, born at Marietta, O. As an editor of newspapers at Marietta, Lancaster, and Cincinnati, O., where he founded the *Cincinnati Enquirer*, he became known as an able writer on political subjects and gained considerable political influence throughout the state. He was elected to the Ohio Legislature in 1838, and in 1863, as the Republican candidate and the representative of those who advocated a vigorous prosecution of the Civil War and supported the Lincoln administration, he defeated Clement L. Vallandigham, the Democratic candidate and the leader of the 'Copperheads,' for the governorship, serving in 1864-5 and rendering services of great value to the general government in the last two years of the war. He was one of the three 'war governors' of Ohio,

William Dennison serving in 1860-2 and David Tod in 1862-4.

**Brough, LIONEL** (1836), English actor, born at Pontypool, Monmouthshire. He began life as a clerk to the editor of the *Illustrated London News*, and afterward was on the staff of the *Daily Telegraph*, when he originated the present system of selling newspapers in the streets. He made his first appearance on the stage at the Lyceum Theatre, London, under the management of Madame Vestris (1854). In 1858 he left the stage for five years, during which time he was engaged on the staff of the *Morning Star*. In 1863 he returned permanently to the stage, and has since figured prominently as a low comedian. He has visited the U. S. at different times, where he won popularity by his portrayal of comic rôles, among them Paul Pry, and Tony Lumpkin in *She Stoops to Conquer*.

**Brougham, HENRY, BARON BROUGHAM AND VAUX** (1778-1868), English statesman, scholar, and scientist, was born in Edinburgh, and was called to the Scottish bar in 1800; but owing to his pronounced Whig and Liberal sympathies, and to a reputation for eccentricity and rashness, he met with comparatively little success as an advocate, and in 1805 he migrated to London, where he permanently settled, being called to the English bar in 1808. But in 1802 he joined with Jeffrey and others in founding the *Edinburgh Review*. To the first twenty numbers he contributed no fewer than eighty articles; and the encyclopædic character of his learning, which included natural philosophy and mathematics, natural theology and metaphysics, besides politics and history, was displayed in these early contributions.

At the English bar he contrived to make a great reputation by his success in some celebrated cases, the first of which was as counsel of the Liverpool merchants who petitioned against the Orders in Council which formed part of the commercial war between England and Napoleon. This was in 1810; and soon after he entered the House of Commons, where his turbulent and aggressive eloquence secured him a ready welcome from the opposition. Brougham was a tireless advocate of slave emancipation, of political reform, of law reform, of national education, and of religious equality. Among other projects which he helped to start were the University of London in 1825, and the Society for the Diffusion of Useful Knowledge (1827). He also made a great reputation for himself as a champion of popular

rights by his speeches in defence of persons prosecuted by the crown for libel. His most celebrated case was his defence of Queen Caroline in 1820, which so endeared him to the English people that for the next ten years he was almost a popular idol. In 1830 he was made Lord Chancellor, and was largely instrumental in getting the Reform Bill passed in 1832. Invaluable in opposition, as a colleague in office he was too turbulent, vain, and rash; and when the Whig ministry was reconstructed in 1834, Brougham was neither then, nor at any subsequent date, reappointed to office. His writings were published in 11 vols. in 1855-61. *His Memoirs of His Life and Times* are hardly trustworthy. Consult Bagehot's *English Constitution*.

**Brougham, JOHN** (1814-80), Irish-American dramatist and actor, was born in Dublin. Besides acting, he undertook theatrical management, first in London, but removed in 1842 to the United States, where he became a member of the stock company of Burton's Theatre in New York. For a time he was manager of Niblo's Garden; in 1850 opened Brougham's Lyceum, which was afterward Wallack's Theatre; then attempted the management of the Old Bowery Theatre—all in New York. He opened Brougham's Theatre in 1869, an unsuccessful venture, and appeared on the stage for the last time in 1879 at Booth's Theatre, New York. As an actor he excelled in Irish parts. He wrote over seventy plays, among the best known being *The Duke's Motto*, *Bel Demonio*, *Romance and Reality*, and the burlesque *Pocahontas*.

**Broughton, BARON.** See HOBHOUSE.

**Broughton, RHODA** (1840), English novelist, was born in Denbighshire, Wales. She began novel writing with a work entitled *Not Wisely but Too Well* (1867), which became popular immediately, and was followed by other novels in quick succession. Her works possess originality, vigor, and a certain undisciplined power. Among her books are *Red as a Rose Is She* (1870); *Nancy* (1873); *Joan* (1876); *Dr. Cupid* (1886); *Scylla and Charybdis* (1895); *Foes in Law* (1901); *Lavinia* (1902).

**Broughty-Ferry**, town, Forfarshire, Scotland, on the north side of the Firth of Tay, 3½ miles east of Dundee. It is a seaport and fishing town, and the residence of Dundee merchants. Pop. 12,000.

**Broussa.** See BRUSA.

**Broussais, FRANÇOIS JOSEPH VICTOR** (1772-1838), French physician, was born in St. Malo. He served as surgeon through campaigns in Germany, Holland, Italy, and Spain; also in the navy. Appointed in 1820 professor at the military hospital of Val-de-Grâce, Paris, and in 1831 professor of general pathology at the Academy of Medicine, Paris, he founded a peculiar theory of medicine—*Histoire des Phlegmasies ou Inflammations Chroniques* (1808), and *Examen de la Doctrine Médicale généralement adoptée* (1816)—in which he defined life as dependent upon irritation, and disease, primarily local in its origin, as excessive or insufficient irritation.

**Brousseau, CLAUDE** (1647-98), French Huguenot leader, was born in Nîmes. He became a

Lord Brougham.

(From the Portrait by Lonsdale.)

lawyer and the legal defender of the Huguenot poor, as well as a leader in their meetings to protest against persecutions. His house in Toulouse was the meeting place of the Huguenot assembly that drew up the famous 'Project' (1683) to hold services simultaneously throughout the country on the ruins of the Protestant meeting houses. Brousseau was compelled to flee from France, but in exile was active in improving conditions for refugees and in inspiring fresh hope among his fellow-sufferers. Though a price was on his head, he returned to France as a preacher (1689), but was not ordained until 1694. From 1694 to 1696, and in 1697-8, he was again in France, conducting meetings with extraordinary boldness and suc-

cess. When the persecutions continued after the Peace of Reysswick, he addressed a series of appeals to the king. In 1698 he was arrested at Oloron, tried, and broken on the wheel. Consult Nègre's *Vie et Ministère de Claude Brousseau*, which contains many of his writings.

**Brouwer, or BRAUWER, ADRIAN** (? 1606-38), Dutch painter, was born of humble parentage at Oudenarde. He studied at Haarlem (1626-7) under Frans Hals, a hard taskmaster, from whose cruelties he fled to Amsterdam, and thence to Antwerp (1630), where he was arrested as a spy, but obtained his liberty, as the story goes, by painting a picture which Rubens recognized as the work of the painter. A life of dissipation brought him to an early death. His subjects, like those of his countryman Teniers, were chosen from low life—tavern brawls, country feasts, boors playing cards, etc.—but are all executed with admirable expression, brilliant coloring, and exquisite finish and vigor. Consult Bode's *Life*.

**Brower, JACOB VRADENBERG** (1844-1905), American archaeologist, was born in York, Mich. In 1894-5 he discovered mounds and the site of the ancient village at Itasca Lake; in 1897-8 he was engaged in an attempt to rediscover the site of the ancient Quivira, which Coronado had visited, and in 1900 he identified over 1,100 ancient mounds at Mille Lac, Minn. His writings include *The Mississippi River and Its Source* (1893); *Prehistoric Man at the Head-Waters of the Mississippi* (1895); *The Missouri River and Its Utmost Source* (1896); *Quivira* (1898); *Mille Lac* (1900).

**Brown, Mount**, peak in Rocky Mountains, Canada, near source of rivers Fraser and Columbia, and between Alberta and British Columbia. Long reputed the highest peak of the Rockies, it was estimated by Coleman to be only 9,055 feet high.

**Brown, AARON VENABLE** (1795-1859), American legislator, was born in Brunswick co., Va., and graduated (1814) at Chapel Hill University, N. C. He removed to Tennessee, was admitted to the bar, and became the partner of James K. Polk. After serving in the Tennessee legislature for a dozen years, he represented his State in Congress from 1839 to 1845, when he was elected governor. As a delegate to the Southern convention of 1850, at Nashville, he prepared 'the Tennessee platform,' and was long prominent in Democratic councils. He was Postmaster-Gen-

eral under President Buchanan, and developed new mail routes to the West before the completion of the railroads. His *Speeches* were published in 1854.

**Brown, ALEXANDER** (1843-1906), American historian, was born in Nelson County, Va. He was educated at Lynchburg College (1860-1), served in the Confederate Army during the Civil War, and thereafter was in turn a merchant and a farmer, though he devoted himself primarily to the study of the early history of Virginia. His important works are *The Genesis of the United States* (2 vols., 1890), a valuable collection of documents and of biographical sketches of persons concerned in the settlement and administration of Virginia, and *The First Republic in America* (1898). He also wrote: *New Views of Early Virginia History* (1886); *Our Earliest History* (1898); *English Politics in Early Virginia* (1901).

**Brown, BENJAMIN GRATZ** (1826-85), American legislator and executive, was born in Lexington, Ky. He was graduated at Transylvania University in 1845, and at Yale in 1847, and was admitted to the bar in 1851. He practised law in St. Louis; was chief editor and part owner of the *Missouri Democrat*, and was a prominent anti-slavery leader in the State legislature (1852-9). He served in the Union Army in the Civil War, rising to the rank of brigadier-general of volunteers. He was a U. S. Senator (1863-7), and governor of Missouri (1871-3). After being defeated for the Vice-Presidency on the Republican ticket headed by Horace Greeley (1872), he resumed the practice of law in St. Louis.

**Brown, CHARLES BROCKDEN** (1771-1810), the first prominent American novelist, was born of Quaker parentage at Philadelphia, Pa. He early developed an inclination for letters, fostered to a degree injurious to his health by his parents and by his teacher, Robert Proud, a writer of repute. He studied law, but soon gave this up for literary work. His writings show the influence of the French philosophical writers of his day, and of Godwin and other English radicals. His first attempt at literature, *Alcuin* (1797), was a dialogue on the social position of women and the marriage problem. The novel, however, became his medium of expression for the moral and psychological ideas in which he was primarily interested. The next four years were most prolific. *Wieland* (1798) was followed by *Ormond*,

*Arthur Mervyn*, and *Edgar Huntly* (1799)—the last-named being the first important story of Indian life; *Clara Howard* (1801), and *Jane Talbot* (1804). His books were popular, but not profitable, and he was forced to rely on his parents for support. In 1799 he published for a few months the *Monthly Magazine and American Review*, and from 1803 to 1808 he edited the *Literary Magazine and American Register*. He wrote a number of political essays (1803-9). His novels are characterized by lively diction, varied and plentiful incident, which is, however, full of improbabilities and of actions without adequate motive. Brown followed the English Gothic school of horrors and mysteries, with only the change from mediæval to American backgrounds. He is said to have had considerable influence on Hawthorne through his preoccupation with moral problems. A collected edition has been published, with *Life* by Dunlap. Consult Prescott's *Biographical and Critical Miscellanies*; Erskine's *Leading American Novelists* (1910).

**Brown, ELMER ELLSWORTH** (1861), American educator, was born in Kiantone, N. Y. He was graduated at the Illinois State Normal University (1881) and at the University of Michigan (1889), and gained the degree of Ph.D. at the University of Halle-Wittenberg (1890). He was principal of the public schools of Belvidere, Ill. (1881-4); assistant professor (1891-2) of the science and art of teaching at the University of Michigan; head of the department of education in the University of California (1892-1906). In July, 1906, he became United States commissioner of education, and in July, 1911, Chancellor of New York University. He is a member of the National Council of Education and a fellow of the American Association for the Advancement of Science. He received the degree of LL.D. from Columbia University in 1907. He has written *Making of Our Middle Schools* (1903); *Origin of American State Universities* (1905); *Government by Influence* (1909).

**Brown, ERNEST WILLIAM** (1866), American mathematician and educator, was born in Hull, England. He was educated at Christ's College, Cambridge. He was professor of mathematics at Haverford College from 1891 to 1907, and has held the same chair at Yale University since 1907. He is a fellow of the Royal Society, of the Royal Astronomical Society (from which he received

a gold medal in 1907), of the American Philosophical Society, and a member of other mathematical societies in the United States and England. Besides many papers on lunar theory and celestial mechanics, he has written *Treatise on the Lunar Theory* (1896); *New Theory of the Moon's Motion* (1897-1908); *Inequalities in the Motion of the Moon Due to the Direct Action of the Planets* (1908, Adams Prize Essay).

**Brown, FORD MADOX** (1821-93), British historical painter, and pioneer of the pre-Raphaelite movement, was educated in Belgium. He studied painting under Wappers; also in Rome and Paris. His true teachers were Holbein and the fifteenth-century Italian masters, from whom he developed his sense of grand style and archaism of form. In 1844 he competed for the wall decorations at Westminster Hall, London. His designs were the indirect means of bringing him into contact with Rossetti, his pupil and friend, and other members of the pre-Raphaelite brotherhood. Among his masterpieces are *Christ Washing St. Peter's Feet* (National Gallery, London); *Last of England*; *Work*; *King René's Honeymoon*; *King Lear*; *Cordelia's Portion*; *Cromwell at St. Ives*. He also designed cartoons for stained glass for William Morris. Consult his *Life* by Hueffer and by H. Rossetti; Cox's *Old Masters and New* (1905).

**Brown, FRANCIS** (1849), American theologian and educator, was born in Hanover, N. H. He was graduated (1870) at Dartmouth, and at Union Theological Seminary (1877), and having been appointed as fellow of the seminary, studied at the University of Berlin (1877-9). In 1879 he was appointed instructor in Biblical philology at Union Theological Seminary, where he became associate professor in the same subject (1881-91), and professor of Hebrew and cognate languages in 1891. Since 1908 he has also been president of the faculty. Among his books are *Assyriology—Its Use and Abuse in Old-Testament Study* (1885); *The Teachings of the Twelve Apostles*, edited with Dr. Roswell D. Hitchcock (1884); *A Hebrew and English Lexicon of the Old Testament*, with Driver and Briggs (1891-1906); *The Christian Point of View*, with Profs. Knox and McGillert (1902).

**Brown, SIR GEORGE** (1790-1865), British general, was born near Elgin, Scotland. He distinguished himself in the Peninsular War (1808-13), and in the United

CHRIST WASHING ST. PETER'S FEET. BY FORD MADOX BROWN. IN THE NATIONAL GALLERY OF BRITISH ART (STATE GALLERY), LONDON.

States (1814), where he fought at Bladensburg, near Washington. Having attained the rank of lieutenant-general, he was sent, in command of the Light Division, to the Crimea (1854-5), and behaved gallantly at Alma and Inkermann, being severely wounded in the latter battle. In 1860 he became commander-in-chief in Ireland.

**Brown, GEORGE** (1818-80), Canadian journalist, the son of a well-known newspaper man, was born in Edinburgh, Scotland. He received an academic education. He went with his father to New York (1838), where he was for a few years publisher of his father's paper. He visited Canada in 1843, and established the *Toronto Globe* (1844), which was at first published as a weekly. He also took an active part in politics for many years, entering Parliament in 1852, and being a consistent advocate of reform in Canadian matters. He was a member of the coalition government of 1864, formed to promote confederation (effected in 1869), and was joint plenipotentiary with Sir Edward Thornton at Washington, D. C. (1874), for the negotiation of a commercial treaty with the United States. In 1873 he became a member of the Canadian Senate. Consult his *Life and Speeches*, by Alexander Mackenzie (1882); Lewis' *Brown* (1906).

**Brown, GEORGE DOUGLAS** (1869-1902), Scottish author, was born in Ochiltree, Ayrshire. After graduating at Oxford in 1895, he proceeded to London, and entered upon literary and journalistic work, acting as literary adviser to Macquenn, the publisher. In 1901 he brought out his novel, *The House with the Green Shutters*, a powerful story of Scottish life, published under the pen-name of 'George Douglas.'

**Brown, GEORGE LORING** (1814-89), American landscape painter, was born in Boston, Mass. After spending twenty years in Europe, he returned to the United States in 1860. His subjects are mainly American and Italian landscapes, among them being *Niagara by Moonlight*; *Doge's Palace and Grand Canal*; *Bay of Naples*; *Crown of New England*; *Bay of New York*.

**Brown, GEORGE WILLIAM** (1812-90), American jurist, was born in Baltimore, Md., and was graduated (1831) at Rutgers College. He became a prominent member of the Baltimore bar, of which city he was mayor at the outbreak of the Civil War, and in that capacity assisted in suppressing the disorders in April,

1861. He served in the Maryland constitutional convention of 1867, and was chief judge of the Baltimore supreme court from 1873 to 1888; at the same time acting as professor of international and constitutional law in the University of Maryland. He was joint author of a *Digest of the Maryland Reports* (1847).

**Brown, GOOLD** (1791-1857), American grammarian, was born in Providence, R. I., of Quaker descent. He received his education from his father, and at the Friends' school, early developing a strong interest in literature and language. In 1810 he began work as a teacher in Rhode Island, and the following year took a position at a Friends' boarding school in Dutchess county, N. Y. He established an academy of his own in New York City in 1813, and conducted it for twenty years, during which period, and subsequently, he devoted himself to the perfection of his system of English grammar. His *Institutes of English Grammar* (1823) was followed by *First Lines of English Grammar* (1823). In 1851 he published *A Grammar of English Grammars*, a monumental work, covering almost every conceivable point of the subject of which it treats.

**Brown, HARVEY** (1796-1874), American soldier, was born in Rahway, N. J. He was graduated at West Point in 1818; served against the Seminole Indians in Florida, being brevetted major for gallant conduct and general efficiency; distinguished himself in the Southern campaign of the Mexican War, and won the brevet of lieutenant-colonel at Contreras and that of colonel at the Gate of Belen, City of Mexico. After the outbreak of the Civil War, as colonel, he held Fort Pickens against a Confederate attack (Nov. 22-23, 1861), thus earning the brevet of brigadier-general. He was subsequently transferred to New York City, and in 1866 was brevetted major-general for distinguished services in the suppression of the riots there. He retired from active service in 1863.

**Brown, HENRY BILLINGS** (1836-1913), American jurist, was born in South Lee, Mass. He was graduated at Yale (1856), and studied at the Yale and Harvard Law Schools. Entering a law office in Detroit, Mich., he was admitted to the bar in 1860. He was assistant U. S. district attorney from 1863 until his appointment (1868) as judge of the State circuit court. He then resumed the practice of his profession, in which he gained

high repute. In 1875 he was appointed by President Grant, U. S. judge for the eastern district of Michigan, and in 1890 was made an Associate Justice of the U. S. Supreme Court. He became a special authority on admiralty law, and published a volume of *Admiralty Reports* (1875). He retired from the bench in 1906.

**Brown, HENRY KIRKE** (1814-86), American sculptor, was born in Leyden, Mass. He studied art in Boston and in Italy, and made his permanent residence in Brooklyn, N. Y. His chief work was the equestrian statue of *Washington* in New York City, which is notable as the first important piece of bronze statuary cast in the United States. His statue of *Lincoln* in the same city has been criticised, but his equestrian statue of *General Scott* in Washington is a most artistic work. Other works are the statue of *De Witt Clinton* in Brooklyn, and busts of *William C. Bryant* and *Willard Parker*.

**Brown, JACOB** (1775-1828), American soldier, was born in Bucks county, Pa. He was a government surveyor in Ohio (1796-8); military secretary to Gen. Alexander Hamilton (1798-1800), and about 1810 became brigadier-general of New York State militia. He is chiefly remembered for his services in the War of 1812. At first he was in command in Northern New York, where he defeated the English at Ogdensburg (Oct. 4, 1812) and at Sackett's Harbor (May 29, 1813). He became a brigadier-general in the regular U. S. Army in 1813, and a major-general in 1814. During the latter part of the war he was in command of the Army of Niagara, defeating the British at Chippewa (July 5, 1814), and commanding the American forces in the latter part of the battle of Lundy's Lane (q. v.), in which he was severely wounded. From 1815 until his death he was the senior officer in the army, and after 1821 the general-in-chief.

**Brown, JOHN** (1800-59), American abolitionist, was born in Torrington, Conn. He was in turn a land surveyor, a tanner, a sheep raiser, a wool trader, and a farmer, meeting with little success in these occupations. He early conceived a hatred of slavery, and in 1834 planned a school for negroes, hoping to bring about emancipation by education. In 1839 all the members of his family took an oath to help in the abolition of slavery; and within the next ten years the idea developed in his mind that force

was the necessary and justifiable means of accomplishing this end.

In 1849, however, Brown settled on a farm in Mount Elba, N. Y., where Gerrit Smith had established a negro colony, and here he entered with enthusiasm upon the work of helping his colored neighbors. In the early fifties, the Virginia plan which caused his death was formed, being known to friends as early as 1854 or 1855; but he was diverted from its execution by the troubles in Kansas.

In 1855, Brown joined five of his sons, who had gone to help the abolition cause in Kansas, where, as a result of the passage of the Kansas-Nebraska Bill (q. v.), the advocates and the opponents of slavery were already contending fiercely. Settling near Ossawatimie, 'Old Brown,' as he was called, immediately became the leader of the radical element of the anti-slavery, or 'Free State' party. Pro-slavery threats of violence and murder, with open dishonesty at the polls, inflamed the 'Free State' men; and Brown led a band of eight to the murder of five of his pro-slavery opponents ('the Pottawatomie Massacre,' May 25, 1856). He did not actually take part in the murders, but without doubt both inspired and approved of them. 'I have no choice,' he said, before the massacre. 'It has been decreed by Almighty God, ordained from eternity, that I should make an example of these men.' Though Brown's energy of purpose made him personally feared by the pro-slavery party, the massacre failed to have the desired effect, for the bitterness of the border warfare was rather increased than diminished thereby. During 1858, under the name of Shubel Morgan, Brown was again in Kansas for six months. This visit was notable for his raid across the Missouri border to free eleven slaves.

The Virginia scheme, the scene of which was laid at Harper's Ferry, was brought to a head in 1859. The plan was to seize, with the help of an armed force, a strong position in the mountains, whence slave-liberating forays could be made into the surrounding country, and slaveholding made insecure. It contemplated, at first, no attack on United States property, and it had the support of some of the most prominent of the Northern abolitionists, including Thomas Wentworth Higginson, Gerrit Smith, and Theodore Parker.

In 1859, Brown, with his men, spent the summer on a farm in

the neighborhood of Harper's Ferry. On Oct. 16, with nineteen followers, five of whom were negroes, he surprised and captured the United States arsenal. On Oct. 18 he was taken prisoner, after being wounded, by United States troops under Robert E. Lee. He was tried and convicted for treason and murder, and on Dec. 2 was hanged at Charlestown, Va. (now W. Va.). His body was taken under special guard to North Elba, where, near the old farmhouse, a huge rock marks his grave.

The affair created a profound sensation throughout the country, and, though conservative Northerners expressed strong disapproval of Brown's attack, it undoubtedly added greatly to the bitterness felt by the South for the North, and probably hastened the Civil War. During the war a popular song in the Federal Army had for its refrain:

John Brown's body lies a-mouldering  
in the grave,  
But his soul goes marching on.

John Brown has been and perhaps always will be the subject of controversy. To Emerson and Thoreau, probably unacquainted with the Pottawatomie murders, he was a saint and hero. Later writers, knowing the facts, laud him as a martyr, while others denounce him as a desperado, a ruffian, and a criminal. The truth, as usual, seems to lie between the two extremes. From however high a motive, he was responsible for deeds which were abhorrent to the moral sense of a civilized community. But deeply imbued with the stern religious convictions of his Puritan forefathers, in many respects a nineteenth-century Cromwellian, ascetic in his habits, a fanatic in temperament, wholly sincere and honest, devoted with his whole soul to the right as he saw it, a visionary and an enthusiast, he appeals to the imagination by his fervor of conviction, and commands respect by his singleness of purpose.

Consult Sanborn's *Life and Letters*; Hinton's *John Brown and His Men*; Avey's *Capture and Execution of John Brown* (1906); Du Bois' *John Brown* (1909); Hill's *Decisive Battles of the Law* (1907); Villard's *John Brown* (1910).

**Brown, JOHN**, of Haddington (1722-87), Scottish Presbyterian divine, was born in Carpow, Perthshire. While a herd boy on the Abernethy hills he learned Latin and Greek, and passed ultimately into the Secession ministry. In 1751 he was settled at Haddington, where the re-

mainder of his life was spent. In 1784 he declined a call to the pastorate of the Dutch Church in New York. Brown was professor of divinity in the Secession Hall from 1768. Of his writings, entirely theological, the best remembered are *Dictionary of the Bible* (1768), and *Self-Interpreting Bible* (2 vols., 1778). He was a man of vast learning, and excelled in Oriental lore. Consult W. Brown's *Memoirs*.

**Brown, JOHN** (1735-88), Scottish physician, was educated in Duns, Berwickshire, and studied medicine in Edinburgh. His innovations in medical practice led to his formal ostracism in Edinburgh in 1778, whereupon he removed to London. Here he died, after ten years of poverty. His doctrines, known as the Brunonian system, now medical commonplaces, were promulgated in *Elementa Medicinæ* (1780), which consisted chiefly in an attack on the indiscriminate use of blood-letting. Brown distinguished 'asthenic' (or weakening) troubles from 'sthenic' conditions, and pointed out that the former required a strengthening and supporting treatment. Thus, alcohol and opium were his favorite medicines. Consult *Life* by W. C. Brown and by Dr. Beddoes.

**Brown, JOHN** (1736-1803), American merchant, was born in Providence, R. I. Like his father, James Brown, he became a successful merchant, the first Rhode Islander to trade in the East Indies. He was implicated in the destruction of the British sloop-of-war *Gaspé* in Narragansett Bay (1772), but the case was not proved against him. Just before the opening of the Revolution he received a large consignment of powder from abroad, and was thus enabled to supply the Continental Army. He laid the corner-stone of the first building of Rhode Island College, now Brown University, of which he was a benefactor, and the treasurer for 20 years.

**Brown, JOHN** (1784-1858), Scottish divine, was born in Whitburn, Linlithgowshire. He was moderator of the Associate Synod in 1818, and was professor of exegetical theology to his denomination from 1834 till his death. He was a notable figure in the religious history of his time, a profound theologian, a prolific writer, and a preacher of rare eloquence.

**Brown, JOHN** (1810-82), Scottish author and physician, was born in Biggar, Lanarkshire. Apprenticed in 1827 to Syme, the surgeon, he afterward settled down to professional life in Ed-

inburgh. Dr. John Brown has been called the Charles Lamb of Scottish literature. His writings, collected into the three volumes of *Horæ Subsecivæ* (1858-61), are among the most charming in the language. The most popular and the finest of his productions is *Rab and His Friends* (1859); while *Pet Marjorie* (1863) and *Jeems the Doorkeeper* (1864) will not soon be forgotten.

**Brown, JOHN GEORGE** (1831), American painter, was born in Durham, England. He was educated in Newcastle-on-Tyne, and studied at the Scottish Royal Academy. After his removal to the United States, in 1853, he continued his studies at the schools of the National Academy of Design in New York, and became noted for his success in painting children. He was made a member of the National Academy (1863); was president of the American Water Color Society (1887-1904), vice-president of the National Academy (1899-1904), and for ten years president of the Artists' Fund Society. He is also noted for his realistic paintings of New York bootblacks and newsboys. Some of the best known are *The Stump Speech*; *His First Cigar*; *The Passing Show*; *A Merry Air and a Sad Heart*; *Dress Parade*; *The Three (Scap) Graces*; *Heels Over Head*.

**Brown, JOHN NEWTON** (1803-68), American clergyman, was born in New London, Conn. He was graduated (1823) at the institution which became Colgate University, where he also received theological instruction. He was pastor of Baptist churches in New York and other Eastern States until 1838, when he became professor of theology and ecclesiastical history in the Theological Institution at New Hampton, N. H. He was afterward editorial secretary of the Baptist Publication Society, and editor of church periodicals. He prepared and revised the 'New Hampshire Confession,' and edited the *Encyclopadia of Religious Knowledge* (1835).

**Brown, JOSEPH EMERSON** (1821-94), American lawyer and legislator, was born in Pickens county, S. C. He was graduated at the Yale Law School (1846). He was elected governor of Georgia in 1857, and re-elected until the close of the Civil War, during which he was the most active Secessionist governor of the Southern States. He was chief justice of the Georgia supreme court (1868-70); president of the Western and Atlantic Railroad; and U. S. Senator (1880-91).

**Brown, NICHOLAS** (1769-1841), American merchant and philanthropist, nephew of John Brown (1736-1803), was born in Providence, R. I. He was graduated at Rhode Island College in 1786. Five years later he inherited his father's fortune, and formed the firm of Brown & Ives, with his brother-in-law as partner. A liberal benefactor of his alma mater, its name was changed to Brown University in his honor. He also gave liberally to other institutions. Consult Hunt's *American Merchants*.

**Brown, NORRIS** (1863), American legislator, was born in Maquoketa, Ia. He was graduated at the Iowa State University in 1883, and admitted to the bar the same year. He settled in Kearney, Neb., in 1888; was deputy attorney-general of Nebraska in 1900-04; and attorney-general in 1904-06. He was elected U. S. Senator for the term of 1907-13.

**Brown, PETER HUME** (1850), Scottish historian, was born in Haddingtonshire. He was educated at Edinburgh University, and intended to enter the Church, but took to literature instead. In 1898 he was appointed editor of the Register of the Privy Council of Scotland, and in 1901 Fraser professor of ancient history and palæography in Edinburgh University. Since 1908 he has been historiographer-royal for Scotland. His works include *George Buchanan, Humanist and Reformer* (1890); *Early Travelers in Scotland* (1891); *Scotland Before 1700* (1893); *John Knox* (1895); *History of Scotland* (1898-1909); *Scotland in the Time of Queen Mary* (1908).

**Brown, ROBERT**, founder of the Brownists. See BROWNE.

**Brown, ROBERT** (1773-1858), Scottish botanist, was born in Montrose. He resigned a position as assistant surgeon in the army to become naturalist to the expedition under Flinders that explored the coast of Australia. He returned to Britain in 1805, bringing with him a collection of 4,000 species of plants. He was later librarian to Sir Joseph Banks and librarian of the Linnean Society. He published the results of his researches in *Prodromus Floræ Novæ Hollandiæ* (1810), the first British work on botany which treated of plant arrangement in a truly philosophical spirit. In 1823 Sir Joseph Banks bequeathed to Brown his library and herbarium, which the latter handed over to the British Museum. In 1827 he became keeper of the botanical department of that institu-

tion. In the same year he discovered 'Brownian movements' (q. v.) In 1839 he was awarded the Copley medal of the Royal Society. Brown's *Miscellaneous Botanical Works* (2 vols.) were edited by J. J. Bennett.

**Brown, SAMUEL ROBBINS** (1810-80), American missionary, was born in Connecticut, and was graduated (1832) at Yale. He went as a missionary to China in 1838, and founded the Morrison Chinese School for boys at Canton, the first Protestant school in China, remaining at its head until 1847. Returning to the United States, he again visited the Orient in 1859, settling at Yokohama, Japan, in which country he was one of the earliest Protestant missionaries. He translated the Bible into Japanese, and published grammars of the Japanese language, besides numerous papers on Oriental subjects.

**Brown, SANGER** (1852), American physician, was born in Bloomfield, Ontario, Canada. After a course at the University of Belleville, Ont., he was graduated (1880) at the Bellevue Hospital Medical College, New York. He was assistant physician and medical superintendent of various psychopathic institutions in the East (1880-6), and in 1890 became professor of neurology at the Chicago Post-Graduate Medical School. He was professor of medical jurisprudence and hygiene at Rush Medical College (1892-7), associate professor of medicine and clinical medicine (1901-6), and has been professor of clinical neurology since 1901 at the College of Physicians and Surgeons of the University of Illinois.

**Brown, THOMAS** (1663-1704), English satirist, generally styled 'Tom' Brown, author of numerous dialogues and other miscellanies, was a native of Shropshire. As a student he distinguished—and extinguished—himself at Oxford by his rendering of Martial's epigram, which he applied to the dean of his college, beginning 'I do not love thee, Dr. Fell.' From Oxford he went to London, where he laid out his powers on jests and buffoonery, levelled principally at the distinguished men of the time.

**Brown, THOMAS** (1778-1820), Scottish metaphysician. Having studied law and medicine, in 1806 he became partner of the celebrated Dr. Gregory. Dugald Stewart, professor of moral philosophy in Edinburgh University, being in a declining state of health, Brown was appointed his colleague in 1810. His *Lectures* (21st

ed. 1870) were published shortly after his death, and were popular in Great Britain and the United States. In 1804 (new ed. 1824) he produced an elaborate *Inquiry into the Relation of Cause and Effect*, in defence of Hume. Brown was a disciple of the Scottish school of Reid and Stewart.

**Brown, THOMAS EDWARD (1830-97)**, English schoolmaster and poet, was born in Douglas, Isle of Man. After taking orders and serving as vice-principal of King William's College and master of the Crypt School, Gloucester (1858-61), he went to Clifton College, Bristol, where he was assistant master under Dr. Percival from 1864-93. His English poetry is full of sentiment and imagination, but has been little valued in proportion to its deserts, either before or since his death. His Manx poems, chiefly rollicking narratives in a racy dialect, were prompted by a passionate love of his native island, with every corner of which he was familiar, and to which he retired on leaving Clifton in 1893. His published works include *Betsy Lee* (1873); *Fo'c'sle Yarns*, etc. (1881; 2d ed. 1889); *The Doctor*, etc. (1887); *The Manx Witch*, etc. (1889); *Old John, and Other Poems* (1893); *Collected Poems* (with portrait), edited by W. E. Henley, H. G. Dakyns, H. F. Brown (1900); *Letters*, edited by S. T. Irwin (1900).

**Brown, WALTER FOLGER (1869- )**, American public official, was born in Massillon, Ohio. He was graduated from Harvard University in 1892 and from Harvard Law School in 1894, after which time he practised his profession in Toledo. He was appointed by President Harding to effect a reorganization of the Federal bureaus but his plan was so wide reaching that Congress has never accepted it. After serving as assistant Secretary of Commerce from 1927 to 1929, he became Postmaster General in President Hoover's cabinet.

**Brown, SIR WILLIAM (1784-1864)**, British merchant and banker, was born in Ballymena, Ireland. When he was sixteen he went to the United States, where he started his commercial career in the linen trade in Baltimore. In 1809 he returned to England, and established a branch of his firm at Liverpool, becoming, at the same time, a general merchant, and subsequently a banker, founder of the firm Brown, Shipley and Company. He acquired immense wealth, and a few years before his death gave £40,000 to erect the Public Library and Derby Museum in Liverpool, which was opened in 1860. He represented South Lancashire in Parliament

in 1846, 1847, 1852, 1857, and 1859, when he retired, and in 1863 was raised to the peerage.

**Brown Bess**, the English soldiers' name for the regulation bronzed flintlock musket formerly used in the British army.

**Brown Coal**, or LIGNITE, a variety of coal. See LIGNITE; COAL.

**Browne, CHARLES FARRAR (1834-67)**, better known as ARTEMUS WARD, American humorist, was born in Waterford, Me. At first a compositor, and then a reporter and contributor to various newspapers, in 1858 he began to write in the *Cleveland Plain Dealer*, under the title of 'Artemus Ward, showman.' His droll contributions, with their mixture of quaint spelling, keen wit, and shrewd common sense soon came to be widely read. In 1860 he left Cleveland for New York City, to work on a new comic paper, *Vanity Fair*, which, however, had only a brief existence. He then gave, in Brooklyn, N. Y., his first satirical lecture, *The Babes in the Wood*, which was conceived in a unique vein of humor, and in which the lecturer said nothing whatever about the 'Babes.' With this lecture he travelled (1862) over the plains and the Rocky Mountains, meeting with some adventures among the Indians and the Mormons, the latter of whom were utilized for future lecture material. From 1864 to 1866 ill-health prevented his lecturing, but in 1866 he visited England and opened his show with a panorama in the Egyptian Hall. His lectures excited roars of laughter, his wit being, to Englishmen, of a new and wholly unconventional type, but his health failed rapidly and he died at Southampton. Many of his sketches were published in volumes, respectively entitled *Artemus Ward, his Book* (1865); *Artemus Ward, his Travels among the Mormons* (1866); and *Artemus Ward in London* (1867). They were subsequently collected into a single volume, entitled *The Complete Works of Artemus Ward*, with a biographical sketch by Melville D. Landon (1875).

**Browne, EDWARD GRANVILLE (1862-1926)**, English Oriental scholar and lecturer, was born in Newcastle-on-Tyne. He studied medicine and science, but after a course of travel in Persia he abandoned the practice of science for the cultivation of Oriental languages. In 1888 he was appointed lecturer in Persian at Cambridge and in 1902-26 he was Sir Thomas Adams professor of Arabic. He published many valuable treatises, notably a Persian text of the history of the Báb, with an English translation and notes (1891), *The New History of Mirza Ali Muhammad the*

*Báb* (1893), *Catalogue of Persian Manuscripts in Cambridge University Library* (1896), a critical edition of Dawlatshah's *Tadhkira* (1901), *The Literary History of Persia* (1903), *The Persian Revolution of 1905-9* (1910).

**Browne, EDWARD HAROLD (1811-91)**, bishop of Ely and of Winchester, was born in Morton House, Buckingham, England. In 1832 he was a wrangler at Cambridge, in 1833 gaining the Crosse theological scholarship, in 1834 the first Hebrew scholarship, and in 1835 the Norrisian prize. From 1843 to 1849 he was vice-principal at St. David's College, Lampeter, and in 1857 vicar of Heavitree, Exeter, and canon of Exeter. In 1864 he became bishop of Ely, and in 1873 succeeded Wilberforce as bishop of Winchester, but resigned in 1890 on account of ill health. His best known works are *Exposition of the Thirty-nine Articles* (1850-3), which is a textbook for candidates for Episcopal ordination; *The Messiah* (1862); and *The Pentateuch and Elohistic Psalms* (1863), a reply to Dr. Colenso.

**Browne, GEORG, COUNT VON (1698-1792)**, Irish soldier of fortune, was born and educated in Limerick. Owing to the Catholic Disabilities Acts he entered first the service of Germany (1725), and afterwards the army of Russia (1730), and soon distinguished himself by suppressing a revolt of the Guards against the Empress Anna. He took part in various campaigns against Poland, France, and the Turks, in the latter being made prisoner and sold as a slave. Liberated through the influence of Ville-neuve, French ambassador at Constantinople, he returned to Russia, was made a general, and distinguished himself in the Swedish War (1742). At the beginning of the Seven Years' War he was severely wounded at the battle of Zorndorf. He was created a field-marshal by Peter III., and entrusted with the conduct of the war against Denmark. For the last thirty years of his life he was governor of Esthonia and Livonia.

**Browne, HABLOT KNIGHT (1815-82)**, English book illustrator, caricaturist and water-color painter, known as 'Phiz,' was born in Surrey. He was apprenticed to Finden, the engraver, and later attended an art school in London. He was chosen by Dickens (1836-7) to illustrate the *Pickwick Papers*, then being published, signing his pictures with the pseudonym 'Phiz,' as an appropriate compliment to the author's 'Boz,' and often making his illustrations from merely verbal descriptions. Numerous examples of his work occur in other novels (by Lever

and Ainsworth) and publications of the mid-Victorian era. Stricken with paralysis in 1867, he was kept from want by an annuity from the Royal Academy.

**Browne, JOHN ROSS** (1817-75), American traveller, was born in Ireland, and when a child was taken to America by his father, who settled in Kentucky. When eighteen years old, he made his way to New Orleans, where he worked for some time as a stenographer in the State senate. He then shipped for a long cruise on a whaler and on his return was for several years private secretary to Robert J. Walker, secretary of the treasury. After an unsuccessful trip to San Francisco, he visited Sicily and the Holy Land as a correspondent in 1851, and ten years later travelled extensively in Europe. He was U. S. minister to China (1868-9), and was at one time inspector of customs on the Pacific coast, and subsequently made investigations for the U. S. government as to the mineral resources and commerce of that region. Among his published works are *Elchings of a Whaling Cruise* (1846), *Yusef, or the Journey of the Fragi* (1853), *Crusoe's Island* (1864), *The Land of Thor* (1867), and *Adventures in the Apache Country* (1869).

**Browne, JUNIUS HENRI** (1833-1902), American journalist, was born in Seneca Falls, N. Y. He was graduated from St. Xavier College, Cincinnati, and engaged in newspaper work in that city until the outbreak of the Civil War, when he removed to New York, and became war correspondent of the *New York Tribune*. After various exciting adventures, he joined an expedition formed to run the Vicksburg batteries; in May, 1863, he was captured with his fellow-correspondent, Albert D. Richardson, and the two were confined for many months in various Southern prisons, finally escaping from Salisbury, N. C., late in 1864, bringing with them a list of Union soldiers who had died at Salisbury. After the war he was occupied as journalist and author, in New York City. His published works include *Four Years in Secession* (1865), *The Great Metropolis* (1869), *Sights and Sensations in Europe* (1871), and *Women* (1889).

**Browne, MAXIMILIAN ULYSSES, BARON DE CONNUS, COUNT OF MOUNTANY** (1705-57), Austrian field-marshal, nephew of Georg, Count von Browne, was born in Bâle. He early entered the Austrian army, and took part in the wars of the Polish succession (1733-8), in Italy (1734), against the Turks (1737-9), and was appointed commander-in-chief in Silesia. He fought in the War of the Austrian Suc-

cession, and was created a field marshal in 1749. At the beginning of the Seven Years' War he was in command in Bohemia, and unsuccessfully opposed Frederick II. at Kolin (1756), and the Saxons at Pirna (1756). In 1757 he distinguished himself in the battle near Prague, but was severely wounded, and died in Prague during the ensuing siege.

**Browne, ROBERT** (?1550-1633), English clergyman, founder of the religious sect of the 'Brownists,' was born in Tolethorpe, Rutlandshire. In 1572 he became a schoolmaster in London and an outdoor preacher, afterwards gathering at Norwich and elsewhere congregations who held with their leader that the church was not so much a witness of divine truth to enlighten the world, as merely a witness against the world. He was several times arrested and imprisoned, though occasionally and successfully interceded for by his relative Cecil, Lord Burghley; but at last, for refusing to appear before a bishop when cited, he was excommunicated, and was forced to flee to Holland (1581-4). Unwilling, however, to leave the Church of England, he discontinued his agitation; and after spending many years, first (1586) as schoolmaster of Stamford, and then (1591) as rector of a church, he died in Northampton jail, to which he had been committed for assaulting a constable. Consult John Browne's *History of Congregationalism in Norfolk and Suffolk*; Dexter's *Congregationalism of the Last Three Hundred Years*.

**Browne, THOMAS A.** See **BOLDREWOOD, ROLF**.

**Browne, SIR THOMAS** (1605-82), English physician, antiquary, and author of *Religio Medici*, was born in London. He studied in France, Italy, and Holland, receiving the degree of M.D. from the University of Leyden about the year 1633, and that of Oxford in 1637. In that year he settled in Norwich, where he practised as a physician all his life, living calmly amid the din and discord of the civil war, and maintaining an active correspondence with the antiquaries and scientists of his time. He was knighted by Charles II. in 1671. In 1840 his grave in St. Peter's, Mancroft, at Norwich, was discovered by some workmen, and his skull was placed in the hospital museum of the town. The *Religio Medici* ('Religion of a Physician') was written about 1634 for his own pleasure; but an edition having been published without his sanction in 1642, the next year he published an authorized edition, which was most successful. It reveals the pious musings of a man of simple faith on the things of spiritual life and

the mysteries of the unseen. In 1646 appeared his *Pseudodoxia Epidemica, or Enquiries into . . . Vulgar and Common Errors*, though he himself was a believer in alchemy, astrology, and witchcraft. In 1658 he published his *Hydriotaphia, or Urnburial*, which for richness of diction can hardly be paralleled by any work in the English language. To this work was appended the *Garden of Cyrus*, a quaint conceit, treating of horticulture from 'Adam's time to that of Cyrus,' and showing that the quincunx, or number five, is found 'in roots of trees, in leaves, and everything.' Several tracts on morals and antiquities, attributed to him, were published (1683; new ed. 1712) after his death. There was a notable edition of Browne's works by Simon Wilkin (4 vols. 1835-36); a recent one by Charles Sayle (3 vols. 1904-1907).

**Browne, WILLIAM** (1591-?1643), English pastoral poet, was born in Tavistock. He first attended Exeter College, Oxford, was next a student at the Inner Temple, then tutor to Robert Dormer, the future earl of Carnarvon. But little is known of his life. He was living at Dorking about the close of 1640. His great work is *Britannia's Pastorals* (books i., ii., 1613-16; reprinted 1625). A third book was printed by the Percy Society in 1852, and by W. C. Hazlitt in his collective edition of Browne's works for the Roxburghe Club (2 vols. 1868); which includes also *The Shepherd's Pipe* (1614), a collection of eclogues, a masque produced at the Inner Temple in 1615, sonnets, and 'visions' on the model of Du Bellay. Browne was an admirer and imitator of Spenser. Ben Jonson, Michael Drayton, and Selden were numbered among his friends. He wrote the epitaph, sometimes ascribed to Ben Jonson, on 'Sidney's sister.' His works were collected and printed in 1772.

**Brownell, HENRY HOWARD** (1820-72), American poet, was born in Providence, R. I. He was graduated (1841) from Trinity College, Hartford, and taught school in the South for a while, but returned to Hartford, and was admitted to the bar (1844). In 1847 he published a volume of *Poems*, and after 1849 he devoted himself altogether to literary work, which up to the Civil War, comprised principally the writing of popular histories. Some spirited verses on Farragut's general orders preceding the battle of New Orleans led the admiral to invite Brownell to witness the battle of Mobile Bay as acting ensign on the *Hartford*, which he did, describing it in his best known poem, 'The Bay

**Fight.** After the war he accompanied Farragut on his cruise to the ports of Europe, resigning in 1868, and returning to Hartford, where he died. Mr. Brownell published *Lyrics of a Day* (1864) and *War Lyrics, and Other Poems*, a final collection (1866). Dr. Holmes wrote warmly concerning Brownell's battle pieces.

**Brownell, WILLIAM CRARY** (1851), American author, was born in New York city, and graduated (1871) at Amherst. He was a member of the staff of the *N. Y. World* (1871-9), and subsequently art critic of the *Nation* (1879-81). After several years of travel and study abroad, he joined the N. Y. publishing house of Charles Scribner's Sons as literary adviser in 1888. He contributed occasionally to the magazines and published *French Traits: An Essay in Comparative Criticism* (1889), *French Art: Classic and Contemporary Painting and Sculpture* (1892), and *Victorian Prose Masters* (1901).

**Brownhills**, vil., Staffordshire, England (Brownhills from Cannock Chase), 5 m. N.N.E. of Walsall; has extensive coal mines. Pop. (1911) 16,856.

**Brownian Movements**, or **MOTIONS**, are rapid vibratory motions observed in microscopic particles, both vegetable and mineral, when suspended in water, and first noticed by the botanist Robert Brown in 1827. The movements have often been mistaken for vital motions; but they are still apparent when the liquid containing bacteria has been sterilized. Jevons has proved that solid matter of every kind, when finely divided, gives evidence of Brownian movements.

**Brownie**, a term in Scottish tradition signifying 'little brown one,' and applied to a race chiefly remembered as occupying a servile position in houses and on farms. A typical specimen was the brownie who lived at Strathmiglo in Fifeshire. 'Every day he used to cross the water of Miglo by stepping-stones, and acted as the useful drudge at the Tower of Cash; and all he asked in return was to feed out of any dish he chose.' Accounts vary, but the brownies are generally described as a naked people, with hirsute skins. Supernatural powers are also attributed to them. It would seem that they were an early European race, remembered in a dim and confused way by the peasantry. See GNOME, DWARFS, etc.

**Browning, ELIZABETH BARRETT** (1806-61), English poet, was born at Coxhoe, in the county of Durham, on March 6, 1806. Her girlhood was spent at Hope End in Herefordshire. From an early age an invalid—largely due to an accident to her spine—her

health gave chronic anxiety till she was thirty-four, when her nervous weakness was increased by the death of her only brother by drowning at Torquay. Six years later, however, she was (against her father's wish) married, in London, to Robert Browning, Sept. 12, 1846; and after the birth of

is—*Aurora Leigh*. It is possible, that this famous 'novel in verse' found a wider circle of readers; it is incredible, however, that the inner circle which loves poetry for its own beauty should rank that diffuse if beautiful work, or any other of the author's longer writings, with the matchless *Son-*

Mrs. Browning. From a Chalk Drawing by Field Talfourd.  
(Photo by Emery Walker.)

their son, in Florence, early in 1849, she gained a fresh lease of life. For many years the Brownings lived in Florence, with intervals of residence in London and Paris, and latterly at Rome; and it was in her loved Florence, the city of her *Casa Guidi*, that, on June 29, 1861, she died, after a frail life prolonged to the fifty-sixth year by the power of love and happiness.

It is often said that the most popular work of Elizabeth Barrett Browning was—even that it still

*nets from the Portuguese* (not, as implied by the title, a translation, but original with Mrs. Browning), the highest and finest expression, in English or any other literature, of a woman's love for a man. This, surely, is the lasting monument of England's greatest woman-poet. Already *Aurora Leigh* is among the masterpieces that are seldom read. Out of all the mass of Elizabeth Barrett Browning's poetry—none of it worthless, little of it uninteresting, most of it delightful, and

Doc. No. 22, 1928

some of it beautiful and fragrant with genius of a rare and lovely kind—one or two poems and lyrics, as the *Dead Pan* and *The Cry of the Children*, are as yet untouched by time.

Works.—*An Essay on Mind* (anonymous), and the privately-printed poem *The Battle of Marathon* (1826); *Prometheus Bound*,

*The Greek Christian Poets and the English Poets* (1863); *Selected Poems*, edited by Robert Browning (2d ser. 1866, 1880); *Letters to R. H. Horne* (2 vols. 1876-7); *Earlier Poems* (1826-33, 1878). Collected Works—2 vols., New York, 1871; 5 vols., London, 1890. Life.—The most accessible monograph is that by J. H. Ingram,

He is a leading exponent of the training of teachers. As a Liberal he contested unsuccessfully Norwood (1886), E. Worcestershire (1892), and W. Derby (1895). Chief works: *Modern England* (1879), *Modern France* (1880), *Aspects of Education* (1888), *Life of George Eliot* (1890), *Hist. of England* (4 vols. 1890), *The Citizen: his Rights and Responsibilities* (1893), *Charles XII. of Sweden* (1898), *Wars of the 19th Century* (1899), and many other works, mainly historical.

**Browning, ROBERT** (1812-89), by many held to be the greatest English dramatic poet since Shakespeare, and almost universally admitted to be one of the two greatest poets of the long and brilliant Victorian era, was born at Camberwell (then an outlying suburb of London), May 7, 1812. Browning had a happy childhood in a prosperous and well-ordered household, and enjoyed the careful training of affectionate and cultured parents. From boyhood he showed exceptional intellectual and literary tendencies, and when he was no more than twelve years old his father printed for him his poetic 'first-fruits,' under the title *Incondita*. He never went to a public school, nor to one of the great universities; though when his education by a private tutor was finished, he attended, during the session of 1829-30, a course of lectures at University College, London. The most important educational event in the youth of Browning was his sojourn, in his twenty-second year (1833-4), in Russia and Italy. His first publicly-printed poems appeared (above the signature 'L') in the *Monthly Repository* (1834). His earliest dramatic effort, *Strafford*, was produced by Macready at Covent Garden (May 1, 1837). From this date (by which time *Pauline* and *Paracelsus* had been published) Browning determinedly devoted himself to the art of poetry; and it is significant that the three greatest modern English poets—Wordsworth, Tennyson, and Browning—each consciously and scrupulously ordered life and circumstances to the one great end, never swerving, never despairing, never expending energy in any other direction. But the attention of the reading world was not easily won; and it must be admitted that the first important work (in the sense of size and ambition)—*Sordello* (1840)—was not likely to make way readily. Ordinary readers blamed for obtuseness by enthusiasts, may take consolation in the circumstance that Tennyson himself, friend and admirer though he was, 'could make nothing of it.' 'There are,' he declared in effect, 'only two lines in *Sordello* that I can understand

Robert Browning. From the Portrait by G. F. Watts, R.A.  
(Photo by F. Holtzer.)

etc. (1883); *The Seraphim* (1838); *A Drama of Exile*, and *Sonnets from the Portuguese*, etc., collected in *Poems* (2 vols. 1844; reprinted at New York as *A Drama of Exile*, etc., 1845); *The Runaway Slave at Pilgrim's Point* (1849); *Casa Guidi Windows* (1851); *Two Poems by E. Barrett and R. Browning* (1854); *Aurora Leigh* (1856-57); *Poems before Congress* (1860). Posthumous.—*Last Poems* (1862);

in the 'Eminent Women Series' (1888). See also T. H. Ward's *English Poets* (1883), Miles's *English Poets* (1899), *Dict. Nat. Biog.*, and other specialist critiques.

**Browning, OSCAR** (1837), English university lecturer in history, and principal of Cambridge University Day Training College. He graduated with classical honors in 1860. From 1860 to 1875 he was assistant master at Eton.

—the first and the last—and neither is true! (i.e. 'Who will, may hear Sordello's story told, and 'Who would, has heard Sordello's story told'). The publication, during 1841-6, of the remarkable series of dramatic and lyrical poems, in eight parts, collectively grouped under the title *Bells and Pomegranates*, was followed by his marriage, Sept. 12, 1846, to Elizabeth Barrett (see BROWNING, E. B.), already a poet far more widely known than himself. Their union was an ideal one, and in March 1849, a son was born to them in Florence, where they had settled in the winter of 1847, and which, with several breaks of varying intervals, remained their home till the summer of 1861, when Mrs. Browning died. Following this event Browning resided in London, though with frequent and often prolonged visits to Italy. In November of 1889 he joined his son at his former home in Venice, where he died on December 12. On the last day of 1889 his body was placed in the Poets' Corner, Westminster Abbey.

The greatness of Robert Browning as a poet is beyond dispute. The spiritual secret of his mastery is revealed in his words spoken of Shelley: 'I prefer to look for the highest, not simply the high.' Great as has been his moulding influence on the character and mind of a vast number of readers—to whom perhaps, in the main, the ethics of his poetry is of more import than its verbal beauty—he has also nobly enriched our literature with verse of enduring beauty for its own sake. Among many masterpieces—from *Pippa Passes* to the *Asolando* of his old age; from the superb verse of *Paracelsus* to the last 'flute-note with an accompaniment'—we may discern the figure of one who, beyond all cavil, is a great poet. His spiritual message, as distinct from his poetic achievement, can be summed up in one line (in the prologue to *Pacchiarotto*): 'Hope hard in the subtle thing that's spirit.'

His many works include:—*Incondia* (privately printed, 1824); *Pauline* (1833); *Paracelsus* (1835); *Strafford* (1837); *Sordello* (1840); *Bells and Pomegranates* (1841-6), in eight parts—viz. 'Pippa Passes' (1841); 'King Victor and King Charles' (1842); 'Dramatic Lyrics' (1842); 'The Return of the Druses' (1843); 'A Blot in the 'Scutcheon' (1843); 'Colombe's Birthday' (1844); 'Dramatic Romances and Lyrics' (1845); 'Luria,' and 'A Soul's Tragedy' (1846); *Christmas Eve and Easter Day* (1850); *Two*

*Poems by E. Barrett and R. Browning* (1854); *Men and Women* (2 vols. 1855); *Dramatis Personæ* (1864); *The Ring and the Book* (4 vols. 1868-69); *Balaustion's Adventure* (1871); *Prince Hohensteil-Schwangau* (1871); *Fine at the Fair* (1872); *Red Cotton Night-cap Country* (1873); *Aristophanes' Apology* (1875); *The Inn Album* (1875); *Pacchiarotto* (1876); *La Saisiaz* and *The Two Poets of Croisic* (1878); *Dramatic Idylls* (2 ser. 1879-80); *Jocoseria* (1883); *Ferishtah's Fancies* (1884); *Parleyings with Certain People* (1887); *Asolando* (1889-90). Collected editions of his complete works were published in 1895, 1898, 1909 and 1912.

Besides his original writings, Browning published a translation of the *Agamemnon* of Æschylus (1877). He also edited the forged *Letters of Shelley* (1852), *Selections from Mrs. Browning's Poems* (1866 and 1880), Mrs. Browning's *Poetical Works* (1889-90), and (in 1884) Rev. T. Jones' *The Divine Order*. Consult Chesterton's *Robert Browning*; Cooke's *A Guide Book to the Poetic and Dramatic Works of Robert Browning*; Clarke's *Browning and his Century*; Douglas's *Robert Browning*; Griffin's *The Life of Robert Browning*; Orr's *Life and Letters of Robert Browning*; Phelps' *Robert Browning*; How to Know Him (1915); Hermann's *The Faith of Robert Browning*; Sim's *Robert Browning, the Poet and the Man* (1923).

**Brownlists.** See BROWNE, ROBERT.

**Brownlow, WILLIAM GANNAWAY** (1805-77), American journalist, was born in Wythe County, Va. He was self-educated and from 1826 to 1836 was an itinerant Methodist preacher. In 1838 he became editor of the Knoxville, Tenn., *Whig*, which he conducted so aggressively as to be known as 'the fighting parson.' He was an advocate of slavery, but was opposed to secession and for this reason his paper was suppressed by the Confederate authorities in 1861 and the following year he was sent within the Union Lines. After the war he was reconstruction governor of Tennessee for two terms, and served as United States senator from that State, 1869-75, returning to Knoxville and the editorship of the *Whig*, at the expiration of his term. His publications include a book describing his ante-bellum experience and several brochures.

**Brown-Sequard, brour-sā-kār'**, CHARLES EDWARD (1817-94), physician and physiologist, was born in Mauritius, his father being a native of Philadelphia,

and his mother French. He was graduated M.D. at Paris in 1840, and devoted himself to physiological investigations, making numerous discoveries in the composition of the blood, animal heat, the spinal column and its maladies, the muscular system, and especially the nervous system. After acting (1859-63) as physician to the Hospital for the Paralyzed and Epileptic in London, he went to the United States, becoming professor of physiology and pathology at Harvard University, 1864-8. He returned to Paris in 1868, and became professor of pathology (1869-72), in the Faculty of Medicine but went again to the United States, practicing medicine in New York City, 1873-8. In 1878 he succeeded Claude Bernard in the chair of experimental medicine at the Collège de France, Paris. In addition to many essays and memoirs, he published *Lectures on Physiology and Pathology of the Nervous System* (1860) and *Lectures on the Diagnosis and Treatment of Paralysis of the Lower Extremities* (1861).

**Brown/son, ORESTES AUGUSTUS** (1803-76), American author and theologian, was born in Stockbridge, Vt. He was successively a Presbyterian, a Universalist, a Deist, and finally became a Roman Catholic. In 1838 he founded the *Boston Quarterly Review*, afterwards *Brownson's Quarterly Review* (1844-64), in which most of his writings appeared. He was a clear and vigorous writer, sincere in his beliefs in spite of frequent changes. His works include *Charles Elwood, or the Infidel Converted* (1840), an account of his religious experiences; *The Spirit-rapper: an Autobiography* (1854); *The Convert, or Leaves from my Experience* (1857); *The American Republic: Its Constitution, Tendencies, and Destiny* (1870). His collected works were published (1882-1907), and a *Life* (1898-1900), by his son, Henry F. Brownson.

**Brown Spar,** in mineralogy, a term applied to any light carbonate of lime, tinged by, or combined with, oxide of iron, such as ankerite, dolomite, magnesite, or siderite.

**Browntall Moth,** a European moth (*Euproctis Chrysorrhæa*) whose larvæ are exceedingly destructive to apple, pear, plum, oak, willow, elm, and maple trees. The adult female is pure white except the tip of the abdomen which is brown. Aside from its propensity to devour foliage the microscopic hairs on its body are often exceedingly poisonous to some people, producing a dermatitis similar to that caused by

poison ivy. It was first noticed in the United States in Somerville, Mass., in 1897 and methods were at once devised for its extermination. Cutting and burning of the winter webs before the caterpillars emerge in April, and spraying with arsenate of lead in mid-summer, are both effective means of control.

**Brownsville**, city, Tennessee, county seat of Haywood County, on the Louisville and Nashville Railroad; 55 miles northeast of Memphis. It is the seat of the Brownsville Training School for Boys, established in 1900. It is in a fertile fruit growing region and has manufactures of chemicals, flour and cotton products. Pop. (1910) 2,882; (1920) 3,062.

**Brownsville**, city, Texas, county seat of Cameron County, on the Rio Grande River, opposite Matamoros, Mexico, and on the Missouri Pacific and the Rio Grande Railroads. It has steamboat connection with Galveston and extensive trade with Mexico. Features of interest are the Courthouse, Customs House, the Roman Catholic Cathedral, and a Roman Catholic convent. It attracted country-wide attention on account of a shooting affray on August 14, 1906, when a party of men believed to be members of the Twenty-fifth U. S. Infantry (colored), stationed there, after much indiscriminate shooting killed one man. After failing to discover the real culprits President Roosevelt dishonorably discharged three companies of the regiment for this outrage, causing considerable bitter criticism. Pop. (1920) 11,791.

**Brown University**, an institution of higher learning in Providence, R. I., chartered in 1764. It owed its origin to the disabilities attaching to Baptist students in most of the existing American colleges, but, although by its charter a majority of its fellows and trustees must be Baptists, all religious tests and sectarian instruction are prohibited. In 1765 the college, originally called Rhode Island College, was opened at Warren, where the first president, James Manning, had established a Latin school, but in 1770 removed to its present site in Providence. Its work was interrupted by the Revolution, during which University Hall was used as a barracks and hospital for American and French troops. In 1804 the name was changed to Brown University in honor of Nicholas Brown, a generous benefactor.

During the presidency of Francis Wayland, D.D., 1827-1855, the university was reorganized and greatly developed. Under the presidency of E. Benjamin Andrews, D.D., 1889-98, the

number of departments was rapidly increased, old departments were expanded, and important additions were made to grounds and buildings. The Women's College, founded in 1891, became part of the university in 1897. It has its own dean, campus and buildings and is related to the university only through a common board of trustees and teaching staff. In the régime of William H. P. Faunce, D.D., LL.D., 1899- , the student body has been more than doubled, the endowment has been increased to nearly ten million dollars and such noteworthy buildings as the John Carter Brown Library of American History, the John Hay Library, the John R. Hegeman Hall of Residence, Rockefeller Hall, the Jesse Metcalf Chemical Laboratory and the Marston Hall of Languages have been added to the physical plant.

The university confers the degrees of A.B., Ph.B., B.S. (in engineering and chemistry), B.ED. (in the School of Education), A.M., SC.M., M.B.A. (Master of Business Administration); Ph.D., and D.P.H. (Doctor of Public Health). There are many scholarships for undergraduate work, several fellowships, and a loan fund available to needy students.

The John Hay Library and the department libraries contain more than 350,000 volumes. The John Carter Brown Library has the most complete collection in the world on the colonial history of North and South America. The McLellan Lincoln Collection is a close rival to the Lincoln Collection in the Library of Congress; and the Harris Collection of American poetry is among the finest of its kind. Other outstanding collections are the ones relating to Dante and Napoleon. For recent statistics see Table under the heading COLLEGE.

**Brownwood**, city, Texas, county seat of Brown County, on a tributary of Colorado River, and on the Gulf, Colorado, and Santa Fé and the St. Louis-Port Worth and Rio Grande Railroads; 125 miles northwest of Austin. It is the seat of Daniel Baker College (Presb.) and Howard Payne College (Bapt.). Manufactures include cotton and woollen goods, cotton seed oil, and flour, and there is an extensive export trade in wheat, hides, wood, pecan nuts, and petroleum. Pop. (1910) 6,967, (1920) 8,223.

**Bruay**, brü-ä, mining town, France, in the department of Pas-de-Calais, 6 miles southwest of Béthune. It is one of the few mining towns which remained in French hands during the Great War. Pop. (1921) 29,710.

**Bruce**. See ELGIN and KINCARDINE, EARLS OF.

**Bruce**, BLANCHE KELSO (1841-98), negro public official, was born a slave, of African descent, in Prince Edward County, Va. He was educated with his master's son and at the opening of the Civil War left the plantation, taught school in Missouri, studied at Oberlin, O., and by 1869 was a successful planter in Mississippi. He filled several local and State offices until 1875, when he was elected U. S. senator from Mississippi, being the second colored member in the National Senate. He was register of the U. S. treasury, 1881-5, and 1897-8, and in 1890 was appointed recorder of deeds for the District of Columbia.

**Bruce**, DAVID (1324-71), Scottish king, son of Robert Bruce (q.v.), whom he succeeded in 1329, when a mere child. In 1333 he was sent to France by his guardians but returned to Scotland in 1341 and soon made several unsuccessful raids into England. He was taken prisoner in 1346 and confined in the Tower of London, whence he was removed to Odiham, where he remained until 1357. He had no descendants and his later years were marked by various intrigues with England regarding his successor to the throne. Consult Dunbar's *Scottish Kings*.

**Bruce**, JAMES (1730-94), Scottish traveller, was born in Kinross, Stirlingshire. He was educated at Harrow, studied law, and after a brief career in business, in 1762 obtained a consulate in Algiers. After some two years during which he was involved in a series of disputes with the Algerian dey, he resigned, and in 1765 set forth on an archaeological tour through Barbary. In 1768 he undertook a journey to Abyssinia, and in November, 1770, found the sources of the Bahrel-Azrek, or Blue Nile, which was considered the main stream of the Nile. After remaining in Abyssinia about two years he made his way back to Alexandria. Returning to Scotland, he prepared for publication his *Travels to Discover the Sources of the Nile*, which appeared in 1790, in five large quarto volumes. His general accuracy, which was at first considered doubtful, has been verified by later travellers. Consult Murray's *Life of James Bruce* (1808).

**Bruce**, MICHAEL (1746-67), Scottish poet, was born in Kinrosswood, Kinross-shire. After attending Edinburgh University he became a school-master. His reputation rests mainly on the poem *Ode to the Cuckoo*, and on certain versified renderings

of Scriptural passages included in the Scottish Paraphrases; but his claim to the latter has been disputed by David Laing and J. Small, in favor of John Logan, a college associate, who edited his *Poems on Several Occasions* (1770). The question has given rise to a long and heated controversy, but the balance of authority is in favor of Bruce. See the *Lives* by MacKelvie (1837), Grosart (1865), and Stephen (1895).

**Bruce, ROBERT (1274-1329)**, king of Scotland, belonged to the Norman family De Bruis, which, in the person of Robert de Bruis, came to England with the Conqueror in 1066. This knight received large grants of land, chiefly in Yorkshire; and his son Robert, who was an associate of the prince who afterwards became David I. of Scotland, obtained the lordship of Annandale. The family thus held lands in both kingdoms, and this fact is the explanation of the somewhat tortuous policy pursued by them, as well as by others of the Norman barons whom David introduced into Scotland. At the battle of the Standard (1138), Robert Bruce, who had received the original grant of Annandale, fought on the English side; while his son, the third Robert, fought under David, and was taken prisoner, it is said, by his own father. The fifth lord of Annandale, Robert de Bruis (1210-95), was a competitor with John Baliol for the crown of Scotland in 1290, claiming the honor as a son of the second daughter of David I. But in 1292 Edward I. awarded the crown to Baliol; and Bruce, to avoid recognition of his rival's claims, resigned to his son, Robert de Bruis (d. 1304), his Scottish lordship of Annandale. This sixth lord in turn did fealty to Edward I., and fought on the English side when Baliol was forced to throw off the English yoke. He claimed the throne which Baliol relinquished; but Edward refused, and the claims of the house of Bruce were inherited by his son, the greatest of the family, ROBERT BRUCE, who at first followed the family policy. In 1296 he swore allegiance to Edward I.; but he changed sides so often that it is difficult to follow his devious career. In any case, the year 1306, which saw him finally break with Edward I., was the beginning of the salvation of Scotland. What the circumstances were which led him at Dumfries to murder Comyn, a nephew of Baliol, and a rival for the Scottish crown, are not clearly known; but the event meant at once a complete break with Edward I., who had favored Comyn, and the hostility of half of Scotland which held by Comyn. But from 1306 Bruce faced the diffi-

culties of his situation, and gradually won, by his ability and his success, the esteem and confidence of the people of Scotland, who had known many years of Edward's 'resolute' government. At first fortune was against him. He had himself crowned at Scone, where the poverty of his support was painfully apparent; but within a few months he was surprised at Methven, and defeated in the Highlands by the Lord of Lorn, an uncle of the murdered Comyn, and was forced to withdraw from Scotland and winter in the island of Rathlin, off the north coast of Ireland; while, to complete his misfortunes, his wife and his daughter Marjory were captured by the English, and his brother Nigel and many of his supporters were executed as traitors.

In 1307 the tide turned. Bruce landed at Turnberry, in Ayrshire, defeated the Earl of Pembroke at Loudon Hill, and made good his footing again in Scotland; and the great Edward I. died in the same year, and was succeeded by Edward II., who was incompetent to carry on the war against such a military leader as Bruce now proved himself to be. District after district owned Bruce's authority; castle after castle fell into his hands. English armies of invasion were checked by his policy of devastating the country before them; and the Scots soon gained strength and confidence enough to make counter-raids into England. In 1310 the Scottish clergy declared him their lawful king, and thus the ban of excommunication which rested on him was practically removed, and in 1313 Stirling Castle alone resisted his authority. This stronghold was sorely pressed by the king's brother Edward, who was induced rashly to accept a promise of its peaceful surrender if it was not relieved by the English before June 24, 1314. This meant a pitched battle between the two nations, on a site prescribed by the necessity of keeping the English out of Stirling, and the result was the disastrous defeat of the English at Bannockburn. From 1314 Scotland was free, and Bruce devoted himself to securing the formal recognition of the sovereignty he had won. He had to deal not only with obstinacy on the part of England, but with the influence of the Pope, who favored the English; but eventually he achieved his purpose, and by the treaty of Northampton (1328) the independence of Scotland was acknowledged. The ultimate success of Scotland resulted from his policy of carrying on offensive war against England in the northern counties and in Ireland. The king's brother Edward, who had

been offered the Irish crown by the chieftains of Ulster if he would assist them in expelling the English, landed on the island in May, 1315, and soon broke the power of the English. He was crowned king of Ireland after his victories in Ulster, but was himself killed at Dundalk in 1318.

Robert Bruce was as wise a king in peace as he was brave and skilful in war, and his policy was directed to the restoration of Scottish prosperity, and to the safeguarding of the land against English aggression. He encouraged the burghs, and first gave them a place in the Scottish Estates (Cambuskenneth, 1326); and he had the power to carry out as well as the wisdom to devise. His career may be summed up in the words of Professor Hume Brown: 'At the beginning of his great enterprise the probability is that he was prompted solely by the desire of making good the claims of his own house. But as his work grew and prospered he rose to the conception of a true patriot king.' He died at Cardross of leprosy in 1329, and was succeeded by his infant son David II. By his will his heart was to be buried in Jerusalem. It was entrusted to Sir James Douglas to carry thither; but Douglas was killed fighting against the Moors in Spain. Bruce's heart was saved, and being brought back to Scotland, was buried in Melrose Abbey.

**Brucea**, a genus of Simarubaceae, named in honor of the Abyssinian traveller, J. Bruce. It consists of shrubs with compound leaves, flowers in heads, four-merous flowers, succeeded by four drupes. The species are natives of Abyssinia, China, etc., and some of them possess properties similar to quassia, the seeds of *B. sumatrana* being used locally as a remedy for dysentery.

**Bruch, MAX (1838)**, German violinist, composer, and conductor, was born at Cologne. In 1865 he became director of the Musical Institution at Koblenz. From 1871 to 1873 he lived in Berlin, and afterwards at Bonn, devoting himself almost exclusively to composition. In 1878 he twice visited England, and in 1880 he succeeded Benedict as conductor of the Liverpool Philharmonic; but in 1882 he returned to Breslau, and in 1889 to Berlin. In 1883 he visited the U. S. where, at Boston, he conducted his oratorio *Arminius*. This one of his compositions is extremely popular in the U. S., having been sung twice at the Worcester (Mass.) festivals, and has also been heard in Philadelphia. His popularity rests upon his compositions for choir and orchestra, of which nearly a dozen have enjoyed great

favor, as *Szenen aus der Frühjohsaga*, *Schön Ellen*, *Odysseus*, *Arminius*, *Lied von der Glocke*, *Römischer Triumphgesang*, *Wes-sobrunner Gebet*, *Normannenzug*, *Salamis*, *Thermopylä*; though he has also written two operas—*Lorelei* (1863) and *Hermione* (1872)—music for Schiller's *Jungfrau von Orleans*, and many religious and secular pieces, including violin concertos and symphonies.

**Bruchsal**, tn. and important railway junction, grand-duchy of Baden, Germany, 21 m. s. of Heidelberg. It was formerly the residence of the archbishops of Spire, whose palace still remains. There is a large convict prison. Pop. (1900) 13,555.

**Brucine**, or DIMETHOXY-STRYCHNINE ( $C_{23}H_{26}N_2O_4$ ), is an alkaloid present in *nux vomica* and St. Ignatius's bean. It is a colorless crystalline solid, with a very bitter taste and similar properties to strychnine; but it is less poisonous, and gives a red color with nitric acid.

**Brucite**, a magnesian mineral associated with the serpentines; recently shown to be an important rock-forming mineral in this group. It is a soft, flaky mineral with pearly lustre and composition  $MgO_2H_2$ . The fibrous variety is called Nematite. It is abundant in the serpentines of Hoboken, N. J., from which locality it was first described in 1814—named after Col. Bruce.

**Brucker**, JOHANN JAKOB (1696–1770), German historian of philosophy, born at Augsburg; became a minister of the Reformed Church, but soon abandoned preaching for literature. His most important work is *Historia Critica Philosophiæ* (1742–44; new ed. 1766–7), a work of immense labor and high reputation; a portion of it was translated into English by W. Enfield (1837). In addition to this he wrote various other learned works, such as *Pinacotheca Scriptorum nostra Ætate Literis Illustria* (1741–55), etc.

**Brückner**, ALEXANDER (1834–96), Russian historian of German descent, born in St. Petersburg; was professor of history at the law school in St. Petersburg from 1861–7, and in 1872 was appointed professor of Russian history at the University of Dorpat, but lost the appointment when the university was Russified in 1891. Among his works are *History of the Russo-Swedish War from 1788–90* (1869, in Russian); *Kulturhistorische Studien: die Russen im Ausland, die Ausländer in Russland im 17. Jahrhundert* (1878); *Beiträge zur Kulturgeschichte Russlands im 17. Jahrhundert* (1887); *Die Europäisierung Russlands* (1888). He has also contributed the monographs *Peter*

*der Grosse* (1879) and *Katharina II.* (1883) to Oncken's collection *Weltgeschichte in Einzeldarstellungen*.

**Bruckner**, ANTON (1824–96), Austrian organist and musical composer, was born at Ansfelden, Upper Austria. In 1868 he was appointed organist of the imperial chapel at Vienna; professor at the conservatorium, and in 1875 lecturer on music at the university. Of his compositions, the best are his religious works—e.g. two masses, a *Te Deum*, etc. He has also written nine symphonies showing an ultra-Wagnerian tendency. His romantic symphony in E flat (No. 4) was given by the Philharmonic Society in New York, in March, 1888, his symphony in D minor by the Symphony Society in 1885, and in 1886 the Philharmonic Society performed the E major symphony (No. 7).

**Brudenell**, JAMES THOMAS. See CARDIGAN, EARL OF.

**Brüdergemeinde**. See MENNONITES; MORAVIANS.

**Brüderhof**. See MENNONITES.

**Brueghel**. See BREUGHEL.

**Bruelys**, DAVID AUGUSTIN DE (1640–1723), French dramatist and theologian, was born at Aix. Educated in the religious principles of the Calvinists, he engaged in controversy on their behalf; but being converted by Bossuet, he entered the Roman Catholic Church, and wrote religious pamphlets from the new standpoint. He is best remembered by his plays, some of them written in collaboration with Jean Palaprat (1650–1721), the chief being *Le Concert Ridicule* (1689), *Le Grandeur* (1691), *Le Muet* (1691). By himself De Bruelys wrote *Gabinie* (1699) and two or three other plays (some never performed), including *L'Avocat Patelin* (1706). His dramatic works were published in two volumes in 1712.

**Bruges** (Flem. *Brügge*), tn. and episc. see of Belgium, chief tn. of W. Flanders, 63 m. N.W. of Brussels and 8 m. inland from the North Sea, with which it is connected by two canals leading to Ostend and Sluis respectively, and by a third and much larger (230 ft. wide and 26½ ft. deep) one formally opened in 1907 at a cost of over \$7,500,000 to Heyst. From the 12th to the 16th century Bruges was the largest commercial city in the north of Europe, a centre for the English and Scandinavian trade as well as the emporium of Hanseatic and Venetian and other Italian merchants, and had at the height of its prosperity a population of 200,000. At the present time it is a quiet, quaint mediæval place, traversed by canals, with small houses turning their

gable ends towards the streets, and a great number of charitable and religious asylums, hospices, refuges, etc. The present cathedral (St. Salvator)—the old cathedral was destroyed by the French in 1799—is of all periods between the 12th and the 19th century. The church of Our Lady, also dating from the 12th century, contains the fine tombs of Charles the Bold, Duke of Burgundy, and his daughter Mary, wife of the Emperor Maximilian. Both churches, and also the church of St. James (13th to 19th century), are adorned with notable Flemish pictures; but the most valuable works of this description in Bruges are the small collection of Memlinc's pictures in the hospital of St. John. Amongst other public buildings are the Gothic town hall (14th century); the town chancellery (16th century); the famous belfry of Bruges (353 ft. high), built between the 13th and the 15th century, but equipped with its present carillon only in 1743; the museum and picture gallery, with valuable Flemish pictures; the museum of antiquities in the Gruuthuuse, a 15th-century structure; the 14th-century (Poorters Loge) archives, the municipal library, a former palace of the dukes of Burgundy, the law courts (with a magnificent 16th-century fire-

The Belfry of Bruges.

place), the chapel and museum of the Sacred Blood (12th century), and the Beguines' house (13th century). In the lower part of the belfry is an archaeological museum. Pop. (1838) 44,374; (1900) 51,657. The foundation of Bruges goes back to before the 7th century. Its citizens played a prominent part in the bloody 'Flemish Vespers,' and the succeeding defeat of the French

at Courtrai (1302). In the 15th century the sanding up of the seaway to and at Sluis, the growth of Antwerp, and the shifting of the centres of European commerce brought about by the discovery of America and the sea route to India, tended (with certain political causes) to weaken and destroy the commercial supremacy of Bruges. The independent yet turbulent spirit of its people was shown in 1488, when they kept prisoner for some months the Roman king (afterward emperor) Maximilian, and forced him to abdicate the government of Flanders. See W. C. Robinson's *Bruges* (1900).

**Brugsch**, HEINRICH KARL (1827-94), German Egyptologist, was born at Berlin. He was sent by the Prussian government to Egypt in 1853, where he joined Mariette in the Memphis excavations. Appointed assistant curator of Berlin Egyptological Museum (1855), he visited Persia in 1860, and acted as German consul at Cairo (1864-8), returning to the chair of Oriental languages at Göttingen. In 1870 he became head of the Khedive's school of Egyptology at Cairo. He visited the U. S. in 1876 as representative of the Egyptian Government to the Centennial Exposition in Philadelphia. On grounds of economy he was dismissed from his post in 1879, and afterwards resided principally in Germany, making a visit to Persia in 1884 as member of a German embassy, and again visiting Egypt on behalf of the Prussian government. He died at Charlottenburg. Of his numerous works on Egyptology (over thirty), the most important are *Egypt under the Pharaohs* (1877; trans. 1880); *Dictionnaire Géographique de l'Antienne Egypte* (1877-80); *Thesaurus Inscriptionum Egyptiacarum* (1882-91); *Religion u. Mythologie der alten Ägypter* (1884-8). See his *Mein Leben u. mein Wandern* (1894).

**Brühl**, HEINRICH, COUNT VON (1700-64), prime minister of Augustus III., elector of Saxony and king of Poland, whose position on the throne was established (1733) mainly by Brühl's assistance. From that date to 1746 he gradually got into his own hands the principal offices of state, and from 1746 ruled Saxony in his master's name. He brought the country to the verge of ruin, involving it in a war (1756-63) with Frederick II. of Prussia, who took his capital. After the death of the Elector Augustus, Brühl, dismissed by his successor, survived his master only three weeks. Brühl amassed great wealth, and his collection of 62,000 volumes forms part of the royal library at Dresden.

See two anonymous biographies, *Leben des Grafen von Brühl* (1760-1), and *Zuverlässige Lebensbeschreibung d. Grafen von Brühl* (1766).

**Bruises** are the result of laceration of subcutaneous tissues, the skin itself being unbroken. They commonly result from direct violence, such as a blow with a blunt weapon, a crush, or a pinch, but are also produced by sudden, violent muscular efforts. The softer the flesh the more easily it is bruised, and fatty tissues bruise easily; some diseases, such as anæmia, scurvy, and hæmophilia, predispose to it. In a bruise the discoloration is caused by hæmorrhage from capillaries and other small blood-vessels, the changes in color arising from the different stages of blood disintegration and absorption. In the case of a bruise of the eyeball the discoloration is red, the blood keeping its arterial color.

Medico-legal investigations frequently involve the question of bruising before and after death. It is held that a body may be bruised at any time within two hours after death, but far greater violence is necessary than that would be the case before death. A bruise visible on the surface, and produced before death, would be accompanied by more or less swelling; and on incision coagulated blood would be found, with discoloration of the skin proper. A body bruised after death shows no swelling; and on cutting into the bruise little coagulated blood is found, and the skin is not blackened. It must also be remembered that in the case of a deep-seated injury, received shortly before death, there might be no external sign; though, on cutting down, the hæmorrhage of a severe bruise might be found. A bruise may be distinguished from the post-mortem stain, due to hypostasis, by incision, when the bruise will show coagulated blood, and the post-mortem stain only a few bloody points. The position of the discoloration will also help a decision; for hypostasis is produced by gravitation, and occurs at those points upon which the weight of the dead body has been for some time pressing.

*Treatment* of a bruise depends upon the stage which it has reached. If firm elastic pressure can be applied immediately after the injury and maintained for twenty-four hours, the discoloration will be comparatively slight. The popular remedy of a piece of beef-steak applied to a bruised eye owes its virtue to the elasticity with which the raw meat can be fitted accurately into the orbit, and presses equally on the loose tissues of the eyelids, where other-

wise blood would find its way. A cold compress, said of lead lotion, is also useful, as helping toward coagulation and the stoppage of further subcutaneous hæmorrhage. Later, or if the bruise is already fully developed, frequent gentle massage over the part will greatly hasten the removal of the coagulated blood, and consequently of the disfigurement. Free movement of the part will also help, once the bruise has developed; but perfect rest is necessary if pressure has been applied with the view of preventing discoloration. In very severe cases of bruising, amounting practically to crushing, the flesh is sometimes so severely damaged as to be the seat of gangrene.

**Bulov**, or BRYLOFF, CONSTANTIN PAVLOVICH (1799-1852), Russian painter, born at St. Petersburg; spent six years in Italy, where he made copies from Raphael for the imperial house, especially good being the reproduction of the *School of Athens* (now in the St. Petersburg Academy). Between 1830 and 1833 he executed one of his greatest works, *The Destruction of Pompeii* (now in the Hermitage, St. Petersburg), and in 1834 the *Death of Inez de Castro* (now in the St. Petersburg Academy). On his return to Russia he was appointed (1836) professor at the St. Petersburg Academy. To this period belongs the great canvas *The Siege of Pskov* (now in the St. Petersburg Academy); but he confined his activity chiefly to portraiture and sacred painting, the most notable results being an *Assumption* (in the cathedral of St. Petersburg) and *The Apostles* and other frescoes (in the cathedral of St. Isaac at St. Petersburg). See Muther's *Hist. of Modern Painting* (1895-6).

**Brumaire**, the second month of the year in the French republican calendar, extended from October 22 to November 20 in the years I.-III. and V.-VIII. The 18th Brumaire of the eighth year of the republic (Nov. 9, 1799) is the date on which Napoleon overthrew the Directory and became first consul.

**Brummell**, GEORGE BRYAN (1778-1840), or BEAU BRUMMELL, English leader of fashion, was a friend of George IV. when prince regent. Owing to his gambling losses he fled (1816) to Calais, where he renewed his old course of life, and in Caen was cast into prison for debt; but being released, he was appointed consul (1830-2) at Caen, where he died in a lunatic asylum. Brummell is remembered for his readiness in repartee and for his fastidious neatness in dress, in which, however, he was not extravagant and foppish, but studiously moderate.

See Jesse's *Life of G. Brummell* (1844; new ed. 1886), Fitzgerald's *Life of George IV.* (1881), Bulwer's *Pelham* (1880), and Lister's *Granby* (1826).

**Brunanburh**, a place in the north of England, where Athelstan and his brother Eadmund, in 937, won a decisive victory over Anlaf of Dublin, Constantine of Scotland, the Celtic king of Northumberland, and the Northumbrian Danes, the battle practically establishing the unity of England for many years. The site of Brunanburh is uncertain, but it has been variously located in Northumbria, in Yorkshire, Bamber Bridge in Lancashire, and Bruns-ward or Birrenswark in Dumfriesshire. The battle was commemorated by a stirring alliterative ballad contained in the Anglo-Saxon Chronicle, and in the *Saga of Egil Skallagrimsson* (trans. by W. G. Green, 1893). The most spirited version is that of Lord Tenynson.

**Brunck**, RICHARD FRANÇOIS PHILIPPE (1729-1803), one of the greatest classical scholars of the 18th century, was born at Strassburg. After serving for some time in the Seven Years' War (1756-63), he took up (1760) the study of Greek, and from 1776 devoted the greater part of his income as receiver of taxes to the issue of editions of the Greek authors, with emendations of the text. These included *Analectica Veterum Poetarum Græcorum* (1772-6), *Anacreon* (1778), *Apollonius Rhodius* (1780), *Aristophanes* (1781-3), *Gnomici Poetae Græci* (1778), and *Sophocles* (1786-9).

**Brundisium**. See BRINDISI.

**Brune**, GUILLAUME MARIE ANNE (1763-1815), marshal of France under Napoleon, served in the army of the revolution under Dumouriez (1793). After establishing the Helvetic republic in Switzerland and the Batavian republic in Holland, and defeating the Duke of York at Bergen in Holland (1799), he was deputed in 1800 to suppress the Chouan rebellion. In the same year he was named commander-in-chief in Italy, and defeated the Austrians on the Mincio. In 1803 he was sent as ambassador to Constantinople, and during his absence was created (1804) a marshal. He was appointed French governor of the Hanseatic League towns in 1806, and captured (1807) Stralsund and Rügen. At Napoleon's first abdication he joined Louis XVIII., whom he deserted during the Hundred Days, but rejoined after Waterloo. He was murdered at Avignon by a royalist mob (1815). See *Vie de Brune* (1887); and Marmouit, *Le Maréchal Brune* (1900).

**Brunel**, British protectorate

in N.W. Borneo, between British N. Borneo and Sarawak. It was until 1888 an independent (Mohammedan) territory, and its sultan was at one time overlord of the whole island. The population is estimated at about 50,000. Area, 15,000 sq. m. Brunei, the capital, is mostly built on piles. The chief export is sago.

**Brunel**, ISAMBARD KINGDOM (1806-59), English civil engineer, was the only son of Sir Marc Isambard Brunel. He entered his father's office in 1823. He assisted in the two great undertakings—his father's block machinery and the Thames Tunnel (1825-43). Upon his own account he constructed (1831) Monkwearmouth Docks, and many other works of a similar character; and he designed (1831) the plans for the Clifton Suspension Bridge, though the bridge was not completed (1864) until after his death. His last great railway undertaking was the Royal Albert Bridge of the Cornwall Railway at Saltash (1853-9). Brunel was also one of the pioneers in the development of ocean steam-navigation. He designed the *Great Western* steamship, which was the first to make regular voyages (1838) across the Atlantic. He next built the *Great Britain*, the first large iron steamship which was navigated (1845) by the screw propeller. Under the auspices of the Eastern Steam Navigation Company, he began (1853) the construction of the huge *Great Eastern*. See the *Life of I. K. Brunel*, by his son, Isidore Brunel (1870).

**Brunel**, SIR MARC ISAMBARD (1769-1849), English engineer, was the son of a farmer and landowner in Normandy. Obligated to leave France in 1793 on account of his royalist opinions, he came to the U. S. and settled in New York as a civil engineer and architect. He was engaged in the survey of a canal between Lake Champlain and the Hudson River, designed and constructed the Bowery Theatre in New York, was appointed chief engineer of that city and prepared plans for its defence. In 1799 he returned to England, and persuaded the Admiralty to accept his designs for making ship blocks by machinery. The invention was perfected in 1806, and Brunel was awarded £17,000. In 1824 the Duke of Wellington accepted his plan for the construction at London of a tunnel beneath the bed of the Thames. The work was completed in 1843, with the assistance of his son. Brunel's inventions included machines for knitting, for ruling paper, for manufacturing nails, for making druggists' boxes, and for making seamless shoes for the

army. See Beamish's *Memoirs of Sir Marc Brunel* (1862).

**Brunelleschi**, FILIPPO (1377-1446), Italian architect and sculptor, was born at Florence. He promoted the restoration of the ancient classical style of architecture as a substitute for Gothic. His first great work was the church of San Lorenzo in Florence; and in 1418 he became architect of the unfinished cathedral of Florence, for which he designed the great dome, the largest in the world, imitated by Michael Angelo in the design for that of St. Peter's. He was also the architect of the Pitti Palace, and of the chapel of the Pazzi, Florence. See *Life*, by Manetti (ed. Milanese, 1887); and Scott, *F. di ser Brunelleschi* (1901).

**Brunetière**, FERDINAND (1849-1906), born at Toulon, member of the French Academy from 1893, is generally acknowledged to be the most influential of recent French critics. After 1875 he contributed regularly to the *Revue des Deux Mondes*, of which he was editor. His articles have been collected from time to time in series, entitled *Études Critiques sur l'Histoire de la Littérature Française* (6 vols. 1880-98), *Questions de Critique* (2 vols. 1889-90), *Essais sur la Littérature Contemporaine* (2 vols. 1892-5), and *Histoire et Littérature* (3 vols. 1884-87). He confirmed his reputation and achieved considerable popularity by four series of lectures dealing respectively with *Evolution des Genres dans l'Histoire de la Littérature* (1890), *Epoques du Théâtre Français* (1892), *Evolution de la Poésie Lyrique en France au XIX<sup>e</sup> Siècle* (2 vols. 1893; 3rd ed. 1900-1), and *Bossuet* (unpublished). He lectured in the U. S. in 1897. His work is characterized by wide and accurate knowledge, and it would be difficult to find his equal in tracing a tendency in literature, or in stating an author's relationship to his predecessors. He is an extreme classicist, holding that French literature attained its perfection in the reign of Louis XIV., and that earlier literature was but a preparation, and subsequent literature a decadence. He has, accordingly, hardly done justice to the middle ages, and, on the other hand, has not ceased to oppose, since his *Roman Naturaliste* (1883), the realistic school of modern literature. In his later years he wrote, though with little success, on moral and political questions. He will be best remembered by his application of the theory of evolution to the study of literature. His later publications include *La Science et la Religion* (1895); *Education et Instruction* (1895); *La Renaissance de l'Idéalisme* (1896); *La*

*Moralité de la Doctrine Evolutive* (1896); *L'Art et la Morale* (1898); *L'Idée de Patrie* (1897); *Les Ennemis de l'Ame Française* (1899); *Manuel de l'Histoire de la Littérature Française* (1898; Eng. trans.); *Discours Académiques* (1901); *Nouveaux Essais sur la Littérature Contemporaine* (1904); *Histoire de la Littérature Française Classique* (begun in 1905); *Sur les Chemins de la Croissance* (1905). Consult J. Lemaitre's appreciation in *Mes Contemporains*; Babbitt's *Masters of Modern Criticism* (1912).

**Brunhilda**, bröön-hil'dä, in the *Nibelungenlied*, queen of Iceland, wife of Gunther, who procured the murder by Hagen of Kriemhild's husband Siegfried (see *Nibelungenlied*). She is identified with one of the Valkyrie, in Norse mythology, whom Odin deprived of her divinity, and threw into a deep sleep, from which Sigurd awakened her.

**Brunhilda**, a Visigoth princess, was married (567) to Sigbert, king of Austrasia, and became (596) regent for her two grandsons in the rule of half the Frankish kingdom; Fredegond ruling the other half for Clotaire II. On Fredegond's death (598) she became sole Merovingian queen, but was deposed and put to death in 613.

**Bruni**, bröö-nî', island, Tasmania, in Storm Bay, and 20 miles south of Hobart Town; there is a lighthouse on the south end. Area, 160 square miles.

**Bruni**, LEONARDO (1369-1444), Italian humanist and historian, was born in Arezzo. He devoted his youth to the study of the classics, and was papal secretary under four popes (1405-15). He then retired to Florence, of which city he became historian, and chancellor (1427). His *Historiarum Florentinarum Libri XII* is a monument of research; while his *Commentarius Rerum suo Tempore Gestarum et Epistola Familiares* are full of interest for the history of the time. Though small in compass, the best known of Bruni's writings is the *Life of Dante*.

**Brünig Pass**, brü'nich (3,396 ft.), leads from the Swiss canton of Unterwalden and Lucerne to that of Berne, reached at Meiringen in the Hasli or Upper Aar Valley. It is extremely easy, and is traversed by a mountain railway.

**Brünn**, brün, town and episcopal see, capital of Moravia; 70 miles northeast of Vienna. It is at the foot of the Spielberg, an isolated hill rising 185 feet above the town, and crowned by the Citadel or Castle, which from 1621 to 1855 served as an imperial state prison, where, among other political offenders, Baron von der Trenck (1746-9) and the Italian poet Silvio Pellico (1822-

30) were incarcerated. Among the churches the most noteworthy are the Cathedral (fifteenth century) and the Gothic Church of St. James. There are also the handsome Meeting House (1876-81) of the Moravian Estates, National Industrial Art School, Technical High School, Picture Gallery, and the Blind Institute for Moravia and Silesia.

Brünn is a busy industrial town. Woolen factories are the most important; and the manufacture of machinery, leather, gloves, hats, chemicals, sugar, starch, spirits, brewing, dyeing, flour milling, and brick making are conducted on a large scale. The town was besieged, but in vain, by the Hussites in 1428; by the Bohemian King George Podiebrad in 1467; by the Swedes in 1645; by the Prussians in 1742; and by the French in 1805; the last named forced it to capitulate four years later. Pop. (1900) 108,944; (1911) 125,008—about one-half of Czech race, the rest mostly of Teutonic descent.

**Brunne**, brun, ROBERT OF. See MANNING, ROBERT.

**Brunnen**, bröön'en, summer resort, Switzerland, on the Lake of Lucerne; 20 miles southeast of Lucerne.

**Brunner**, bröön'er, ARNOLD WILLIAM (1857), American architect, was born in New York City, and was educated at the College of the City of New York and the Massachusetts Institute of Technology. He designed Mount Sinai Hospital, Columbia School of Mines, City College Stadium, and Students' Hall, Barnard College, New York City; U. S. Post Office, Custom House, and Court House, Cleveland, O.; the new State Department Building, Washington, D. C. He was president of the Architectural League (1903-04), and a member of the New York Art Commission (1908-10). He is a member of the National Academy of Design and the National Institute of Arts and Letters. Author of *Interior Decoration* (1891).

**Brunner**, HEINRICH (1840), German lawyer, was born in Wels, Upper Austria. In 1873 he became professor of the history of laws at the University of Berlin. His two principal works are *Die Entstehung der Schwurgerichte* (1872) and *Deutsche Rechtsgeschichte* (2 vols., 1887-92). His works on the history of German, Frank, Norman, and Anglo-Norman jurisprudence are also of great value.

**Bruno**, bröön'no, GIORDANO (?1550-1600), Italian philosopher, was born at Nola, in the kingdom of Naples. In his youth he was a Dominican monk, but fled (1576) to Switzerland on account of his heretical opinions. After spending two years (1577-

9) in Geneva, he proceeded to Toulouse, and finally (1581) to Paris, where, in 1582, he published a satirical comedy, *Il Candelaio*, in which he ridiculed several classes and professions. He next gave lectures on philosophy, and strongly attacked the Aristotelians. Thereafter he visited England (1583), where he contracted a friendship with Sir Philip Sidney, to whom he dedicated his next two works, the *Spaccio della Bestia Trionfante* ('Expulsion of the Triumphant Beast'), an attack upon Rome; and the *Cena delle Ceneri* ('Evening Conversations on Ash Wednesday'), defending the Copernican system of astronomy.

Bruno's *Della Causa Principio ed Uno* (1584) and his *Del Infinito Universo e Mondi* (1584) are his chief metaphysical works, and in these he develops a pantheistic system. He held that the infinite soul of God did not merely inhabit or pervade the universe, but that the universe was simply a manifestation of Him, and therefore itself divine. God was therefore, in the most literal and physical sense, all in all. Bruno's philosophy seems to have influenced Spinoza, Descartes, Schelling, and other thinkers. In 1586 he obtained a professorship at Wittenberg, where he published in 1587 his treatise *De Lampade Combinatoria Lulliana*. In 1592 he returned to Italy, but was at length arrested (1593) and imprisoned by the Inquisition. Refusing to recant his heresies, he was condemned to death, and was burned at the stake on Feb. 17, 1600. On the scene of his martyrdom, the *Campo dei Fiori*, a monument to his memory was unveiled in 1889. Consult works on Bruno by Bartholmèss, Bertl, Sigwart, Brunnhofer, Miss Frith, and L. M'Intyre; also J. A. Symonds' exposition of his teachings.

**Bruno**, St. (c. 1040-1101), was born at Cologne, and became a canon of Rheims, and a director of the schools of the diocese. With six companions he retired to the desert near Grenoble, and founded there the Carthusian order (1084). (See *CARTHUSIANS*.) Pope Urban II, summoned him to Rome; but after a few years of the papal court he retired (1094) into Calabria, where he founded a second Carthusian monastery at Della Torre. He was canonized in 1628. His day is Oct. 6.

**Bruno THE GREAT** (925-965), archbishop of Cologne (953) and duke of Lorraine (954), was the son of Henry the Fowler and brother of Otho I. A celebrated scholar and statesman, he reconciled his brother and the French court, and is credited with the authorship of a commentary on the Pentateuch, and of a work on the lives of the saints.

**Brunsbüttel**, bröons'bööt-el, fortified seaport town, Holstein, Prussia, at the mouth of the River Elbe; 15 miles east of Cuxhaven. The Kaiser Wilhelm Canal (q. v.) terminates in two locks at this place. Pop. 3,000.

**Brunswick**, brunz'wik (German *Braunschweig*), a sovereign duchy of the former German Empire, embracing five small enclaves and three larger divisions, surrounded by the provinces of Hanover, Saxony, and Westphalia. The northern division is fertile, and consists partly of undulating hills, offshoots of the Harz Mountains. It partly merges into the Lüneburg Heath. The two southern divisions belong to the Harz and Weser Mountains, while the River Weser crosses the western division. The leading industries are agriculture (especially cattle grazing and fruit growing), mining (lignite, iron, asphalt) in the Harz, and some manufacturing (chiefly sugar, sulphuric acid, beer, and spirits). The duchy includes extensive forests. Area, 1,424 square miles. Pop. (1910) 494,387, the majority being Lutherans.

Originally Brunswick formed part of the duchy of Saxony, but in 1235 the independent duchy of Brunswick was created. Subsequently, along with Hanover, Lüneburg, Celle, and other territories, it was transferred and reconveyed several times as the various Brunswick dynasties were founded and died out. The direct Welf (Guelf) line became extinct in 1884, and after 1885 the duchy was governed by a regent.

**Brunswick**, town, capital of Brunswick, Germany; 32 miles by rail southeast of Hanover. The central portions consist of the old town, built in typical German architectural style, surrounded by a chain of parks. Among the noteworthy public buildings are the Cathedral (1172), containing the tomb of Henry the Lion, duke of Saxony, and the Ducal Palace, with fine collections of pictures, majolica, and gems, among the finest in Germany. Spohr, the musician (1784), and the mathematician Gauss (1777) were born here, and Lessing died in the town (1781). The principal manufactures are jute spinning, printing, the manufacture of sewing machines, sugar, gold and silver wares. Pop. (1910) 143,534.

The town owed much of its importance to the fact that it stood at the intersection of the trade routes from the Rhine to the Elbe and from Hamburg to Leipzig, and to its alliance with the Hanseatic towns (1274).

**Brunswick**, city, Georgia, county seat of Glynn county, on St. Simon's Sound, and the Southern, the Atlantic Coast

Line, and the Atlanta, Birmingham, and Atlantic Railroads; 70 miles southwest of Savannah. It is connected by steamer with points north and south, and is a popular health resort. Features are the Shell Boulevards, St. Simon's Island and lighthouse, and Cumberland Island, according to the U. S. Census for 1914, there were 34 industrial establishments, with \$831,000 capital, and products valued at \$841,000. Industries include truck gardening, fishing, lumber mills, foundries, and machine shops, vegetable and oyster canneries, and box, carriage, and cigar factories. The town was founded by James Oglethorpe in 1735. Pop. (1900) 9,081; (1910) 10,182.

**Brunswick**, town, Cumberland county, Maine, on the Androscoggin River, and the Maine Central Railroad; 9 miles west of Bath. It is the seat of Bowdoin College (q. v.). The river here affords excellent water power, which is utilized in large paper, pulp, and cotton mills. Other manufactures are flour, general hardware, canned goods, boxes, and wooden articles. A bridge connects the town with Topsham, across the river. Brunswick was settled in 1628 under the name of Pejpepscot. Pop. (1900) 6,806; (1910) 6,621.

**Brunswick**, FRIEDRICH WILHELM, DUKE OF (1771-1815), fourth son of Duke Ferdinand, served in the Prussian army in the war against France (1792), and on the death of his father, in 1806, continued his opposition to Napoleon, who abolished the duchy of the Peace of Tilsit (1808). In 1809 he cut his way through Germany, shipped to Heligoland, reached England, and served under Wellington in the Peninsula. Reinstated in his duchy by the allies in 1813, he afterward took part in the campaign of 1814-15, and was killed at Quatre Bras.

**Brunswick Black**, a varnish composed of asphalt or pitch, linseed oil, and turpentine; used to give a glossy appearance to metal and other articles. *Berlin black* is a finer variety of the varnish.

**Brunswick Green**. See PIGMENTS.

**Brusa**, brö'sä, BRUSSA, or BROUSSA, town, Asiatic Turkey, at the base of Mount Olympus or Keshish Dag; 60 miles southeast of Constantinople. It has important silk manufactures, and produces fruit and wine. It is the seat of an archbishop of the Greek and of the Armenian Church. Near it are iron and sulphur springs, known formerly as Pithya. It is connected by rail (26 miles) with its port, Mudania. Under the name of *Prusa* it was the capital of ancient Bithynia. Pop. 110,000.

**Brush**, CHARLES FRANCIS (1849), American inventor, was born in Euclid, O., and was graduated from the University of Michigan (1869). He is the inventor of the Brush dynamo-electric machine (1876), the 'series' electric arc lamp (1878), and many electrical devices, chiefly for improving those two inventions. He is the founder of the Brush Electric Company, Cleveland, O. In 1881 he was decorated by the French government, and in 1899 was awarded the Rumford medal of the British Royal Society.

**Brush**, GEORGE DE FOREST (1855), American painter, was born in Shelbyville, Tenn., and studied at the Ecole des Beaux Arts, Paris. His early paintings depicted Indian life, but he subsequently devoted himself to figure painting and portrait groups in the style of the Dutch and Flemish schools. He received gold medals at the Chicago, Paris, Buffalo, and St. Louis Expositions. He is a member of the National Academy of Design and the National Institute of Arts and Letters. Among his works are: *The Moose Chase*; *The Indian and the Lily*; *The Silence Broken*; *The Artist*; *Mother and Child*; and numerous *Family Groups*.

**Brushes**. In the making of brushes, a great variety of materials are employed. For coarse work, twigs of broom, birch, heather, and rushes are generally used, as well as rope, yarn, and the fibre of cane, coconut, and many other plants. Scratch brushes for cleaning metal surfaces are made of wire; brushes for working in acids, of spun glass. Small brushes are known as pencils, and for these the carefully chosen hair of certain animals is utilized. For artists' pencils sable is the best and dearest, but the hair from the camel, the ichneumon, and the cow's ear is much used. Varnishing brushes are made from bears' fur; while badgers' hair, being long and elastic, is used for graining and gilding. By far the greatest number of brushes are made from pigs' bristles. (See BRISTLES.)

Brushes may be divided into *simple* and *compound*—the former consisting of one tuft, the latter of many. Simple flat or round brushes are made by fastening a bundle of arranged bristles into the specially shaped socket. In the manufacture of artists' brushes, the hairs, after cleaning, are arranged in bunches, the point being formed very carefully. The bunch is then tied and inserted in a quill which has previously been expanded by heating in hot water. On drying it contracts, holding the bunch securely. Metal caps are also used

in place of quills. Other brushes are made of broom corn and of feathers.

Compound brushes may be 'set' or 'drawn.' In the former, the tuft is fastened directly into the hole bored in the stock or head; in the latter, the bristles are bent double across a wire, which is then used as a loop to draw the tuft into position. Compound brushes are made chiefly by the Woodbury machine. Many materials other than wood—such as celluloid, ebonite, and metal—are used for stocks and handles. Bottle-brushes are made by fastening the bristles between two wires and allowing them to project on both sides. The wires are then twisted firmly together.

According to the U. S. Census of 1910, there were in the preceding year 1,282 establishments in the country producing brooms and brushes, with 12,153 wage earners, a capital of \$18,982,000, and products valued at \$29,126,000 (an increase of 38 per cent. since 1904).

In electro-technics, brushes are strips of copper or carbon rods which convey the current from the terminals of an electric motor to the commutator; or in the case of a dynamo, in the reverse direction. (See DYNAMO AND MOTOR.)

**Brush Turkey**, the popular name of *Cathartes lathami*, the largest of the megapodes. These birds are natives of Australia and

Brush Turkey.

the Pacific Islands, about the size of the common turkey, blackish brown in color, and construct mounds of loose soil, twigs, and leaves in which the eggs are laid. See MOUND BIRDS.

**Brussa.** See BRUSA.

**Brussels** (French BRUXELLES), the capital of Belgium, Brabant province, stands near the middle of the country, on the Senne River, and on the Willebroeck and Charleroi Canals; 27 miles by rail south of Antwerp, and 193 miles northeast of Paris. The modern city is handsome, and has a ring of fourteen large industrial suburbs (Schaerbeek, St. Josse ten Noode, Ixelles, St. Gilles, Molenbeek St. Jean, Laeken, Anderlecht, Koekelberg, Jette Saint

Pierre, Forest, Uccle, Watermael Boitsfort, Woluwe Saint Lambert, and Itterbeek), separated from it by wide boulevards, which also intersect the city. There is an extensive system of electric and steam tramways.

The city is divided by the river into the Lower Town—the old section—to the northwest, and the Upper Town—the new quarter—on the slope to the southeast. The Upper Town

The Conservatoire Royal de Musique (1876-7) contains a collection of rare musical instruments. The Picture Gallery is comparable in the richness of its collection to that of Antwerp. The massive Palais de Justice (1866-83), costing \$10,000,000, ranks first among the modern buildings. Important monuments are Poelaert's Doric column (147 feet high) in the Place du Congrès, commemorating the

Brussels and Environs.

contains the Royal Palace, the embassies, hotels, and fine residences; while the Lower Town is devoted chiefly to industry and commerce.

The Cathedral of St. Gudule (1220-1539), overlooking the Lower Town, is renowned for its statues, painted glass, and carved pulpit. In the Park (Upper Town) are the ministries of state and Belgian Houses of Parliament, at the northern end; and at the southern end, the Royal Palace and the palace presented to William II. in 1829 by the nation, and now used by the Academies of Science, Letters, Fine Arts, and Medicine. The Palace of Fine Arts and the Museum of Modern Paintings are both extremely rich in works by the great Flemish masters. East and southeast of the Park are the handsome and aristocratic quarters of Léopold and Northeast and the Avenue Louise. Still farther east are the Royal Museum of the Industrial and Decorative Arts (Palace of the Cinquantenaire), the Museum of Education, the Museum of Natural History, the unique Wiertz Museum, and the Museum of Forestry (opened in 1902).

Congress of 1831, and the elaborate monument to Egmont and Hoorn (1864).

In the Lower Town, approached by the steep Montagne de la Cour, an important shopping centre, is the picturesque old market place, with its guild houses, the sixteenth-century Maison du Roi (Brood Huis), now used by the municipal officials, and the Hôtel de Ville (fifteenth century).

Brussels with its suburbs is the seat of important industries, especially the manufacture of lace, furniture, bronzes, woolen, fine cottons, carriages, automobiles, bicycles, leather goods, beer, bricks, shoes, and cigarettes. There is connection by canal with the Scheldt, with Ostend, and with the Sambre; and an extensive port, under construction since 1900, is expected to be opened to seagoing vessels in 1914. Improvements on the Willebroeck and Charleroi Canals will be completed about the same time. In 1911-12, 11,223 vessels of 16,299,746 tons entered the port, and 11,243 vessels of 16,340,009 tons cleared.

Brussels is governed by a burgomaster, assisted by an

elective council. The city maintains 12 hospitals. The University of Brussels (q. v.), the Royal Academy of Fine Arts, the Royal Library, and the numerous museums are the most important educational institutions.

**Population.**—The population of Greater Brussels is 775,039 (1921). In 1911 it was 728,910; in 1900 it was 547,362.

**History.**—Brussels is said to have been founded in the sixth century. In the eleventh century it was chosen by the Duke of Lower Burgundy as his capital, and in 1477 it became the capital of the Austrian Netherlands. The town was foremost in the revolt of the Netherlands against Spain (1566–85). In 1695 it suffered a bombardment by Marshal Villeroi. From 1697 to 1794 it was again under Austrian dominion. Between 1815 and 1830 it was, alternately with The Hague, capital of the Netherlands, and in 1830 it became the capital of the new kingdom of Belgium.

Early in the Great War, on Aug. 20, 1914, the city was occupied by the Germans in their invasion of Belgium, the government having been transferred to Antwerp three days previously (see EUROPE, GREAT WAR OF). The city was reoccupied by the Belgian army on Nov. 18, 1918, and the sovereigns returned in state on Nov. 22.

Several international conferences have been held in Brussels. Here in 1874, at the call of the Emperor of Russia, there convened an important international conference on the laws and usages of war, generally known as the Brussels Conference. The United States took no part, but all the leading European states were represented. Its purpose was to ameliorate the conditions of civilized warfare, and it reached unanimity on the questions of combatants, non-combatants, spies, sieges and bombardments, prisoners of war, capitulations, armistices, flags of truce, and the legitimate means of injuring an enemy. Great Britain, however, refused to agree to any interference with the rules of naval warfare, and stood out for the rights of small states when invaded by demanding that conquest should be effective before it could be recognized, and by maintaining the right of a people to rise *en masse* in opposition to an invading army. (See BELLIGERENT.)

In 1876, Leopold, king of the Belgians, summoned to a conference at Brussels unofficial representatives of the Great Powers, in order to decide upon the best methods for the exploration and opening up of Africa to European trade and civilization. It resulted eventually in the creation of the

Congo Free State. In 1899–1900 another conference, for the suppression of the slave trade in Africa, took place here, and in 1892 Brussels was the meeting place of the International Monetary Conference. In 1910 the Brussels Exposition (q. v.) was held. Consult Gilliat-Smith's *Story of Brussels* (new ed. 1912).

**Brussels Carpet.** See CARPETS.

**Brussels Conference.** See BRUSSELS, *History*.

**Brussels Exposition,** an international exposition held in Brussels, Belgium, from April 23 to Nov. 7, 1910. The grounds in the Avenue Louise covered an area of 225 acres, and the buildings had a total floor space of 2,278,650 square feet. The three principal buildings were the Industrial, Machinery, and Railway Halls. Twenty-four foreign countries participated, the Belgian, French, German, British, and Italian exhibits being the most extensive. The Exposition was visited by nearly 13,000,000 persons, the largest attendance in any one day being 200,000. The total admission receipts were \$1,119,400.

On Aug. 14 the Belgian, British, and part of the French sections in the Industrial Hall were destroyed by fire. The loss was placed at \$10,000,000.

**Brussels Lace,** a lace of Brussels and its vicinity, famous since the seventeenth century. It was made in separate pieces, which were then woven together. The needlepoint (*point d'Aiguille*) was the most beautiful and expensive kind; the *point d'Angleterre* was made on pillows with bobbins.

Modern Brussels is manufactured by applying needles or bobbin-made flowers to a net ground, usually machine made; while the thread used is largely cotton, instead of linen, as formerly. See LACE.

**Brussels Sprouts,** a cultivated form of *Brassica oleracea*, is distinguished from the cabbage in the growth of small heads (each of them a miniature cabbage) in the axils of the leaves for the whole length of the stem, the leaves being cut away as the buds develop. Its cultivation is similar to that of the cabbage (q. v.), a deep rich soil being necessary to bring it to perfection. It is harder than cabbage, and makes its best growth in the fall. The seed should be sown about June, and transplanted to the field the last of July or first of August—about 20 inches apart in rows 2 feet apart.

**Brussels Sugar Convention.** In 1898 representatives of the powers met at Brussels to discuss measures for the abolition of bounties on sugar (see BOUNTY), but no plan was then agreed

upon. In 1902 another conference was held, and a convention, to take effect Sept. 1, 1903, was concluded. By the terms of this Convention all export bounties, direct and indirect, were abolished, and the excess of import duties over excise duties was limited to 53 cents per 100 pounds. The Convention was ratified by Germany, Austria-Hungary, France, Belgium, the Netherlands, Sweden, Italy, Spain, and the United Kingdom. Russia, Luxemburg, and Peru were subsequently admitted to the Convention.

The Convention was originally in force for five years from Sept. 1, 1903. It was renewed in 1907 and in 1912; but in the latter year Great Britain gave notice of her withdrawal because of opposition to the limitation by the convention of Russian export of sugar. The outbreak of the Great War rendered the Convention ineffective.

**Brussels, University of,** an institution of learning in Brussels, Belgium, founded in 1834. It consists of the faculties of philosophy and letters, science, law, and medicine, the Polytechnic School, the Schools of Political and Social Science, of Applied Sciences, and of Commerce, and an Extension Department giving instruction in many places. In 1922–3 the University had 2,110 students, and a library of over 80,000 volumes. It publishes *La Revue de l'Université de Bruxelles*.

**Brussiloff,** brus'i-lov, BRUSILOV, or BRUSILOFF, ALEXEI ALEXEIVITCH (1856– ), Russian general, was born in Kutais, Russian Caucasus, of a family which for many years stood high in the imperial service. Educated in the Russian military schools, he entered the Tver Dragoons stationed in the Caucasus. After the Russo-Turkish War (1877–8) he was made adjutant to Colonel Sukhomlinoff, head of the Officers' Cavalry School at Petrograd, and later entered the Imperial Guards, rising successively to the command of a regiment, a brigade, a division, and the Fourteenth Army Corps stationed at Lublin. From Lublin he was transferred to Warsaw (1912), where he was promoted to the rank of full general, and from Warsaw to Vinnitsa (1913), headquarters of the Twelfth Army Corps.

In the first months of the European War, General Brussiloff cooperated with General Ruskyy in driving back the Austrian forces under General von Auffenberg; and later at Lupkoff Pass in the Carpathians he defeated an Austrian force which was seeking to relieve Przemysl. In April, 1916, he succeeded General Ivanoff in

*died*  
*Mar. 17, 1926*

command of the forces from the Pripet Marshes to the Roumanian frontier, and in June opened the brilliant offensive which resulted in the occupation of Bukovina and much of Southern Galicia. In June, 1917, he was appointed to succeed General Alexieff as commander-in-chief of all the Russian armies. He resigned from this position early in the following August, and was succeeded by General Korniloff. He later accepted the Bolshevik rule, and cooperated with the soviet government to the extent of serving on its military committees.

**Brūt**, brōōt, a chronicle in 32,000 verses, written by Layamon (q. v.), recording the wanderings of Brut or BRUTUS, one of the heroes of Troy.

**Bruta**. See EDENTATA.

**Brütt**, brüt, FERDINAND (1849- ), German historical and genre painter, was born in Hamburg, and studied at the art institute in Weimar. His early canvases deal with peasant life—e.g., *A Peasant Deputation*, *The Hope of the Country*, *Rest Disturbed*. After 1880 he made a specialty of town life, and painted *Convicted* (Hamburg Museum), *Acquitted*, *A Difficult Choice*, *On the Stock Exchange*, *The Peasant in Court* (Berlin Museum), *In the Theatre Lobby*, and *The Installation of the Young Minister*. He has also painted portraits and religious pictures—*Christ Victorious* and *The Christ Night*.

**Brūt(ium)**, ancient name of the southern extremity or 'toe' of Italy. The sea coast was occupied by Greek colonies; the interior was held by the *Bruttii*, who were subdued by Rome in 272 B.C. In the Second Punic War they helped Hannibal, and after its conclusion their territory was confiscated, and they were declared public slaves. See CALABRIA.

**Brutius**, a Roman family of the Junian clan, of which the most famous members were:

(1) LUCIUS JUNIUS BRUTUS, son of M. Junius and Tarquinia, sister of Tarquinius Superbus. When Tarquinius murdered his possible rivals, in order to make sure his own position as king, Lucius saved himself by pretending to be an idiot; hence his name Brutus, 'the imbecile.' After the outrage on Lucretia (q. v.), Brutus vowed vengeance on the Tarquins, and roused the people to expel the King and his family. He became the first consul of Rome in 509 B.C., and executed his two sons, who were found guilty of a conspiracy to restore the Tarquins. He fell the same year, fighting against Aruns, son of Tarquinius.

(2) MARCUS JUNIUS BRUTUS (85-42 B.C.), was a nephew of

Cato, by whom he was imbued with a love of learning, which he retained throughout life. On the outbreak of the civil war in 49 he joined Pompey, and fought with distinction near Dyrrachium. After Pharsalia (q. v.), in 48, he asked and obtained pardon from Cæsar, who in 46 made him governor of Cisalpine Gaul. In 44 he was prætor, and Cassius prevailed on him to join the conspirators who murdered Cæsar on March 15. In 42 he and Cassius fought Antony and Augustus at Philippi (q. v.): in a first engagement, Brutus defeated Augustus, while Cassius lost to Antony; in a second, Brutus was completely defeated, and killed himself. Consult Plutarch's *Lives* and Cicero's *Letters*.

(3) DECIMUS JUNIUS BRUTUS ALBINUS, another of the murderers of Cæsar, the hero of 'Et tu, Brute!' In 49 he commanded Cæsar's fleet which took Massilia, where he remained true to Cæsar, in spite of Mark Antony's attempts to draw him into a plot against Cæsar's life. After Cæsar's death he went to his province, Cisalpine Gaul; but the coalition of Antony, Lepidus, and Augustus induced him to attempt to join Marcus Brutus in Macedonia. On his way he was betrayed by a Gaulish chieftain to Antony, who had him put to death.

**Brüx**, brüks (Czech. *Most*), town, Czechoslovakia, at the southern foot of the Erzgebirge; 45 miles northwest of Prague. It is the centre of rich coal fields, and has iron foundries and manufactures of sugar, agricultural machinery, and spirits. Pop. (1921), 27,239.

**Bruxelles**. See BRUSSELS.

**Bruyère, La**. See LA BRUYÈRE.

**Bry**, JEAN THÉODORE DE (1561-1623), son of Théodore Bry (q. v.), was born in Strassburg. As an artistic engraver he was better known than his father. He executed, in the form of a frieze, *The Triumph of Bacchus*, *The Triumph of Jesus Christ*, *The Marriage of Isaac and Rebekah*.

**Bry**, brē, or BRIE, THÉODORE DE (1528-98), Belgian goldsmith, engraver, and painter, was born in Liège. When a young man he lived for a time in London. With his sons, Jean Théodore (q. v.), and Jean Israël (d. 1611), he published several illustrated books of travel, the best known being *Collectiones Peregrinationum in Indiam Orientalem et Occidentalem* (6 vols. 1590-9). This monumental work was continued by his sons, being published in 19 vols. (1599-1634) with Latin text, but containing some parts in English, French, and German.

**Bry'an**, village, Ohio, county seat of Williams county, on the

Cincinnati Northern and the New York Central Railroads; 55 miles southwest of Toledo. It has manufactures of condensed milk, picture frames, automobile parts, electric washers, wheelbarrows, furniture, toys, candy, and wooden ware. Pop. (1910), 3,641; (1920) 4,252.

**Bryan**, city, Texas, county seat of Brazos county, on the Southern Pacific and the International-Great Northern Railroads; 100 miles northwest of Houston. The State Agricultural and Mechanical College is situated nearby. Cotton, cottonseed oil, carriages, and fertilizers are manufactured. Pop. (1910) 4,132; (1920) 6,307.

**Bryan**, CHARLES PAGE (1856-1918), American diplomat, was born in Chicago, Ill., and educated in the University of Virginia and the Columbian Law School, Washington, D. C., in which city he was admitted to the bar in 1878. He practised in Colorado in 1879-84, and served for two terms in the State legislature. In 1891-2 he visited Europe in the interest of the Columbian Exposition. He was a member of the Illinois assembly (1888-97) and colonel on the governor's staff (1887-96). He served as minister plenipotentiary to China (1897-8), Brazil (1898-1902), Switzerland (1902-03), Portugal (1903-10), Belgium (1910-11), and as ambassador to Japan (Aug., 1911-Nov., 1912). In 1913 he was decorated by the Emperor of Japan with the Grand Cordon of the Order of the Rising Sun.

**Bryan**, CHARLES WAYLAND (1867- ), American editor and public official, was born in Salem, Ill. He was for a time a traveling salesman, later became private secretary to his brother, William J. Bryan (q. v.), and in 1896 established with him the journal known as *The Commoner*. He was mayor of Lincoln, Nebraska, 1915-16, and a member at various times of the City Council. In 1922 he was elected governor of Nebraska. At the Democratic National Convention in New York City, July, 1924, he was nominated for Vice-President by acclamation on the first ballot. Mr. Bryan owns and operates two farms near Lincoln, and is particularly friendly to the agricultural interests of the country.

**Bryan**, ELMER BURRITT (1865- ), American educator, was born in Van Wert, O. He was graduated from Indiana University (1893), and studied at Harvard and Clark Universities. From 1897 to 1901 he was assistant and associate professor of pedagogy at Indiana University. In 1901-02 he served as principal of the In-

© Underwood & Underwood, N. Y.

WILLIAM JENNINGS BRYAN

Vol. II., facing page 352

VOL. II.—Oct. '25

sular Normal School, Philippine Islands, and in 1903 as superintendent of education for the Philippines. He was professor of psychology, Indiana University, in 1903-05, and president of Franklin College in 1905-09. In 1909 he became president of Colgate University. His published works include: *The Basis of Practical Teaching* (1905); *The Longer Life*; *Fundamental Facts for the Teacher* (1911).

**Bryan, NATHAN PHILEMON** (1872- ), American legislator, was born in Orange (now Lake) county, Florida. He was graduated from Emory College in 1893, and in 1895 was admitted to the Florida bar. In 1905-09 he was chairman of the Board of Control of the Florida State Institutions of Higher Education. He was U. S. Senator (Dem.) in 1911-17, and after 1920 a judge in the U. S. Circuit Court of Appeals.

**Bryan, WILLIAM JENNINGS** (1860-1925), American public official, orator, and editor, was born in Salem, Ill. He was graduated from Illinois College, Jacksonville (1881), and from the Union College of Law, Chicago (1883), practised law at Jacksonville (1883-87), and in 1887 removed to Lincoln, Neb. In 1891-95 he was a member of Congress, and in 1894-96 editor of the Omaha *World-Herald*.

In 1896 Bryan was a delegate to the National Democratic Convention at Chicago, in which he was a leader of the free-silver forces, and wrote the silver plank of the platform. His brilliant, impassioned speech, on this occasion, in which occurred the famous passage, 'You shall not press down upon the brow of labor this crown of thorns; you shall not crucify mankind upon a cross of gold,' contributed, it is generally believed, to his own unexpected nomination. He was subsequently nominated by the People's and National Silver Parties, also, and conducted a notable campaign. In the ensuing election he was defeated by William McKinley, who received 271 of the 447 electoral votes and 7,104,779 of the 13,607,704 popular votes. In 1900 Bryan was again the Presidential candidate of the Democratic and Populist Parties, and of the Silver Republicans, on an anti-imperialism and free-silver platform, and was again defeated by McKinley.

During the Spanish-American War (1898) Bryan raised the Third Nebraska Volunteer Infantry Regiment, and was commissioned its colonel. In 1901 he established at Lincoln the weekly political journal, *The Commoner* (changed to a monthly in 1913), which he subsequently edited.

For the third time, in 1908, Bryan was the Democratic can-

didate for President, on a platform which called for a lower tariff and the prevention of private monopoly. He was defeated by William H. Taft, who received 321 electoral votes out of 487, and a plurality of 1,271,837.

In 1912 Bryan was a delegate to the Democratic National Convention at Baltimore, where he was influential in securing the nomination of Woodrow Wilson for President. In March, 1913, he was appointed Secretary of State. In this office he aided in bringing about the recognition of the Chinese Republic by the United States and negotiated arbitration treaties with many governments. On June 8, 1915, he resigned his office because of President Wilson's policy toward Germany in the Great War of Europe (q. v.), which he believed to be detrimental to the promotion of international peace.

As a delegate-at-large to the Democratic National Convention of 1920, Bryan sought for the adoption of a 'dry' plank in the party platform but without success. Having removed to Miami, Fla., he was a delegate from that State to the Democratic Convention of 1924.

William Jennings Bryan played a prominent part in the movement for international peace, and his famous 'peace plan' led to the conclusion of arbitration treaties with more than thirty countries (see ARBITRATION, INTERNATIONAL). He was also an ardent temperance advocate and after his appointment as Secretary of State created much comment and not a little ridicule by serving grape juice instead of alcoholic beverages at diplomatic dinners. His appearance on the Chautauqua lecture circuit while a member of the Cabinet was also sharply criticised.

In his later years Bryan attracted much attention by his attacks upon the Darwinian theory of evolution, which he held was irrevocably opposed to the teaching of the Bible. He lectured widely on the subject, and published *The Menace of Darwinism and The Bible and Its Enemies* (1921) and *In His Image* (1922). Shortly before his death he volunteered his services to the State of Tennessee, in its prosecution of John T. Scopes on a charge of violating the law prohibiting the teaching of evolution in the schools of that State. He died suddenly of heart disease at Dayton, Tenn., July 26, 1925, a few days after the conviction of Scopes. He was buried in the Arlington National Cemetery.

Bryan's published works include: *The First Battle* (1897); *The Commoner Condensed* (1902); *Letters to a Chinese Official* (1906); *The Old World and Its Ways*

(1907); *Speeches* (1911); *A Tale of Two Conventions* (1912).

**Bryan, WILLIAM LOWE** (1860- ), American educator, was born near Bloomington, Ind. He was graduated (1884) from Indiana University, and studied at Berlin (1886-87), Clark University (1891-92), and Paris and Würzburg (1900-01). He was successively instructor in Greek (1884-85), professor of philosophy (1885-1902), vice-president (1893-1902), and president (1902- ) of Indiana University. He was president of the American Psychological Association in 1903; president of the National Association of State Universities in 1911-12; and in 1910 became a trustee of the Carnegie Foundation for the Advancement of Teaching. In collaboration with his wife, he edited *Plato the Teacher: Selections from Plato* (1897); *The Republic of Plato* (1898); *The Spirit of Indiana* (1917).

**Bryansk.** See BRIANSK.

**Bryant, JOSEPH DECATUR** (1845-1914), American surgeon, was born in East Troy, Wis. He was graduated from the Bellevue Hospital Medical College (1868); and was lecturer there in 1871-74, assistant demonstrator in anatomy in 1875-77, professor of anatomy after 1877, and of anatomy and clinical and orthopedic surgery after 1883; also professor of the principles and practice of surgery in University and Bellevue Hospital Medical Colleges after 1898. He was personal physician to President Cleveland. He wrote: *Operative Surgery* (1905); *American Practice of Surgery* (with A. H. Buck, 8 vols., 1906-11).

**Bryant, WILLIAM CULLEN** (1794-1878), distinguished American poet and editor, was born in Cummington, Mass., on Nov. 3, 1794, being descended on both sides from *Mayflower* Pilgrims. He attended Williams College for two sessions when sixteen years old; then studied law privately, was admitted to the bar (1815), and practised at Plainfield for one year, and at Great Barrington for nine. At an early age he began to write verse, his first work being published in Boston in 1808, *The Embargo, or Sketches of the Times*. In 1817 his famous poems 'Thanatopsis' and 'To a Water Fowl' appeared in *The North American Review*.

In 1825 Bryant removed to New York, where he was assistant editor of the *New York Review* for one year. In 1826 he joined the editorial staff of the *New York Evening Post*, and three years later became its editor-in-chief and principal owner, a position which he held for fifty years, until his death. As editor he supported the Democratic

Party generally until the nomination of Lincoln in 1860, to whom he gave his support. He died in New York on June 12, 1878. A statue to the poet's memory by Herbert Adams was unveiled in Bryant Park, New York City, in 1911.

As a journalist Bryant was among the most distinguished of Americans, and his prose style was simple, straightforward, vigorous, and marked by common sense and breadth of view. While editor of *The Evening Post* he made several trips to Europe, described in letters to his paper. These were published as *Letters of a Traveller* (1850), *Letters from Spain and Other Countries* (1859), and *Letters from the East* (1869). Of his numerous addresses on public occasions, a selection appeared in *Orations and Addresses* (1873). His translations of the *Iliad* and *Odyssey* into English blank verse were published in 1870-72.

Bryant is best known as a poet, however. To a tone of noble reflection on life and nature is added mastery of language and of metres. Writing with a restraint that sometimes gives the impression of coldness, he produced blank verse of a high order, and other poetry that gives him an enduring place in American letters. Among his well-known poems are 'A Winter Piece,' 'A Forest Hymn,' 'The River by Night,' 'Among the Trees,' 'Hymn to Death,' 'Life,' 'The Battlefield,' 'Death of the Flowers,' and 'The Song of Marion's Men.'

Bryant's son-in-law, Parke Godwin, prepared the final edition of *The Poetical Works and Prose Works of William Cullen Bryant*, and wrote the standard *Life*. Consult also John Bigelow's *Life* ('American Men of Letters' Series); Stedman's *Poets of America*; Burton's *Literary Leaders of America*; Bradley's *William Cullen Bryant* ('English Men of Letters' Series); W. P. Trent and John Erskine's *Great Writers of America* (1912).

**Bryce, GEORGE** (1844- ), Canadian author and educator, was born in Mount Pleasant, Brant county, Upper Canada. He was ordained a Presbyterian minister; was principal of Manitoba College from 1871 to 1884, and professor of English literature there from 1871 to 1909. He was one of the founders of Manitoba University and chairman of its science department (1891-1904); president of the Royal Society of Canada (1909); and a member of the Conservation Commission on Canadian Resources (1909-13) and of the Royal Commission on Technical Education (1910-13). His chief books are: *Manitoba: Its Infancy, Growth, and Present Condi-*

*tion* (1881); *Short History of the Canadian People* (1887; new ed. 1913); *Remarkable History of the Hudson's Bay Company* (1900); *Makers of Canada—Mackenzie, Selkirk, Simpson* (1905); *The Romantic Settlement of Lord Selkirk's Colonists* (1909); *The Scotsman in Western Canada* (1911); *Life of Lord Selkirk* (1912).

**Bryce, VISCOUNT JAMES** (1838-1922), British statesman,

© Harris and Ewing

Viscount James Bryce

diplomat, and man of letters, was born in Belfast, Ireland. He was educated at Glasgow, Oxford, and Heidelberg, was called to the bar in 1867, and entered the House of Commons in 1880. In 1886 he was Under-Secretary for Foreign Affairs in Gladstone's first administration; in August, 1892, when Gladstone was again in power, he became Chancellor of the duchy of Lancaster, with a seat in the Cabinet; and from May, 1894, to June, 1895, was president of the Board of Trade. The measures he was instrumental in placing on the English statute books include the International Copyright Act (1886), the Railway Rates Act (1894), and the Merchant Shipping Consolidation Act (1895).

During the Home Rule debates of 1886 and 1892, Viscount Bryce was a strenuous supporter of Gladstone's proposals. He was a member of the Royal Commission on the Medical Acts, and chairman for some years of the Commons Preservation Society and of the Royal Commission on Secondary Education. In 1902 he became one of the first fellows of the British Academy, and chairman of its historical and archaeological committee. In 1905-06 he served as Chief Secretary for Ireland in the Campbell-Bannerman ministry. From February, 1907, to November,

1912, he was British Ambassador to the United States. In 1913 he was appointed a member of The Hague International Prize Court; and on Jan. 1, 1914, was created Viscount Bryce of Dechmont. He served as chairman of the commission appointed by the British government in 1915 to investigate alleged German atrocities in Belgium, and made valuable reports, also, on other phases of the war.

In 1862 Viscount Bryce published *The Holy Roman Empire*, an expansion of his Arnold Prize essay, which placed him in the front rank of historical writers. He also wrote: *Two Centuries of Irish History 1601-1870* (1888); *Impressions of South Africa* (3d ed. 1899); *Studies in History and Jurisprudence* (1901); *Studies in Contemporary Biography* (1903); *Hindrances to Good Citizenship*; (1909); *South American Observations and Impressions* (1912); *University and Historical Addresses* (1913); *Modern Democracies* (1921); *International Relations* (1922). He is best known in the United States by his *American Commonwealth*.

**Bryce, LLOYD** (1851-1917), American author and diplomat, was born in Flushing, N. Y. He was graduated from Oxford University, and studied law at Columbia University. He was a member of Congress (1887-89), and was proprietor and editor of *The North American Review* from 1889 to 1896. In 1911-13 he was U. S. Minister to the Netherlands and Luxemburg; and was a delegate to the Second International Opium Conference. He wrote: *Paradise* (1887); *A Dream of Conquest* (1889); *The Romance of an Alter Ego* (1889); *Romance in Exile* (1893); *Lady Blanche's Salon* (1899); *The Literary Duet; After Christianity, What?*

**Brydges, GEORGE.** See RODNEY, GEORGE BRYDGES.

**Bryennios, brē-en'ni-os, PHILOTHEOS** (1833- ), Greek theologian, was born in Constantinople. He represented the Greek Church at the Old Catholic conference at Bonn in 1875, and was chosen metropolitan of Serres (1875), and of Nicomedia (1877). He is the editor of the *Clementine Epistles*, and the discoverer of the *Didachē, or Teaching of the Twelve Apostles*. See DIDACHÉ.

**Brym'ner, DOUGLAS** (1823-1903), Canadian archivist, was born in Greenock, Scotland. He went to Canada in 1857, settling in Montreal as a journalist. In 1872 he was appointed Archivist of the Dominion of Canada, continuing in office for thirty-one years. His collection of manuscripts—English and French, originals and copies—amounted to 3,155 volumes, and his reports, published by the Department of Agriculture, contained

abstracts of many valuable papers in the Canadian archives.

**Brynmawr**, brin-mär, town, Brecknockshire, Wales, on the London and Northwestern Railway; 8 miles southwest of Abergavenny. It has coal mines and iron works. Pop. (1911) 7,592.

**Bryn Mawr College**, a leading institution of higher education for women at Bryn Mawr, Pa.; 10 miles northwest of Philadelphia. The college was established through the gift of Dr. Joseph W. Taylor, who purchased the site and left the greater part of his estate to the college. It was incorporated in 1880, and instruction was begun in 1885. The general scheme of instruction is based on the university model. Three classes of persons are admitted—graduate and undergraduate students and hearers. Graduate Departments of Education and of Social Economy and Social Research were opened in 1913 and in 1915.

There are twenty fellowships of the value of \$810 awarded annually in various departments, the holders of which must reside in the college, wear academic dress, and assist in examinations, and one resident research fellowship of the value of \$1,200 for research in physics or chemistry. Twenty graduate scholarships of the value of \$350 each are offered to graduate students next in rank to the fellows. There are several other graduate scholarships varying in value from \$350 to \$550; and nine graduate scholarships (established in 1909), of \$720 each, open to women of British, German, French, Spanish, Italian, Swiss, and Scandinavian nationalities. In addition, three European fellowships of \$500, one of \$700, and one of \$1,500, are open to graduate students to defray the cost of one year's study at a foreign university. Hearers must be women of at least twenty-five years of age, who have at some time pursued studies included in the matriculation examination. They receive no degrees. Candidates for the degree of master of arts must be graduates of Bryn Mawr, or must have completed a course corresponding to the Bryn Mawr undergraduate course in a college or university of good standing. The doctor's degree may also be conferred upon graduates of other institutions. Residence in the college buildings is required of undergraduates. For recent statistics see Table of American Universities and Colleges under the heading COLLEGE.

**Bryology**, the study of MOSSES (q. v.).

**Bryony**. In Europe, two unrelated climbing plants are known by this name. One is the

white-rooted *Bryonia dioica*, of the gourd family, with white flowers and palmate leaves, with tendrils at their bases, and red berries in fall; its root has pur-

White Bryony.

1, Male flower; 2, female flower; 3, fruit.

gative properties. The other, or black bryony (*Tamus communis*), known also as Our Lady's Seal, belongs to the yam family, and has tiny greenish flowers and elliptical red berries; the leaves are heart shaped.

Black Bryony.

1, Male flower; 2, female flower; 3, fruit.

**Bryophytes**. See MOSSES.

**Bryozoa** ('moss animals'), a name of the POLYZOA (q. v.).

**Bryum**, a large genus of common mosses, forming small, dense patches on damp earth and rocks. The capsules are pear-shaped, with a double row of transverse teeth, and are pendent at the end of the stems.

**Brzesc**. See BREST LITOVSK.

**Brzezany**, bzhe-zhá'ni, town, Galicia; 31 miles southwest of Tarnopol. In the course of the Great War it was occupied by the Russians (September, 1914), but was evacuated a year later towards the end of their great retreat. Pop. (1900) 11,244; (1911) 12,626.

**Brzeźny**, town, Russian Poland, Piotrkov government; 14 miles east of Lodz. It has woollen manufactures. Pop. 8,000.

**B. Th. U.**, or BRITISH THERMAL UNIT, is the unit quantity of heat employed by engineers. It is the amount of heat required to raise the temperature of 1 lb. of water from 49° to 50° F., and is mechanically equal to 778 foot-pounds of work.

**Buballs**. See HARTE-BEEST.

**Bubas'tis**, once a famous city, now a heap of ruins (TELL BASTA), in the Nile delta, Lower Egypt; 1 mile from Zagazig, capital of Sherkhújah province. It was the PI-BESETH of Ezekiel xxx. 17, and is described from personal knowledge by Herodotus under its Greek name of Bubastis. It had a magnificent temple to the goddess Bast, the Egyptian Artemis, which was a place of pilgrimage. It was captured by Mentor, the general of Artaxerxes III., and began to decay after the foundation of Naucratis, and especially after the foundation of Alexandria. The ruins of its great temple were discovered by M. Naville in 1887, and extensive excavations next year revealed that Bubastis was once the seat of a great Hyksos settlement.

**Bubble-shell** (BULLA), a genus of gasteropod molluscs in which the oval shells are thin, with a concealed spire, and usually prettily marked with blotches of color on a pale ground. The species are widely distributed in both tropical and temperate seas, in shallow water.

**Bubble, South Sea**. See SOUTH SEA SCHEME.

**Bubo**. See OWL.

**Bubo**, an inflammatory swelling of a lymphatic gland in any part of the body. The term is usually confined to swelling of the glands of the groin. Buboes are divided into (1) *simple*, due to inflammation of a gland through ordinary irritation from an inflamed surface; (2) *specific*, an abscess inoculated with the pus of a chancre; and (3) the indolent enlargement of the lymphatic glands which accompanies the development of the initial sore of syphilis.

**Treatment** includes rest in bed, hot fomentations, baths, opening freely, curetting, and antiseptic dressing. Should such treatment fail, the diseased glands must be excised.

In the most frequent form of plague, buboes appear early, situated in neck or groin, for the most part. Hence the term 'bubonic plague.' See PLAGUE, BUBONIC.

**Bubonic Plague**. See PLAGUE, BUBONIC.

**Bucaramanga**, bōō-kā-rā-māng'gā, capital of the depart-

ment of Santander, Colombia, on the Lebrija River, at an elevation of 3,250 feet. It is one of the three great coffee markets of Colombia, and is also an important centre for tobacco and cotton. Iron, copper, and gold, and allied minerals are found in the region. The streets are wide, and the city is lighted by electricity. It has a Pedagogic Lyceum founded in 1912, and a School of Arts and Crafts. Pop. (1912) 19,755.

*cannée*, and the hunters *boucaniers*. Eight years later, Spain destroyed this settlement; but the adventurers returned in force, and thenceforward, for about seventy years, were the terror of the Spaniards in that part of the world. The British conquest of Jamaica in 1655 gave the buccaneers a new headquarters. New Segovia, in Honduras, was taken and sacked in 1654; Maracaibo and Gibraltar, on the Gulf of Venezuela, were

thirty-nine vessels, crossed to the mainland, traversed the isthmus, and took and burned the rich town of Panama, with circumstances of great cruelty and outrage.

A second time the outlaws took Porto Bello. In 1680 they again crossed the Isthmus of Panama, took Santa Maria, and embarked on the Pacific under John Coxon. Defeating a Spanish squadron, various bands, under Sharp, Watling, and Sawkins, pushed south to the coasts of Peru and Chile, and returned to Cape Horn. In 1683 Van Horn, with six vessels and 1,200 men, plundered Vera Cruz.

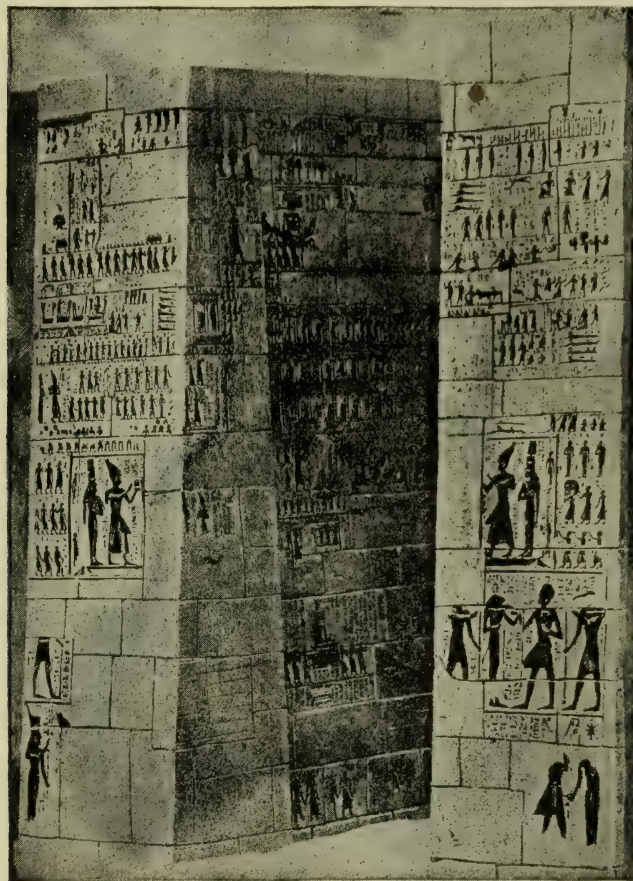

Another body of priates, under John Cook, in 1683 went by Cape Horn, picked up at sea a vessel which had been sent out to them by English sympathizers under the command of one Eaton, and after Cook's death served under Edward Davis and Swan in the Pacific, pushing up to Panama, and being there joined in 1685 by more buccaneers, who had crossed the isthmus—one body under Grognet and L'Escuyer, and another under Townley and others. They won extraordinary successes, but fell out among themselves, the result being that the French and English deserted each other.

The buccaneers were further divided by the war which broke out between Great Britain and France in 1689, and in 1697 they were very roughly handled by a combined English and Dutch fleet outside Cartagena. After the Treaty of Ryswick they were discountenanced by both England and France, and from that time they gradually disappeared, although bands of pirates lingered on at Providence in the Bahamas. William Dampier (q. v.), the navigator (later in the royal navy), served with Cook, Davis, and Swan. See **FILIBUSTER**; **PIRACY**.

Consult Burney's *History of the Buccaneers of America*; Stockton's *Buccaneers and Pirates of Our Coasts*; Masefield's *On the Spanish Main*; Dampier's *Voyages* (2 vols.); Brand's *Free Lances*; Roche's *By Ways of War*; Pyle's *Adventures of Pirates and Sea Rovers*; Esquemeling's *Buccaneers of America*; Haring's *Buccaneers in the West Indies in the Seventeenth Century*; Johnston's *Famous Privateersmen and Adventures of the Sea*.

**Buccinum**. See **WHELK**.

**Buccleuch Family**, buk-klōō. The Border house of the Scotts of Buccleuch is traced back to Sir Richard le Scot, a man of distinction in the reign of Alexander III. of Scotland. He died in 1320, and from him was lineally descended Sir David Scot of Branxholm, who sat in the Parlia-

BUBASTIS.—Gateway of the Temple of Osarkon II.

**Buccaneers'**, or **FILIBUSTERS**, piratical adventurers of divers nationalities who preyed upon Spanish trade and property in the West Indies and on the neighboring mainland in the seventeenth century. The buccaneers were originally smugglers, who made San Domingo and Tortuga their headquarters. San Domingo was full of wild cattle, and the buccaneers took their name from the grating or barbecue on which the flesh was roasted, which in the Indian language was called a *boucan*. The flesh was called *viande bou-*

plundered; and Providence, in the Bahamas, was settled by the freebooters. The leaders among the earlier buccaneers were Montbars and Olonnais, Frenchmen, Mansvelt, and Henry Morgan (q. v.), a Welshman.

Morgan distinguished himself especially by the capture and sack of Porto Bello; but his successes, directed from Jamaica, induced Great Britain and Spain, in 1670, to conclude a treaty, in virtue of which buccaneering was to be suppressed. Morgan and his friends revolted against this, and in 1671, with a fleet of

ment held by James III. at Edinburgh in 1487, under the designation of 'Dominus de Buccleuch,' being the first of the family so designated. His grandson was Sir Walter Scott of Branxholm and Buccleuch, who figures in the *Lay of the Last Minstrel*, written by his famous namesake. The first 'Lord Scott of Buccleuch' was Sir Walter Scott, warden of the Western Marches, who is celebrated for his rescue of one of his attendants, 'Kinmont Will,' from the castle of Carlisle. He was elevated to the peerage in 1696 as Lord Scott of Buccleuch, and afterwards won distinction in the Netherlands under Maurice, Prince of Orange. The title Earl of Buccleuch was granted in 1619 to one of the family who served as commander of a regiment under the states of Holland against the Spaniards. The granddaughter of this Sir Walter, Anne, Countess of Buccleuch, married, in 1663, the Duke of Monmouth, illegitimate son of Charles II., and they were created Duke and Duchess of Buccleuch. The duke's honors were forfeited on his execution in 1685, but those of the duchess in her own right remained unaffected by the attainder. Upon her death, in 1732, her grandson Francis succeeded to the title of Duke. One of the branches of the Buccleuch family was that of Harden, which produced the Scotts of Raeburn, ancestors of Sir Walter Scott. In 1914 John Charles Montagu-Douglas-Scott succeeded to the dukedom as 7th Duke.

**Bucentaur**, bū-sen'tōr, the name of the state galley of the republic of Venice, in which the dogs annually, from 1311 to 1789, on Ascension day, 'married the Adriatic,' in token of Venetian supremacy over the seas. This custom is traced to a naval victory gained on Ascension day in 1177 by Doge Sebastiano Liani over the emperor Frederick Barbarossa. The last *Bucentaur*, made in 1722-9, was burned by the French in 1798.

**Bucephala**, bū-sef'a-la, a city on the Hydaspes (the Jhelum), in Northern India, founded by Alexander the Great in 326 B.C., in honor of his horse Bucephalus.

**Bucephalus**, bū-sef'a-lus, favorite charger of Alexander the Great, which died on the banks of the Hydaspes in Northern India in 326 B.C.

**Bu'cer**, or BUTZER, MARTIN (1491-1551), German reformer, was born in Lower Alsace. He entered the Dominican order at fifteen, but was converted in 1518 by Luther and the writings of Erasmus to the reformed faith. In 1521, having been released

from his monastic vows, he became court preacher to the Elector Palatine, and in 1523 pastor in Strassburg, which was henceforth the centre of Protestant learning. In the controversy between Luther and Zwingli concerning the eucharist, Bucer endeavored to steer a middle course, although he and his followers were inclined to support the views of Zwingli, with the result that he incurred Luther's stern disapproval. He brought about the conference at Marburg (1529), at which he attempted unsuccessfully to reconcile Luther and Zwingli; and attended the Augsburg Diet, but being unable to accept the Interim, he went, at Cranmer's invitation, to England, where he was a lecturer at Cambridge University until his death. In 1556, in the reign of Queen Mary, his body was exhumed and publicly burned. His *Correspondence* with the Landgrave Philip of Hesse was published by Lenz in 1880-91.

**Buch**, bōōk, CHRISTIAN LEOPOLD VON, BARON VON GELMERSDORF (1774-1853), Prussian geologist, was born in the castle of Stolpe, in the Uckermark. He contributed largely to the development of geological science, though his extreme view of the Vulcanian theory of the origin of the earth's crust is no longer tenable. In 1815 he accompanied the botanist Smith to the Canaries, and published *Physikalische Beschreibung der Kanarischen Inseln* (1825). Besides this he wrote *Beiträge zur Bestimmung der Gebirgsformationen in Russland* (1840) and *Betrachtungen über die Verbreitung und die Grenzen der Kreidebildungen* (1849). He prepared an admirable geognostic chart of Germany in forty-two sheets (2d ed. 1832), and wrote monographs on the Terebratula (1834), Spirifers (1838), Leptæna (1842), and Ceratites (1849). A complete edition of his works appeared in 4 volumes in 1867-85.

**Buchan**, buk'an, district, now included in Banffshire and Aberdeenshire, Scotland, lies between the rivers Deveron and Ythan. The coast line of 40 miles is mostly bold and rocky, especially at the Bullers ('boilers') of Buchan, 6 miles south of Peterhead, a huge vertical well into which the sea rushes by a natural archway. It was formerly a haunt of smugglers.

**Buchan**, ALEXANDER (1829-1907), Scottish meteorologist, became secretary to the Scottish Meteorological Society in 1860, and after 1878 was curator of the library and museum of the Royal Society of Edinburgh. His works include, *Handy Book of Meteorology* (1867), *Introductory Text-*

*book of Meteorology* (1871), and *Atmospheric Circulation and Oceanic Circulation* ('Challenger' Reports for 1889 and 1895).

**Buchan**, DAVID (1780-?1837), British explorer. In 1818 he and Lieut. John Franklin received the command of two vessels, the *Dorothea* and the *Trent*, with the charge to find a way from the Atlantic to the Pacific Ocean. Buchan, however, was unable to get beyond Spitzbergen. He was appointed high sheriff of Newfoundland in 1825, and a few years later sailed into northern seas, but never returned.

**Buchan**, ELSPETH (1738-91), Scottish religious enthusiast, was the daughter of a Banffshire innkeeper. Having pretended to miraculous powers, she and her followers were expelled from Irvine, and established themselves near Closeburn, Dumfriesshire. According to Robert Burns they held community of goods and of women.

**Buchan**, JOHN (1875- ), Scottish historian and novelist, was born in Perth. He was educated at Glasgow University and at Oxford, entered the publishing business, and became a member of the firm of Thomas Nelson & Sons. He was private secretary to the High Commissioner for South Africa from 1901 to 1913, was on the Headquarters Staff of the British Army in France in 1916 and 1917, and was Director of Information under the Prime Minister in 1917 and 1918. His publications include *Sir Quixote* (1895), *Musa Piscatrix* (1896); *A History of Brasenose College* (1898); *The Half-hearted* (1900); *The Watcher by the Threshold* (1902); *A Lodge in the Wilderness* (1906); *Prester John* (1910); *Sir Walter Raleigh* (1911); *Salute to Adventurers* (1915); *Greenmantle* (1916); *The South African Forces in France* (1920); *Francis and Riversdale Grenfell* (1920); *A Book of Escapes and Hurried Journeys* (1922); *A History of the Great War* (1921-2).

**Buchan**, WILLIAM (1729-1805), Scottish physician, a native of Ancrum, Roxburghshire, practised medicine in Ackworth (Yorkshire), Sheffield, Edinburgh (c. 1766), and after 1778 in London, where he was well known for his medical skill, convivial habits, and great benevolence. His chief work, *Domestic Medicine* (1769), the first English book of its kind, reached its twenty-first edition in 1813.

**Buchanan**, bū-kan'an, village, Michigan, on the St. Joseph River, and on the Michigan Central and the Pere Marquette Railroads; 27 miles south of Benton Harbor. Manufactures include high speed machine tools, motor truck axles, and tractors. Pop. (1910) 1,831; (1920) 3,187.

**Buchanan, FRANKLIN** (1800-74), American naval officer, was born in Baltimore, Md. He entered the navy as a midshipman in 1815, served some years at sea, became lieutenant in 1825, and master-commandant in 1841. In 1845 he was chosen by the Secretary of the Navy to organize the Naval Academy at Annapolis, and for two years was its superintendent, leaving this position to take part in the Mexican War, during which he participated in the capture of Vera Cruz. He went with Perry's expedition to Japan, 1852-55, was made a captain in 1855, and became commander of the Washington Navy Yard in 1859. He entered the Confederate Navy in 1861, commanded the *Merrimac* in the attack on the Federal fleet in Hampton Roads, and for his gallantry was promoted to admiral of the Confederate Navy. He commanded the *Tennessee* in the battle of Mobile Bay (1864) and was wounded and taken prisoner, but was exchanged the following February. After the war he was for a time president of the Maryland Agricultural College.

**Buchanan, GEORGE** (1506-82), Scottish historian and scholar, was born in Killearn, near the southeast shore of Loch Lomond. In 1520-22 he studied 'the humanities' at the University of Paris, was later a student at St. Andrews (B.A., 1525), and in 1526 returned to Paris, where he entered the Scottish College and obtained the M.A. degree (1528). For some years he held a professorship in the college of Sainte Barbe, but in 1535 returned to Scotland, where he was engaged by King James V. as tutor to one of the king's natural sons, James Stewart, later abbot of Kelso. A satire entitled *Somnium*, in which the ignorance and depravity of the monks were held up to contempt, brought Buchanan into great disfavor and when, at the instigation of the king, he published two others, *Palinodia* and *Franciscanus*, he was arrested and imprisoned. Escaping, he fled to England and then to France, where he taught in Bordeaux and in Paris. In 1547 he went to Coimbra, Portugal, and there taught in the newly established University, but his Protestant views were looked upon with suspicion by the Portuguese clergy and he was confined in a monastery, where he began his beautiful translation of the Psalms into Latin. In 1551 he was released, returned to England, and then went to France. His tragedy *Jephthes*, written at this time, he dedicated to the Maréchal Comte de Brisac, who appointed the writer tutor to his son. In 1561 Bu-

chanan again returned to Scotland, and was thereafter successively classical tutor to the young Queen Mary, principal of St. Leonard's College, St. Andrews (1566), and moderator of the General Assembly of the Reformed Church of Scotland (1567), of which he had become a member about 1562. His sympathies were consequently all on the side of the Protestant lords in their revolt against Queen Mary; and his sentiments were displayed with much arrogance and vehemence in his *Detectio Maria Regina* (1569).

On the assassination of the Regent Moray (1570), the queen being now a prisoner to her cousin Elizabeth, Buchanan was chosen as one of the preceptors of the boy-king, to whom he afterwards dedicated his *De Jure Regni apud Scotos* (1579), and who owed to this erudite instructor the scholarly attainments which distinguished him in after life. The closing event of his life was the publication (1582) of his famous *History of Scotland*. Two editions of his works have been published, one edited by Ruddiman (2 vols. 1715), and one by Burman (1725). Consult Irving's *Life of Buchanan*; P. Hume Brown's *George Buchanan, Humanist and Reformer*.

**Buchanan, JAMES** (1791-1868), fifteenth President of the United States, was born, of Scotch-Irish descent, near Mercersburg, Pa., on April 23, 1791. He was graduated from Dickinson College, Carlisle, Pa., in 1809, was admitted to the bar in Lancaster, Pa., in 1812, and soon became prominent both as a lawyer and as a political leader, being first a Federalist and afterward a Jackson Democrat. From 1821 to 1831 he was a representative in Congress; in 1831-3 he was U. S. minister to Russia, negotiating a commercial treaty with that country (1832); and from 1833 to 1845 was a member of the U. S. Senate, in which he showed ability in debate but did not connect his name with any measure of lasting importance. He was Secretary of State in the cabinet of President Polk (1845-9), during a period marked by the Oregon boundary treaty, the annexation of Texas, and the Mexican War. From 1853 to 1856 he was U. S. minister to Great Britain, and during this time was one of the signers of the Ostend Manifesto (q. v.). In the national Democratic conventions of 1844, 1848, and 1852, he had received votes for the presidential nomination; in that of 1856 he was nominated, and in the ensuing election he defeated his Republican opponent, Frémont, by 174 to 114 electoral votes.

Buchanan's administration (1857-61) covered a particularly trying and critical period in the history of the country, and his policy has been severely criticised, perhaps often unjustly so. He was a conservative man, personally opposed to slavery but believing that unadvised interference by the North in the domestic concerns of the South was bound to create a state of affairs dangerous to the peace and prosperity of the nation. His cabinet was divided in its sympathies, some of its members being outspoken secessionists. Buchanan himself denied the right of secession and in this he remained firm, but being a man of mediocre attainments he wished as far as possible to proceed along the line of least resistance and therefore determined to leave to his successor the weathering of the storm then brewing.

During his administration diplomatic affairs were on the whole handled satisfactorily; the success of the Atlantic cable was first assured; Minnesota and Oregon were admitted to the Union; the Dred Scott decision was rendered by the Supreme Court. Upon the actual outbreak of hostilities Buchanan reorganized his cabinet, surrounding himself with men of strong character and ability, such as J. S. Black, John Dix, and Edwin M. Stanton, under whose influence he displayed greater firmness and confidence in the handling of affairs. Consult Buchanan's own defence of his policy, *Mr. Buchanan's Administration on the Eve of the Rebellion* (1866); Curtis' *Memoir* (2 vols.); Rhodes' *History of the United States from the Compromise of 1850* (5 vols.); *The Works of James Buchanan* comprising his Speeches, State Papers, and Private Correspondence, edited by John Bassett Moore.

**Buchanan, ROBERT CHRISTIE** (1811-78), American soldier, was born in Baltimore, Md., and was graduated (1830) from West Point. He served in the Black Hawk, Seminole, and Mexican Wars, and in the Civil War, during which he took part in the siege of Yorktown, in the battle of Gaines' Mills, the second battle of Bull Run, and in the Maryland and Rappahannock campaigns. He was appointed brigadier-general of volunteers in November 1862, and for his services at Manassas and Fredericksburg he was brevetted major-general U. S. A. in 1865.

**Buchanan, ROBERT WILLIAMS** (1841-1901), English poet, novelist, and dramatist, was born in Warwickshire, of Scottish parents, and was educated at the University of Glasgow. His first volume of poems, *Undertones*,

appeared in 1860; but he rose to a much higher level in his *London Poems* (1866), in which the life of the poor of London is vividly, humorously, and pathetically described. Among his subsequent poetical works are *The Book of Orm* (1870), *Balder the Beautiful* (1877), *The City of Dreams* (1888), and *The Wandering Jew: a Christmas Carol* (1893).—A complete edition of his verse was published in 1901. His miscellaneous works include *The Land of Lorne* (1871), *David Gray* (1868), and *The Hebrid Isles* (1882); his novels, *The Shadow of the Sword* (1876), *God and the Man* (1881), *The New Abelard* (1884), *The Heir of Linne* (1888), *Rachel Dene* (1894), and *The New Rome* (1899). In conjunction with H. Murray, he also wrote *The Charlatan* (1895). As a playwright he achieved success with *Lady Clare*, *Sophia*, and *Joseph's Sweetheart*.

**Buchanan**, WILLIAM INSCO (1853–1909), American diplomat, was born near Covington, O., settled in Sioux City, Ia., in 1882; and organized and managed the first four 'corn palace' exhibitions there. He was Minister to Argentina, 1894–1900; deciding arbitrator in the Argentina-Chile boundary dispute, 1899; director-general of the Pan-American exposition, Buffalo, 1901; delegate to the 2d and 3d Pan-American conferences, 1901–2 and 1906; first U. S. Minister to Panama; delegate to the Hague Peace Congress, 1907; High Commissioner at the inauguration of the International Court of Justice at Cartago, Costa Rica, 1908; High Commissioner to Venezuela, 1909; and, at the time of his death, agent for the United States in the one case at the Hague Court between the United States and Venezuela which had not been settled by his diplomacy.

**Buchanites**. See BUCHAN, ELSPETH.

**Bucharest**, bōō-ka-rest', or BUKHAREST, city, capital of Roumania, is situated on both banks of the Dimbovitza, in the midst of a fertile plain, 30 miles north of the Danube. Modern fortifications surround the city, and twelve bridges span the river here. On the right bank stands the old town, with many monuments and ruins; on the left is the modern city, including the business section. Although many of the streets are narrow and crooked, the city as a whole is attractive. There are several beautiful public gardens, the most noteworthy of which are the Cismegiu and the Shoseaua Kisselef, and the Strada Lipsicani and the Calea Victoriei are fine thoroughfares. Notable public

buildings are the Royal Palace, National Bank, National Theatre, Post Office, Athenæum, Art Gallery, Library, University, and Law Courts. Of churches, mention may be made of the Cathedral (1656), which occupies a commanding site above the city, the Domnita Balasa, in Byzantine style, lavishly decorated; St. Spiridon (rebuilt in 1890); and the chapel Stravropolos, small, but a gem of Byzantine art. Bucharest is the seat of a university (founded in 1864), two Greek-Orthodox seminaries, an academy of arts, a conservatory of music, and the Roumanian Academy of Sciences.

Manufacturing is yet in its infancy, but commerce is well developed, Bucharest being the distributing centre for Roumania, as well as for some parts of the Balkan Peninsula. The population, which is mixed, numbers 308,987 (1917).

In 1698 Bucharest became the capital of Wallachia. It was pillaged by the Serbians in 1716, and was occupied by the Russians in 1769, by the Austrians in 1789, by the Russians again in 1828 and in 1853, and again by the Austrians in 1854. In 1862 it became the capital of Roumania. A number of important treaties have been signed in Bucharest. Negotiations between Russia and Turkey in May 1812 resulted in the cession of Bessarabia and a part of Moldavia to Russia; in 1913 the Treaty of Bucharest settled the status of parts of European Turkey captured during the second Balkan War (q. v.); and in May, 1918 the Roumanians here signed what is known as the Peace of Bucharest, which terminated hostilities with the Central Powers.

**Bucharest**, TREATY OF. See BALKAN WAR 1913.

**Bucher**, bōōk'er, LOTHAR (1817–92), German politician, was born in Neu-Stettin. In 1848 he was elected to the National Assembly, and became a democratic leader. With others he was condemned to imprisonment for refusing to pay taxes, but escaped to England, where he acted as correspondent to the *National Zeitung*. In 1860 he returned to Germany, received an appointment in the Foreign Office, and became Bismarck's private secretary. He was responsible for the constitution of the North German Confederation, and was intermediary in the Hohenzollern overtures for the Spanish crown.

**Buchez**, bü-shā', PHILIPPE BENJAMIN JOSEPH (1796–1865), French philosopher and politician, was born in Matagne-la-Petite (now in Belgium). A thorough democrat, he took part in

numerous conspiracies against the Bourbons, and was one of the founders of the French Carbonari Society, which made several attempts at revolution. About 1825 he attached himself to the St. Simonian Society, but left it in 1829, and shortly afterward founded a Neo-Catholic school, and, to expound the doctrines of Buchezism, published a periodical, *L'Européen* (1831–48). Expositions of his theory of the progress and development of the human race are contained in *L'Introduction à la science de l'histoire* (1833), *Essai d'un traité complet de philosophie au point de vue du catholicisme et du progrès* (1839–40), and *Traité de politique et de science sociale* (1866). In conjunction with Roux Lavergne he published *L'Histoire Parlementaire de la Révolution Française* (40 vols. 1838– )—one of the chief sources of information regarding the French Revolution. Following the Revolution of 1848 he was president of the Constituent Assembly.

**Buchholz**, bōōk'hōlts, town, Saxony, on the Sehma River; 36 miles south of Chemnitz. Its most important building is the parish church built in the sixteenth century, which contains some good paintings. Lace making, bookbinding and the manufacture of paper are the leading industries. Pop. (1910) about 9,300.

**Büchner**, büch'ner, EDUARD (1860–1917), German chemist, was born in Munich. He was educated in Munich and Erlangen, lectured in chemistry at Munich, and held professorships at Kiel, Tübingen, the Agricultural College of Berlin, and Breslau. In 1907 he received the Nobel prize in chemistry for his discovery that the liquid obtained by crushing yeast with fine quartz sand and subjected to intense pressure possesses the power of setting up fermentation in solutions of grape sugar, maltose, invert sugar, etc. He died of wounds received while serving as a major in the Great War.

**Büchner**, FRIEDRICH KARL CHRISTIAN LUDWIG (1824–99), German physician and naturalistic philosopher, was born in Darmstadt, and qualified for the medical profession. He became lecturer in the university at Tübingen and in 1855 brought out his *Kraft und Stoff*, in which he attempted scientifically to establish a materialistic view of the universe. The work aroused violent controversy and its author was obliged to resign his post at the university. His later writings were devoted to the popularization of Darwinism and similar theories. Of these works may be mentioned *Die Darwinische Theorie* (5th ed. 1890); *Der*

*Mensch und seine Stellung in der Natur* (1870; 3rd ed. 1889), translated into Eng. under the title *Man in the Past, Present, and Future* (1872); *Der Fortschritt in Natur und Geschichte im Licht der Darwinschen Theorie* (1884); *Das goldene Zeitalter oder das Leben von der Geschichte* (2nd ed. 1891); *Die Macht der Vererbung* (1882); *Das künftige Leben und die moderne Wissenschaft* (2nd ed. 1889).

**Buchtel College**, former name of the University of Akron. See AKRON.

**Buck, DUDLEY** (1839-1909), American composer and organist, was born in Hartford, Conn. He was at Trinity College for three years, and in 1858 went to Europe, where he spent four years studying music in Germany and France. In 1862 he returned to Hartford and became organist in the North Congregational Church. In 1869 he went to Chicago, remained there as organist in St. James Church for three years, and removed to Boston in 1872. He went to Brooklyn, N. Y., in 1875, and in 1877 became conductor of the Apollo Club and organist and choirmaster at Holy Trinity Church, where he remained until his retirement from church work in 1903. He was a member of the National Institute of Arts and Letters. His compositions include much church and secular music, including the opera *Serapes*; the comic opera *Deseret*, *The Legend of Don Munio*, *Marmion*, *The Golden Legend*, *The Light of Asia*, *The Voyage of Columbus*, many short cantatas, and several song sequences for the Apollo Club. He published also a *Dictionary of Musical Terms*.

**Buck, LEFFERT LEFFERTS** (1837-1909), American engineer, was born in Canton, N. Y. He was educated at St. Lawrence University and at Rensselaer Polytechnic Institute, served in Civil War, and was made captain for bravery. He was a noted bridge builder, constructing many bridges in the United States and South America. He rebuilt the suspension bridge at Niagara Falls, and while chief engineer of the Bridge Department in New York City, built the Williamsburg Bridge and had charge of the Manhattan Bridge plans.

**Buckbean, MARSH TREFOL, or BOG BEAN** (*Menyanthes trifoliata*), a plant belonging to the order Gentianaceæ, common to most parts of the United States. It grows in moist places, having a creeping jointed rootstock and a procumbent stem, 6 to 12 inches high. The three-foliolate leaves are glabrous and long petioled; the bearded white or reddish flowers are borne on tall

peduncles. The leaves are bitter, and from them is prepared an extract used in stomach troubles and in intermittent fevers. In

*Buckbean.*

1. Seed vessel. 2. Seed.

Germany it is sometimes used in the place of hops.

**Bucket Shop**, an establishment conducted ostensibly for the buying or selling of stocks or commodities, but actually with no intention of receiving and paying for the property so bought or of delivering the property so sold; in practice, therefore, simply a concern for the placing of wagers on the fluctuation of market prices. Its method of operation, generally speaking, is the same as that of the legitimate broker trading in margins, except that it does not buy the stock bargained for, or, if it does, soon sells it again instead of using it as collateral security for loans in order to get the money necessary to complete payment on the purchase. In other words, it accepts a portion of the purchase price, charges interest on the balance, and if the market falls calls for more margin, without, however, rendering any service whatever. It is obvious, therefore, that bucket shops enjoy greater prosperity in a declining market. The clients reach the point where they cannot offer additional margin, and their accounts are closed out. As the bucket shop has never purchased the securities bargained for, the customer's loss is its profit. In an advancing market conditions

are different, the client takes his profits or demands his securities, and as these demands multiply the establishment closes its doors and takes refuge in bankruptcy. Market manipulation to bring prices to a point where the account may be closed out and other dishonest practices add to the menace of the bucket shop.

The New York Stock Exchange began a war on bucket shops as early as 1878; other exchanges have also conducted anti-bucketing campaigns, and many of the States have enacted legislation prohibiting their operation.

**Buckeye**, the HORSE CHESTNUT (q. v.).

**Buckeye State**, popular name of the State of Ohio.

**Buckhannon**, buk-an'an, city, West Virginia, county seat of Upshur county, on the Buckhannon River, and on the Baltimore and Ohio Railroad; 90 miles northeast of Charleston. The West Virginia Wesleyan College is located here. Pop. (1910) 2,225; (1920) 3,785.

**Buckle**, town, Scotland, on the North Sea; 15 miles east of Elgin. It is a fishing town, with a good harbor. Pop. (1921) 8,690.

**Buckingham**, town, Canada, province of Quebec, on the Rivière du Lièvre, and on the Canadian Pacific Railroad; 20 miles northeast of Ottawa. Mining of phosphate, mica, and plumbago is carried on in the vicinity. Pop. (1921) 3,835.

**Buckingham, GEORGE VILLIERS, FIRST DUKE OF** (1592-1628), was the second son of a Leicestershire knight, Sir George Villiers. In 1614 he entered the service of the court, where his handsome person and engaging manners early won him favor and rapid promotion. In the course of two years after the fall of Carr, Earl of Somerset (1616-18), he was knighted, and was created successively Viscount Villiers, Baron Waddon, Earl of Buckingham, and Marquis of Buckingham. In 1620 he married the daughter of the Earl of Rutland, the richest heiress in the kingdom. During the negotiations for a treaty of marriage between Prince Charles and the Spanish Infanta, Buckingham accompanied the prince on his fruitless mission to Spain; and he continued to maintain his ascendancy after Charles' accession to the throne in 1625. Those events which culminated in the failure of the expedition against Cadiz greatly diminished his popularity, however, and on two occasions his impeachment was attempted, but each time this measure was thwarted by the dissolution of Parliament by the king. In 1627 Buckingham commanded

a fleet sent to relieve La Rochelle; but he was unsuccessful, and returned in disgrace to England. The following year he planned a second expedition against La Rochelle, and proceeded to Portsmouth to embark, but was there stabbed to the heart by a disappointed officer named John Felton. Buckingham's character has been portrayed by Scott in *The Fortunes of Nigel*.

**Buckingham, GEORGE VILLIERS, SECOND DUKE OF (1628-87)**, son of the First Duke of Buckingham, was born at Wallingford House, Westminster. On the outbreak of the civil war he served with the royal forces at the storming of Lichfield Close (1643) and at the restoration he became one of the most powerful men at court. The downfall in 1667 of the chancellor Clarendon made him paramount; and Pepys records that at this time the king had 'become a slave to the Duke of Buckingham.' Buckingham, however, became more and more deeply involved in political intrigues, notably with France, until at length, in 1674, the king definitely threw him over in consequence of pressure from both houses of Parliament. At the accession of James II. his public career was practically at an end. Buckingham was an accomplished courtier, and the author of certain satirical poems, political pamphlets, and a comedy entitled *The Rehearsal*, which held the stage for a long time, and probably inspired Sheridan's *Critic*. The latter was first printed in 1672; his *Miscellaneous Works* in 1705. He was buried in Westminster Abbey. Sir Walter Scott has portrayed Buckingham in *Pepper of the Peak*; and the author of *Hudibras* has delineated him with merciless accuracy in 'A Duke of Bucks' (Thyer's *Genuine Remains of Samuel Butler*, ii. 72, ed. 1759).

**Buckingham, WILLIAM ALFRED (1804-75)**, American public official, was born in Lebanon, Conn., the son of a farmer. He received a public school education, and subsequently settled in Norwich, Conn., where he became a successful merchant and manufacturer. He was mayor of the city for several terms and was 'war governor' of Connecticut, holding office from 1858 to 1866, and raising 55,000 troops from his State, without recourse to the draft, greatly exceeding the State's quota. He was U. S. Senator from Connecticut from 1869 until his death. Governor Buckingham was prominent as a temperance advocate and was known for his philanthropy.

**Buckingham and Normanby, DUKE OF.** See SHEFFIELD, JOHN.

**Buckinghamshire, or Bucks,** inland county of England, with

Northamptonshire on the north, the Thames on the south, Oxfordshire on the west, and Middlesex, Bedfordshire, and Hertfordshire on the east. Its greatest length is 53 miles; its greatest breadth 27 miles; its area nearly 749 square miles. The chief rivers are the Thames, Ouse, Ousel, Thame, and Colle. The Chiltern Hills in the east central part are covered with magnificent forests of beeches. The northern part is largely given to pasturage; the vale of Aylesburg in the centre is one of the most productive districts in the country, and is famous for its sheep and dairy products. Agriculture is the leading industry, wheat, barley and oats being the principal crops. Straw plaiting, lace making, paper making and chair manufacturing are also carried on. Buckingham is the county seat and Aylesburg is the chief commercial centre. Pop. (1921) 236,209. Consult Roscoe's *Buckinghamshire* (1918).

**Buckland, FRANCIS TREVEL-YAN (1826-80)**, English naturalist, was born in Oxford. After studying medicine for five years at St. George's Hospital, London, he was house surgeon there in 1852-3 and assistant surgeon to the 2nd Life Guards from 1854 to 1863, during which time he devoted himself to the study of zoology, and published his *Curiosities of Natural History* (1857-72). He was the highest authority of his day on pisciculture, especially on the artificial rearing of salmon; and in 1865 he promoted an exhibition of fisheries at South Kensington. He was inspector of salmon fisheries (1867), and special commissioner on the salmon fisheries in Scotland (1870). His published works include *Fish-hatching* (1863), *Natural History of British Fishes* (1881), and *Notes and Jottings from Animal Life* (1882).

**Buckland, WILLIAM (1784-1856)**, English geologist, a native of Tiverton, succeeded Dr. Kidd as professor of mineralogy at Oxford in 1813, and in 1818 was presented to the readership in geology. About this time he began his geological collection, now at Oxford. In 1825 he was presented to the living of Stoke Charity, and in 1845 became dean of Westminster. He received the Copley medal of the Royal Society in 1822 for his account of the remains in Kirkdale Cave, which he more fully described in his *Reliquiæ Diluvianæ* (1823). Other important works are one of the Bridgewater Treatises, *Geology and Mineralogy Considered with Reference to Natural Theology*, and *A Description of the Southwest Coalfield of England* (1825).

**Buckle, a metal devise for fas-**

tening straps or bands in garments, shoes, harnesses, etc. It consists of a rim, generally of iron, tin, or brass, or if for ornamental purposes, of gold or silver, with one or more movable tongues or catches. Shoe buckles were introduced into England during the reign of Charles II., and, as they became more and more the vogue, were made of costly materials and richly adorned with precious stones. Their popularity waned towards the end of the eighteenth century.

**Buckle, HENRY THOMAS (1821-62)**, English historian and sociologist, was born in Lee, Kent, son of a London merchant. He was a delicate child and had little regular schooling, but acquired a liberal education at home. The death of his father in 1840 gave him an income of £1,500 a year, and he spent the next ten years in foreign travel, in the study of races and institutions, in learning languages, and in forming a library. In 1857 the first volume of his *History of Civilization in England* appeared, meeting with great success in both Europe and America. The second volume was published in 1861, but further progress was arrested by the death of the author at Damascus in the following year. The work is an attempt to give a scientific basis to history, by demonstrating the effect of natural conditions upon the progress of any race. Social progress is regarded as intellectual and not moral; a point of view which has been wholly superseded. It appears that the author had projected a huge work, of which these two volumes published formed but the introduction. Consult *Life* by Huth, and *Works*, edited by Miss Taylor, and by Grant Allen.

**Buckley, JAMES MONROE (1836-1920)**, American clergyman and author, was born in Rahway, N. J. He studied at Wesleyan University, and prepared for the Methodist ministry at Exeter, N. H., joined the New Hampshire Methodist Episcopal Conference (1859), was transferred to Detroit (1864), and later to Brooklyn, N. Y. (1866). From 1880 to 1912 he was editor of the New York *Christian Advocate*. Some of his published works are *Two Weeks in the Yosemite Valley* (1873); *Supposed Miracles* (1875); *Christians and the Theatre* (1876); *Faith Healing, Christian Science and Kindred Phenomena* (1892); *Extemporaneous Oratory* (1899); *The Fundamentals and Their Contrasts* (1906); *Theory and Practice of Foreign Missions* (1911); *Constitutional and Parliamentary History of the Methodist Episcopal Church* (1912).

**Buckminster**, JOSEPH STEVENS (1784-1812), American clergyman, was born in Portsmouth, N. H., son of a clergyman of that city. He was graduated from Harvard (1800), taught in Phillips Exeter Academy, and in 1804 became pastor of the Brattle Street Congregational Church, Boston. In 1811 he was appointed the first lecturer on Biblical criticism at Harvard (1811), but did not live to fulfil his duties. Buckminster left a remarkable reputation as a preacher and thinker, and was a predecessor of the group of Trinitarian Congregationalists who became Unitarians. A volume of his *Sermons*, with a memoir by Samuel C. Thacher, appeared in 1814, and his *Works* were published in 1839.

**Bucknell University**, a Baptist coeducational institution of learning at Lewisburg, Pa., founded in 1846, and named in honor of a liberal contributor to its endowment funds. It includes a collegiate department, with engineering courses, and a school of music. For recent statistics see Table of Colleges and Universities under COLLEGE.

**Buckner**, SIMON BOLIVAR (1823-1914), American soldier, was born in Kentucky. He was graduated from West Point in 1844, was a professor there (1845-6, 1848-50), and in the Mexican War (1846-7) served as a second lieutenant under General Scott, winning the brevet of first lieutenant at Contreras and Churubusco and that of captain at Molino del Rey. In 1855 he resigned from the army, and at the outbreak of the Civil War, at which time he was in command of the State Guard of Kentucky, he joined the Confederate army, rising to the rank of lieutenant-general. At Fort Donelson he was third in rank on the Confederate side, and, after the escape of Generals Floyd and Pillow, his superiors, the surrender devolved on him, between 12,000 and 15,000 men and valuable munitions of war being turned over to General Grant. He subsequently took part in the battles of Stone River and Chickamauga. He was governor of Kentucky in 1887-91 and in 1896 was the candidate of the National Gold Democrats for the vice-presidency.

**Bucknill**, SIR JOHN CHARLES (1817-97), English physician, was born in Market Bosworth, and studied medicine at University College, London. He began practice in Chelsea, but owing to ill-health removed to Exminster, to take charge of the Devon County Asylum (1844-62). He was elected fellow of University College, London (1850), and was the lord chancellor's medical visitor of lunatics from 1862 to 1876.

He was knighted in 1894. Bucknill was the highest authority of his time on insanity; he wrote *Unsoundness of Mind in Relation to Criminal Acts* (1854), *The Psychology of Shakespeare* (1867), *Notes on American Asylums* (1876), *Habitual Drunkenness and Insane Drunkards* (1878), *A Manual of Psychological Medicine* (4th ed. 1879), etc. He edited the *Journal of Mental Science* (1855-62), and was one of the founders of *Brain*, *A Journal of Neurology* (1878).

**Buckskin**, a soft, pliable leather of a yellow or grey tint, prepared from the skin of a buck or sheep. It is used for gloves and shoes and was formerly employed by the Indians and early American colonists for clothing. The name is also applied to a strong twilled cloth with shorn pile, carefully finished, used for breeches.

**Buckstone**, JOHN BALDWIN (1802-79), English actor and dramatist, was born in Hoxton, London. He was articled to a solicitor, but in 1820 abandoned law for the stage, and played at Peckham in melodrama. In 1823 he appeared in London in the Surrey Theatre as Ramsay in *The Fortunes of Nigel*, and in 1827 joined the company at the Adelphi, where he produced some of his best-known dramas. In 1833 he removed to the Haymarket, where he was manager from 1853 to 1876. He visited the United States in 1840. Buckstone was noted for his humor and pathos, and for his droll interpretation of comic characters. He wrote over a hundred dramas, the most popular being *Green Bushes*, *Flowers of the Forest*, and *Popping the Question*. His most famous rôles were Tony Lumpkin, Bob Acres, Sir Benjamin Backbite, and Scrub.

**Bucks Stove Case**. See BOYCOTT.

**Bucktails**, the name applied after 1812 to a faction of the Democratic-Republican Party in N. Y., identified with Tammany Hall, and opposed to De Witt Clinton and (after 1817) to the building of the Erie Canal. The faction gained the ascendancy in the party about 1822, but lost it within two years; however, after Clinton's death (1828), it became the regular Democratic Party in the State. The name was derived from the insignia of Tammany—a buck's tail worn in the hat.

**Buckthorn**, a genus of hardy evergreen shrubs belonging to the order Rhamnaceæ, and including nearly 100 species found in all parts of the temperate zone. The Common Buckthorn, Waythorn, or Hartshorn (*R. cathartica*) is a spreading shrub, about ten feet in height, introduced into America from Europe. It

has a smooth bark, branches terminating in thorns, small unisexual four-petalled green flowers, and four-seeded black berries about the size of currants. It is cultivated for hedges; the juice of the berries is sometimes used in medicine, as a purgative, and in the preparation of the color known as sap green; the bark furnishes a handsome yellow dye. Other species are the Alder Buckthorn (*R. frangula*), which also affords coloring matter; the Carolina Buckthorn or Indian Cherry (*R. caroliniana*), and *R. crocea*, which are generally larger than the European species; and *R. palinurus*, one of the plants which are said by tradition to have been used in Christ's crown of thorns.

**Buckwheat** (*Fagopyrum*), a cereal plant of the natural order *Polygonaceæ*, to which belong also the dock, sorrel, and rhubarb. There are three cultivated species, the Common Buckwheat (*F. esculentum*), the Notch-seeded Buckwheat (*F. emarginatum*), and the Tartary or Siberian Buckwheat (*F. tartaricum*). Buckwheat is an annual, is erect in habit, and generally grows to a height of about 3 feet. It has a long taproot with a stem one fourth to five eighths of an inch in thickness, varying in color from green to purplish red, changing to brown at maturity. The grain has a thick, hard, smooth hull, silver gray or brown in color. The flower is pink and fragrant and a favorite with bees.

Buckwheat thrives best in a moist, cool climate. It matures in from eight to ten weeks, and is well adapted to high altitudes and short seasons. It succeeds fairly well on soils too poor for other crops, but is not specially adapted to heavy clays or wet lands. Seed is sown from May to September or, in northern localities, from the middle of June to the middle of July, either in drills or broadcast. Three pecks of seed per acre is sufficient for good soil, but four or five pecks are necessary in poorer ground. Harvesting is begun soon after the first seeds are ripe. The varieties most commonly grown are the Common Gray, Silver Hull, and Japanese, the last being generally regarded as the best yielding variety. Barnyard manure or nitrogenous fertilizers are seldom profitable for buckwheat, but the use of lime and phosphoric acid is beneficial. Early plowing is desirable in order to allow the ground to settle before the seed is sown.

The buckwheat crop, while the least important of the six leading grain crops in the United States is nevertheless of considerable value as a source of food and is profitably grown for green ma-

nure, as a catch crop, and for the improvement of the mechanical condition of the soil. The grain contains 12.6 per cent. water, 10 per cent. protein, 2.2 per cent. fat, 64.5 per cent. nitrogen, 8.7 per cent. crude fibre, and 3 per cent. ash. It is used in the preparation of buckwheat flour, so largely employed in the United States for pancakes and griddle cakes, and of buckwheat farina and groats. Buckwheat is grown also as a bee plant, and is used as feed for pigs and for poultry; the middlings, the portion next to the hull, have a high food value and are fed to dairy cows.

Buckwheat is remarkably free from plant diseases and insect pests. It has no definite place in crop rotation but is largely grown as a substitute for spring-planted crops that have failed. In 1921 the United States production was 14,079,000 bushels, valued at \$11,438,000. The leading States were Pennsylvania and New York, with Wisconsin, Michigan, West Virginia, Minnesota, and Ohio following, but far behind.

**Bucyrus**, Ohio, county seat of Crawford county, on the Sandusky River, and on the Pennsylvania, and the Toledo and Ohio Railroads; 69 miles southeast of Toledo. Electric lines connect with Columbus and Cleveland. Manufactures include cranes, machine tools, hog rings, copper kettles, steel products, tires and tubes, tractors, lumber products, clothing, cigars, dairy products, and soft drinks. Pop. (1900) 6,560; (1910) 8,122; (1920) 10,425.

**Buczacz**, bö'chäch, town, Galicia, on the Stripa, an affluent of the Dneister; 47 miles northeast of Stanislaw. Agriculture is the chief industry; there are also tanneries and manufactures of potash. Pop. 13,000.

**Bud.** A bud is an unexpanded branch—stem, leaves, and sometimes flowers being all present in a miniature and undeveloped form. This branch is formed in advance, so that, when spring and sunshine arrive, no time is lost in pushing ahead and effecting growth before winter again arrives and checks activity. In some cases, by the efforts of art or nature, the bud, while growing in size, never really develops. We see this in the cabbage head, which is in reality a large bud.

As buds have often to live through severe weather, with excessive cold and wet, their parts are packed tightly together, so that the minimum of surface may meet the outer world; they are usually covered by certain scales, which are modified leaf-bases, stipules, or leaves. The buds of evergreens have usually no protecting scales. Often additional protection is afforded by means

of hairs or resin; and many plants which die down every year have their buds waiting beneath the earth's surface until the sun's warmth tempts them to push forth and develop into the stems, leaves, and flowers that they really are. Certain aquatic plants (as the bladder-worts) at the approach of winter form spherical buds, which are drawn down to the bottom until spring, when they elongate, and rise to the surface, to expand into branched,

Buds.

1, 2. Acer and section. 3. Horse chestnut. 4. Pear flower-buds. 5. Walnut, extra axillary buds. 6. Honeysuckle, clustered.

floating plants. Buds usually arise in the axils of leaves, though circumstances may cause them to form elsewhere. The so-called fruit-buds of apple and pear trees may usually be distinguished from those buds which will yield stems and leaves only, by their greater size, and by their being commonly situated at the end of a stem or spur.

**Budæus**, bü-dē'us, or **BUDÉ**, GUILLAUME (1467-1540), French philologist, was born in Paris. After a somewhat reckless youth, he became one of the most profound Greek scholars of his day. His most remarkable works are *De Asse* (1514), a treatise on ancient Greek and Latin coins and measures, and *Commentarii Linguae Graecae* (1529; improved ed. 1548). His collected works were published at Basel (1557). He was highly esteemed by Francis I.

**Budapest**, bö'dä-pest, capital and chief city of Hungary, is situated on the Danube; 163 miles southeast of Vienna. It consists of the two cities of Buda and Pest on opposite banks of the river, together with Obuda (Altofen) and Kőránnya, which in 1872 were united into the one municipality. Six bridges, three of which are of the suspension type, cross the Danube here.

Buda, on the west side of the river, is the older part of the city. It occupies the heights overlooking the Danube and contains the old fortress crowning the summit of a high hill; the

royal palace, erected by Maria Theresa in 1749-71 and greatly enlarged in 1894-1906; the Matthias Church completed in the 15th century; and the Fisher-Bastion containing a bronze statue of St. Stephen. Buda has many famous hot sulphur springs, around which luxurious bathing establishments have been established; among these are the Rudas Fürdő, the Racz Fürdő, the Elizabeth Saline Bath, and the Hunyadi-Janos mineral springs.

Pest, on the east bank of the river, is the finest and most important part of the city. Its centre is the quarter *Belváros* or the 'inner city,' beside the Danube, enclosed within a boulevard which has replaced the old city walls. From this boulevard the streets radiate to the northeast and southeast, the finest being the *Andrássy Street*, the *Kerepesi*, and the *Üllői*. Along the Danube the Francis Joseph quay stretches for a mile between the Francis Joseph Bridge and the Margaret Bridge. Near its northern end imposing new Houses of Parliament were completed in 1903, and in the same vicinity are the *Curia Regia* and the *Law Courts*. Other noteworthy institutions and buildings are the University, the Academy of Sciences, the Museum of Fine Arts, the National Museum, the Industrial Art Museum, the Opera House, the Bourse, the Leopoldstadt Basilica, St. Stephen's Church, the Ráth Museum, Stefanie Hospital for Children, and the Josephicum Orphanage. The botanical, public, and Orczy gardens and Margaret Island, once the seat of a convent, offer pleasant recreation grounds.

The chief industries include engineering, flour milling, carriage building, printing, shipbuilding, brewing, distilling, and the manufacture of tobacco, glass, chemicals, and fancy and leather goods. There is a good trade in grain and wine. The city is the centre of the Hungarian railway system, and has excellent street-railway facilities.

In 1921 the population was 1,184,616. In 1881 it was but 370,767, of which four-fifths was in Pest. A large percentage of the inhabitants are Roman Catholics, and there are many Jews.

Buda, or Ofen, originated in the Roman military colony of Aquincum, and was the capital of Lower Pannonia. Destroyed by the Mongols in 1241, it was rebuilt by Bela IV., and from 1351 to its conquest by the Turks in 1526 it was the residence of the kings of Hungary. While in Turkish hands, the city was six times besieged by the imperialist forces, who took it in 1686. The Hungarians stormed it in

1849. Pest existed from Roman times, but was not of much consequence till the 18th century. In 1867 it was made the capital of Hungary. From the 10th to the 14th century the Hungarian national assemblies used to meet in the open air on the Rákos plain, east of the city.

**Budaun**, or **BUDAON**, tn. in Rohilkhand div., United Provs., India. Founded, according to tradition, by Budh, an Ahar prince, about 905 A.D., it was a centre of disturbance during the mutiny of 1857. Pop. (1901) 39,031. The district of Budaun is a level fer-

tama saw the visions which led him to devote himself to the study of religion and philosophy. Paternal promptings which followed the birth of a son threatening to interfere with the divine call, Gautama, in a pathetic parting from his sleeping wife and babe, completed his great act of renunciation—leaving family and friends, wealth and power, to become a penniless and despised student and homeless wanderer. It is impossible, within the scope of this article, to follow Gautama in his wanderings and in his efforts to 'acquire merit.' Repeatedly

the reformation of Hinduism. In withstanding the corruption and sensuality of his age, his broad philanthropy opened a heaven to the meanest outcast; and although he was thus placed in an attitude of passive antagonism to the distinctions of caste, he continued a devout Hindu. In spite of the inherent weakness of the creed he promulgated—its end contemplation, inertia, Nirvána—there is much that is fascinating in Buddha's devotion to duty, and in the example of a lifelong sacrifice which sought no selfish or sordid end. For a beautiful

tile tract with an area of 1,990 sq. m. Pop. (1901) 1,025,753.

**Buddha**, 'The Enlightened One,' was the founder of Buddhism. His father, Siddhodana, was the chief of a small Aryan tribe named the Sakyas, whose capital, Kapila-vastu, was situated about 100 m. N.E. of Benares. As a child he received the name of Gautama. He is also known as Siddhartha and as Sakyamuni, and lived from about 560 to 480 B.C. Miraculous circumstances are alleged to have attended the conception and birth of Gautama, and many legends are preserved of the wisdom and prowess which marked his childhood and youth. It was not until his twenty-ninth year that Gau-

tempted to return to the comforts of his home, assailed by doubts as to the reality of that virtue for which he had sacrificed so much, deserted by his followers, overwhelmed by the bitterness of failure, it was long ere, brooding in silent solitude under the bo-tree (tree of wisdom), there dawned the kindly light which enabled him triumphantly to exclaim, 'I know it all.' Henceforth he was the Buddha. On his return home his wife embraced his feet, and widowed herself in becoming one of the first Buddhist nuns. His son and his half-brother joined the order of pious mendicants which he established. Buddha received his religious instruction from Brahmans, and his mission was

poetic rendering of Buddha's life and work, see Edwin Arnold's *Light of Asia* (1900).

**Buddh Gaya**, or **BODH GAYA**, vil., Gaya dist., Bengal, India; situated 6 m. s.w. of Gaya town. It is said to have been the dwelling-place of the founder of Buddhism, and has interesting Buddhist remains, including the palace of Asoka, the great Buddhist emperor.

**Buddhism**. The Buddhist scriptures do not contain a life of the founder. He was born in the 6th cent. B.C., the age of Zoroaster, Thales, the second Isaiah, Lao Tse and Confucius. His father was a king in what is now Nepal. At the age of twenty-nine he became an ascetic, and

after long search discovered a new 'way' of salvation. The faith which he then promulgated was Buddhism. In its inception Buddhism was a reformation and a protest against Brahmanism, which had run to seed in a tangle of philosophy and ritual; the arrogance of the priesthood and the injustice of caste were crying evils when Buddha preached his broad philanthropy. Making no attempt to solve the problem of the origin of things, he proclaimed the equality and brotherhood of man, and that the great end and object of existence was to attain extinction of personality (*Nirvāna*) by self-sacrifice, contemplation, and suppression of all passion. Subtly mingled with this inertia was the doctrine of *Karma*. This was a remodeling of the doctrine of transmigration on the basis of his psychology. Buddhism recognizes no soul, and therefore no future corporeal existence of any individual; but each human act, right or wrong, each thought, pure or impure, is not only irrevocable but irredeemable. After death these actions (or results of actions) and thoughts (or their results), good or evil, have an existence in a new being in whom are combined the effects of the actions of the former being whose heir and successor he is. The basal assumption of Buddhism is that individual existence is an evil, the object of striving is therefore to attain *Nirvāna*. Innumerable 'precepts' and 'paths' of duty and of holiness point the 'way' by which each human being is to work out his salvation. By temperance, chastity, kindness, brotherly love, the body and the senses are brought under subjection, until being is absorbed in blissful *Nirvāna*. The life of an insect is as precious as that of a man; therefore to kill the humblest creature is accounted murder. Theft, deception, insobriety are denounced. Marriage is discouraged, but incontinence and unchastity are condemned. The encouragement of celibacy led to the formation of monastic orders, male and female. These monks and nuns were addressed by the Buddha as 'mendicants.' In process of time the monasteries became the repositories of learning, and thus gradually, almost imperceptibly, the priestly supremacy and arrogance which Buddha exerted himself to overthrow were once more re-established.

The Buddha wrote nothing. It was at least one hundred and thirty years after his death, when the Emperor Asoka—the Constantine of Buddhism— assembled a council of monks, that the first attempt was made to reduce the teachings of Buddhism to writ-

ing. Subsequent councils sought to amplify its doctrines and to explain difficulties, but each attempt to reduce to dogma the precepts of the great teacher raised fresh doubts and further objections. Astute Brahmans, quick to mark evidence of decay in the voice of dissent, at once adopted Buddha as an incarnation of Vishnu, and by concessions and adaptations enticed dissenters back into the fold of Hinduism. Thus was Buddhism driven from its birthplace, and at the present day it has almost ceased to exist in India. There are many passages of remarkable and poetic beauty to be found in Buddhist scripture, but the apparent hopelessness of the creed makes small appeal to the more sanguine and robust Western mind. This 'knowledge of the way'—a religion without theology, without deity, and with no gorgeous ritual—was spread by mendicant missionaries, northwards over Nepal and Tibet, eastwards through Burma and China to far-away Japan, and over Ceylon in the south. To-day it is the acknowledged faith of probably five hundred millions of the inhabitants of the world. In its diffusion it has lost some of its characteristics, and it has been absorbed in other and even antagonistic faiths. The Lamaism of isolated Tibet is far removed from the religion of progressive Japan; deep gulfs separate the Burman, the Chinaman, and the Ceylonese; yet all reverence the benign Buddha. For a popular treatise, see T. W. Rhys Davids's *Buddhism* (1877; new ed. 1894), and his American Lectures with the same title (New York, 1896), in which all the leading authorities are given; Lillie's *Buddha and Buddhism* (1900); also Grünwedel's *Mythologie des Buddhismus* (1901).

**Budding.** The process of budding consists in taking from the tree which it is desired to propagate a piece of the bark with bud attached, and inserting it beneath the bark and against the wood of the tree which is to serve as parent or stock. The process is chiefly employed in the propagation of peaches, but it is also much used for propagating plums, pears, and apples, and occasionally for multiplying choice varieties of maples and other ornamental trees. July, August and September, are the months usually chosen for performing the operation, and it is very desirable that the bark should slip readily from the subjacent wood. Where possible, the stock for fruit-tree buds should be not less than an inch in circumference, and the bud should be inserted a very few inches above the ground-level, the leaves of the stock being rubbed off for two inches on either

side just previous to the operation. Everything being in readiness, a vertical incision an inch or more long is made with a sharp budding knife just through the bark of the stock, and a horizontal incision of half an inch across its highest point—the two cuts forming a T. A well-ripened shoot of the current season's growth is next cut from the variety which it is desired to increase, and its leaves cut off, leaving a small piece of each leaf-stalk attached to the stem. The best buds are situated at the lower and older part of the stem. By a careful use of the knife, the bud, together with half an inch of bark above and below is cut out—the smallest thickness of wood remaining attached to the base of the bud. Should there be no wood, but a hollow opposite to the bud, then the bud is useless. If, on the other hand, there is much thickness of wood left attached, the harder part of it should

Budding.  
a, Shield budding; b, c, ring budding.

be carefully cut away. The whole bud and bark ought to be shield-shaped, widest in the middle where the bud is situated, and tapering to a point above and below. The bark of the stock must next be carefully loosened from the wood by means of the handle of the budding-knife, and the bud inserted in the cleft so that its inner surface presses against the surface of the bared wood of the stock. The whole must then be closed and carefully bandaged over, above and below the bud, with raffia or some other soft string like waxed cotton strips or yarn. The tying material, which must be applied securely, but not too tightly, should completely cover the bark of the scion and the wound of the stock—only the bud itself projecting uncovered. In three weeks the tying material should be removed. The following spring, if the budding has been successful, the stock should be cut off immediately about the bud, so that all the energy may be concentrated in its development. For further information, see L. H. Bailey's *The Nursery Book* (1895); Batlet's *Grafting and Budding*.

**Budge,** ERNEST A. WALLIS, English Egyptologist, studied at Cambridge, where he was a distinguished Oriental scholar. He has conducted excavations at Assouan in Egypt, at Jebel Barkal

in the Sudan, and at Nineveh and Der in Mesopotamia, and became keeper of Egyptian and Assyrian antiquities in the British Museum. Among his numerous works are *Life and Exploits of Alexander the Great* (1896); *Guide to Babylonian and Assyrian Antiquities in the British Museum* (new ed. 1908); *Book of the Dead* (1901); *History of Ancient Egypt* (8 vols. 1902); *Egyptian Sudan, Its History and Monuments* (2 vols. 1907); *Guide to Egyptian Collections in British Museum* (1908); *Legends of the Gods and Annals of Nubian Kings* (1911); *Osiris and the Egyptian Resurrection* (2 vols. 1911); *Rosetta Stone* (1913); *Short History of the Egyptian People* (1914); *Miscellaneous Coptic Texts in the Dialect of Upper Egypt* (1915); also several works on the texts and inscriptions of ancient Egypt, Assyria, and Babylonia.

**Budgell, EUSTACE** (1686-1737), English essayist, was born near Exeter. He acted as under secretary to his cousin, Joseph Addison, when the latter was lord-lieutenant of Ireland and was associated with Addison and Steele in writing *The Tatler*. He contributed to *The Spectator* and *The Guardian*, and from 1733 to 1735 published a weekly periodical, *The Bee*. In 1717 Budgell was made Accountant and Comptroller-General of the Revenue in Ireland, but was removed for a lampoon directed against the lord-lieutenant's secretary. He subsequently met with large financial losses in the South Sea scheme, was accused of various irregular transactions in connection with the will of Matthew Tindal, and eventually drowned himself.

**Budgerigar**, buj'er-i-gâr, a dealers' name for the zebra grass-parrakeet (*Melopsittacus undulatus* of Australia). It is a small bird, about seven inches long, in color a yellowish green striped with black, and having two blue tail feathers. Its natural voice is soft and musical and it makes an attractive cage bird. America and England import large numbers of these birds. See PARRAKEET.

**Budget, Family, or INDIVIDUAL**, a detailed plan for the expenditure of the family or personal income. *The Cost of Living*, published in 1899, by Ellen H. Richards, with a discussion of the family budget was the first work in the United States to call attention to this matter in any effective way. About 1919, the subject began to be widely discussed, and after the opening of the European war in 1914 increasing attention was given to the necessity for such a plan and for the checking of the plan by the keep-

ing of detailed classified accounts.

Many statistics have been gathered giving the expenditure of selected families (usually those of low or very moderate income), classified under a few general headings. These figures have been much used by bodies considering the minimum wage, or the lowest possible cost of living decently, for family or individual. In addition there have been issued many so-called 'ideal' budgets, in the attempt to help those who are making such a definite plan for the first time. These have been issued by government agencies, educational institutions, banks, and individuals. Such 'ideal' budgets generally give the percentages of expenditure for a fairly good income as follows:

	Per cent
Food.....	25
Rent.....	20
Operating Expenses (of house).....	15
Clothing.....	20
Other Expenses, including Savings.....	20

This last heading is often called Higher Life, or Advancement, although it must include many expenditures that do not seem to the ordinary man or woman to belong under such a title.

As Dr. Engel pointed out long ago, in his 'laws,' there are certain proportions of family expenditure that seem to remain constant as the income changes, while others vary widely. The Engel 'laws' briefly stated are: First, the higher the income, the lower the percentage of the cost of subsistence (bare necessities)—in the lowest incomes food has to have a very large proportion. Second, the percentage for clothing remains the same for all incomes. Third, the percentage for housing (rent plus fuel plus lighting) also remains the same. Fourth, as the income increases, the percentage available for the higher needs grows larger.

It is being increasingly recognized that for those who have more than enough money for the bare necessities of life, wide latitude of choice in the expenditure of the extra amount is not only allowable, but socially desirable, and that what should decide many of the items of a particular budget is not what someone else thinks the family ought to have, but what they themselves deliberately decide that they wish. A larger number of headings than that given above is now general. 'Food and clothing' are often subdivided, 'savings' is always given a separate heading, and

many other items are taken out of the general headings. The use of 'Miscellaneous, Sundries, or Incidentals' as a heading has proved dangerous, because difficult to plan for or control, and in the best lists no such heading is used.

A number of books have been published discussing the subject of the family budget, some of which are named below. There are also a large number of budget and account forms printed, to be used in carrying out such a plan. The movement for the budget has been approved and encouraged by the savings banks of the country, since it is the universal testimony that where the budget and accounts habit is established, savings increase. Some banks have a department for advising individuals how to make their own or their family budget, and to keep the right accounts, the head of the department being a woman who has specialized in this subject.

Since the expenditure of the largest proportion of the family income is usually in the hands of the woman who presides over the home, it is women who ask most for such advice; but the importance of having all members of the family accept early the principle of the budget and establish its practice is being recognized in the training, in school, of girls and sometimes of boys in the budget and account habit for their own personal expenditure. Emphasis on the co-operative aspect of family life leads to a new attitude as to the relation of all members of the family to the apportionment and use of the family income.

The period for which the budget is made is usually a short one for dependent families or those living on a very narrow margin of expenditure. For the ordinary family the budget period must be longer, since some expenses are not evenly distributed. Insurance, for example, may be paid only once or twice a year. Clothing necessitates heavy expenditure in one month and none in another. A year is generally accepted as the right length for the budget period for such families, with readjustment of the items within that period if the necessity arises.

The accounting side is one of great importance, as the budget must be checked by accounts kept under the same headings as those under which money is assigned in the budget. The accounts must be such that they answer the questions that the family or individual may wish to ask, without being so great a burden that they will be neg-

lected or dropped. Household accounts are not bookkeeping in the business sense. The books noted discuss this subject fully. The extension of the money resources by conserving what is bought and by using the labor income of the family are being stressed more than ever before.

With the adoption of the budget plan goes, naturally, careful study of the best use of the money assigned to each heading, so that the greatest value possible may be had for the money expended. In 1899 Mrs. Richards judged that American families were using most unwisely the money spent for food and for operating expenses. Since that time clothing and amusement have in many instances come to the front as the chief offenders; but these generalizations do not necessarily help any one family or any one individual, since each has its or his or her own problems to meet.

Of the following books, the first two give directions for making a budget and keeping accounts, the last two the general principles of the subject without detailed directions: Taber's *The Business of the Household* (1918); Lord's *Getting Your Money's Worth* (1922); Richards' *The Cost of Living*; Abel's *Successful Family Life on a Moderate Income* (1921).

**Budget, Governmental.** In a general sense, a budget is a periodical financial document forecasting revenues and expenditures of an enterprise or government during a certain determined period of time, it being also an authorization or an order by competent authorities to collect the designated revenues and to make the designated expenditures. Such documents generally present a report of receipts and expenditures during the fiscal period just closed and the manner in which revenues and expenditures are balanced, together with an estimate of the receipts and expenditures for the future period. Such preliminary plan is the basis for the enactment of the required financial legislation.

**United States.**—In the United States there was no Federal budget system until 1922, though the subject had been agitated for more than a decade prior to that time. In 1912 President Taft's non-partisan Commission on Economy and Efficiency recommended to Congress the adoption of a responsible budget system; a number of budget bills were subsequently introduced into Congress, and in 1920 the Good Bill was passed by both House and Senate but was vetoed by President Wilson

(June 4, 1920). The bill was re-introduced into Congress on April 25, 1921, and was passed on May 5, 1921. In the meantime the McCormick Budget Bill was adopted in the Senate. Differences having been settled in Conference, the final bill, known as the McCormick-Good Budget Bill, was approved by President Harding, June 10, 1921, and Charles G. Dawes was appointed first Director of the Budget.

This act authorizes the President to transmit to Congress, on the first day of each regular session, the budget containing an estimate of the expenditures and appropriations necessary for the support of the government during the ensuing fiscal year; estimates of the receipts for the same period; a summary of the expenditures and receipts of the previous fiscal year; estimates of expenditures and receipts of the fiscal year in progress; the amount of appropriations available for expenditure during the fiscal year in progress; statements of the condition of the treasury at the end of the previous year, the estimated condition at the end of the year in progress, and at the end of the ensuing fiscal year; and facts regarding the indebtedness of the government.

The act creates within the Treasury Department a Bureau of the Budget, in charge of a Director and Assistant Director, appointed by the President. The chief duty of this Bureau is to prepare the budget and to this end it is empowered to revise, reduce, or increase the estimates of the several departments, prepared by the budget officer of each department, which officer is established by the act. The Bureau of the Budget must also make a detailed study of the various departments and make a report to the President, that he may decide what changes are necessary in their organization for efficiency and economy.

The first budget submitted under the new law was for the years 1922 and 1923. It is given on page 363.

The earlier arguments in favor of a budget system made a strong appeal to the country and so gained in favor that by 1912 Massachusetts and New Jersey appointed commissions to inquire into methods for securing greater economy in conducting State business. The next year New York, Pennsylvania, Minnesota, California, Illinois, and Iowa appointed similar commissions. Thus has the work continued so that in 1921 forty-six of the forty-eight States had enacted or had pending constitutional or statutory measures on the subject.

There have been established three general types of State budgets—executive, legislative, and commission. In the *executive type*, the governor is responsible for giving an account of the acts of the administration involving the raising and spending of State money and the preparation of an estimate and plan of administration for a future period for which an appropriation is asked. The said account and plan are the subject of inquiry and action of the legislative body. Oregon and Ohio established this system in 1913; Iowa, Minnesota, and Nebraska in 1915; Maryland and New Jersey in 1916; Delaware, Illinois, Kansas, New Mexico, and Utah in 1917; Massachusetts, Mississippi and Virginia in 1918; Arizona, Colorado, Idaho, Indiana, Nevada, New Hampshire, Oklahoma, South Carolina, and Wyoming in 1919.

In the *legislative type* the preparation of estimates and plan of administration for the financing of a future period are made up by the legislature through its committees or agents, the administrative officers acting only in an advisory capacity. Arkansas adopted this type in 1913 and New York in 1916. The *commission type* provides for a commission which may be composed of executive and administrative officers or appointees of the governor, or, in other instances, may be part *ex officio*, with other members appointed by either the executive or legislative powers. This commission reviews the acts of the administration involving the raising and spending of money, and prepares estimates for the financing of a future period which are submitted to the legislature for inquiry, deliberation, and action. This type of State budget was adopted by California and Wisconsin in 1911, by Connecticut, Washington, North Dakota, and Vermont in 1915, by Louisiana in 1916, by Tennessee and South Dakota in 1917, by Kentucky, West Virginia, and Georgia in 1918, by Alabama, Montana, Michigan, Texas, Maine, and North Carolina in 1919, and by Florida and Missouri in 1921.

Until the last two decades municipal budgets, if so they may be called, have been prepared in the same manner as in the State and Federal governments—that is by committees of Council or of the Board of Aldermen—and were finally enacted into financial measures by those municipal legislative bodies. A few of the larger cities of the United States have other methods adopted in accordance with their charters. In New York City a Board of Estimate and Apportionment

## UNITED STATES BUDGET 1922 AND 1923.

(The first Budget of the United States made up by Director Charles G. Dawes and submitted to Congress on Dec. 5, 1921.)

## BUDGET SUMMARY.

(Exclusive of postal revenues and postal expenditures paid from postal revenues.)

	1923. Estimated.	1922, Estimated.	1921, Actual.
Total receipts.....	\$3,338,182,750	\$3,943,453,663	\$5,624,932,960.91
Total expenditures, including reduction in principal of public debt....	3,505,754,727	3,967,922,366	5,538,040,689.30
Excess of expenditures.....	\$167,571,977	\$24,468,703	.....
Excess of receipts.....	.....	.....	\$86,892,271.61

The White House, Dec. 5, 1921.

WARREN G. HARDING.

## ESTIMATED EXPENDITURES FOR 1922 AND 1923.

	Estimated Budget Expenditures, 1923.	Estimated Expenditures, 1922.	Actual Expenditures, 1921.
Legislative.....	\$16,265,215	\$15,984,446	\$18,994,565.17
Executive Office.....	227,045	227,045	197,341.68
State Department.....	10,432,624	11,406,032	8,780,796.84
Treasury Department.....	168,997,160	169,871,163	476,352,192.21
War Department.....	369,902,107	389,091,406	1,101,615,013.32
Panama Canal.....	7,358,839	7,219,849	16,461,409.47
Navy Department.....	431,754,000	478,850,000	650,373,835.58
Interior Department.....	41,799,022	35,005,829	39,687,094.86
Indian Service.....	31,883,000	33,135,000	41,470,807.60
Pensions.....	252,350,000	258,400,000	260,611,416.13
Post Office Department.....	3,357,092	3,276,454	5,230,650.15
Deficiencies in postal revenues.....	21,509,666	48,172,270	130,128,458.02
Department of Agriculture.....	47,497,530	48,637,100	62,385,702.93
Expenditures for good roads.....	*125,700,000	*105,000,000	57,452,056.48
Department of Commerce.....	19,939,970	20,131,800	30,828,761.55
Department of Justice and Judicial.....	6,301,835	4,796,916	8,502,509.55
Department of Labor.....	18,415,681	16,825,568	17,206,418.03
Shipping Board and Fleet Corporation.....	50,495,735	73,911,081	130,723,268.26
United States Veterans' Bureau.....	455,232,702	438,122,400	.....
Railroad Administration and Transportation Act.....	.....	337,679,235	730,711,669.98
Federal Board for Vocational Education.....	5,529,244	4,756,344	104,671,772.62
Other independent offices, including War Finance & Grain Corporations.....	17,034,583	16,983,165	83,596,418.52
District of Columbia.....	25,070,877	22,275,063	22,558,264.16
Increase of compensation.....	.....	35,000,000	.....
Purchase of obligations of foreign Governments.....	.....	.....	73,896,697.44
Purchase of farm loan bonds.....	.....	.....	16,781,320.79
Deduct unclassified repayments, etc.....	.....	.....	922,593.14
Ordinary expenditures.....	\$2,127,053,927	\$2,574,758,166	\$4,088,295,848.20
Reduction in principal of the public debt:			
Sinking fund.....	\$283,838,800	\$272,442,200	\$261,100,250.00
Purchase of Liberty Bonds from foreign repayments.....	30,500,000	30,500,000	73,939,300.00
Redemption of bonds and notes from estate taxes.....	25,000,000	25,000,000	26,348,950.00
Redemption of securities from Federal Reserve Bank franchise tax receipts.....	30,000,000	60,000,000	60,724,500.00
Total net reduction in principal of public debt.....	\$369,338,800	\$387,942,200	\$422,113,000.00
Investments of trust funds:			
Government life insurance fund.....	\$26,162,000	\$22,022,000	\$20,325,152.88
Civil Service retirement fund and D. of C. teachers' retirement fund.....	8,200,000	8,200,000	8,161,956.87
Trust fund investments.....	\$34,362,000	\$30,222,000	\$28,487,109.75
Interest on the public debt.....	\$975,000,000	\$975,000,000	\$999,144,731.35
Total expenditures.....	\$3,505,754,727	\$3,967,922,366	\$5,538,040,689.30

\* The above table includes estimates of additional expenditures during 1923 and 1922 for good roads, authorized by the act of Nov. 9, 1921.

Excess of estimated expenditures over ordinary receipts, fiscal year, 1923.....	\$167,571,977.00
Excess of estimated expenditures over ordinary receipts, fiscal year, 1922.....	24,468,703.00
Excess of ordinary receipts over expenditures payable therefrom, fiscal year, 1921.....	86,892,271.61

was established in 1871, composed of the mayor, president of the Board of Aldermen, and the five borough presidents, to draw up annually a scale of estimates and the apportionment of appropriations for the conduct of the city's business. Their estimates are submitted to the Board of Aldermen for legislative enactment under certain fixed limitations. Baltimore also has a Board of Estimates performing somewhat the same duties in a like manner. The Board of Estimates in Detroit, Mich., is composed of two members from each ward and five at large who are chosen by the electorate. This body passes upon the appropriation measures after these have been enacted by the city councils. In Philadelphia the City Comptroller is the only officer who submits the estimates to the City Councils, where they are received, revised, amended, and prepared as legislative ordinances by a finance committee of that body. The mayor of Cleveland, Ohio, performs a budget function, similar to that of the comptroller in Philadelphia.

Only with the extensive adoption of the commission and city-manager forms of municipal government during the last two decades, has municipal budget making received any great attention. In the commission and city-manager governed municipalities, the budgets of estimated annual expenditures are usually prepared by the finance member or manager and submitted to the whole commission for deliberation and action. It is rare in American municipal budget making to include a statement of estimated revenues and a public balance sheet. Revenues, being principally derived from taxation, are generally made to conform to the estimated fiscal requirements of the municipality, as expressed in the budget.

In recent years efforts have been made to establish a budget system in the administration of county financial affairs. Examples of such applications are now in operation in Los Angeles county, Cal., and in Westchester, Ontario, and Monroe counties, New York.

**England** has the most efficiently developed responsible budget system of all civilized nations. The principal political officer of the Treasury is the Chancellor of the Exchequer, who receives all the estimates of the civil departments of the government. He then reviews and compares these estimates with the expenditures of previous years, also revising, correlating, and reducing these estimates to the necessary minimum figures

for the running expenses for the efficient administration of the departments for the following fiscal year. He also estimates the revenues for the coming year on the basis of existing taxes, which he balances with the estimated expenditures, and if the latter exceed the former he draws up proposals for new taxation. Increases or decreases in revenue are an essential part of the budget. These estimates and proposals are presented, together with the estimates of the War Office and the Admiralty, which must first have received the Treasury approval, to the Cabinet, which finally approves the whole financial policy.

The approved estimate, which includes an itemized account of the proposed government expenditures, where and how the revenues will be raised to meet the same, a comparison in parallel columns of the expenditures and revenues of the current year, together with a balance sheet of past and proposed public finances, is presented by the Chancellor of the Exchequer to the House of Commons at the opening of its annual session. The House considers the budget item by item, while sitting as a committee of the whole, and, while there is much debate, yet rarely are changes made in the Budget Bill, as the Commons has no right to increase or shift any items of the estimate nor to make any decreases except with the consent of the Cabinet. The House of Lords is required only to give a formal assent to the measure. The estimates, together with the Finance Bill and the Appropriation Bill, are generally passed by the House as they are introduced, but the government is held to a strict accountability both for the efficiency and economy of its service and the regularity of its accounts.

The main feature of parliamentary control in the British budget system is through the audit of the Comptroller and Auditor-General, an independent parliamentary officer appointed for life. The audit-report of this officer reveals any and all irregularities in the accounts—such as loss, waste, fraud, extravagance or incompetence—that may appear in comparison of the accounts with original grants. This report is submitted to the Public Accounts Committee of the House of Commons, a standing committee of fifteen members, the chairman of which is a member of the Opposition, whose statutory duty is the securing of parliamentary control of the budget. The committee examines the points raised by the Auditor-

General relative to the appropriation accounts, holds investigations and public hearings on irregularities, and even refuses to sanction the payment of money until irregularities are explained to its satisfaction. It makes detailed reports to Parliament.

The budgets of English municipal and local governments are usually prepared by the finance committee of the town council. This committee is held to strict account for all financial affairs of the government but the several committees are responsible for the expenditures within their jurisdiction. The manner of laying the rates (taxes) varies in different cities.

The **British dominions** having separate local autonomy—Canada, Australia, New Zealand, South Africa, and India—have established budgets in which are incorporated many of the main features of the home system.

**France.**—In the preparation of the French budget responsibility is scattered throughout the Ministry and in the legislative branch of the government, but at all times the budget is considered as a unit. Each minister is responsible for the estimates of his department, which he submits to the Minister of Finance, who organizes these estimates into a whole without the power of revision. The finance minister also devises the means of raising sufficient revenue to meet the expenditures of the budget. In fact, he draws up the whole budget bill, which is submitted as a project of law to the Chamber of Deputies, who refer it to the Budget Committee. This committee meets in closed session and has power to increase, reduce, or eliminate items, add new items, rewrite the budget bill, or reject it completely and return it to the minister, demanding that he write a new bill, thus causing a constant struggle between the members of the ministry and the committee. The committee reports the bill to the Chamber for debate, where the members amend the bill with the restriction that no item can be increased nor new items added relative to salaries, pensions, etc. After the expenditure and revenue proposals of the budget are debated and passed chapter by chapter, the entire budget is formally adopted as a whole. The bill is then taken to the Senate, who have the power to restore items eliminated by the Chamber and to reduce or eliminate any of the items. Debate and passage are similar to those of the lower house. Following the Senate action the bill is returned to the Chamber

for the consideration of the Senate amendments. This process may be followed several times before an agreement is finally reached. If the bill fails of passage in the Assembly, the ministry resigns and a new one is formed which will control a majority in the Chamber.

In France control of expenditures is by three processes. First, there is an executive control through the departmental boards of control who make annual reports of accounts to the Minister of Finance. These accounts are then examined by the Bureau of Public Accounts of the Finance minister's department, which prepares a general account of the nation's finances. Second, this report is submitted to an independent commission of nine members appointed by the President, who compare the accounts with the original records and report to the Assembly. Third, there is a judicial control by the Court of Accounts, an independent body composed of judges appointed for life. The Minister of Finance submits all the accounts to this court, which performs a duty somewhat similar to that exercised by the Comptroller and Auditor-General and the Committee of Public Accounts in England. This court does not judge the officer responsible for irregularity but leaves it to the Minister of Finance to institute proceedings either civil or criminal to penalize officials responsible for irregularities. An annual report of the Court of Accounts is submitted to the President. Parliamentary control is limited to formal sanction, which is done by the passage of the law of accounts—an act formally approving the expenditures of the budget.

**Budissin.** See BANTZEN.

**Büdos-Hegy**, bu'desh-hed'y, a volcanic peak of the Carpathian Mountains, in the eastern part of Transylvania. It is some 3,000 feet high and is known as the 'Stinking Mountain,' due to the fumes from the vast beds of sulphur nearby.

**Budrum**, bood-room', BUDRUN, or BOODROOM, seaport, Asia Minor, is situated on the north shore of the Gulf of Cos; 96 miles south of Smyrna. It is the site of ancient Halicarnassus (q.v.). Pop. 6,000.

**Budur**, boo-door', or BURDUR, town in Anatolia, Asia Minor, 68 miles north of Adalia. Industries are linen-weaving and leather-tanning. Pop. 17,000.

**Eudwels**, boot'vis, town and bishop's see, Bohemia, on the Moldau, 84 miles southeast of Pilsen. It is an active trading and industrial town, manufacturing stoneware, needles, nails, pencils, beer, cigars, spirits and flour. The cathedral (1500), municipal museum, and episcopal residence are notable. Pop. (1911) 45,137.

**Budworm**, or BOLLWORM, is the name in the Southern United States for the caterpillar of a very destructive moth (*Heliothis armiger*), better known in the North as the tomato fruit-worm. It attacks the flower buds of the corn (maize) and the bolls of the cotton plant. It also feeds upon a great variety of garden vegetables and flowers. See BOLLWORM.

**Buell**, bü'el, DON CARLOS (1818-98), American soldier, was born in Lowell, O. He was graduated from West Point in 1841, and served as first lieutenant in both the northern and southern campaigns of the Mexi-

can War, winning the brevet of captain at Monterey, and that of major at Contreras and Churubusco. Soon after the outbreak of the Civil War he was made brigadier-general of U. S. volunteers, and in March, 1862, major-general. In November, 1861, he was placed in command of the Department of the Ohio, succeeding Gen. Sherman. He occupied Bowling Green, Ky. (Feb. 14, 1862), and, after marching from Nashville, Tenn., arrived on the battlefield of Shiloh in time to take part in the second day's fighting, his arrival making certain a Federal victory (see SHILOH, BATTLE OF). Soon afterward he was pitted against Gen. Bragg in Kentucky, reached Louisville first in a race for that city, and then pursued Bragg, who, after the indecisive battle of Perryville, withdrew into Tennessee (see PERRYVILLE, BATTLE OF). Buell was severely criticised for not pushing the pursuit with greater vigor, and on Oct. 24, 1862, was superseded by General Rosecrans. On June 1, 1864, he was mustered out of the volunteer service. Consult his defence in *Statements of Major-General Buell* (1884).

**Buenaventura**, bwā'nā-ven-tōō'rā, seaport, department Cauca, Colombia, 10 miles from the Pacific at Choco Bay, and 110 miles northwest of Popayán. It is the terminus of a railroad through the Cordillera Occidental from Buga, and is connected by cable with Panama. Pop. 5,000.

**Buena Vista**, bwā'nā-vēs-tā, city, Rockbridge County, Virginia, on the north branch of the James River, and on the Norfolk and Western, and the Chesapeake and Ohio Railroads; 40 miles northwest of Lynchburg. It is a manufacturing town, producing iron, fertilizer, tannic acid, paper, leather, brick, flour, and corn meal. Pop. (1900) 2,388; (1910) 3,245; (1920) 3,901.

**Buena Vista, Battle of**, an important and decisive battle of the Mexican War, fought a short distance southeast of the little village of Buena Vista, state of Coahuila, Mexico, on Feb. 22-3, 1847, between an American force of about 5,000 under Gen. Zachary Taylor and a Mexican force of about 20,000 under Gen. Santa Anna. Most of General Taylor's regular troops having been withdrawn a short time before to reinforce General Scott, Taylor was left in a greatly weakened condition. Santa Anna attempted to take advantage of this; but Taylor, who was occupying a strong position, by excellent generalship and the intrepidity of his troops, beat back the Mexican attacks. The American loss in killed and

wounded was about 750; that of the Mexicans about 2,000. See MEXICAN WAR.

**Buen Ayre**, bwen i'ra, (Fr. *Bonaire*), the most easterly of the Dutch West Indies, off the western end of the Venezuelan coast, in lat. 12° 10' N., and long. 68° 25' W. Area, 95 square miles. It is a dependency of the Curaçao colony and has a port called Buen Ayre at the eastern extremity. The chief products are timber and cattle. Pop. 6,500.

**Buenos Aires (AYRES)**, bwā'nōs i'rās ('good air'), the most populous and progressive province of the Argentine Republic. It is bounded on the north by the provinces of Córdoba, Santa Fé, and a part of Entre Ríos, on the east and south, by the Atlantic Ocean, and on the west by El Pampa territory and part of the Territory of Río Negro. The area is 117,777 square miles, the surface for the most part a vast plain intersected by numerous streams and studded with lakes. Two low mountain ranges, the Sierra de la Ventana and the Sierra del Tandiel, cross the southern part. The principal rivers are the Paraná, which separates the province from Entre Ríos on the north, and the Salado del Sur (400 miles).

Buenos Aires is essentially an agricultural country devoted to cattle raising and wheat growing. Alfalfa, sugar, and tobacco are also raised. Mineral resources are scanty, but marble, stone, lime, slate, granite, petroleum and salt are found in limited quantities. Manufacturing thrives in some of the larger towns. The roads are good and the rivers are in general navigable. The Atlantic coast, 740 miles in length, and the river Paraná, 150 miles, contain twelve ports, the chief being Ensenada and Bahía Blanca, besides Buenos Aires, which has been federalized. The capital of the province is La Plata. Extensive lands have been acquired by the Jewish Colonization Association, some of which are under cultivation. The school system, which has been inadequate, is being extensively improved. Pop. (in 1908, excluding city of Buenos Aires) 1,647,029.

**Buenos Aires**, capital of the Argentine Republic, is situated on the west bank of the Río de la Plata estuary, which is 30 miles wide at that point; 150 miles from the Atlantic Ocean. It is the largest city in South America and, aside from Paris, the largest city of the Latin races in the world. It is situated on a level plain about 25 feet above the sea. Six railroads have their terminal stations in

the city and twelve transatlantic steamship lines make it their terminus. The climate is temperate, ranging from 55° to 79° F.; frost seldom occurs, and rainfall is abundant, averaging 34 inches annually.

The city is uniformly laid out, the streets, which are well-paved and well lighted, intersecting at right angles. The finest of these is the Avenida de Mayo, over a mile in length. There are several wide boulevards, and many beautiful parks, walks, and squares, the finest being the Plaza 25 de Mayo, adjoining which are the Government House, the Cathedral, the Hall of Congress, and other public buildings. A fine statue of Liberty occupies the open square. San José de Flores, 5 miles southwest of the city, Belgrano, 5 miles northwest, and Barracas, 3 miles to the south, are beautiful suburbs, dotted with 'quintas' or country-seats, with well laid-out gardens. Palermo Park, 2 miles north, on the bank of the La Plata, covers 840 acres and has a fine zoological garden. The Recoleta, or Roman Catholic cemetery, lies between Palermo Park and the city.

Buenos Aires has one of the most complete tramway systems in the world, consisting of nearly 500 miles of line and carrying some 355,000,000 passengers annually. In order to relieve congestion in the business section an underground tube was opened in 1916.

The principal public buildings are the Casa Rosada, or Government House, the University (with 4,650 students), with the state museum and library (containing 200,000 volumes), the Cathedral, post-office, fine terminal station of the Great Southern Railroad, the Exchange, and the new Hall of Congress. The present Cathedral, built in 1752, resembles the famous Madeleine of Paris. It holds 9,000 persons and the archbishop is head of the Roman Catholic Church in Argentina. There is an imposing opera house, comparable with that of Paris; and the Jockey Club is said to have the most magnificent clubhouse in the world. The centre of the town has been practically rebuilt since 1885, stately buildings of European design replacing former one-storied white-washed houses, and tall steel-framed buildings springing up in the congested business district.

The municipal water-works system and the public school system are constantly being improved. There are good banking facilities, and a large number of newspapers in both Spanish and English are published.

The industrial life of the city

is growing rapidly. In 1918 there were 11,400 factories and workshops employing 150,000 men. Shoes, blankets, cotton, flour, glass, machinery, hats, tobacco, leather and canned goods are manufactured. Exports, consisting chiefly of meat, grain, leather and wool, were valued at about \$223,312,000 in 1915. The chief trade is with Great Britain. In spite of great improvements the city's docking facilities are somewhat inadequate. The only natural harbor is the mouth of a small river, the Riachuelo. The chief harbor was constructed at enormous expense but the channels require constant dredging to keep them open. The Puerto Madero docks cover three miles of water front, and a port of entry established at Ensenada, about thirty miles down the La Plata, is connected with the city by rail. Four new docks with a depth of 33 feet are in course of construction.

Since 1850 Buenos Aires has had a rapid gain in population. During the last quarter of the nineteenth century, when the attention of Europe was drawn to the exceptional resources and business opportunities of the Argentine Republic, immigration, chiefly Spanish, Italian, French, and Russian, reached large proportions. Pop. (1909) 1,231,698; (est. 1913) 1,444,082.

**History.**—Buenos Aires was founded in 1530 by a Spaniard, Pedro de Mendoza, and French, English, and Dutch attempts to capture it proved unavailing. At the time of the insurrection of Spanish-American colonies against Spain, it took a prominent part in the struggle, and the revolutionary Congress met here in 1810. In 1816 it became the capital of the Republic of the United Provinces of the Río de la Plata, a name superseded by that of the Argentine Republic. In 1851 Buenos Aires seceded from the Republic and became a separate state until 1859, when it reentered the confederation. In 1880 it was declared Federal property and became the capital of the country. In 1910 the centenary of Argentine independence was celebrated by an international exposition held in the capital.

Consult Barrett's *Municipal Organization in the Capitals of Latin America*, in *Bulletins of the International Bureau of American Republics* (1909).

**Buer**, boor, village, province Westphalia, Prussia, 9 miles north of Essen, with coal-mining. Pop. 32,000.

**Buff**, CHARLOTTE (1753—1828), inspired in Goethe the passion of love on the occasion of a visit he paid to her native town of Wetz-

lar in 1772. She was the prototype of the heroine of his *Werther*. See GOETHE.

**Buffalo**, a kind of wild ox with the horns flattened and angulated, not rounded as in oxen and bison, and placed below the vertex of the skull. The back has a distinct ridge in the region of the withers. The true buffaloes are confined to the Old World, occurring especially in India and Africa, but the name is popularly applied also to the bison (q. v.) of North America.

The large Indian, Asiatic, or Water Buffalo (*Bubalus buffelus*) has beautiful twisted horns, somewhat triangular in section, thick and broad at the base, and with a spread sometimes as great as six feet. The hair is short and scanty, almost bristly, slightly longer on the head, shoulders, and front of neck, and almost black in color. The bare brown polished hide is, however, the more striking feature. The animal measures about 7 feet in length, and stands about 4 feet high at the shoulder. It walks or runs with the horns lying back on the shoulders and the muzzle projecting characteristically forwards. It frequents marshy lands, preferring for its food the rank coarse herbage which they afford.

This buffalo is a powerful animal, capable of dragging or carrying a far heavier load than the ox. It exhibits a considerable amount of intelligence and in a state of domestication is capable of becoming very docile. In a wild state the animal is savage and dangerous.

Two species of buffalo are commonly attributed to Africa—the Cape Buffalo (*B. caffer*) and the West African species (*B. pumilus*), but it is not certain that the two are distinct. The Cape, or Black, Buffalo is a large, fierce animal and is never domesticated. It measures about 8 feet from the root of the horns to the tail, and the height is 5½ feet. The hair is dark brown, nearly black, and sparse except on the ears and tip of the tail. This species, like the Indian variety, is found in marshy swamps and feeds on aquatic plants. Large herds of Cape buffaloes were formerly seen, but their numbers have been so depleted by sportsmen that bands of five or ten are now more common. Buffaloes are also found in Egypt, the Sudan, Hungary, Spain, and Turkey. A small species, known as the Ahoa, is native to Celebes (see ANOA).

**Buffalo**, city and port of entry, New York, county seat of Erie county, and one of the most important commercial and manufacturing cities in the United

States, second in population in the State and twelfth in the United States. It is situated at the eastern end of Lake Erie, at the head of Niagara River, 20 miles above the Falls, and is the western terminus of the Erie Canal. It is served by the New York Central lines (New York Central, West Shore, Lake Shore, Nickle Plate, Michigan Central) and by the Erie, the Lackawanna, the Lehigh Valley, the Grand Trunk, the Pennsylvania, the Wabash, the Buffalo, Rochester and Pittsburgh, the Toronto, Hamilton and Buffalo, the Pere Marquette, the Buffalo Creek (terminal), and South Buffalo, (terminal) Railroads.

Buffalo is beautifully situated on a plain rising gradually from the lake and covers an area of 42 square miles. There are more than 600 miles of paved streets, generally shaded by fine trees. Delaware Avenue is the leading residential street, and Main Street, running north from the lake, the principal business thoroughfare. Other notable streets are North, Summer, Front Avenue, Richmond Avenue, Broadway, and Lincoln Parkway. The park system comprises 1,229 acres and includes six large parks—Delaware (365 acres), Riverside (48 acres), Humboldt (56 acres), Cazenovia (106 acres), South Park (155 acres), and The Front (48 acres)—seventeen beautiful park approaches, and thirty smaller parks scattered throughout the city. In South Park there is a fine Conservatory, and adjoining Delaware Park are the beautiful grounds of the State Insane Hospital and Forest Lawn Cemetery. Four public markets are conducted by the city, and it maintains seventeen city playgrounds.

Buffalo has an abundant water supply from the lake, and all water is sterilized by means of liquid chlorine. The street railway system comprises over 223 miles, and seven interurban traction lines enter the city.

Among the principal buildings are the U. S. Government building, erected at a cost of \$2,000,000, the City and County Hall, Music Hall, the State Armory and Arsenal, State Insane Asylum, Albright Art Gallery, Masonic Temple, Grosvenor Free Library, Ellicott Square Building, Buffalo Historical Society, and General Hospital. There are sixty hotels, of which the Iroquois, Lafayette, Lenox, Statler, and Genesee are noteworthy.

Institutions for higher education include the University of Buffalo (q. v.), State Normal School, Buffalo Seminary for Girls, Academy of the Sacred

Heart, and Martin Luther Seminary. There are two municipal libraries with about 400,000 volumes. The Buffalo Library building also houses the Fine Arts Academy and the Society of Natural Science. The public school system is excellent and in 1921 included 2,700 teachers and 65,000 enrolled pupils. There are 5 high schools, 63 grammar schools, 4 vocational schools, and one training school, as well as evening, vacation and Americanization classes, and an 'opportunity school.' Among charitable institutions are the Orphan Asylum, Orphanages of St. Vincent and St. Joseph (R. C.); the Social Service Building, a centre of philanthropic work, containing the offices of the Buffalo Charity Organization Society, the first of its kind founded in the United States; the Children's Aid, Children's Hospital, and the Adam Memorial Hospital.

#### Commerce and Industry.—

By virtue of its position and commercial facilities, Buffalo is one of the country's greatest ports. It is an important railroad centre and is the terminus of several steamship lines. The Barge Canal connects it with the Hudson and New York City; the Welland Canal, connecting Lake Ontario and Lake Erie, gives access to ports on Lake Ontario and the St. Lawrence, and steam ferries and the International Bridge connect it with Canada. Federal, State, and municipal enterprise have all contributed to the improvement of shipping facilities. Buffalo River has been dredged and Black Rock Harbor converted into a ship canal, so that there is now a lake port of over 3 miles and a river front of 17 miles. Buffalo is an immense grain port, handling the bulk of the grain from the Western States and the Canadian Northwest *en route* to the Atlantic seaboard. Its 22 grain elevators have a capacity of 30,600,000 bushels, and in 1920 received 128,697,528 bushels of grain. It has also a large trade in lumber, fresh fish, coal, copper, stone, and livestock.

Manufacturing industries include iron and steel production, manufactures of steel cars and car wheels and of machinery, oil refineries, slaughtering and packing establishments, brickyards, and soap, starch, cigar, furniture, leather, stove, surgical instruments, carriage, harness, and cutlery factories. Power for these industries is obtained chiefly from Niagara Falls, but a part is procured from a steam generating plant recently completed. According to the Census of Manufactures for 1914, the number of industrial establish-

ments is 2,225, with an invested capital of over \$243,000,000 and products valued at \$337,000,000.

The population of Buffalo in 1920 was 506,775. The rapid growth of the city is indicated by successive census figures. In 1820 the population was 2,095; in 1840 it had risen to 18,213 and in 1860 to 81,129. It was 155,134 in 1880; 255,664 in 1890; 352,387 in 1900; and 423,715 in 1910.

**Government and Finance.**—Since January 1, 1916, Buffalo has been governed by a Council, consisting of a mayor and four councilmen, elected for a term of four years, and exercising executive, administrative, and legislative powers. The government is divided into five major departments, designated as the Department of Public Safety, Finance and Accounts, Public Works, Parks and Public Buildings, and Public Affairs. Other officials are nominated by the mayor and appointed by the Council. The mayor has no veto powers, but votes in the sessions of the Council.

On July 1, 1921, there were twelve commercial banks and trust companies and four savings banks. The discount banks had a total capitalization of \$20,000,000 and deposits amounting to \$241,294,528. The four savings banks have 177,820 depositors, \$130,744,470 in deposits, and a surplus of \$14,766,804. Bank clearings in 1920 totaled \$2,293,015,689.

The assessed valuation of the city for the fiscal year 1920-21 was \$608,178,150. The total bonded debt is \$43,222,596.

**History.**—In 1798, Joseph Elliott, agent of the Holland Land Company, began the first survey for the town of Buffalo, which he called New Amsterdam. This survey was completed in 1805. In 1806 the first schoolhouse was built, and in 1810 the town of Buffalo, so called from the visits of the bison to the neighboring saltlicks, was incorporated. The first village charter was granted in 1813, and in 1832 Buffalo was made a city. During the War of 1812 Buffalo was the scene of several naval engagements and in 1813 the town was burned by the British. The building of the Erie Canal gave to the city its commercial importance, and from its opening in 1825 Buffalo increased rapidly in wealth and population. In 1901 the Pan-American Exposition (q. v.) was held in Buffalo and President McKinley was assassinated (Sept. 6) here by an anarchist fanatic who was promptly tried and executed. Consult Powell's *Historic Towns of the Middle States*.

VOL. II.—Oct. '21

**Buffalo Berry** (*Shepherdia argentea*), a shrub found in the northwestern part of the United States, especially in the Upper Mississippi valley, whose branches are thickly covered in the autumn with silvery leaves and clusters of crimson berries somewhat resembling the red currant. It is cultivated for ornamental purposes, and the berries are sometimes used to make jellies.

**Buffalo Bill.** See CODY, W. F.  
**Buffalo Bird.** See OXPECKERS.

**Buffalo Fish**, one of the large hump-backed suckers of the family Catastomidae and genus Ictiobus, of which several species dwell in the Mississippi River and its tributaries. Its flesh is of little value.

**Buffalo Gnat**, a gnat (*Simulium meridionale*) of the interior of the United States, related to the Eastern blackfly (q. v.), and annoying to cattle and smaller animals. Its mode of reproduction and habits are similar to those of the mosquito. When first encountered by frontiersmen they thronged about the bison herds.

**Buffalo Grass** (*Bulbifolium dactyloides*), a grass common to the western plains of North America, from Manitoba to Texas. It is usually about 6 inches high; it spreads by runners as well as by seed, and soon forms a thick sod. It is an excellent pasture grass and furnishes nutritious food for all kinds of stock.

**Buffalo Moth**, a name given to the larva of a beetle (see CARPET BUG) under the erroneous idea that it was the young form of a moth, and because it first began to be observed in the neighborhood of Buffalo, N. Y. It destroys carpets, woollens, etc.

**Buffalo, University of**, a co-educational institution of learning established in Buffalo, N. Y., in 1846. It consists of colleges of medicine, pharmacy, law, dentistry, arts and sciences, and a teachers' college. For the first forty years of its existence it consisted solely of the college of medicine. In 1901 the Gratiwick Cancer Laboratory, the first in the world to be established for the study of cancer, was erected here. For latest statistics see Table of American Colleges and Universities under the heading COLLEGE.

**Buffington**, ADELBERT RINALDO (1837- ), American soldier, was born in Wheeling, W. Va. He was graduated (1861) from West Point, and began service in the ordnance department of the army, with which he was always associated. During the Civil War he served principally in Missouri, New York, and Southern ports, being in com-

mand of the New York arsenal in 1863-4. After the war he was in general service and was then assigned to the command of the national arsenal, Springfield, Mass. (1881-92), and to the Rock Island arsenal (1892-7). He was made brigadier-general and chief of ordnance, U. S. A., in 1899, and retired in 1901. General Buffington made many inventions in connection with small arms and gun carriages.

**Buffiehead**, a common small fresh-water duck of the north temperate portions of North America (*Chariionetta albeola*), so called because the long feathers on its head suggest the shaggy mop about the head of the bison ('buffalo'). It is about 13 inches in length and has a handsome plumage and delicate flesh, and is a favorite among sportsmen.

**Buffon**, buf'un, GEORGE LOUIS LECLERC, COMTE DE (1707-88), French naturalist, was born in Montbard (Côte d'Or) in Burgundy. During his early manhood he published many scientific treatises, and this resulted in his election as a member of the Academy of Sciences, and in his appointment in the same year (1739) as superintendent of the Jardin du Roi, the present Jardin des Plantes and Museum of Natural History. This was the turning-point of his career, and after ten years' assiduous labor there appeared in 1749 the first three volumes of his famous *Histoire Naturelle*, in the production of which he was assisted by Daubenton. Succeeding years brought forth fresh volumes, the work in its final form consisting of forty-four volumes, eight of which were published after Buffon's death. A second edition of thirty-six volumes was published in 1774-1804. The naturalist was created Comte de Buffon by Louis xv., and enjoyed the favor and friendship of Louis xvi. His *Histoire Naturelle* is now almost obsolete, and of comparatively little scientific value, but it had an immense popularity in its day.

**Buford**, bü'ferd, JOHN (1826-63), American soldier, was born in Woodford county, Ky. He was graduated (1848) from West Point, and was engaged in service on the plains up to the time of the Civil War. In that contest he was assigned to active duties with the rank of brigadier-general (1862), took part in General Pope's campaign in Northern Virginia, and was wounded at Manassas. Later in the year he commanded a cavalry brigade in the Army of the Potomac, and was thereafter prominent in all its engagements, particularly at Gettysburg, until transferred to the Army of the Cumberland

just before his death (Dec. 16, 1863), on which day he was commissioned a major-general.

**Bug**, böög, the name of two rivers of Russia. The *Southern* or *Black Sea Bug* rises in Volhynia and follows a southeastern course through the governments of Podolia and Kherson, to Nikolaiev, where it forms a *limen* (estuary) 30 miles long, which joins that of the Dnieper. It is 450 miles long but is navigable only from Nikolaiev to the sea. The *Southern Bug* is the Hypanis of Greek and Roman geographers, the Ak-su of the Turks.

The *Western* or *Polish Bug*, an affluent of the Vistula, rises on the eastern slope of the Carpathians, in Galicia, and falls into the Vistula at Novo Georgievsk (Modlin), some 20 miles northwest of Warsaw, after a course of 450 miles. Of its whole extent, more than half is navigable for vessels of moderate size.

**Bug**, a name used sometimes to denote all the insects included in the order Hemiptera and sometimes reserved for one section of this order, the Heteroptera. Bugs are characterized by the fact that the mouth is adapted for sucking; their food consists of the juices of plants or the blood of animals; and as reproduction is frequently very rapid, they may be of great importance in connection with agriculture. They include arboreal, terrestrial, and marine forms. See **HEMIPTERA**; **HETEROPTERA**; **BED BUG**; **BOAT FLY**; **CHINCH BUG**; **WATER BUGS**.

Bugs.

1. Bed-bug; 2. Skater (aquatic); 3. A bark-bug (*Aradus depressus*).

**Buga**, böögä, town, state of Cauca, Colombia, is situated in the Valley of the Rio Cauca, at an elevation of 6,000 feet, 3 miles from the river, and 55 miles by rail from the Pacific port of Buenaventura. The fertility of the region is famous, and large shipments of coffee and sugar-cane are made from this point. The town dates from 1570. It was called Nueva Galicia by the early settlers, who were Galicians. Pop. 13,000.

**Bugasón**, böögä-sön', pueblo, Antique province, Panay, Philippine Islands, is situated on the west coast of the island; 24 miles north of San José de Buenavista. Pop. 14,000.

**Bugeaud de la Piconnerie**, bü-zhō'd'lā pē-kōn-rē', THOMAS ROBERT (1784-1849), Duc d'Isly and marshal of France, was born in Limoges, joined the army as a private (1804), and rose to the rank of colonel (1815). By the revolution of July, 1830, he obtained a seat in the Chamber of Deputies; he won the favor of Louis Philippe, and was sent to quell the Arabs in Algeria (1837). His success over Abd-el-Kader led to his creation as marshal of France, and his victory over the Moors at Isly (1844) won his ducal title. He governed Algeria (1840-7) and died of cholera at Paris.

**Bugenhausen**, böög'en-hä'gen, JOHANN, or DR. POMMER (1485-1558), German Protestant reformer, was born on the island of Wollin, in Pomerania, and entered the priesthood. He was converted to the doctrines of Luther in 1520, and became a close and lifelong friend of the great reformer. In 1522 he settled as pastor and university professor at Wittenberg, and wrote a Commentary on the Psalms (1524); but his most arduous work was assisting in Luther's translation of the Bible, and in organizing the reformed church in Germany (Hamburg, Lübeck, Pomerania) and in Denmark (1537). He also wrote a *History of Pomerania* (1728; new ed. 1901).

**Bugge**, böög'e, ELSEUS SOPHUS (1833-1907), a Norwegian antiquary and philologist, was born in Laurvig. He was educated in Christiania, Copenhagen, and Berlin, and in 1866 became professor of comparative philology and of the Old Norse language at Christiania. His specialty was old Norse literature and archæology, including the Germanic languages, and notably Anglo-Saxon. As early as 1858 he showed his interest in old Norse folk-songs by publishing *Gamle Norske Folkeviser*; and in 1867 he issued an edition of the songs of the *Edda* under the title *Norrøne Fornkvædi*. His works embrace *Studier over de Nordiske Gude og Heltesagns Oprindelse* (1881-9); *Norges Indskrifter med de Aeldre Runes* (1891); *Norrøne Skrifter af Sagnhistorisk Indhold* (1864-73); *Bidrag til den Aeldste Skaldedigtningens Historie* (1894); *Lykische Studier* (1897; English trans., *The Home of the Eddic Poems*, by Schofield); *Studies on Northern Mythology* (trans., Stephens, 1884).

**Buggy**, a light, one-horse, four-wheeled vehicle with or without a hood. In England the term is applied to a light two-wheeled vehicle with no hood. See **CARRIAGES**.

**Bugis**, böög'jēz, or **BUGINESE**,

a Malayan people originally inhabiting the southern peninsula of Celebes, but now spread all over the East Indies as merchants and traders. They are lighter in color than the Malays, are superior to them morally, and resemble the Javanese in appearance. They are Mohammedans by religion; speak a Malayo-Polynesian dialect akin to the Macassar, and have a written literature. See **BONI**.

**Bugle**, bü'g'l (*Ajuga*), a pale-arctic genus of *Labiata*. The Common Bugle (*A. reptans*) is abundant in Europe. Its flowers are generally blue, but white and purplish varieties are sometimes grown in flower borders. *A. alpina* is one of the beautiful flowers of the Swiss Alps.

**Bugle**, a treble wind instrument of copper or brass emitting a penetrating note, used for purposes of military signalling (see **BUGLE CALLS**). It has a smaller bell and a shorter tube than the trumpet. It is made in the key of Bb, and its effective notes are the open notes of the tube—C (below the staff), G, C, E, G.

**Bugle Calls** are used as *warning* and *formation* calls to denote the hours of service, alarm calls, such as *Fire Call*, *To Arms*, *To Horse*, etc., and as drill signals to large or scattered bodies of troops, as when drilling in extended order. The drill signals include both preparatory commands and commands of execution, and officers and men are required to be thoroughly familiar with these and all other bugle calls. The drill signals are more easily memorized by remembering that all movements to the right are on the ascending scale, the same movements to the left are corresponding signals on the descending scale, and that changes of gait are all on the same note. In a garrison where no band is stationed, the bugles played for marching, having replaced the fife and drum for this purpose. Each company, troop, and battery has two buglers, or trumpeters.

The following are a few of the more generally used bugle calls in the U. S. army:

Quick. MESS.

Quick. COMMENCE FIRING.

51. CEASE FIRING.

Quick. CHARGE.

Repeat at will.

Quick. BOOTS AND SADDLES.

10. ADJUTANT'S CALL.

9234—19

**Bu'gloss**, a name popularly applied to many plants of the natural order Boraginæ, more strictly to *Anchusa* (*Lycopsis*) *arvensis*, a common weed in corn-fields in Britain. The beautiful *Echium vulgare* bears the English name of viper's bugloss. Both these plants are naturalized in the United States.

**Buguruslan**, bōō'gōō-rōōs-lān', town, Russia, in Samara government, 106 miles northeast of Samara. It has trade in cattle and leather, and farming is the chief industry. Pop. 15,000.

**Buhi**, bōō'hē, pueblo, Luzon, Philippine Islands, in Ambos Camarines province, on Buhi Lake, 29 miles southeast of Nueva Caceres. Pop. 10,000.

**Buhl Work**, būl, or more correctly BOULLE WORK, a species of marquetry invented by Charles André Boulle (q.v.), a French woodcarver. Tortoise-shell, brass and rosewood are the materials most frequently used in this kind of inlaid work, and the effect is highly decorative. This artistic method of treatment is applied to the more ornamental articles of furniture, such as drawing-room tables, clock cases, and *bric-à-brac* stands.

**Buhrstone**, būr'stōn, or BURR-STONE, a name given to certain quartzose rocks, the worked surfaces of which possess the property of cutting or grinding. They are used principally as millstones. The best kinds are of creamy

white, with a granular and somewhat cellular texture, and are obtained in the Tertiary formation of the Paris basin and the surrounding district. American production is supplied chiefly from New York, Virginia and Pennsylvania, and, for their present uses in the grinding of the coarser mill products, are considered entirely satisfactory.

**Building**. The erection of any edifice is the work of several distinct trades, and an account of masonry, bricklaying, carpentry, steel and iron construction and the like, will be found under their several titles. Here we shall indicate the manner in which these trades coöperate under the architect and general contractor. Excavation is measured by the cubic yard. 'Sheathing' or timbering the sides of excavations is necessary in soft ground, and is measured by the square yard; and concrete work is measured by the cubic yard when above 12 in. thick, but by the superficial yard when below that thickness. The *damp-proofer* lays a 'damp course' on the top of masonry walls, just above ground-level, consisting of three to five layers of tarred felt, each well coated with hot asphaltum applied with a brush or mop. The whole surface under the building may be damp-proofed in this manner over a layer of broken stone or concrete and a bed of concrete is placed above this to prevent it from being forced up by water. In deep excavations this is often three feet in thickness and is usually reinforced with steel. *Mason work* is carried out by brick masons and by stone masons. Earthenware drains are set by the brick mason, or under certain conditions by unskilled labor, and all cut stone is set by the stone contractor, who lays no brick. Rubble walls are measured by the superficial or cubic yard. All stones used as plinths, jambs, heads of window openings, cornices, etc., are measured by the cubic foot; plain, sunk, and moulded work on these by the superficial foot; narrow margins, grooves, etc., by the linear foot; and mitres, cusplings, etc., are numbered. Brick walls are measured by the cubic foot, the thickness being figured, as 8-inch, 12-inch, 16-inch, etc., and all openings deducted. Fireproof floors of concrete or terra-cotta and partitions of hollow tile are set by a separate contract. Tile, terrazzo and mosaic floors, hearths, mantel facings, bath-room floors and wainscots of ceramic tile, heating and ventilating apparatus are handled by separate contractors.

The many subdivisions of work on a modern building have

brought about the formation of large 'construction companies,' that handle the clerical detail incident to the erection of an important building, and relieve the architect of much labor. The *carpenter* has to put in lintels and bucks; floor-joists; roof, consisting of joists, rafters, and tie beams, covered with a layer of sheathing; the studding is erected for lath and plaster partitions; and furring strips are nailed to the under side of joists; while strips are nailed along the sides of each joist for the pugging-boards to rest on. The *roofer* sets the leader heads or baskets, and the leaders and gutters are furnished and set by the *sheet-metal* contractor, to be connected to the house drain by the *plumber*. The *plumber* puts in the pipes and cisterns of the water supply; sets the boiler of the kitchen range; is responsible for the baths, sinks, wash-tubs, water-closets, vent and soil pipes, traps, etc. The gas-pipes are set by a separate contractor or by the plumber. The *roofer* covers the sheathing with a layer of building paper, over which he nails the slates; or if tiles are preferred, he nails on horizontal strips to give the tiles the proper tilt, and affixes the latter. Slating is reckoned by the square yard. Shingled roofs are constructed by nailing strips of wood to the rafters at proper intervals, no sheathing being used in many cases. Tin or copper is widely used for flat or deck roofs, the tin being in small sheets, which are soldered by the *roofer* and laid on the sheathing. The *structural iron contractor's* work includes the providing and erection of steel or cast iron columns, and steel beams and girders.

Beams are measured by the pound, the depth and weight being given; connections, bolts, etc., are numbered. Iron railings and ornamental work are furnished and set by a separate contractor. The *lather* nails laths horizontally to walls and ceilings, leaving just sufficient space between the laths to allow the plaster to form a key between them. In fireproof buildings patent metal lathing is used. Then the *plasterer* lays on three successive coats of plaster, the last being of pure lime or of some special cement. In the cheaper grades of work plastering is done in two coats, the first being of mortar gauged with plaster of paris. Cornices, plaster panellings, and mouldings are included in his work. After the first coat of plaster is on the walls, the wiring is done by the *electrical contractor* for bells, lights, etc. When the plaster is dry the *carpenter* returns, inserts windows and all the interior trim, stairs, wardrobes,

dressers, etc., and lays the floors. The building is now finished, except for the contracts of the *glazier* and the *painter*, who is responsible for painting, staining, varnishing, papering, white-washing, and size-coloring in the interior, and who protects, by at least three coats of paint, all external wood and iron work from the weather. See BRICKLAYING, CARPENTRY, MASONRY, STRENGTH OF MATERIALS.

**Building Acts, or BY-LAWS,** statutes enacted by the legislature or regulations of local authorities prescribing in the interests of the public health and safety, the form, height and materials of buildings. In the United States such acts and regulations usually apply only to buildings in towns and cities, but in England, under the Public Health Acts of 1875 and 1890, they were in many cases extended by district councils to the rural districts. Recently, however, local regulations deemed to be vexatious and unnecessarily restrictive of the improvement of rural areas have been modified or withdrawn. The regulations in force in towns and cities are various in character and deal with such matters as the decent and healthful construction and sanitation of hotels and tenement houses, the use of brick, stone or other non-combustible material for houses in the more densely populated districts of cities (sometimes known as the fire area), the depth and thickness of foundations and walls, the height of buildings in narrow streets, and the like. The actual form and the enforcement of regulations of this character are usually committed to the local authorities, who are generally invested with large discretion in adapting them to local conditions. In the United States, where private rights of property are protected by constitutional provisions against legislative interference, the validity of such regulations has frequently been questioned, but their constitutionality has invariably been sustained as a proper exercise of the police power vested in Congress and reserved to the several States. See HEALTH LAWS; POLICE POWER.

**Building and Loan Associations,** a method of helping people to become 'their own landlords' which is about a century and a half old. It had its beginning in England somewhere about 1785 or 1790 in Birmingham, and soon spread to other countries. The United States has had the greatest development of this plan, which ranks high as an aid to people of moderate means to obtain homes, and to save. The method is used

not only in England, but in the British colonies, in Belgium, Germany and to a very limited extent in a few other countries.

In the United States the plan was first tried in Frankford, a suburb of Philadelphia, in 1831; it was tried in New Jersey in 1835, and has now spread into every State in the country, operating on a very large scale. In recent decades, when wealth has increased rapidly among all classes, it has had its greatest growth. In 1900 there were 5,356 Associations with a membership of 1,495,136, and total assets of \$571,366,628; and in 1914 this had risen moderately to 6,616 associations with a membership of 3,103,935, and total assets of \$1,357,707,000. By 1927 the associations had virtually doubled in number, 12,804 associations, with a membership of 11,333,261, while the total assets had grown to \$7,178,562,451. This represents an enormous growth, not equalled in ratio anywhere else in the world. The 1929 figures are over eight billions of assets and over 12,000,000 members, and the movement is still growing.

The average assets per member have doubled in dollar value; being \$382.15 in 1900, and in 1928, \$668.23. The membership has been multiplied almost tenfold since 1900.

This great growth is explained by the evolution in the character of the building and loan association in America. The original English idea was that of a 'terminating association'; that is, an association which terminated its existence as soon as the loans of the members were consummated. This was the first stage, or first method, used in this country, and is still widely used. The funds or capital of such associations comprise the instalment payments of the members, of interest and premiums paid by those who borrow from it, and various fees exacted. The association is terminated when sufficient has been paid into the association over a period of time, after subtracting expenses, losses, etc., to redeem at face value all the shares issued. This termination marks the time when the objects for which the members have joined have been accomplished.

The association plan permits the average man who has bought a lot on which to build his house, to take say five shares for each \$1,000 he requires to finance his building, in the building and loan association, giving a mortgage on the lot and his shares as security. Instead of the money being loaned him at interest rates, the money is auctioned off to members on a bidding plan for the

highest premium. The members secure the money to build the house, and as soon as this loan is paid off the association has ended its specific usefulness. Every borrower is a stockholder through his shares and is thus in close touch with the affairs of the lender.

The basic plan of the building and loan association is the community mutual help idea, and its brilliant success is due to the fact that it operates locally in a close community of interest, developing the community where it operates and thus increasing the values of its members, and avoiding danger by its ability to appraise land values accurately from close local knowledge.

With the usual impetus so familiar in America toward over-expansion, the building and loan association in the nineties began a career toward expanding from local into national organizations. The theory was that what worked so well locally, should work equally well nationally. This was an error, as was soon discovered, because of the inaccuracies of land appraisal arising from lack of local familiarity with land values in a national organization. The broad scope operation brought also corruption, excessive overhead expense, and the like, which drained profits. By 1900 national associations had been eliminated, and the building association had been firmly established on a *local* basis, operating within a single State, or on a fifty mile radius limitation, and regulated by the State banking laws.

The logical evolution, it was seen, was not toward geographical width of operation, but toward enlarging the usefulness and efficiency of the local association. This was accomplished by breaking away from the terminating type of association and making the building and loan association permanent; new series of borrowers beginning and ending at various times under the title and organized machinery of a single association.

A third plan was developed in the individual rather than the series plan, with optional payment plans enabling the individual to terminate at any time he could afford it the particular transaction he had with the association. This again increased the economy and flexibility of the building association idea, and in particular enlarged its scope beyond that of saving for building purposes, to saving for any purposes, or for investment alone. The eight billion dollar total of assets is used today to the extent of only 50 per cent. for residence building.

There are various types of building and loan shares, which in series form usually terminate in three, six, or twelve months; some companies, issuing a new series of stock every year. Some issue 'prepaid shares,' at a fixed price payable outright, participating fully in the profits as do the instalment shares, although some limit it to a fixed rate of interest; the additional share in the undivided profits, if any, being held until maturity. This is called the guarantee stock plan, which has had wide advance in the West.

Building and loan shares have, prior to maturity, two values: (1) holding a book value, and (2) withdrawal value; the latter the sum fixed by each association as the value to be paid back in case the shareholder desires to quit membership in such associations as permit withdrawal.

After having passed through its experimental and evolutionary period the building and loan association is now on a remarkably secure basis. Even in the nineties when there was dangerous national expansion, the essentially solid and secure character of these enterprises was noted. The Department of Labor in 1893 made an investigation of the associations, and even in that greatly depressed period only 35 out of the thousands in existence showed any loss, and this loss totalled only \$23,000. The very close, well-knit, well-regulated and well-secured nature of the business protects it from loss, and when loss occurs it is relatively small. In the years 1924-1928 inclusive, there have been only 100 failures with an estimated loss of about \$3,000,000; the rate of loss being on the average less than one-hundredth of one per cent. As a rule the failures are due to second mortgages and to deflation of real estate values.

During the years 1925-1929 the assets have grown at an average rate of \$800,000,000 annually, doubling the total of assets in this period. Ninety-one and a half per cent. of the assets are invested in mortgage loans. The States showing the greatest gain in the last few years are, in order of rank, Ohio, New Jersey, Pennsylvania, California, New York, Massachusetts, Wisconsin, Illinois, Indiana, Texas, Missouri, Michigan.

The building and loan association, it might be said, is an industry and not a banking institution. It sells a concrete product—mortgages on real estate, on long-term credit. If it is a sound building and loan association, it does not borrow on short term notes to render long

term credit, which is an un-economic procedure. It has a statutory right to borrow money to assist in repayment of its maturities, and it lives upon its income. It is a strictly mutual, participating enterprise. In the Middle West, but not in the East, new types of associations have sprung up, which permit waiving of 100 per cent. participation, offering instead a stated dividend on participation if earned. These are organized and operated by a few stockholders and others, not on a participating basis. This borders on a banking business, and as such has not been favored in the eastern part of the country, which is more conservative.

In this field there has thus been created two wings—a conservative wing, and a more radical wing. The advocates for the conservative wing say that the enormous development of the building and loan association is built upon conservatism, it being the third great trustee of the people's savings (after the banks and the insurance companies). It is also maintained that a building and loan association is a public service institution to be regarded as a public trust, and not a device to be commercialized along high-pressure salesmanship lines, or promises which may not be possible to fulfil, and it is pointed out that careless, irresponsible promoters could do irreparable damage to this bulwark of the common people. The radical wing maintains that the building and loan movement is a commercial device like any other, and should apply commercial principles. In the West, where people are less conservative and more given to chance-taking these new forms of associations have had rapid growth.

The conservative wing has drafted a uniform law to be passed by each State, setting up a building and loan commission, whose duty it would be to investigate a building and loan association applying for a charter, and to have power of revocation over charters.

The conservative wing objects to the privately capitalized organization calling itself a building and loan association, which from the time it was first organized was mutual in character and method. They believe that such privately capitalized organizations jeopardize the reputation of the building and loan association, now synonymous everywhere with safety.

The future of the building and loan association is regarded as excellent. There is a movement toward an extensive modernization of homes, and new building,

to fit the new consciousness of values in the home, now so widespread as a result of great technical and artistic progress. It has been said that 60 per cent. of the homes of today are obsolete. The construction of new homes will increase rather than decrease, especially in the rural and semi-rural districts, and in this work the building association will necessarily have a large share.

**Building Lease**, a lease of land in which the tenant undertakes to improve the premises by the erection of dwellings, stores or other buildings of a substantial character. As such buildings when erected become by law a part of the freehold and thus ultimately the property of the landlord, the agreed cost of the improvements is allowed as part of the consideration for the lease, in lieu of rent, and the lease is always for a long term. The rental in such cases is known as a ground rent. The ordinary way of developing a building estate is for the owner of the land to enter into an agreement with a builder to erect a certain number of houses on the land, and to covenant to grant him leases of the several plots as the houses are built. Though leases of this character are not unknown in the United States they are less common than in England, where they constitute a favorite method of securing the improvement of land. See GROUND RENTS.

**Building Stone**, a stone suitable for use in the erection of buildings. The qualities necessary to a first-class building stone are so many that it is rare to find a material which combines them all and is, at the same time, accessible, abundant, and cheap. One prime essential is ability to resist a great, crushing stress, and to bear the weight of a lofty superstructure. This excludes nearly all clay rocks and shales and such granular limestones as chalk, and renders firm, fine-grained sandstone and crystalline rocks such as granite of special value for some kinds of work, as the pillars and abutments of bridges. Resistance to atmospheric action and weathering is of great importance, especially in structures which are meant to endure. Granite and pure siliceous sandstone in this respect hold the first place; calcareous and ferruginous sandstones, limestones of many different kinds, and marbles are less resistant, but are nevertheless largely employed. A good building stone should also be of uniform and pleasing color; not liable to discoloration on exposure, as are many sandstones which contain pyrites and com-

pounds of iron; obtainable in large blocks and in any quantity; not too expensive to saw and dress; accessible, and easily quarried.

The best varieties of granite are durable, strong, impervious to moisture, and, when of suitable color, have a pleasing and even ornamental effect. Stones that are difficult to dress, or are quarried in remote districts, are too expensive for general use in large towns. There are a great number of localities in the United States where good granites occur. These are distributed through many of the States. All colors are represented from the bright grayish white of Georgia or Connecticut to the red granites of Maine, Wisconsin or Minnesota, or even to the dark bluish-gray granite of Quincy, Mass. Maine, Vermont and Massachusetts, formerly the chief producers, are now supplemented by many others, notably California, North Carolina, Minnesota and New Hampshire. Sandstone has been one of the most widely used of building stones, most of the large cities being to a great extent built of it; but it is now little used. The brown Triassic sandstones of Connecticut and New Jersey are very much used in Eastern cities. The bluestones of New York are the most noted flagstones; while the beautiful, uniform, light buff berea grit of Ohio is a popular building stone. The Hinckley sandstone of Minnesota is much used for paving, and the Jasper and Sioux quartzites of the same State are probably the most durable and expensive building stones of the United States. Limestones are widely employed, especially in the Mississippi Valley. Nearly one-half of the total value of stone produced in the United States is of this rock. Indiana, Pennsylvania, Illinois and New York are the leading producers, the Indiana product alone being nearly twenty million dollars annually. The Bedford Indiana stone which is an oölite is the most noted. Magnesian limestones, which vary greatly in quality, are among the principal building stones in the Mississippi Valley. There are many quarries in Missouri, Wisconsin, Minnesota and other States. There are many fine marbles in the United States and more rarely other decorative stones mostly used for interiors. Serpentine, dolerite, diorite, and basalt are little used as building stones; their dark color and the difficulty in dressing them being sufficient reasons for their neglect. Consult Johnson's *Materials of Construction*; Merrill's *Stones for Building and Decora-*

*tion*; U. S. Geological Survey, *Mineral Resources*, annual.

**Buitenzorg**, boi'ten-zorch', (= *sans souci*, 'without care'), town, Java, located at a high altitude in the interior; 34 miles south of Batavia. Here the governor-general of the Dutch East Indies has his summer palace in the midst of beautifully laid out botanic gardens, said to be among the finest in the world. It is also a fashionable resort for all the island. It has a trade in coffee, rice and sugar. Pop. 46,700.

**Bujalancé**, bōō'ha-län'tha, city, Spain, in Andalusia, 25 miles east of Cordova. It has manufactures of leather, woollen cloth and pottery. Pop. 12,000.

**Bukhara**. See BOKHARA.

**Bukharest**. See BUCHAREST.

**Bukkefjord**. See BUKNEFJORD.

**Bujknfjord**, böök'n-fyör, a large fjord on the west coast of Norway, between Stavanger and Bergen, with numerous ramifications—e.g. Lysifjord, Sandsfjord, and Sandeidsfjord.

**Bukowina**, böō-kō-vē'nä, or BUKOVINA, a division of Roumania, which stretches from the Dniester across the Pruth and Sereth, and up the eastern face of the Carpathians to the border line with Transylvania; area, 4,030 square miles. It is very mountainous, and almost one-half of the surface is covered with forests (beech, conifers, alder, etc.). The principal crop is maize. Much fruit is grown, especially in the valley of the Suczawa. Manganese and salt are the only minerals extracted. It contains many interesting and unique examples of art and architecture. There is a university at Czernowitz, the capital. Bukowina formerly was a crown land of Austria but was allotted to Roumania in 1918. During the war the Russians overran Bukowina in January 1915, but were subsequently compelled to evacuate it, owing to the general retreat of their armies in that year. It was recovered in June 1916. When Roumania entered the war the Russians established contact with the Roumanian troops in the southern Bukowina, where, on January 15, 1917, they defeated a German attempt to break through. Pop. 810,000.

**Bulacan**, böō-lä-kän', province, Luzon, Philippine Islands, situated about the middle of the island, and bounded by Nueva Ecija, Infanta, Rizal, Manila Bay and Pampanga; area, 841 square miles. The Rio Grande de la Pampanga, one of the largest rivers in Luzon, forms the west boundary. Flat in general contour, with rivers draining to the west, the terrene rises abruptly at the Infanta border in the Cordillera Grande Orient-

al. The exuberant vegetation has won the province the name of 'the garden of the Philippines.' Rice, corn, sugar, indigo, beneseed, cacao, and coffee, are produced abundantly, and there are rich deposits of coal, copper, lead, silver and magnetic ores. Transportation facilities are excellent and include rail and wagon roads and navigable streams. Malolos, the capital, is 20 miles northwest of Manila.

**Bulacan**, pueblo, Luzon, Philippine Islands, in the province of Bulacan, 7 miles southeast of Malolos, on one of the 44 islands in the delta of the Pampanga Grande. River traffic is an important industry. Pop. 10,000.

**Bulan**, böō'län, pueblo, Luzon, P. I., in Sorsogon province, on Bulan River and San Bernardino Strait, near the extreme southern end of the island; 25 miles southwest of Sorsogon. It is a port of call for coastwise steamers. Pop. 15,000.

**Bulandshahr**, böō-land-shä'h-r, district of the Meerut division of the United Provinces, India, with an area of 1,908 square miles. It is an alluvial plain lying between the Ganges and the Jumna. The Ganges Canal passes through the district from north to south. Indigo is the main crop. Pop. 1,100,000.

**Bulandshahr** or BARAN, town, India, capital of the district of Bulandshahr, 40 miles southeast of Delhi. It is a place of great antiquity. Pop. 20,000.

**Bulb**, an underground store of plant nutriment which in a dormant state shows no signs of roots, stems, or leaves, yet when placed under suitable conditions develops all these appendages. Tuber of dahlia, corm of crocus, rhizome of anemone, share with the true bulb of onion or tulip this general name. And functionally they all may be considered together, though morphologically the differences are considerable. In the onion or hyacinth, the area of storage becomes clearly marked off, and in autumn the vegetative portion of the leaf dies away, leaving the successive leaf-bases overlapping each other around the excessively shortened disk-like axis. In a true bulb, such as that of a tulip, almost the whole substance is composed of a series of overlapping fleshy scales. These are really modified leaves, and the little that remains when they are removed is a rudimentary stem to which they were attached. After the tulip has flowered, it accumulates fresh food material in a new bulb, formed by the development of a bud contained among the scales of the old and now withered bulb of the previous year.

A corm is composed of the swollen base of the stem, and not, as with true bulbs, of the leaves—the latter having degenerated into mere membranous sheaths, which have no function beyond serving as protective envelopes for the food-store and living nucleus within. The rhizome and tuber (qq. v.) show differences even more marked.

The use of the bulb to the plant, as affording at once a citadel of refuge during the severity of the winter of cold climates, or of the dry season of warmer ones, and a store of materials for a vigorous start in spring before the competition of other plants has become active, is obvious. The large nutritive store gives a proportional possibility of reproductive outlay, and the remarkable size and beauty, as well as the earliness of flowering of most bulbous plants, as the hyacinth, narcissus, and tulip, are thus explained.

In growing bulbous plants great care must be taken that no damage is done to the leaves when flowering is finished, for it is on the activity of these leaves that the next year's flowers depend. Bulb growing is a great Dutch industry, and bulbs are an important article of Dutch export. Consult Arnott's *The Book of Bulbs*.

**Bulbar Paralysis.** See PARALYSIS.

**Bulbul**, bööl'bööl, an Arabic word, much used in Persian poetry, though there is some dispute as to the bird to which it applies. Ornithologists apply the term to the members of the Indian and African family Pycnonotidæ, closely allied to the thrushes, but the true bulbul is probably the Persian nightingale (*Daulias hafizi*).

**Buldana**, bööl-dä'nä, district, Berar, British India; area, 3,662 square miles. Agriculture and the manufacture of cotton cloth are the leading industries, and cotton, wheat, and oil seeds are exported. Pop. 425,000. **Buldana**, the capital, has a population of 4,500.

**Bulfinch**, CHARLES (1763–1844), American architect, was born in Boston, Mass. He was graduated from Harvard in 1781, and spent some time (1785–7) in travel and study in France and Italy. He built the first theatre in New England, the old Federal Street Theatre, Boston (1793), and erected the famous State House in that city (1795–8), afterward greatly enlarged. In 1818 he was appointed to succeed B. H. Latrobe as architect of the Capitol in Washington, completing the original structure in 1830. He designed also University Hall, Cambridge (1814), the Connecticut State House (now the Hartford City Hall),

and the Massachusetts General Hospital, and remodelled Faneuil Hall (q. v.). Consult *Life and Letters* by Ellen S. Bulfinch.

**Bulfinch**, THOMAS (1796–1867), American author, was born in Boston, Mass. He was graduated from Harvard, and devoted himself to mercantile pursuits until 1837, when he became connected with the Merchants' Bank of Boston. His books, which were written in the intervals of business, include *Hebrew Lyrical History* (1853), *The Age of Fable* (1855), *The Age of Chivalry* (1858), and *Oregon and Eldorado, or Romance of the Rivers* (1866). His *Age of Fable*, planned to popularize mythology, still remains a favorite.

**Bulgaria**, a European kingdom, in the northeastern part of the Balkan Peninsula, created a principality by the Treaty of Berlin in 1878, greatly extended by the incorporation of Eastern Roumelia in 1885, and declared an independent tsardom in 1908. It has a total area (1919) of 43,300 square miles, and is bounded by Roumania on the north, by Servia on the west, by Greece and the Ægean Sea on the south, and by the Black Sea and former European Turkey on the east and southeast. (See Map of Balkan Peninsula.)

**Topography.**—The physical aspects of Bulgaria are varied, but the land is for the most part hilly, and the geology is largely that of the Balkans, which traverse the country from east to west. To the north of this great range is the fertile valley of the Danube, which for a considerable distance forms the boundary line between Bulgaria and Roumania; to the south, closely parallel with the main range, are the minor ranges of Sredna Gora and Karaja Dag; in the southeast are the Rhodope mountains, culminating in the imposing summit of Muss Alla, over 9,600 feet in height, next to Mt. Olympus the loftiest peak in the Balkan Peninsula.

Numerous rivers traverse northern Bulgaria to join the Danube, notably the Lom, Ogust, Iskr, Vid, Osem, Yantra, and Eastern Lom. The Kamcyk, or Kamtchyk, flows directly from the Balkans into the Black Sea; the Maritza, with its tributaries the Tunja and Arda, traverses the wide plain of Eastern Roumelia and empties into the Ægean; while the Struma, rising about 20 miles south of Sofia, follows a southerly course and also comes to the Ægean.

**Climate.**—Bulgaria is in general characterized by rainy springs; hot, rainless summers; clear, fine autumns; and dry winters of great severity, especially north of the Balkans, where the temperature sometimes falls to 20° below

zero. Local variations of temperature are extreme.

**Natural Resources** are abundant. Forests of fir, oak, beech, pine, willow and poplar cover about 30 per cent. of the surface, and there are valuable mineral deposits, though lack of capital has prevented the development of the mines to their fullest extent. Coal occurs in large quantities at Pernik and in the vicinity of Trevna, and lead, manganese, iron, gold, silver, salt, and copper have been discovered. Over 228,000 tons of stone were quarried in 1918, of which granite, marble, fireclay, and ochre formed the bulk. The province of Vratza abounds in hot springs, while Stara Zagora is known for its natural mineral waters. The soil of the country is exceedingly fertile and is adapted for the growing of the various European crops. Bears, wolves, buffalo, deer, lynx, and other wild animals inhabit the dense Bulgarian forests.

**Agriculture and Stock Raising.**—Agriculture is the principal occupation, engaging in normal times about five-sevenths of the population. The holdings are small—usually only a few acres, and the methods of cultivation are primitive. The chief crops are maize and wheat, the former product being raised principally for home consumption, the latter for export. Grapes are grown throughout the country, but the Bulgarian wines are usually of inferior quality. Tobacco is also cultivated both for home consumption and for export, and there are rice plantations in Philippopolis. Barley, oats, potatoes, rye, fruits, and garden vegetables are among other products of the soil. In 1917 7,200,000 acres were devoted to agriculture; while the 1916–17 harvest included wheat, 1,040,700 metric tons (1 metric ton = approximately 2,200 lbs.); rye, 215,650 metric tons; barley, 320,900 metric tons; oats, 107,000 metric tons.

An important industry, especially in Philippopolis, is the growing of mulberry trees for silkworm culture. About \$2,000,000 worth of silk is annually produced, and more than 50,000 families depend for their livelihood on this work. Rose culture for the production of attar of roses is also of importance, especially in the Kezanlik and Karlovo valleys (see ATTAR OF ROSES).

The raising of sheep, goats, and cattle is an important occupation in the mountain districts. Poultry of various kinds are also raised, and large quantities of eggs are shipped to foreign countries.

**Manufactures.**—The manufacturing industry is still in its infancy, but is being greatly stim-

ulated by government bonuses and special privileges. There are a number of large establishments devoted to the manufacture of textiles—wool, silk, and cotton—and several distilleries, sugar refineries, and cigarette factories.

**Transportation.**—Bulgarian railways and ports are in the hands of the state and are managed by the General Board of State Railroads. Over fourteen railroads traverse the country, the total railway mileage in 1916 being 1,824 miles. The chief ports are Varna and Burgas on the Black Sea, and Sistova, Vidin and Rustchuk on the Danube. Roads are poorly kept and are in constant need of repairs. Postal, telegraph, and telephone facilities are well developed.

**Commerce.**—The commerce of Bulgaria follows three main routes—the Black Sea, the Danube, and the mainland railway communication. In 1914, the year prior to Bulgaria's entrance into the Great War, the total value of foreign trade was approximately \$79,183,000, of which \$30,885,000 represented exports, and \$48,298,000 represented imports. The chief articles of export and their approximate annual value under normal trade conditions are: cereals, \$20,000,000; tobacco, \$5,000,000; eggs, \$2,000,000; attar of roses, \$1,500,000; woolen goods, \$1,250,000; cattle, \$1,000,000; skins, \$750,000; cocoons, \$400,000. The principal imports are textiles, machinery, hides and skins, minerals and mineral oils, and fuel. Trade is chiefly with European countries and Turkey.

**Population.**—According to the official Census of 1910 the population of Bulgaria was 4,337,516, of which number 3,203,810 were Bulgarians; 488,010 Turks; 75,773 Roumanians; 63,487 Greeks; 98,004 Gipsies; 37,663 Jews; 3,863 Germans; and 3,275 Russians, beside 61,690 of other nationalities. The population in 1917 was estimated at 5,517,700. The large bulk of the people are peasants, who still preserve the dress and custom of several centuries back.

The chief towns, with their population in 1910, are Sofia, the capital, 102,812; Philippopolis, 47,981; Varna, 41,419; Rustchuk, 36,255; Sliven, 50,598; Plevna, 23,049; Shumla, 22,225.

The state religion is that of the Greek Orthodox Church, but the Bulgarian Church has not been included in the Orthodox Communion since 1870. Other faiths are tolerated, and there are over half a million Mohammedans (602,101 in 1910), particularly in the north and east, some Catholics (32,130), Jews (40,070), and Gregorian Armenians (12,270), and a few Protestants (6,252).

**Education** is free and nomi-

nally compulsory, and is supported by the state and municipalities or communes. In addition to elementary schools (4,589 in 1913-14) there are a number of high schools, lower middle schools, and special schools. There is a university at Sofia with faculties of history and philology, physics and mathematics, medicine, and law.

**Government.**—The government of Bulgaria is that of a constitutional hereditary monarchy. The executive power is vested in the king, assisted by a council of eight ministers responsible to the king and to the National Assembly. The Assembly, or *sobranje*, elected by universal manhood suffrage, is the law-making body, but all its measures require the royal assent. For administrative purposes the country is divided into districts, where local autonomy is practiced.

Military service is compulsory for all except Mohammedans, who pay an exemption tax.

**Finance.**—The estimated revenues of Bulgaria for 1918, derived chiefly from taxes, were \$93,700,000, and estimated expenditures \$93,300,000. The consolidated debt on Dec. 1, 1917, amounted to about \$21,500,000, and the floating debt to about \$465,000,000, including a debt of some \$82,670,000 to the Bulgarian National Bank. The monetary unit is the *leva*, worth \$.19295 in American money.

**History.**—The country now known as Bulgaria was originally inhabited by Thracians, and under the Romans formed the province of *Moesia*. The Thracians disappeared before the great Slavonic immigration of the fourth and fifth centuries, and the Slavs were in turn overrun (seventh century) by the Bulgars, a Ugro-Finnish people, coming from the banks of the Volga, where the ruins of their ancient capital, *Bolgary* (q. v.) still stand. Though fewer in number, the Bulgars rapidly subjugated their Slav predecessors, adopted their language and customs, and at once absorbing and being absorbed, became a great Slav power. In 864 their prince, Boris, was baptized, and they became dependent on the patriarchate of Constantinople.

During the ninth and tenth centuries the Bulgarians reached the height of their power, dominating the greater part of the peninsula, including Macedonia, Thessaly, Epirus, and Albania. Their prince, Simeon, assumed the title of 'Autocrat or Tsar of all the Bulgarians and of the Greeks'; the Bulgarian archbishop was made an independent patriarch; and the Serbs and even the Byzantines paid Simeon tribute. At the end of the tenth century part of Eastern Bulgaria

was incorporated with the Byzantine Empire, and in 1018 the Western Bulgarian kingdom became a Byzantine province. A third Bulgarian kingdom was formed in 1186 by a successful rebellion, and maintained itself against the emperors of Constantinople until the arrival of the Osmanli Turks, who defeated the Servians—the allies of Bulgaria—at the decisive battle of Kosovo in 1389, and four years later seized Tirnova, the Bulgarian capital. The conquerors severely repressed all signs of popular aspiration, and for several centuries the Bulgarians were practically forgotten as a nation.

The first national awakening dates from the year 1762, when the monk Paisios, then at Mt. Athos, wrote the national chronicles, and revived memories of ancient glory. A new national literature began; the first Bulgarian school was opened in 1835, and was followed by others. A newspaper appeared in 1844. The Crimean war stirred up Slavonic sympathies which Russia cherished, and in 1872 the Bulgarian Church and archbishop threw off the hated supremacy of the Greek patriarch, and assumed an autonomous church organization. Following the troubles in Bosnia (q. v.) and Herzegovina in 1875, two or three ill-organized local risings in Bulgaria, in 1876, were swiftly suppressed by Turkish troops. At the same time the Turkish population, aided by the Pomaks—*i. e.* Bulgarians who had adopted Mohammedanism—committed such excesses against the Christian population that over fifty villages were destroyed, and about 12,000 people were killed. These atrocities evoked great indignation in Europe, and led to the international conference at Constantinople (December, 1876), and to the Russo-Turkish War (1877-8). The Berlin Treaty (July 13, 1878) constituted Bulgaria north of the Balkans into an autonomous but tributary state, while Eastern Roumelia was granted administrative autonomy, and Macedonia was given to Turkey. The prince of Bulgaria, freely elected by the people, was to be confirmed by the Porte with the assent of the powers. The first choice of the Bulgarians was Prince Alexander of Battenberg, a cousin of the grand-duke of Hesse (see ALEXANDER I.).

In 1885 Eastern Roumelia was annexed to Bulgaria; in the same year the Servians were defeated at Silvnitz after a brief but spirited campaign; and in 1886 Alexander was forced by Russian hostility to abdicate. He was succeeded in 1887 by Prince Ferdinand of Coburg (see FERDINAND I.), who chose Stepan

Sofia, Capital of Bulgaria. On the left is the Church of St. Nicholas; in the centre the House of Parliament; on the right the Statue of a Former Tsar of Bulgaria.

## VIEWS OF BULGARIA

Stambuloff (q. v.) as his minister, and under their administration the country made rapid progress. On Oct. 5, 1908, Ferdinand proclaimed Bulgaria an independent kingdom and himself assumed the title of tsar. In 1909 Turkey recognized Bulgaria's independence, and in 1911 the Crown Prince Boris was formally acknowledged as heir to the throne.

In 1912 Turkish oppression of the Bulgar-Serb communities in Macedonia led to the First Balkan War in which Bulgaria allied herself with Serbia, Montenegro, and Greece against Turkey. The war came to an end with the Treaty of London (May, 1913), by which Turkey surrendered her claim to Crete and to all European territory west of a line from Midia on the Black Sea to Enos on the Aegean. Disputes over the division of the spoils prevented a lasting peace, however, and in a month's time the former allies were engaged in the Second Balkan war, Bulgaria having taken a stand against Greece, Serbia, and Montenegro. Turkey and Roumania also entered the conflict, and Bulgaria was forced to accept peace terms by which she surrendered 2,000 square miles of her northeastern territory to Roumania, and received only 7,000 square miles on the south and west. (See BALKAN WARS.)

**The Great War (1914-18).**—Bulgaria entered the Great War on the side of the Central Powers in the fall of 1915, after months of diplomatic interchanges. On Sept. 21, announcement was made that the Bulgarian army had been mobilized; on Oct. 11 Bulgarian forces crossed the Serbian frontier; and on Oct. 14 Bulgaria declared war on Serbia. Great Britain declared war on Bulgaria, Oct. 15, France on Oct. 18, Russia and Italy on Oct. 19. War was declared by Bulgaria on Roumania Aug. 31, 1916; and Greece declared war on Bulgaria July 2, 1917. Bulgarian forces played an important part in the conquest of Serbia in the fall of 1915; they co-operated with the Germans in the Roumanian campaign of 1916-17; and a Bulgarian army invaded Macedonia in the summer of 1916.

On Sept. 18, 1918, the Allied armies began a powerful offensive in the Balkans which resulted in the unconditional surrender of Bulgaria and the signing of an armistice at Salonica, on Sept. 29, 1918. Three Bulgarian delegates represented Bulgaria, and Gen. Franchet D'Esperey (q. v.), Allied Commander-in-Chief in Macedonia, was the representative of the Allies. (See EUROPE, GREAT WAR OF.)

On Oct. 4, 1918, King Ferdinand abdicated the throne in

favor of his son, Crown Prince Boris.

**Bibliography.**—Consult G. Samuelson's *Bulgaria Past and Present*; H. Wood's *Danger Zone of Europe* (1911); W. Murray's *Making of a Balkan State* (1912); S. Guerin's *Histoire de la Bulgarie* (1913); L. Leger's *Serbes, Croates, and Bulgares* (1913); J. Macdonald's *Csar Ferdinand and His People* (1913); L. De Launay's *La Bulgarie d'hier and la demain* (1914); B. Rankin's *Inner History of the Balkan War* (1914); N. Forbe's *The Balkans* (1915); M. Newbigh's *Geographical Aspects of the Balkan Problems* (1915); E. Pear's *Forty Years in Constantinople* (1916); E. Daudet's *Ferdinand 1st Tzar de Bulgarie* (1917); J. Historicus' *Bulgaria and her Neighbors* (1917); L. Garnet's *Balkan Home Life* (1917).

**Bulgarian Language**, an inflected language belonging to the southeastern Slavonic branch of the Indo-European stock, closely allied with Russian. The ancient Bulgarian vernacular, called 'Old Church Slavonic' or 'Old Bulgarian,' is based on the Cyrillic alphabet (q. v.) invented by St. Cyril (see CYRIL AND METHODIUS), apostle of the Slavs. In the course of the centuries that language became greatly modified, and the Bulgarian speech of today bears but little resemblance to the original. Like the Russian, it lacks the syllabic quantity, and has neither inflection of nouns nor comparison of adjectives. Foreign words, from the Turkish, Servian, Russian, Greek, Romanic, Albanian, Italian, and Persian, abound; Turkish adjectives and substantives are used; and even strictly Slavic verbs are conjugated in a purely Turkish way. A large number of pure Slavonic words still exist, but their meaning has been totally changed in many cases. Thus, *pravil*, originally 'to say,' is translated 'to do'; *dumat*, originally 'to think,' now signifies 'to speak.' Two other features are particularly noteworthy: the placing of the article after the noun—thus, *kon* = 'a horse,' *konet* = 'the horse'; and the occurrence of the vowel *ü*, which has its analogy only in Roumanian. The literary idiom differs markedly from that of conversation and song.

The modern literature (since 1762) is chiefly educational and popular and political. The poems of Slaviikov, the novels of Karavelov, the historical works of Drinov, deserve mention; there is also a rich lyrical popular poetry.

Consult Morse and Vasiliëf's *Grammar and Dictionary*.

**Bulgarin**, bööl-gá'rin, FADDÉI VÉNEDIKTOVITCH (1789-1859), Russian journalist and author, of Polish descent, was born in

Lithuania. After serving in the Polish army under Napoleon, he established himself at St. Petersburg, and founded (1823) the *Northern Archive*, and in 1825 a new edition of the political daily the *Northern Bee*. He wrote several novels in the manner of Sir Walter Scott — e. g. *Ivan Vishigin, or the Russian Gil Blas* (1829; Eng. trans. as *Ivan Vejeeghen, or Life in Russia*, 1831); its continuation, *Peter Ivanovitch Vishigin* (1831); *Mazepa* (1834), etc. He also published (in Russian) *Russia: an Historical, Geographical, and Literary Survey* (1837); and his *Memoirs* (1846-50).

**Bulgars.** See BULGARIA, History.

**Bulkley**, bulk'li, MORGAN GARDNER (1837), American public official, was born in East Haddam, Conn. He served in the Union army, and on his father's death, in 1872, settled in Hartford and organized the U. S. bank, of which he was president until 1879, when he resigned to take the presidency of the Ætna Life Insurance Company. He filled local public offices, including four terms as mayor of Hartford (1880-88), was Republican governor of Connecticut (1889-93), and Republican U. S. Senator from the same State for the term 1905-11.

**Bulkheads.** (1) *In tunneling and excavating*, the vertical partitions of timbers or masonry to keep out water, air, or mud. Such structures may be solid, or provided with doors to give ingress and egress to workmen and materials. (2) *In harbor work*, the sea-walls marking the shore-line. From them project piers and docks. (3) *On shipboard*, steel partitions, both transverse and longitudinal, which divide a vessel into a number of water-tight compartments, and thus lessen the danger of foundering when the ship is breached. In men-of-war the bulkheads are provided with water-tight doors. In twin and triple screw ships each engine often is in a separate compartment, as are also the boilers and the coal-bunkers. *Collision bulkheads* are those nearest the bow and the stern.

**Bulk'ley**, L. DUNCAN (1845), American physician, was born in New York City. He was graduated from Yale (1866), and from the College of Physicians and Surgeons, Columbia University (1869), and studied dermatology in Vienna, Paris, and London. He became attending physician to the N. Y. Skin and Cancer Hospital (1882), consulting physician to the N. Y. Hospital (1894), and dermatologist to other New York institutions. Among his technical works are: *Acne and its Treatment* (1885); *Eczema and Its Management* (1911); *Compendium of Diseases*

Died July 20, 1928

of the Skin (1912); *Diet and Hygiene in Diseases of the Skin* (1913); *Cancer, Its Cause and Treatment* (vols. i and ii., 1915, 1917).

**Bulkeley**, or **Bulkeley**, PETER (1583-1659), American colonial clergyman, was born in Odell, Bedfordshire, England. He was educated at St. John's College, Cambridge, of which he was for some time a fellow, was rector of Woodhill for twenty-one years, and, having through his non-conformity come into conflict with Archbishop Laud, emigrated to Cambridge, Mass., in 1635. In 1636 he was the principal founder of Concord, Mass., where he was pastor until his death. He published a series of sermons, *The Gospel Covenant, or the Covenant of Grace Opened* (1646), which, says Prof. M. C. Tyler, 'stands for the intellectual robustness of New England in the first age. It is an honor to that community of pioneers, drudging in the woods of Concord, that these profound and elaborate discourses could have been produced, and endured, among them.'

**Bull**, an instrument, ordinance, decree, or letter of the Pope. The word is derived from the Latin *bulła*, which means a bubble or capsule of wax enveloping a seal; later it was applied to the seal itself, and then to the document to which the seal gave authority. Down to 1878 papal bulls were written on parchment in antiquated Gothic script and in the Latin tongue, and had usually a leaden seal appended. By a *Motu proprio* of December 9, 1878, Leo XIII. ordained that the leaden seal should be employed henceforth only in case of bulls concerning collations, erections, and dismemberments of greater benefices (reserved to the Pope), and other solemn acts of the Holy See. In other bulls, 'especially those relating to ordinary benefices and marriage dispensations,' the old leaden seal is replaced by a red seal stamped on the parchment itself, while ordinary Latin current writing displaces the Gothic character.

Bulls are generally named from the first word or words. Some of the most celebrated are: *Clericis Laicos* (1296) and *Unam Sanctam* (1302), by Boniface VIII. against Philip the Fair of France; *In Cæna Domini* (1362), first issued by Urban v. against heretics; *Execrabilis* (1460), by Pius II., in which he proclaimed papal superiority over the councils; *Exsurge Domine* (1520), by Leo x. against Luther; *Unigenitus* (1713), by Clement xi., condemning one hundred and one Jansenistic propositions taken from the *Reflexiones morales* of Quesnel; *Dominus ac Redemptor noster* (1773), by Clement xiv.,

abolishing the Jesuit order, and *Sollicitudo Omnium* (1814), by Pius VII., for its re-establishment; *Ineffabilis* (1854), which contains the dogma of the Immaculate Conception, and *Pastor Æternus* (1870), which proclaims the infallibility of the Pope, by Pius IX.

A collection of bulls is called a *bullarium*. The best editions are those by Coquelines, continued by Barberi and Gaude, and the *Turin Bullarium* (26 vols., 1857-85). See BRIEF.

**Bull**, an unconscious and amusing blunder in speech, implying an evident contradiction in terms. A classical example was elicited by the Parnell Commission: 'Better be a coward for five minutes than be dead all the rest of your life.' Consult *Essay on Irish Bulls*, by R. L. Edgeworth and his daughter Maria.

**Bull**. See CATTLE.

**Bull**, CHARLES STEDMAN (1846-1911), American physician, was born in New York City. He was graduated from Columbia University (1864) and from the College of Physicians and Surgeons (1868), and continued his studies at the universities of Paris, Berlin, Vienna, Heidelberg, and Utrecht, and in the hospitals of London, devoting his attention chiefly to ophthalmology. He was surgeon to the N. Y. Eye and Ear Infirmary, professor of ophthalmology in the Cornell University Medical College, and consulting ophthalmic surgeon to various New York hospitals. He published a number of medical works, and edited, with original contributions, Wells' *Treatise on Diseases of the Eye*.

**Bull**, GEORGE (1634-1710), English bishop, was born at Wells, and studied at Exeter College, Oxford, whence he retired in 1649, having refused to take the commonwealth oath. Ordained in 1655, he took the small parish of St. George's, Bristol, and subsequently obtained the bishopric of St. David's (1705). He gained a great reputation, especially among continental theologians, by three books on the Trinity—*Defensio Fidei Nicæna* (1685), to prove that ante-Nicene fathers held the Nicene faith; *Judicium Ecclesiæ Catholicæ* (1694), to prove that the Nicene fathers accepted in its full sense the divinity of Jesus; and *Primitiva et Apostolica Traditio* (1710), to prove that the doctrines of Christ's pre-existence and incarnation were not inventions of early heretics. He published also *The Corruptions of the Church of Rome* (1705-07), in reply to Bossuet's query as to why he did not join the Roman Church. Consult Nelson's *Life of Bishop Bull*.

**Bull**, GOLDEN. See GOLDEN BULL.

**Bull**, JOHN, a generic name for the English people, and a per-

sonification of what is supposed to be the English type. It takes its origin from an amusing skit by John Arbuthnot, a contemporary of Swift, in his *History of John Bull* (1712). The figure now so familiar in cartoons was developed by the London *Punch*.

**Bull**, JOHN (?1563-1628), English musician, and first music lecturer in Gresham College, London, was born in Somersetshire. After a brilliant career in England he went to the Continent, where he became organist of the Cathedral of Notre Dame, Antwerp (1617). Bull's printed music is small in quantity, but there is a mass of it unpublished.

**Bull**, OLE BORNEMANN (1810-80), Norwegian violin virtuoso, was born in Bergen, Norway, and was sent to the University of Christiania by his father, a chemist, who intended him for the church. His connection with the university soon came to an end, however, and he devoted himself exclusively to music, having already studied the violin with Paulsen. He had a hard struggle at first, but was assisted by a lady of means, and receiving a considerable sum as the proceeds of his first concert in Paris (1833), given in company with Ernst and Chopin, he was enabled to make a musical tour of Italy, followed by similar tours in other countries of Europe, by which he acquired both wealth and fame.

Returning to his native town (1840) he bought an estate and remained there in retirement for three years. He visited the United States in 1843-5, meeting with his usual success in his concerts, and on his return to Bergen repeated his Continental triumph. He built a theatre for the presentation of Norse drama in Bergen, and undertook to establish Norwegian schools of letters and art, but his fortune was broken by lawsuits, and in 1852 he revisited the United States, where he bought a tract of land in Potter county, Pennsylvania, containing 120,000 acres, with the idea of founding a Norwegian colony, which was to be called 'Oleana.' A number of families settled upon it, but the title proved defective, and the plan came to an end. Bull subsequently married (1870) an American lady, his second wife, and lived partly in the United States and partly near Bergen until his death. He seldom performed other than his own compositions, but his playing was full of fire, poetry, and charm; he possessed a 'magnetic personality,' and rarely failed to rouse his audiences to enthusiasm. Consult *Memoir*, by Sara C. Bull.

**Bull**, WILLIAM TILLINGHAST (1849-1909), American surgeon, was born in Newport, R. I. He was graduated from Harvard

(1869) and from the College of Physicians and Surgeons, New York, and after studying in Europe, entered upon the practice of medicine in New York City. He was professor of surgery in the College of Physicians and Surgeons (1889-1909), and was known as one of the foremost surgeons in the United States, especially in cases of appendicitis and cancer. He eventually fell a victim to the latter disease.

**Bull'la**, a locket-like ornament worn by Etruscan and Roman children as an amulet, and laid aside at maturity. The name was also given to the seals used by the emperors of Constantinople and of the Holy Roman empire, and by the Pope. (See BULL.)

In *pathology*, a bulla is a small raised portion of the epidermis filled with watery fluid like a blister.

**Bullace**, bööl'lās (*Prunus insititia*), a shrub or small tree, larger and much less spiny than the blackthorn (q. v.) or sloe, but very closely allied to it, as it is also to the plum, so that many botanists regard them as one species (see PLUM). It is found chiefly in Great Britain and other European countries, but is rare in the United States.

For the Jamaica *Bullace Plum*, see HONEYBERRY.

**Bull Baiting**, an obsolete sport in which a bull, tied to a stake, and having the points of his horns guarded, was worried to death by dogs. In 1835 the sport was declared illegal in Great Britain.

**Bulldog**, a variety of dog, probably of English origin, derived from a cross between a mastiff and some other breed. It was used for many centuries for bull and bear baiting, but at present it is bred mainly as a pet and for show purposes. Although of surly disposition it must be thoroughly aroused before it will show its former activity and courage. It is not generally regarded as capable of strong attachment and is accounted of little value as a watch dog.

The average bulldog weighs from 40 to 50 pounds. The points are as follows: Thickset and compact in build; very heavy in front and comparatively light behind; legs strong and short, muscular, and set outside the body; shoulders massive, and standing well out; chest wide and deep; skull large; temples high, with stop well defined; eyes wide apart and black; under jaw wide, projecting, and turned upwards; face short and deeply wrinkled; nose large and black; ears folding over at back showing the underside; bottom teeth projecting at least half an inch in advance of top ones; a good dewlap; back short and roached; ribs well sprung; fine loin, well tucked up; tail short, kinked, and set on

low; coat fine and smooth; action rather slovenly, the hind legs not being lifted high, and the body having a peculiar characteristic swing. The accepted colors are brindle, fawn, red, and solid white, or white pied.

The *French Bulldog* is a small compactly built dog, differing from the English variety chiefly in size and in its erect bat-like ears, which give it a singularly alert appearance. *Toy Bulldogs* are small breeds, usually weighing less than 22 pounds, but conforming in other points to the standards for the larger dog. The *Bull Terrier*, of which the so called Boston Bull or Boston Terrier is a familiar example, is the result of a cross between the bulldog and the smooth terrier. It is intelligent, agile, and of great courage. Consult Cooper and Browne's *Bulldogs* (1914).

**Bull'en**, FRANK THOMAS (1857-1915), English writer on sea life, was born at Paddington, London. He had but little schooling and was at sea from 1859 to 1883, visiting many parts of the world. From 1883 to 1899 he was engaged as clerk in the British Meteorological Office. His works include *The Cruise of the 'Cachalot'* with introduction by Kipling (1898); *Idylls of the Sea* (1899); *The Log of a Sea Waif* (1899); *Men of the Merchant Service* (1900); *With Christ at Sea* (1900); *Deep-sea Plunderings* (1901); *A Whaleman's Wife* (1902); *A Sailor Apostle* (1903); *Sea-Wrack* (1903); *Creatures of the Sea* (1905); *Told in the Dog Watch* (1910); *From Wheel and Outlook* (1913).

**Bul'ler**, CHARLES (1806-48), British lawyer and politician, was born in Calcutta. He studied at Harrow and Cambridge, and was a private pupil of Thomas Carlyle. He practised chiefly in Indian and colonial appeals; was interested in reforms of parliamentary procedure and of the poor law; and originated the Record Commission. He was secretary (1838) to Lord Durham when the latter was governor-general of Canada, and along with Wakefield drew up the famous *Report on the Affairs of British North America*.

**Buller**, SIR REDVERS HENRY (1839-1908), English general, was born near Crediton, Devonshire. He served in China (1860), in the Red River expedition (1870), and in the Ashanti War (1874), and in the Kafir and Zulu wars of 1878-9, in which he came to the front as a soldier of exceptional resource and daring. In the Boer War of 1881 he served as chief of staff to Sir Evelyn Wood. In 1882 he was head of the intelligence department in the Egyptian campaign, for his services in which he was knighted, and in 1884-5 he was

chief of staff in the Sudan. He was appointed quartermaster-general in 1887, was for a short time under-secretary for Ireland, and from 1890 to 1897 acted as adjutant-general. He took part in the South African War (1899-1900), first as general commanding the forces in South Africa, and afterward as general officer commanding in Natal. He conducted the operations for the relief of Ladysmith, which, after three unsuccessful attempts, was effected following an investment of 118 days. He was subsequently engaged in the expulsion of the Boers from Natal; but was superseded by General Roberts. In 1901 General Buller retired to Aldershot, where, in 1898, he had been appointed commander of the First Army Corps, but he was soon called upon to resign his command (1901) owing to an indiscreet speech. Investigations concerning Buller's career in South Africa disclosed facts very damaging to his reputation as a commander. Consult Butler's *Life* (1909).

**Bullet**, the solid projectile discharged from any kind of small-arm. Formerly all bullets were spherical, and cast in molds. Now all rifle bullets are elongated, and cut by machinery from rods of lead. The expanding or dilating action of a bullet has been claimed by many inventors; but the British government in 1857 awarded the English gunmaker Greener \$5,000, as the person who had practically solved the difficulty as far back as 1836. In 1841 Delvigne, a French officer, invented the first elongated cylindrical bullet with a hollow base, which was expanded by the explosion of the charge so that the lead entered the grooves of the rifle. Thus the great difficulty in muzzle-loading with a bullet of almost the same diameter as that of the barrel was avoided. The use of an elongated bullet also allowed the diameter of the bore of the rifle to be diminished without necessarily decreasing the weight of the bullet. Captain Minié in 1847 assisted the expansion of the base by iron plugs or cups fitting into the hollow, and driven into it by the explosion of the charge, and Minié balls were largely used in the Civil war.

Some of the early elongated bullets had cannelures, or sharp-edged grooves, cut in rings outside the cylindrical base, the object of which was to assist in retaining the bullet in its course, the resistance of the air acting on one side of it whenever the bullet deflected from its course, and thus turning the point back to the original direction. All these bullets for large-bore rifles were of lead, latterly slightly hardened with tin.

When small-bore rifles were adopted, the diameter of the bullet was necessarily much reduced. Although its weight was diminished, it was still necessary for its efficiency that it should not be too light. It had therefore to be made much longer proportionately to its diameter than the old bullet. It is absolutely essential to the accuracy in direction of an elongated projectile that it should

Bullets.

1. Belted. 2. Greener. 3. Delvigne.  
4. Mimé ball.

fly point foremost, and the rotation imparted to it by the rifling of the barrel prevents its turning over during its flight. The longer the bullet in proportion to its diameter, the more rotation it requires to keep it in position. This is why the grooving of the small-bore rifle has a far more rapid twist than had that of the large-bore. The rifling of the modern small arms makes one turn in about 8 inches. (See RIFLE.) But a bullet of so soft a metal as lead, treated to this rapid rotation in the bore of a rifle, would issue from it a shapeless mass, and fly quite inaccurately; therefore the modern bullet has a casing of hard metal (usually cupro-nickel) covering a core of antimonious lead. This hard metal envelope cannot be expanded by the explosion of the charge, and accordingly the small-bore bullet has no cavity in the base. To force it to take the grooves, it is made to cut its way into them by giving the bullet a slightly larger diameter than that of the barrel through which it will have to travel.

The bullet for the Springfield rifle, model 1903 (calibre .300 in.), at present in use in the U. S. army, has a diameter of .308 in. It weighs 150 grains, is  $1\frac{1}{4}$  in. long, and composed of 1 part tin to 25 parts lead, covered with a jacket of cupro-nickel. The powder charge for this bullet is 48-50 grains, which gives it a muzzle velocity of 2,700 feet per second, and a pressure in the chamber of 49,000 pounds per square inch. For the prohibition of explosive and expansive bullets, see HAGUE CONVENTION.

**Bull-fighting** is the national sport of Spain, but has been introduced into France, where, in spite of the prohibitive laws of the country, it has taken a great hold on the people. The bulls used in

Spain are bred upon the plain between the sierras and the marshy coast-land of the south. The choosing of suitable animals from a large herd is considered excellent sport and by many Englishmen is preferred to the amphitheatre performance; agility and courage are required in the highest degree. The owners ride to the grazing ground with their friends and several *novilleros*, or apprentice fighters. The *novilleros* tease the young bulls (*novillos*), and ward off dangerous rushes by long lances with blunt points. On the occasion of a bull-fight the processional entry into the arena is one of the chief attractions. In the front rank walk three *matadors*, who are the principal actors in the show. Then come the *banderilleros*, whose task it is to infuriate the bull by planting darts (*banderillos*) in his shoulders. The *picadores*, mounted on worn-out horses and armed with lances, follow. Last of all come the *monosabios*, attendants who lead spare horses with bright-colored saddles. The procession passes across the arena and salutes the mayor. Then the *picadores* move off with their horses, the *banderilleros* shake out their red and yellow capes, and the arena fills with attendants in blue overalls, vermilion shirts, and red hats with blue knobs. All these supers carry sticks, with which to urge on the horses when they show signs of falling.

Directly the bull is let into the arena, a *banderillero* runs up to it and flourishes a cape before its eyes. He then runs toward the railing, the bull at his heels, and the fight commences. The *banderilleros* throw their bright-colored darts, with streamers attached, into the animal's neck. When this has gone on for some time, and the bull is half mad with pain and rage, the *matador* salutes the mayor. He wears a pigtail and carries a bright vermilion cloth, called the *muleta*, and a sword. Then ensue the most exciting moments of the fight, ending with the death of the bull at the hands of the *matador*.

The popularity of these *matadors*, or chiefs of the ring, is remarkable. Kings are not cheered more loudly than they. One of the most popular *matadors* was Rafael Guerra, commonly known as Guerrita, who retired with an enormous fortune. He was probably the greatest bull-fighter of any time; his chief rival was Manuel Espartero, who was killed in the bull-ring of Madrid.

The first bull-fight in Paris took place on Oct. 8, 1899. See Degado's *La Tauromachia* (1894); Hoot's *Les Courses de Taureaux à Paris* (1890).

**Bullfinch** (*Pyrrhula europæa*),

a common and handsome bird, with a red breast, coal-black head and quills, and gray back. It is readily tamed, and is often kept in confinement for its singing, in which it is capable of learning tunes.

**Bullfrog.** The largest of N. American frogs (*Rana catesbiana*), sometimes 8 inches in length. It is green, mottled with brownish, and inhabits warm, sluggish streams and marshes everywhere east of the Plains, preying upon smaller frogs, little fishes and aquatic animals generally. It is especially numerous along the margins of the Great Lakes, where thousands are annually killed and sent to city markets, the large hind legs, when suitably prepared, forming a delicacy highly esteemed. See FROG.

**Bullhead, or BULLPOUT.** In the United States any of the small catfish of warm, sluggish streams, especially the little, long-horned *Amiurus nebulosus* of the Eastern states, one of the fishes most easily and often caught by young anglers. It is not often eaten; but having been introduced into central California rivers, has there become a much larger and finer fish, locally called 'Sacramento cat,' which is popular for the table. See CATFISH.

In Great Britain this name is given to various species of the family Cottidae, also called 'miller's thumbs.' These are small fresh-water or littoral bony fishes, common in the north temperate zone. The head is broad, de-

Bullhead.

pressed, and armed with spines; as in many shallow-water fish, scales are absent. The common marine species, *C. bubalis* and *C. scorpius*, are typical littoral fish, to be found in every pool. The fresh-water *C. gobio* is stated to be sometimes used as food.

**Bullinger, HEINRICH** (1504-75), Swiss reformer, was born at Bremgarten; became Protestant pastor of Bremgarten in 1529, and of Zürich (1531) in succession to Zwingli, of whose followers he became leader in their struggle against Catholics and Lutherans. He assisted in drawing up the first Helvetic confession of faith at Basel in 1536. With Calvin and Farel he drew up an agreement on the subject of the Lord's Supper between the churches of Geneva and Zürich. He wrote numerous volumes of sermons.

in high repute in England, and published at Cambridge by the Parker Society; a *Life of Zwingli* (1535); and *Reformationsgeschichte* (6 vols. 1838-40). See *Life* by Pestalozzi (1858) and *Christoffel* (1875).

**Bullion**, uncoined gold and silver in bars or other masses; the word is also used to distinguish metallic from paper money, and occasionally means coin not allowed to pass, or not current at the place where it is tendered. The word was originally applied to the mint, or the place where precious metals were alloyed and converted into stamped money; derived from the Latin *bullā*, 'a lead stamp.'

**Bullock**, RUFUS BROWN (1834-1907), Amer. political leader, b. at Bethlehem, N. Y. He was for some time a telegraph operator, conspicuous for his skill, and became the representative of the Adams Express Co. in Georgia. Though he opposed secession, he adhered to the Confederacy during the Civil War, and during the Reconstruction period was a leader of the Republicans of Georgia. He was a member of the Constitutional Convention of 1868, and was governor of Georgia (1868-70), his administration meeting with much criticism. 'Party lines in the state had been so affected by the governor's conduct of affairs,' says Prof. Dunning, that the only division playing an important rôle was that into 'Bullock men' and 'anti-Bullock men.' Bullock subsequently became a leading business man in Atlanta.

**Bullock**, WILLIAM A. (1813-67), American inventor, was born at Greenville, N. Y., and studied mechanics while working as an iron-founder. He had invented presses for cotton and hay when, in 1849, he started a paper, the *Banner of the Union*, at Philadelphia, removing it to Catskill, N. Y., in 1852. There he constructed a wooden press, turned by a hand-crank and fed by a machine, which was the basis of the self-feeding apparatus subsequently invented by him. Before he met his death by an accident while setting up one of his presses, he had devised a self-feeding, perfecting press capable of delivering 12,000 folged papers an hour.

**Bull Run**, FIRST BATTLE OF, a battle of the American Civil War, fought near Bull Run, a small stream in north-eastern Virginia, flowing into Occoquan R. (an affluent of the Potomac R.) on July 21, 1861, between a Confederate force of about 30,000 (including reinforcements which arrived during the battle) under Gen. Beauregard and Gen. Joseph E. Johnston, and a Federal force

of about 29,000 under Gen. McDowell, the latter being decisively defeated. It was the first large battle of the conflict, and both armies were made up for the most part of raw troops, inexperienced in war. McDowell, the aggressor, had wished to delay his movement into Va. until his army should have become better organized, but was impelled forward by his government and by public sentiment in the North. He and Beauregard, by a singular coincidence, had adopted the same plan of battle, each deciding to turn the other's left. McDowell was first in delivering his attack, and for some time the strengthened Federal right prevailed over the weakened Confederate left, 'Stonewall' Jackson, however, standing firm and here earning his sobriquet; but, when a Federal victory seemed assured, a part of Johnston's army, which Gen. Patterson had bunglingly allowed to elude him in the Shenandoah Valley, arrived upon the field, the tables were quickly turned, and finally the Federals were forced, in a wild, disorderly retreat, back upon Washington. The loss of the Federals in killed and wounded was about 2,900; that of the Confederates about 1,700. The battle greatly inspired the South and at first deeply discouraged the North, which, however, devoted itself with renewed vigor and determination to preparation for what, as then became apparent, would probably be a long and severe struggle. The defeat undoubtedly greatly injured the Federal cause in England, where 'the division of the Union,' wrote Adams, the U. S. minister at London, 'is now regarded as a *fait accompli*.' By the Confederates the battle was called the first battle of Manassas—Manassas being the name of a railway junction near the battlefield. See Johnson and Buel (eds.), *Battles and Leaders of the Civil War* (4 v., 1887); Ropes, *Story of the Civil War* (2 v., 1894-8); and Nicolay and Hay, *Abraham Lincoln: a History* (10 v., 1890).

**Bull Run**, SECOND BATTLE OF, a battle of the American Civil War, fought on nearly the same field as the first battle of the same name, on Aug. 29 and 30, 1862, between about 49,000 Confederates under Gen. Robert E. Lee and about 70,000 Federals under Gen. Pope, the latter being defeated. The Confederate army was well organized and disciplined, and fought as a unit; the Federal army was really made up of parts of three armies, and, according to Ropes, was not truly an army but rather 'an aggregation of troops.' Moreover, the Confederates were

greatly superior in leadership, Lee being an over-match for Pope, and Lee's two corps commanders, Jackson and Longstreet, giving him more efficient support than Pope's corps commanders, of whom McDowell was the foremost, gave to him. Pope, having blunderingly allowed Longstreet to reinforce Jackson (against whom Pope was moving) through Thorougfare Gap, attacked on the 29th, ignorant of Longstreet's arrival on the field, and though Porter, blocked by Longstreet, was unable to deliver his attack in pursuance of Pope's orders, on Jackson's right, the Federals on the whole had the better of the day's fighting, which is sometimes known as the battle of Groveton. On the following day Pope renewed the attack, but was repulsed, and Lee, taking the offensive, drove the Federals from the field. The Federal loss in killed and wounded was about 14,500; that of the Confederates about 9,500. Out of Porter's conduct on the 29th arose the famous 'Fitz John Porter Case.' By the Confederates the battle was called the second battle of Manassas. See references under title BULL RUN, FIRST BATTLE OF; and in addition Cox, *The Second Battle of Bull Run* (1882).

**Bulls and Bears**. See STOCK EXCHANGE.

**Bull-terrier**. A dog of English origin, whose breeding has been carried to great perfection. It has great courage, and delights in fighting vermin; but to its master is of a gentle temperament, and this has made it a favorite everywhere. The average weight of the original type was about 35 lbs., but the fancier has evolved the toy variety, and there are now show classes for under 7 lbs., 7 lbs. to 10 lbs., 10 lbs. to 30 lbs., and over 30 lbs. Points—Head long and wedge-shaped, level as possible from skull to head of nose; jaw strong; mouth level; eyes small, dark, and not too prominent; chest broad; body short and well ribbed up; fore legs medium length, showing

Bull-terrier.

plenty of bone and muscle; feet strong and well arched; hind legs well hocked; tail fine and straight, carried in line with back when not

excited (if excited, game dogs will get them up); coat fine, short, and smooth. As to color, pure white, with a black nose or eye, is most approved; but red, fawn, blue, brindle, and pied colors allowed, although they stand little chance in competition.

**Bull Trout**, or **GRAY TROUT** (*Salmo cambricus*), a fish allied to the salmon, common in many British waters. Its flesh is somewhat coarser, and as it is a bad riser to the fly, it is not so much prized by anglers. The name is also given to other related fish, as, in the Rocky Mountains, to the Dolly-Varden trout.

Bull Trout.

**Bulnes**, MANUEL (1799-1866), Chilean soldier, was born in Concepcion, and at sixteen was active in the movement for Chilean independence. He served in the Chilean army through the revolution of 1818-21, afterward suppressed disorders among the Indians, and in 1838 fought successfully against Peru, capturing Lima, and defeating Santa Cruz in several battles. He was made lieutenant-general, and was elected president of Chile in 1841, and re-elected in 1846. Many public institutions were established during his presidency.

**Büllov**, BABETTE VON. See ARNOLD, HANS.

**Büllov**, BERNHARD HENRY MARTIN CHARLES, PRINCE VON (1849), imperial chancellor of the German empire, was born at Klein Flottbeck, Holstein. In 1873 he entered the diplomatic service, and in 1878 was secretary of the Berlin Congress. He was successively first secretary of the embassy at Paris (1880) and at St. Petersburg (1883), minister at Bucharest (1888), and ambassador at Rome (1893-7), when he was appointed foreign secretary. He was made count in 1899, after the acquisition of the Caroline and Marianne Islands. In 1900 he was made chancellor of the German empire and Prime Minister of Prussia, succeeding Prince Hohenlohe. He resigned in July, 1909, upon the rejection of several government bills by the Reichstag, and permanently settled in Italy.

**Büllov**, FRIEDRICH WILHELM, COUNT VON (1755-1816), Prussian general, served with distinction in the campaign of the Rhine; fought with Blücher at Eylau and Friedland; and in 1813 defeated the French at Möckern, saved Berlin, and routed Mar-

shal Ney at Dennewitz—which gained him the title of Count of Dennewitz. He was engaged in the battles of Leipzig and Soissons, and on the conclusion of peace became governor of Lithuania and E. Prussia. At Waterloo he was in command of Blücher's division, which saved the day. He then returned to his post in Lithuania, where he died. See *Life*, in German, by Varnhagen von Ense (1854).

**Büllov**, HANS GUIDO VON (1830-94), German pianist and conductor, born at Dresden; adopted the theories of Wagner, under whose guidance he placed himself, and, having completed his training under Liszt, made his first concert tour in 1853. From 1855 to 1864 he was principal pianoforte teacher at the Stern Conservatorium, Berlin, and in 1864 became conductor of the royal opera and director of the Conservatorium at Munich, where he organized model performances of Wagner's works. After 1869, when he left Munich, he held appointments as conductor at Hannover, Meiningen, St. Petersburg, Hamburg, and elsewhere. He made two concert tours to the U. S., the first in 1875-6, and again in 1889-90. With some eccentricities both as a man and a musician, he was a splendid interpreter of the pianoforte classics, and was eminently successful as a conductor. His memory was extraordinary, and he was the first to set the fashion of conducting without book. His editions of Beethoven and other masters of the pianoforte are of high value.

**Bulrush**. The true bulrush (*Scirpus lacustris*) is European. An American species is very like and found in the Western states, where it is known as tule, and is a valuable fibre and food plant for the aborigines, occurring in streams, ponds, and occasionally in boggy ground, its spiked inflorescence of reddish-brown flowers appearing in late summer. The plant is four feet or more in height, the stems are terete, and the leaves are flat or ribbon-shaped. The entire stem is used for mattings, basketry and various other purposes, as for the centre of the rush-light. The cat-tail (*Typha latifolia*) is often called the bulrush. The stem of this handsome plant is often seven feet in height, and in July culminates in a brownish cylinder of pistillate flowers, this again being crowned with a thin spike of male flowers. The thin, long leaves are used in cooperage to fill open seams; and to make chair-bottoms, thatching, matting and even boats. It is good for paper-stock. The soft down is sometimes used for upholstery stuffing.

**Bulsar**, seapt. tn. in Surat dist.,

115 m. N.E. of Bombay, India, with an export trade in timber. Pop. (1901) 12,857.

**Bulthaupt**, HEINRICH (1849), German poet and dramatist, born at Bremen, where he became (1879) librarian of the municipal library. He belongs to the school of German poets who aim at the special cultivation of form; and among his more notable works are the dramas, *Die Arbeiter* (1876), *Eine neue Welt* (1886),

A. Bulrush (1, flower). B. Great reed-mace (1, male flower; 2, female).

*Der Verlorene Sohn* (1889), and a volume of poems, *Durch Frost und Gluten* (3rd ed. 1900). He has gained great renown by his *Dramaturgie des Schauspiels* (4 vols. 1901, several eds.), *Dramaturgie der Oper* (2 vols. 1887), and *Shakespeare und der Naturalismus* (1893).

**Bulti**. See BALTISTAN.

**Buluwayo**, or **BULAWAYO** ("the place of killing"), in Rhodesia, S. Africa, formerly the kraal of Lobengula, king of the Matabele, now a British town and centre of trade. The present town lies on the open veldt, 1,361 m. from Cape Town, 272 m. from Salisbury, and

has a white population of about 4,000. It is connected with Cape Town and Beira *via* Salisbury by railway and telegraph, and with the Wankie coal field and the Zamezi at Victoria Falls. The railway is being extended (1906) through N.E. Rhodesia to Abercorn, and thence to Lake Nyasa. The transcontinental telegraph now connects it with Ujiji, on Lake Tanganyika.

**Bulwer**, WILLIAM HENRY LYTON EARLE, BARON DALLING AND BULWER (1801-72), English diplomatist, known as Sir Henry Bulwer, and elder brother of Lord Lytton, was born in London. He sat in Parliament for Wilton (1830), Coventry (1831), and Marylebone (1835). For the next thirty years he devoted himself entirely to diplomacy at Constantinople, Paris, Madrid (which he was ordered to quit by Narvaez for his supposed share in conspiracies), and in the U. S., when in 1849 and 1852 he was minister at Washington, where, in 1850, he negotiated the Bulwer-Clayton treaty. After serving as envoy extraordinary to Tuscany (1852-5), he was again accredited to Constantinople in 1857, and remained there till 1865. In 1868 he was elected member for Tamworth, and retained that seat until his elevation to the peerage (1871). Bulwer was very popular, had a great reputation as a diplomatist, and achieved some distinction as the author of two volumes (1867-70) of *Historical Characters* (Talleyrand, Cobbett, Canning, and Mackintosh), and a *Life of Viscount Palmerston* (1870).

**Bulwer-Lytton**, SIR EDWARD. See LYTON.

**Bumblebee**, or HUBLEBEE. See BEE.

**Bumboat**, a wide, flat boat used in Holland. The name is also applied to the boats of small traders (often women) who sell provisions, clothing, etc., to vessels lying in roadsteads.

**Bumpus**, HERMON CAREY (1862), American educator, was born at Buckfield, Me., and graduated (1884) at Brown University. He was professor of biology at Olivet College (1886-9), fellow of Clark University (1889-90), and held associate and full professorships at Brown University (1890-1901), for a portion of this time acting as director of the U. S. Biological Laboratory at Wood's Hole, Mass. In 1902 Dr. Bumpus was made director of the American Museum of Natural History in New York. He published *A Laboratory Course in Invertebrate Zoology* (1893) and numerous papers on biological subjects in scientific periodicals.

**Bunce**, FRANCIS MARVIN (1836-1901), American naval offi-

cer, born at Hartford, Conn. He graduated at the U. S. Naval Academy in 1857, became a lieutenant in 1861 and a lieutenant-commander in Jan., 1863, and during the Civil War served successively on the *Penobscot* (North Atlantic Blockading Squadron), and the *Pawnee* and *Catskill* (South Atlantic Squadron), and took part in various operations against the Charleston (S. C.) defences. In 1865-6 he took the monitor *Monadnock* on a special cruise from Philadelphia to San Francisco. He became a captain in 1883, a commodore in 1895, and a rear-admiral in 1898; commanded the North Atlantic Station (1895-7) and the New York Navy Yard (1897-8); and in 1898 retired from the active service.

**Bunce**, OLIVER BELL (1828-90), American author, was born in New York city, and engaged for some years in the bookselling and publishing business in that city. He was subsequently literary adviser to the publishing house of D. Appleton & Co., and was editor of *Appleton's Journal* until the suspension of that periodical. His books include *A Bachelor's Story* (1859), *Bachelor Bluff*, *His Opinions*, *Sentiments*, and *Disputations* (1882), *My House*, *An Ideal* (1885), and a small book on manners, entitled *Don't* (1884), which reached a sale of 100,000 copies in America alone. Mr. Bunce originated and edited the work known as *Picturesque America*.

**Buncombe**, empty speech-making, tall-talk oratory intended to gull rather than to enlighten. The word is derived from Buncombe, a county of N. C. Near the close of a debate on the Missouri question in the 16th Congress, the representative from the district containing Buncombe co., insisted on inflicting a long speech on a dwindling house, saying, apologetically, that he was 'speaking for Buncombe.'

**Bundelkhand**, a tract of country in Central India, lying between the Jumna and Chambal. Area, 10,322 sq. m. The country is very fertile. It possesses deposits of iron ore, diamonds, and copper. Pop. (1901) 1,309,323.

**Bunder or Bandar Abbas**. See BENDER ABBAS.

**Bundesrat**, the federal council of the German empire, consisting of fifty-eight delegates appointed by the governments of the individual states for each session. In conjunction with the Reichstag it exercises legislative functions, and though mainly a confirming body, it may reject measures passed by the Reichstag, and has limited initiatory powers. Members may appear and speak in the Reichstag on matters directly connected with their states, but

are not eligible for election to that body.

**Bundheim**. See HARZBURG.

**Bundi**, feudatory state in Rajputana, India. Area, 2,220 sq. m. Pop. (1901) 171,227.—**BUNDI**, the chief town, is 95 m. s. e. of Ajmere. Pop. (1901) 19,313.

**Bunion**, a swelling, generally of the bursa, at the base of the great toe. Gout, or the rheumatic constitution, may predispose to it; but the exciting cause is always ill-fitting foot-gear, causing abnormal pressure on the joint. Chronic inflammation is set up, and perhaps a false bursa is formed over the joint. In bad cases the tendon of the muscle which extends the great toe may be displaced. The bones are thickened by chronic inflammation, and the joint may become disorganized, with suppuration. The trouble is more common with women than with men. Soothing lotions may be used, and iodine painted over the enlargement of the joint later. In bad chronic cases the remedy recommended is excision of the head of the metatarsal bone.

**Bunker Hill**, BATTLE OF; a battle fought chiefly on Breed's Hill, Charlestown, Mass., on June 17, 1775, during the American Revolution, between about 1,500 Americans entrenched, under Prescott and Putnam, and an attacking force of about 2,500 British under Sir William Howe, the Americans, after repelling two attacks and exhausting their supply of powder, being driven from their position, which they had occupied and fortified during the preceding night. The British loss in killed and wounded was about 1,050, the American about 450. The British plan of operations, by a frontal attack rather than by an occupation of the neck of the Charlestown isthmus and of Bunker Hill, which dominated Breed's Hill, has been regarded by military critics as a great blunder. This engagement, the first pitched battle of the Revolution, showed how well the Americans could fight even when pitted against regulars. Bunker Hill Monument, a granite obelisk 221 ft. in height (1825-43), stands on Breed's Hill, which is now known as Bunker Hill. At the laying of the corner-stone Webster delivered his famous Bunker Hill oration. He also spoke at the dedication. See Frothingham, *Siege of Boston* (1849), Ellis, *History of the Battle of Bunker's (Breed's) Hill* (1875), and Carrington, *Battles of the American Revolution* (last ed. 1904).

**Bunner**, HENRY CUYLER (1855-96), American author, was born in Oswego, N. Y. After working as a reporter, he was in 1877 made assistant editor of *Puck* on

its establishment, and shortly after he became editor, holding the position until his death. He published *A Woman of Honor* (1883), *Airs from Arcady and Elsewhere*, verse (1884), *The Story of a New York House* (1887), *Short Sixes* (1894), and *Jersey Street and Jersey Lane* (1896). In *Partnership* (1884) was a collection of stories by Bunner and Brander Matthews. His play, *The Tower of Babel*, written in collaboration with Julian Magnus, was produced at Philadelphia in 1883.

**BUNSEN**, CHRISTIAN CHARLES JOSIAS, BARON VON (1791–1860), German diplomatist and scholar, was born at Korbach, Waldeck. After spending some years (1818–27) as secretary to the Prussian embassy in Rome, he was appointed ambassador there in 1827, and filled this office until his recall in 1838. After serving a short time as ambassador at Berne (1839–41), he was appointed to the corresponding post in England, where he remained for the rest of his official life. On questions of church organization he did not always agree with the king of Prussia, and he formulated his views in *Die Verfassung der Kirche der Zukunft* (1845). Appointed commissioner to settle the dispute with Denmark about Schleswig-Holstein, he in 1848 presented to Lord Palmerston a *Memoir on the Constitutional Rights of the Duchies of Schleswig and Holstein*; but his views were not accepted by the British premier. The outbreak of the Crimean War led to his recall (1854). Although he retired into private life, his *Zeichen der Zeit* (1855) showed that he still took a deep interest in political affairs. See the *Memoir*, in German, by his widow (1868–71); her own *Life and Letters*, ed. by Hare (1879; 6th ed. 1890); Bunsen's *Correspondence with Frederick William IV.*, ed. by Ranke (1873).

**BUNSEN**, ROBERT WILHELM (1811–99), German chemist, was born in Göttingen. He held four chairs—at Kassel in 1836; Marburg, 1838; Breslau, 1851; and Heidelberg, 1852–89. He laid the foundations of modern organic chemistry. His examination of the waste gases from blast-furnaces led to great economies in their working, as well as to his development of the methods of gas analysis. In 1852 he investigated the electrolytic preparation of the metals, including magnesium, of which he examined the light-giving capabilities; and with Kirchhoff, in 1859, he developed the methods of spectrum analysis, discovering the elements caesium and rubidium. In the course of these and other researches he invented the battery, burner, grease-spot photom-

eter, filter-pump, ice and vapor calorimeters that are associated with his name and in use in every laboratory throughout the world. Among other books, he wrote *Chemische Analyse mit Spektralbeobachtungen* (1861), with Kirchhoff; *Gasometrische Methoden* (1857; Eng. trans. by Roscoe, 1857); and *Flammenreaktionen* (1880; 2nd ed. 1886). See *R. W. Bunsen ein Gedächtnissblatt* (1900), Debus's *Erinnerungen an R. W. Bunsen* (1901), and Roscoe's *Memorial Lecture Jour.* *Chem. Soc.* (1900).

**BUNSEN BURNER**. In this appliance a jet of coal gas is directed into a tube which is open at both ends, and usually vertical. As a result air is drawn in by the current of gas, and mixes with it, so that, when ignited at the top of the tube, the mixture burns with a very hot, non-luminous flame. Bunsen burners are used for heating by gas, both for technical and domestic purposes.

**BUNSEN CELL**. See CELL, VOLTAIC.

**BUNT**. See PLANTS, DISEASES OF.

**BUNTER**, in geology the lowermost subdivision of the Triassic or New Red Sandstone, so called from a German word meaning 'variegated.' It consists of mottled red sandstones and breccias, with interpolated pebble beds. Few fossils are found in these rocks, which seem to have been deposited in old salt lakes, in countries subject to desert conditions. In Britain their principal exposure is in the Midland counties (e.g. Cheshire and Staffordshire), where their greatest thickness is about 2,000 feet. The red sandstones have been used for building—e.g. Chester Cathedral.

**BUNTING**, a term properly applied to birds belonging to the family Emberizidae. They are related to finches, and are robust, with thick beaks, and confined to the Old World; but several of the larger American finches, more or less related, are styled 'buntings.'

**BUNTING**, JABEZ (1779–1858), 'second founder of Methodism,' was a Manchester tailor's son. In London he filled the highest posts in his denomination, and transformed the Methodist Society into a self-governing church, over which he exercised great authority. His chief interest was in the Wesleyan missions. See *Life* by T. P. Bunting (1859).

**BUNYAN**, JOHN (1628–88) author of the *Pilgrim's Progress*, was born at Elstow, Bedfordshire, England, where people of his surname can be traced back to the 12th century. Nevertheless there is good reason to believe that John Bunyan belonged to a caste of itinerant tinkers or gypsies. For a full discussion of this question, reference

may be made to F. H. Groome's *Gypsy Folk-tales*, pp. 293–295 (1899). Bunyan's early youth, according to his own account, was notoriously ungodly; but although he fought for a few months as a soldier in the Parliamentary army, his marriage to a young woman of religious character when he was only nineteen, his subsequent baptism and admission to 'church privileges,' and the fact that his *Sighs from Hell* (a record of spiritual struggle) appeared when he was just two-and-twenty, all point to his having abandoned his evil ways at the very outset of his career. Bunyan soon began (1655) to preach in the villages, and his graphic discourses had a powerful effect upon his hearers. In 1656 he wrote his *Gospel Truths Opened* and *A Vindication* of it (1657), both directed against the Quakers; and at the assizes in the following year an indictment was preferred against him for preaching at Elstow. Although for the time he escaped punishment, soon after the restoration he was convicted (Nov., 1660) as 'a common upholder of several unlawful meetings and conventicles,' and was committed to Bedford jail, where he remained for twelve years, till 1672. During his imprisonment he wrote the first part of his immortal allegory, the *Pilgrim's Progress* (1677); though the Rev. John Brown assigns this to Bunyan's second imprisonment, of six months' duration, in 1675. During the earlier and longer imprisonment he also wrote four other books—viz., *The Holy City*, or *the New Jerusalem* (1665); *Grace Abounding to the Chief of Sinners*, an autobiographical and devotional narrative (1666); *Justification by Jesus Christ* (1671); and *Defence of the Doctrines of Justification* (1672). In 1671, the year before his release, Bunyan was elected pastor of the Baptist church at Bedford. In 1673 he published his *Differences about Water Baptism no Bar to Communion*; in 1680, *The Life and Death of Mr. Badman*; in 1682, *The Barren Fig-Tree*; in 1684, the second part of the *Pilgrim's Progress* and *The Holy War*; in 1685, *The Pharisee and the Publican*; and in 1688, *The Jerusalem Sinner Saved*, *Solomon's Temple Spiritualized*, and *The Water of Life*. He died on Snow Hill, Holborn, and was buried at Bunhill Fields, London.

A full list of Bunyan's works was given in Charles Doe's *Catalogue Table* (1691). One of the most carefully collected editions is that entitled *The Works of John Bunyan, with an Introduction, Notes, and Sketch of his Life and Contemporaries*, by George Offor (3 vols. 1862).

George Whitefield published an edition of the works in 1767, and Mason's edition, with notes, appeared in 1785. Southey's edition (1830) is one of the best, and his *Life of Bunyan* still holds its place. The Hanserd Knollys Society published an exact reprint of the first edition, edited by G. Ofor (1847). See also *Lives of Bunyan* by Ivimey (1809), Philip (1839), J. H. Froude, 'English Men of Letters Series' (1880; New York, 1888), J. Brown (1885), and Edmund Venables (1888).

**Bunzlau**, tn., prov. Silesia, Prussia, 24 m. w. of Liegnitz; famous for its brown pottery ware. Birthplace (1597) of the poet Opitz. Pop. (1900) 14,590.

**Buonaparte**. See BONAPARTES, THE, and NAPOLEON.

**Buonarroti**. See MICHELANGELO.

**Buoy** (*Du. boei*), a floating object designed to mark:—the limit of a channel; the position of a rock, shoal, or other danger to navigation; the position of an anchor, or of a telegraph cable; or the limit of an anchorage, dumping, or quarantine ground. A buoy is also used to support the end of a permanent mooring, the ship making fast to the buoy directly or to the end of the mooring chain beneath the buoy.

Buoys.

1. Can buoy. 2. Nun buoy. 3. Spar buoy. 4. Mooring buoy. 5. Method of mooring buoy.

In the United States the buoyage of harbors, channels, shoals, etc., is controlled by the Light-house Board. In approaching a harbor or an anchorage from

seaward, a bell or whistling buoy usually marks the outer end of the channel; black buoys with odd numbers will be found on the port edge of the channel, and red buoys with even numbers will be found on the starboard edge. Buoys with vertical stripes of black and white are placed in mid-channel, and must be passed close to avoid danger. Danger buoys, marking outlying rocks or shoals, have horizontal stripes of black and red. Buoys marking submerged wrecks are green; those marking anchorage grounds are white; and quarantine buoys are yellow. The United States is almost the only country having a uniform system of the buoyage in different localities is very confusing to navigators. Except in winter, nearly all important buoys are iron tanks with hemispherical bases below water, and have conical (nun buoys) or cylindrical (can buoys) tops. In winter, in the channels where much ice is found, the iron tanks are replaced by long spars (similarly painted), which are less liable to be injured by the ice. In some important channels the buoys showing the channel limits are all lighted, either by electricity brought to them by a cable, or by self-contained gas.

**Acetylene Gas Buoy.**—A great improvement in gas-lighted buoys became possible with the invention of a commercial process for the production of calcium carbide, from which acetylene gas is made by the simple addition of water. The brilliancy and penetrating power of the acetylene light renders it especially valuable for marine lighting. The Willson buoy, invented by T. L. Willson, inventor of the commercial carbide process, has come widely into use. It generates its own gas at the low pressure of about six pounds to the square inch, and with one full charge of carbide, varying from 1,300 to 3,500 lbs., according to the size of the buoy, gives a continuous light for from six to nine months without attention. These buoys are equipped with lanterns of varying sizes, ranging from 140 to 1,000 candle power, and carried at varying heights above the water level. In operation, the buoy is placed in the water, after filling the generator with large pieces of carbide, the valve at the bottom of the carbide chamber being open. Water flows in upon the carbide and acetylene gas is produced, passing up through the carbide and into the purifier, and thence to the lantern. When the gas is produced faster than it is consumed it accumulates in the generator, and when its pressure is greater than that of the water, it forces

the water out of the carbide, and the generation of gas is stopped until the gas pressure becomes less than that of the water. This automatic action continues until all

Automatic Acetylene Buoy

A, lantern; B, tower; C, purifier; D, recharging door; E, carbide chamber; F, air flotation chamber; G, ballasting counter-weight; H, water line; J, water-inlet valve; K, water port.

the carbide has given up its gas, when the buoy must be recharged.

**Buoyancy.** See SHIPBUILDING, HYDROSTATICS, SPECIFIC GRAVITY.

**Buprestis**, a genus of beetles whose members are remarkable for the metallic brilliancy of their coloring, especially in the case of tropical forms. The coloring is chiefly present in the hard wing-covers, which are often used as ornaments.

**Burbage**, RICHARD (?1567-1619), English actor. He became joint-proprietor of Blackfriars Theatre, and in 1599 transferred 'the Theatre' from Shoreditch to Southwark, under the name of the Globe. As an actor, chiefly at the Globe, Burbage excelled all rivals in tragedy. He filled the chief parts in Shakespearean plays (e.g. Richard III., Hamlet, Lear, Othello), in those of Ben Jonson, and of other writers. See Halliwell-Phillipps's

*Outlines of the Life of Shakespeare* (1885).

**Burbank, LUTHER** (1849), American horticulturist, was born at Lancaster, Mass., the son of a farmer and manufacturer, and after working as a wood turner and pattern maker at Worcester, decided to devote himself to horticulture. He bought a farm at Lunenburg, Mass., and began his experiments with fruits, flowers and vegetables, and while there developed the well-known Burbank potato. In 1875 he removed to Santa Rosa, Cal., believing that climatic and soil conditions in that region offered greater promise for the execution of his purpose. Subsequently he purchased a tract of four acres within the limits of the city for a home and established an experimental farm of fifteen acres at Sebastopol, several miles distant, where he found the lighter soil and warmer exposure needed for his most important work. At these two places, but mainly the latter, he carried on a costly, patient work that was ultimately crowned with marvelous achievements, without any pecuniary assistance till 1904, when the Carnegie Institution unanimously voted him \$10,000 per annum for ten years, to enable him to prosecute his experiments without concern for his financial necessities.

When he went to Santa Rosa his principal capital was ten Burbank potatoes, which he had reserved from the stock raised and sold to a seedsman in Massachusetts. His offer to supply the growers of California with quantities of the new potato for planting met with a liberal response, as the large growers were eager to obtain improved seedlings because of the deterioration of existing varieties. While raising the potato for seed he applied himself closely to the nursery business and also gave much attention to plant breeding. Unlike the general practice of investigators, he took the world, especially the horticultural part of it, into his confidence. In 1893 he issued a modestly worded publication, *New Creations in Fruit and Flowers*, and supplemented it with others in 1894, 1898, 1899, and 1901, in which he described and pictured many of his achievements. These publications elicited widespread and very diverse comment. In the horticultural world amazement followed surprise as one after another new variety of unfamiliar growths was made known. He had already given the world visible, tangible entities, not promises nor prophecies.

In an appreciative review of his work, Dr. Edward J. Wickson, professor of agricultural practice

at the University of California, thus summarized Mr. Burbank's accomplishments: (1) Varieties have been secured which are prolific where the older sorts have proved unsatisfactory; (2) varieties have been produced which, by early and late ripening, prolong the fruit season three or four months; (3) varieties have been produced which show almost incredible precocity in bearing fruit; (4) surprising changes in the natural structure of fruits have been secured, the most notable of which perhaps is the elimination of the shell inclosing the kernel in what is called stone fruits; (5) the ranges of flavor and aroma in several fruits have been enriched and extended; (6) radical changes in form or color have also wrought havoc with old forms of speech, as 'plum-colored' and 'plum-shaped,' that fruit in form having entered the domain of the apple and tomato, and the conventional form of the pear has been inverted; (7) the foregoing results have been obtained by selection and by crossing within the limits of species and variety. Professor Wickson also stated that still more surprising achievements had been reached by crossing fruits which belonged to genera heretofore supposed to be hedged about by impassable barriers. Another noteworthy appreciation was by Prof. David C. Fairchild, eminent as a botanist in the service of the U. S. Department of Agriculture, who, after visiting Mr. Burbank, said: 'It must not be left out of account that this New Englander, transplanted to the Pacific coast, has probably in the last twenty-five years combined more different varieties, species, and genera of plants by cross fertilization than any other living man.' According to Professor Fairchild, Mr. Burbank's methods found their keynote in the principle of immense numbers. Instead of planting, as an ordinary gardener would, a dozen seeds or a few hundred from which to select his new forms, he put out in his seed beds or seed boxes millions of them. Long practice with millions of seedlings enabled him to distinguish at a glance a slight peculiarity in a seedling which indicated that as this plant developed it would show other characteristics widely different from the familiar form.

At the beginning of his experiments in horticulture, Mr. Burbank was obliged to procure his collections from the ordinary stock of the seedsman, but after removing to California he began collecting seeds from the native plants, and in studying their peculiarities he realized a marvelous tendency toward variation in that

state. In his later work, and to secure results which he believed were possible, he drew upon the entire world for needed specimens. Touching the relation of plant nature to human insight and effort, Mr. Burbank, in an essay presented at the Floral Congress in San Francisco in 1901, wrote: 'The chief work of the botanist of yesterday was the study and classification of dried, shriveled plant mummies, whose souls had fled, rather than the living plastic forms. We have learned that they are as plastic in our hands as clay in the hands of the potter or color on the artist's canvas, and can readily be molded into more beautiful forms and colors than any painter or sculptor can ever hope to bring forth. The changes which can be wrought with the most plastic forms are simply marvelous, and only those who have seen this regeneration transpiring before their very eyes can ever be fully convinced.'

The space allotted for this article will permit only a brief reference to his most important achievements. From a half hardy plant found in west central Australia he developed the 'Austrian star flower,' a magnificent growth, which possesses the remarkable peculiarity of retaining permanently both its color and perfume. From the familiar common yellow 'California poppy' he created a flower of beautiful crimson, and from two white varieties, the common white opium poppy and another, he obtained a new red garden poppy. His popular 'Shasta daisy,' which he bred on a colossal scale, was developed by crossing the common field daisy of the East with a daisy from Europe and another from Japan, and is now cultivated in two forms, a single and a double flower. Other new floral creations include a hybrid yellow calla; a most prolific blooming hybrid lily; many hybrid amaryllis; the Snowdrift; a new race of bell-shaped clematis, with broad flowers exquisitely frosted and blending of colors and shadings not found elsewhere in the clematis family; new crinums; the California gladiolus; a new double gladiolus; a new species of columbines; several varieties of the lily, remarkable for enhanced beauty and perfume; new and hardy varieties of the tea rose, secured by using the hardy *Hermosa* as a joint parent with the best existing tea roses of the florists.

Mr. Burbank gave an insight into his method of cultivation and domestication in a public address in San Francisco, in the following words: 'There is not one weed or flower, wild or domesticated, which will not sooner or later respond liberally to good cultivation

and persistent selection. Any variation should be at once seized upon and numerous seedlings raised from this individual. In the next generation, one or several even more marked variations will be almost certain to appear, for when a plant once wakes up to the new influences brought to bear

dinary chestnut of the woods may take from ten to fifteen years from the seedling stage to the nut-bearing stage, but as a result of experimenting I have a specimen tree on my grounds this year (1908) six months old, that has borne two perfect burrs, and each has its regulation number of nuts.'

forms with the grains borne in the tassel, like other grasses, for corn is only a giant grass.'

In the line of fruits Mr. Burbank achieved as distinct triumphs as in that of flowers. Foremost among his creations were the stoneless plum, produced by crossing the *prunier sans noyau*, a fruit that had been known for a hundred years as a curiosity, with the French prunes and other prunes, and the plum-cot, an entirely new fruit, obtained by the crossing of plums and apricots. He spent ten years in developing the former, the most tedious part being the breeding out of the stone, and the increasing of the size, quality, and productiveness of the fruit. Then there are the improved beach plums, Bartlett plum, Climax plum, and improved varieties of the California wild plum. The peach almond is a hybrid of the Wager peach and the Languedoc almond; the Pineapple quince is a luscious fruit combining the qualities of each of its parents; the blueberry is the eastern variety improved in California soil; and the white blackberry is what Wickson called 'one of Mr. Burbank's most startling achievements.' To these should be added some new varieties of grapes, originating from the Isabella Regia of California growth, a large black grape. Two developments from this are a white, seedless fruit, ripening early in the season, and another which ripens about the holidays.

Mention of Mr. Burbank's thornless cactus has been purposely left to the last, because, in view of its enormous economic value, the writer considers it his most important achievement. The narrative of its evolution is thus told by its creator (1908): 'Twelve years ago I became impressed with the possibilities of the *opuntia cactus*, or prickly pear, as a forage plant. If only the spines and bristles could be done away with. I had specimens sent to me from all over the world, and by selecting and crossing, raising year after year thousands of new seedlings only to be destroyed as unavailing, I at last was rewarded in creating a variety absolutely without spines or bristles. I have half a dozen other spineless varieties, and they were all put on the market for the first time last summer.' No absolutely spineless cactus of great agricultural or horticultural value has ever before been cultivated or known, though so-called spineless ones are now being diligently hunted for in every country where the cactus is known to grow. Some of these partially thornless ones are now being exploited as the 'true Burbank Spineless Cactus.'

Luther Burbank

upon it, the road is opened for endless improvement in all directions, and the operator finds himself with a wealth of new forms which is almost as discouraging to select from as, in the first place, it was to induce the plant to vary in the least.' At another time, in speaking of his efforts to secure new varieties that would mature more quickly than the original ones, he said: 'I have been working for a good while to produce a quick-bearing chestnut. The or-

Mr. Burbank cited as an interesting feature in plant experimentation the occasional cropping out of reversions to primitive forms now lost through long cultivation, and said that he was running Indian corn back to where it was, maybe two or three thousand years ago. 'Corn, as we know it to-day, is an artificial product, the result of generations or centuries of selection before the white man ever saw it. I have already secured permanent

Died  
Apr. 11, 1926.

**Burbot.** The only species of fresh-water cod (*Lota lota*), which inhabits some of the rivers of North Europe, and sometimes has a weight of 12 pounds. An American representative (*L. maculosa*) is numerous in the Great Lakes and in the N.E. United States. The flesh of neither kind is very good. The American variety is sometimes known as ling, loche, or cusk, burbot being the English name for this fish. In shape it is long, with broad head and tapering, compressed posterior, and is covered with small, deep-rooted scales.

**Burchard,** SAMUEL DICKINSON (1812-91), American clergyman, was born at Steuben, N. Y., and graduated (1836) at Centre College, Ky. He became pastor of a Presbyterian Church in New York city (1839), with which he was associated for forty years. From 1879 to 1885 he was pastor of the Murray Hill Church in New York. In the Presidential campaign of 1884 he addressed James G. Blaine on behalf of a gathering of ministers, ending his speech with the words: 'We are Republicans, and do not propose to leave our party and identify ourselves with those whose antecedents have been rum, Romanism, and rebellion.' Mr. Blaine appears to have missed the point. At any rate, he did not protest, and the expression, being widely circulated, gave offence to Roman Catholics, and Blaine lost New York State and the Presidency.

**Burchiello** (1404-48), Italian poet, whose real name was DOMENICO DI GIOVANNI, and who received his nickname from a certain portion of his poems, which deals with the most inconsistent themes, and are put together 'any how' (*alla burchia*). Born at Florence, he wrote some sonnets against Cosimo de' Medici which compelled him to leave his native city (1434). In Siena, where he led a vagrant life, his satirical writings eventually caused him to be imprisoned. He died at Rome in great poverty. Many of his sonnets deal in a burlesque vein with his personal affairs; others are directed in a satirical spirit against the Siennese and against individuals in high places. The comic genre of this poet led to many imitations, called *Burchiellesco*. See MAZZI's *Burchiello*.

**Burckhardt,** JAKOB (1818-97), Swiss historian of art, born at Basel; in 1850 he became professor of art history at the University of Basel. His principal work is *The Cicerone or Art Guide to Painting in Italy* (1855, Eng. trans.), which became a classic because of its clear and useful descriptions, dealing with sculpture and architecture as well as painting. In *The Civilization of the Renaissance in Italy* (1860, Eng. trans.), he analyzes

with force and skill the characteristics of the Renaissance. Other noteworthy books, include *Geschichte der Renaissance in Italien* (1867); *Die Kunstwerke der Belgischen Städte* (1842); *Die Zeit Konstantins des Grossen* (1853); *Griechische Kulturgeschichte*. See Trog's *Jakob Burckhardt* (1898).

**Burckhardt,** JOHN LEWIS (1784-1817), Eastern traveller, was born at Lausanne, Switzerland. He went to England in 1806, and was engaged by the African Association to explore N. Africa. In Oriental attire, and under the name of Sheik Ibrahim, Burckhardt visited Palmyra, Damascus, and Lebanon; proceeded to Cairo; made two journeys to Nubia (1814), and thence went to Mecca and Medina, returning to Cairo in 1816. Driven out by the plague, he visited Mt. Sinai, but returned in 1817 to Cairo, to join the Fezzan caravan to the interior of Africa. Attacked by dysentery, he died at Cairo before it started. He wrote *Travels in Nubia* (1819); *Travels in Arabia* (1829); *Notes on the Bedouins and Wahabys* (1830); *Arabic Proverbs* (1830).

**Burdekin River,** Queensland, Australia, rises in Sea View range, flows by Charters Towers and Ravenswood gold fields, and falls into the Pacific Ocean at Upstart Bay.

**Burden,** the term formerly applied to the tonnage measurement of a ship. See TONNAGE.

**Burden of Proof.** See PROOF.

**Burdett,** SIR FRANCIS (1770-1844), British politician, entered Parliament for Boroughbridge in 1796; and in 1807, by his return for Westminster, which he represented for thirty years, won the first triumph for parliamentary reform. Burdett made himself unpopular with the government by vigorously supporting freedom of speech and Catholic emancipation, as well as by protesting against the suspension of the Habeas Corpus Act, the existing prison discipline, and the enormous taxation. He was sent to the Tower for a breach of privilege, but soon regained his liberty. Again, in 1819, he attacked the authorities in a letter on the 'Peterloo massacre,' and was imprisoned for three months. After the Reform Act of 1832 Burdett took no prominent part in public affairs.

**Burdett-Coutts,** ANGELA GEORGINA, BARONESS (1814-1906), daughter of Sir Francis Burdett. She inherited in 1837, the great wealth of her grandfather, Thomas Coutts, a London banker, and was asked in marriage, among others, by Prince Louis Bonaparte. She greatly distinguished herself by the financial aid she gave to benevolent and philanthropic schemes. The weavers of London, the Irish fisher-

men of Cape Clear, the Turkish peasantry after the Russo-Turkish War of 1877, the aborigines of S. Australia all received assistance from her. She liberally endowed the colonial bishoprics of Cape Town, Adelaide, and British Columbia, subsidized Sir Henry James's topographical survey of Jerusalem, and gave pecuniary assistance to Rajah Brooke in Sarawak. In 1871 Queen Victoria, in recognition of her philanthropic work, conferred upon her a peerage, and in 1881 she married Mr. W. L. Ashmead-Bartlett. The Baroness edited, in 1893, *Woman's Mission*, a 'Series of Congress Papers on the Philanthropic Work of Women, by Eminent Writers' (8 vols.).

**Burdette,** ROBERT JONES (1844), American humorist, was born at Greensborough, Pa., and removed to Peoria, Ill., as a boy, where he received a common-school education. He served as a private in the Illinois volunteers during the Civil War, and subsequently worked on Peoria newspapers for some years, joining the Burlington *Hawkeye* in 1872, in whose columns many of his humorous writings appeared. He also gave humorous lectures, and in later years was a member of the staff of the Brooklyn *Eagle*. Mr. Burdette was licensed to preach by the Baptist Church in 1887, and in 1903 was ordained and made pastor of the Temple Baptist Church at Los Angeles, Cal. He became pastor emeritus in 1909. His books include *Hawkeye* (1880); *Innack Garden, and Other Comic Sketches* (1886); *Chimes from a Jester's Bells* (1897); *Smiles Yoked with Sighs* (1900).

**Burdick,** FRANCIS MARION (1845), American lawyer, educator, and editor, was born in De Ruyter, N. Y. He was graduated from Hamilton College in 1869, and from the Law School in 1872. In 1872 to 1883 he practised law in Utica, serving one term as mayor of that city. Since 1882 he has served as professor of law at Hamilton College (1882-1887), Cornell University (1887-1891), and Columbia University (1891). Since 1907 he has been New York commissioner on uniform State laws; and is now an editor of the *American Year Book*, in charge of the Department of Law and Jurisprudence as the appointed representative of the American Bar Association. Among his books are: *Law of Sales* (1901); *Essentials of Business Law* (1902); *Cases on Torts* (3d edition, 1905); *Law of Partnership* (2d edition, 1906); *Law of Torts* (2d edition, 1908).

**Burdock** (*Arctium Lappa*), a coarse plant of the Compositae, common in temperate regions of the Old World, and naturalized in America. The flower head, a 'bur,' is covered with small hooks, and

readily attaches itself to any passing body, thus securing wide distribution of the seeds. It is used medicinally as a diaphoretic and diuretic, and in Japan is eaten as a vegetable.

**Burdwan.** See BARDWAN.

**Bureaucracy** is a term applied to the highly centralized forms of administration in which the officials of a department or bureau are responsible to their administrative superiors only, and are not amenable, in their official capacity, to the common law of the land. Prussia is the typical bureaucratic country, but most of the Continental nations have a similar form of highly centralized administration, with extensive powers of regulation, superintendence, and inspection over the lives and actions of the subject by officials who are responsible only to the head of their own department.

**Bureau of American Ethnology.** See SMITHSONIAN INSTITUTION.

**Bureau of American Republics.** See PAN AMERICAN UNION.

**Bureau of Corporations.** The act of Congress of 1903, creating the Department of Commerce and Labor, established under that department a Bureau of Corporations, to be presided over by a Commissioner of Corporations, charged with the duty of making inquiries into the business of corporations engaged in inter-State and foreign trade, with a view to securing information upon which the President may base recommendations for legislation regulating such corporations. The Bureau of Corporations is given the power to subpoena and compel the attendance of witnesses, to examine the books of a corporation, and otherwise to secure the information sought.

As a consequence of experience in one of the early investigations conducted by the Bureau, in which testimony given by persons under indictment for violation of the Anti-Trust law served as a basis for a plea for immunity, the Bureau investigators have found it expedient to limit their inquiries to such facts as may be discovered, without accepting testimony of those whose acts may be subject to investigation by the Department of Justice. The most important investigations of the Bureau of Corporations have been those relating to the beef industry (1904-05); the sugar and the coal industries (1906); the transportation of petroleum (1907); the prices of petroleum and the profits from the industry (1907); the tobacco industry (1909); taxation of corporations in New England (1909); in the Middle States (1910). Special reports are submitted to the President upon the conclusion of each investigation, and an annual report from the Bureau is submitted with the annual report of the Depart-

ment of Commerce and Labor (q.v.).

**Bureau of Lighthouses,** created in 1910 to take the place of the Lighthouse Board, is a bureau of the Department of Commerce and Labor. It has charge of the construction and maintenance of lighthouses and lighthouse vessels, signals and buoys, and generally of the lighthouse service; also custody of the archives, apparatus, etc., appertaining to that service. The Bureau consists of a commissioner and deputy commissioner of lighthouses, a chief engineer, a superintendent of naval construction, and 19 inspectors for as many lighthouse districts, who are naval officers or army engineers.

**Bureau of Mines.** The National Bureau of Mines for the United States was established by act of Congress approved May 16, and effective July 1, 1910. The chief purpose of the Bureau is to carry on inquiries and investigations with the view of lessening loss of life and waste of resources in mining and metallurgical operations. The Bureau is to make investigations of the methods of mining, especially in relation to the safety of miners; the appliances best adapted to prevent mine accidents; the improvement of mining conditions; the treatment of ores and other mineral substances; as to the use of explosives and electricity in mining; and other inquiries and technologic investigations pertaining to mining, metallurgical, and quarry industries.

The act establishing the Bureau provides that no officer or employee of the Bureau of Mines shall exercise any right or authority in connection with the inspection or supervision of mines and metallurgical plants in any State. Under the Constitution, such inspection and supervision is within the province of the State.

The act also transferred to the Bureau of Mines the personnel and equipment of the technologic branch of the U. S. Geological Survey. This personnel and equipment were developed during the preceding five years in connection with the investigation of fuels and mine accidents, and the new Bureau is to continue similar investigations.

The chief experiment station is located at Pittsburg, Pa. At this station the Bureau is conducting a number of investigations in connection with the use of explosives and electricity, and other mining problems. The work in the laboratories is supplemented by experiments conducted in a small coal mine under the conditions of actual mining.

As a means of facilitating its investigations of mine accidents, which include mine rescue, and first aid to the injured work, the Bureau of Mines has purchased and equipped with rescue apparatus, first aid and

fire fighting devices, six cars of standard Pullman size, each completely fitted with modern appliances. These cars, one stationed in each of the important coal fields or coal-mining regions of the country, will visit all the important groups of coal mines, where demonstrations and illustrations of this work will be given. This will enable the Bureau to render aid after mine disasters and to promote mine rescue work.

The law establishing the Bureau of Mines became effective on July 1, 1910, and a few days later Mr. George Otis Smith, Director of the United States Geological Survey, was temporarily appointed Acting Director. On September 1, Dr. J. A. Holmes, formerly chief of the technologic branch of the Geological Survey, was appointed Director of the new Bureau.

**Buren.** See VAN BUREN.

**Burette,** in chemistry, is an apparatus used in volumetric analysis to deliver accurately measured quantities of liquids. It consists of a vertical glass cylinder of uniform bore, usually graduated in cubic centimetres, and fitted with a stopcock from which any desired quantity of a solution may be allowed to flow.

**Burg,** town, province Saxony, Prussia, 15 m. by rail N.E. of Magdeburg; the seat of important cloth manufactures, dating from the 12th century, but in part founded by French and Walloon immigrants after the Edict of Nantes. Pop. (1905) 23,500.

**Burgage Tenure,** an ancient form of tenure in certain English boroughs, whereby the tenant holds of the lord of the borough in fee by a fixed rent. In Scotland, the tenure of property in royal burghs; See TENURE.

**Burgas,** town, Bulgaria, on the Black Sea, connected by rail with Sofia, and in steamboat communication with Odessa and Constantinople. Exports grain, wool, tallow, butter, and rose water. Pop. 15,000.

**Burgdorf** (Fr. *Berthoud*), a picturesque and ancient industrial town on the Emme, in the Swiss canton of Berne. It is 14½ m. by rail N.E. of Berne. It manufactures ribbons and silk. Pop. (1908) 9,000.

**Burgee,** the distinguishing pennant of a yacht club, is a V-shaped pennant, with the point away from the staff.

**Bürger,** GOTTFRIED AUGUST (1747-94), German poet. In 1772 he received an official appointment at Altengleichen, near Göttingen; this post he resigned in 1784, and became private lecturer at Göttingen. Bürger admired Shakespeare, and learned much from Herder's literary criticism, while he found models of popular ballads in Percy's *Reliques* (1765).

He is often regarded as before all a writer of ballads. Of these, *Lenore* (1774) is the most famous; William Taylor's rendering of it had a marked influence on Sir Walter Scott. Other well-known ballads are *Das Lied vom braven Mann* (1776); *Der wilde Jäger* (1778); *Der Kaiser und der Abt* (1784). Bürger was one of the first to restore the sonnet to honor. There are good editions of his poems by A. E. Berger (1891), and by Grisebach (1894), who also issued his *Abenteuer des Freyherrn von Münchhausen* (1890), retold and amplified. See *Life*, in German, by Döring (1827; new ed. 1848) and W. von Wurzbach (1900).

**Burger**, SCHALK WILLEM (1852), late president of the Transvaal, succeeded to that position on the flight of President Krüger from Lorenzo Marques for Europe on October 19, 1900. Mr. Schalk Burger was, up to the period of the Jameson Raid (1895-6) at all events, one of the few progressive members of the First Raad, in which he represented (1887 onwards) the Lydenburg district, and ranged himself on the side of General Joubert. He was (1895) chairman of the Assembly, and in 1896 was chosen a member of the executive council. In 1897 he was chairman of the Industrial Commission, which went a long way in admitting the grievances of the Uitlanders. In 1898 Schalk Burger and Joubert stood as candidates for the presidency, in opposition to Krüger, but unsuccessfully. At the outbreak of hostilities Schalk Burger proceeded with Joubert to Natal. He was at the time commandant of the Lydenburg district, but during the course of the war was promoted to the rank of general. He was with Louis Botha during at least a portion of the Tugela operations, and was present at the battle of Spion Kop. On the death of General Joubert (March 27, 1900) he was appointed vice-president of the Transvaal. He remained in the field with Louis Botha till the end of the campaign, and was one of those who signed the terms of surrender at Vereeniging. In the war of 1880 he invested the English garrison at Lydenburg, but, in spite of his superior force, failed to compel their surrender.

**Burgers**, THOMAS FRANÇOIS (1834-81), president of the Transvaal republic, was a minister of the Dutch Reformed Church for eight years. He succeeded Pretorius as president of the Transvaal in 1872, and in 1875 unsuccessfully attempted to negotiate the Delagoa Bay railway scheme in England and in Europe. He conducted an unsuccessful war with Secoceni in 1876,

one result of which was the British annexation of the Transvaal on April 12, 1877.

**Burgess**. In mediæval England the term burgess signified a freeholder in a chartered town. Only burgesses could participate in the municipal government. With the increase in number of landless inhabitants of the towns, and the surrender of privileges by the smaller landholders, the burgesses came to be practically an oligarchic governing body, perpetuating itself by hereditary succession, or by co-optation. In American colonial history the term was used usually in its original sense as citizen of a town, and is still thus used in parts of New England. In colonial Virginia, however, the term is found in the sense of a member of a legislative body, in the 'House of Burgesses,' the colonial legislature. In England, since 1835, the municipal electors of a borough are the burgesses. In general, they are the occupiers of houses or other buildings of any value, or of land of the annual value of £10, in the borough, who have paid rates and resided in, or within seven miles of, the borough for a year, and they include unmarried women otherwise qualified. They are entitled to, and must be, enrolled; and the burgess roll is the register of municipal electors.

**Burgess**, ALEXANDER (1819-1901), American P. E. prelate, was born in Providence, R. I., and graduated (1838) at Brown, and at the N. Y. General Theological Seminary (1841). He was ordained a priest (1843), and was rector of a church at Augusta, Me., in 1843-54. From the latter year to 1867, he was rector of St. Luke's, Portland, from there going to Brooklyn, N. Y., and then to Christ Church, Springfield, Mass., where he remained until his consecration as bishop of the newly formed diocese of Quincy, Ill., in 1878. He published various addresses and sermons.

**Burgess**, EDWARD (1848-1901), American yacht designer, was born at West Sandwich, Mass.; he was the son of a wealthy trader with the West Indies, and graduated (1871) at Harvard. His father experiencing financial reverses, Burgess served as instructor in entomology at Harvard in 1879-83. He had previously studied naval designing while on a trip to Europe, and had planned several successful cutters before he took up teaching. He began, with his brother, Sidney Burgess, the business of yacht designing at Boston in 1883, and received his first order for a yacht to defend the *America's* cup in the

spring of 1885. He designed the *Puritan*, a centreboard yacht, which beat the English *Genesta* handily in the September races of the same year. He repeated the experience in 1886 with the *Maysflower*, which won a victory over the *Galatea*, and again in 1887 with the *Volunteer*, which defeated the *Thistle*, designed by George W. Watson. This was an unprecedented record, and brought Mr. Burgess honors and a great number of orders for yachts and fishing craft of every description. He was carried off in the middle of his career by an attack of typhoid fever.

**Burgess**, FRANK GLETT (1866), American humorist and illustrator, was born in Boston, Mass., and graduated (1887) as a civil engineer at the Mass. Institute of Technology. Some of his publications are *The Purple Cow* (1897), *The Nonsense Almanack* (1898), *Goops and how to be Them* (1900), *Romance of the Commonplace* (1902), and *The Picaroons*, with Will Irwin (1903).

**Burgess**, FREDERICK (1853), American P. E. prelate, was born in Providence, R. I., and graduated (1873) at Brown, taking his course in divinity at the N. Y. General Theological Seminary, and studying for a year at Oxford. He was ordained priest in 1877, and was rector of several churches, Eastern and Western, until 1898, when he assumed charge of Grace Church, Brooklyn Heights, N. Y. Four years later, on the death of Bishop Littlejohn, he was consecrated bishop of Long Island.

**Burgess**, GEORGE (1809-66), American P. E. prelate, elder brother of Alexander (q.v.), was born in Providence, R. I., and graduated (1826) at Brown. He passed some years abroad, was ordained priest in 1834, and was rector of Christ Church, Hartford, until 1847, when he was consecrated first bishop of the diocese of Maine, making his residence at Gardiner in that state. He published several theological volumes, and his *Poems* were collected and published with an introduction by Arthur Cleveland Coxe in 1868. See *Mémoir*, by his brother (1869).

**Burgess**, JOHN WILLIAM (1844), American educator, was born at Cornersville, Tenn., and graduated (1867) at Amherst. After studying in Germany, he was professor of history and political science at Amherst from 1873 to 1876, when he was called to Columbia to fill a similar position, his title being later changed to that of professor of political science and constitutional law. He was appointed first lecturer on the Theodore Roosevelt foundation of American his-

Died Oct. 15,  
1925.

tory and institutions at the University of Berlin, for the years 1906-7, on the recommendation of the trustees of Columbia, in accordance with the agreement entered into by Emperor William II. and Pres. Butler for an exchange of professorships between Columbia and the University of Berlin. Prof. Burgess published important treatises on political science and constitutional law, and writings on American history.

*Died 1910*  
**Burgess, NEIL** (1846), American actor, was born in Boston, Mass., and was employed for several years in an art store in that city. Becoming dissatisfied, he adopted the stage as a profession, and, making a chance success in the impersonation of a female character, decided to devote himself to this class of work. His presentation of a play written for him—*My Mother-in-Law*—attracted the attention of David Ross Locke, author of the *Widow Bedott Papers*, who arranged with Mr. Burgess for the latter to appear as the Widow Bedott in a dramatization of the work. It was first presented at Providence (1879), and was a success for many years. In 1889 Mr. Burgess produced Charles Barnard's comedy, *The County Fair*, at Philadelphia, which afterward ran for more than two years at the New York theatres. See Clapp and Edgett's *Players of the Present* (1899).

**Burgers.** See SECESSION CHURCH.

**Burghley, WILLIAM CECIL.** See BURLEIGH.

**Burgkmair, or BURCKMAIR, HANS** (1473-1531), German painter and engraver, born at Augsburg. His early German style is well represented by the portrait of himself and wife in Vienna; his later more Italian style by the *Adoration of the Kings* in Augsburg. His great repute rests on his woodcuts, which rank high for their dramatic force and ingenuity, and for their truth to the life of his time. Among the most important of his engravings are *The Triumph of Maximilian* (135 prints) and the *Genealogy of the Emperor* (237 prints); also 52 plates for the *Book of the Towns*, and 104 designs for a German translation of the *Offices of Cicero*, and 200 for the German translation of Petrarch's *Fortune*. See Wilmot Buxton's *German, Flemish, and Dutch Painting* (1881).

**Burglary.** The breaking and entering a dwelling-house in the night-time with intent to commit larceny or any other felony. The breaking may be either actual (e.g. forcing open a closed window or door) or constructive (e.g. gaining admission by conspiracy with a servant). The entering must

be actual, but it need not be an entry of the whole person. It is enough if a hand be thrust into a broken window with intent to commit larceny or a crime of violence. If the felonious intent is lacking the act of breaking and entering is only a trespass, and if the act is committed by daylight it is, notwithstanding the felonious intent, only house-breaking. So also if the house is uninhabited at the time the offence is committed or if the building entered is not a dwelling-house, the crime is not burglary. The breaking and entering may be by different persons acting together, and may be on different nights. The heinous character of the offence has rendered burglary severely punishable by the law of all civilized states. In England the penalty is penal servitude for life or for a long period of years, and in this country for varying terms of imprisonment, extending to twenty years. In Scots law, the offence is house-breaking with intent to steal, and it is the worst aggravation of theft. There is no distinction between day and night, or between a dwelling-house and other closed buildings. The same result has been reached by statute in some of the United States, the term burglary being used as coextensive in meaning with housebreaking.

**Burglary Insurance.** See INSURANCE.

**Burgomaster,** the chief magistrate in Belgian, Dutch, German, and Austro-Hungarian towns. His duties are similar to those of mayors and provosts in Great Britain, and of *maires* in France.

**Burgos.** (1.) Province, N. Spain, lying between Alava and Navarre. On the whole the province is mountainous, but especially in the N. and N.E. To the S. lies the table-land of Old Castile. In the E. rises the lofty peak of Cerro de San Millan (6,995 ft.), while in the extreme S. is the pass of Pancorbo. The soil is generally poor, and is only adapted for pasturage; gold, copper, silver, and lead are found. The chief rivers flowing through the province are the Ebro, for 62 m.; the Douro, for 37 m.; the Pisuerga; and the Arlanzon. There are potteries, stone quarries, and factories for linen and cotton. Want of railways and of good roads has militated very much against development. Area, 5,650 sq. m. Pop. (1900) 338,828. (2.) City, cap. of above prov., on riv. Arlanzon. It stands on the Northern Ry., 142 m. from Madrid, and is a very ancient city, whose principal glory now is its superb Gothic cathedral (1221), which is one of the noblest in the world. The

Cid Campeador, the local hero, is buried here. The monastery of the Cartuja and the historical nunnery of Las Huelgas, in the neighborhood, are of the highest interest. The city is the centre of a wheat-growing district and there is some industry in leather, cloth, and hosiery. Pop. (1900) 30,167.

**Burgoyne, JOHN** (1722-92), English soldier and dramatist. Early entering the military service, he commanded the English force which cooperated with the Portuguese in repelling an invasion of Portugal by the Spanish in 1762, and entering Parliament in 1768 he won favor at court by his political course. He is best remembered, however, for his service in the American Revolution. With Generals Howe and Clinton he joined Gen. Gage in Boston early in 1775, and in 1777, with the rank of lieutenant-general, he commanded the famous expedition sent from Canada to form a junction at Albany with Sir William Howe (then at New York), and to capture as he went the "American posts which lay upon Lake Champlain." At the head of an army of about 7,500 (including about 250 Canadians and Loyalists), he reached Crown Point (June 27) and forced the evacuation of Ticonderoga (July 6). At first he was assisted by Indian auxiliaries, whose number at one time probably reached or exceeded 1,000, but, disapproving of their methods of warfare—"I would rather lose every Indian," he said, "than connive at their enormities"—he gradually alienated them. Unable to secure provisions in sufficient quantities, unsupported by expected reinforcements from New York, hemmed in on all sides by superior numbers of American militiamen, who flocked in from every quarter to repel his invasion, and confronted by a strong American army first under Gen. Schuyler and then under Gen. Gates, he was forced to surrender to Gen. Gates at Saratoga (Oct. 17) after fighting two stubborn battles (Sept. 19 and Oct. 7). (See SARATOGA, BATTLES OF.) He was bitterly criticised at home, and though he thoroughly vindicated his conduct of the campaign, he failed to obtain a military trial, and resigned his commission. Again entering Parliament, he joined the opposition and advocated a cessation of hostilities in America. He was commander-in-chief in Ireland (1782-4), and in 1787 was one of the managers of the impeachment of Warren Hastings. He wrote several dramas, including *The Maid of the Oaks* (1780); *The Lord of the Manor* (1780), a comic-opera libretto; and *The Heiress* (1786), described by Horace Walpole as one of the

most pleasing English compositions and long popular. See his *Works* (2 vols. 1808); De Fonblanque's *Political and Military Episodes of John Burgoyne* (1875); Wrottesley, *Life and Correspondence of Sir John Burgoyne* (2 vols. 1872); and Stone, *Campaign of Liewenant - General Burgoyne* (1877).

**Burgoyne**, SIR JOHN FOX (1782-1871), English military engineer, natural son of the above, rendered important services while commanding the engineers in Portugal (1809-13), and as virtual second in command in the Crimean War. He was commanding engineer of the expedition to New Orleans in 1814, and took part in the assault and capture of Fort Bowyer (Mobile Point), in February, 1815. For his Crimean work Burgoyne was assailed by the press, but later became a popular hero, and was made baronet and field-marshal. See his *Life and Correspondence*, by the Hon. G. Wrottesley (2 vols. 1873); Sir J. T. Jones's *Journal of the Sieges . . . in Spain* (1814); A. H. Klingle's *Invasion of the Crimea* (1899).

**Burgrave**, or **BURGRAVE**, a title frequently borne in the middle ages by the military commandant of a German town. He was appointed by the emperor or by a bishop of the empire. There were burgraves of Nuremberg, Augsburg, Meissen, Regensburg, Magdeburg, and other towns. The title subsequently became hereditary in certain noble families—e.g. that of Brandenburg.

**Burgundii**, a powerful German tribe whose original home was between the Oder and the Vistula; they were of the same race as the Vandals. The Gepidæ drove them from their first habitations into the country about the Main. Early in the 5th century A.D. the usurper Jovinus invited them to settle on the left bank of the Rhine; hence arose the duchy and county of Burgundy.

**Burgundy** (Fr. *Bourgogne*), former province of France, now forming all or part of the departments Ain, Aube, Côte-d'Or, Haute Marne, Nièvre, Saône-et-Loire, and Yonne. The Burgundians invaded the country with the Vandals, 410 A.D., but were vanquished by the Franks in 523, and again became independent in the 9th century. The struggle for supremacy in France between the Burgundians, the French, and the English fills an important chapter of mediæval history. In 1477, on the death of its last duke, Charles the Bold, Burgundy was attached to the crown of France. The name is now mainly associated with the wine of the province. The finest wine is grown on the slopes of hills in Côte-d'Or,

and is celebrated for its rich flavor. It is divided into three classes—the wines of Basse Bourgogne (Chablis, Montrachet, etc.), Haute Bourgogne (Clos-Vougeot, Chambertin, Corton, Pommard, and Volnay), and the Maconnais and Beaujolais. The annual yield of the vineyards is about 4½ million gallons.

**Burgundy Pitch** is prepared by melting and straining the exudation from the stem of the spruce fir of Southern Europe. It is hard, brittle, reddish brown and opaque, sweet and aromatic. It is soluble in glacial acetic acid, by which the common adulterants can be detected, and is used as a basis for plasters, having a stimulating action on the skin.

**Burhanpur**, tn., Nimar dist., Central Provinces, India, 95 m. S.E. of Indore; was the seat of the Deccan princes of the Mogul empire until 1635; was taken by General Wellesley in 1803; and in 1860 became British territory. It contains the remains of a palace built by Akbar, and a mosque by Aurungzebe; manufactures fine cottons and brocaded silks. Pop. (1901) 33,341.

**Burial**. The usual mode of disposing of the bodies of the dead by inhumation or burying in the earth. The earliest legal regulation of burials in our system of law is connected with the exclusion from consecrated ground of the bodies of such as had incurred ecclesiastical censure, and in England this principle survives in the law side by side with provisions introduced solely from considerations of public health. By the English law every baptised person not a suicide, excommunicate, or a person upon whom the sentence of death has been executed, is entitled to be buried in the churchyard of his parish by a Church of England clergyman, without fee. The baptism may be of a kind recognized by any Christian sect. Before 1823, one who had committed suicide was buried at a cross roads with a stake through his body, on a coroner's warrant; but now, by the Interments Act, 1882, he may be buried, even by a clergyman of the Church of England, with any service other than the burial service of the Church of England. In the United States the burial of the dead is a civil and not an ecclesiastical function, and all persons, except such as have suffered capital punishment, are entitled to decent burial in a public or private cemetery. The duty of burying the dead rests primarily on the executor or administrator of the deceased. A husband is liable for a wife's burial, and a father for a child's; while, in default of any one else, a householder is bound to provide for the burial of a person dying in

his house. Overseers and guardians of the poor must bury a pauper if no one else is liable to do so, and must bury drowned bodies left by the tide. There are stringent provisions of law respecting the time and manner of burial of persons dying of infectious diseases, and it is generally a misdemeanor to bury or otherwise put out of the way a dead body without first procuring a certificate of death from a licensed physician or, in case of sudden death, without the authority of the coroner. See **CEMETERY**, **CORPSE**, **CORONER**.

**Burial Customs**. Although burial strictly means interment, or, at any rate, conveys the idea of covering over, a brief mention may here be made of the various modes of disposing of the dead, whether under ground or otherwise. Probably the method still followed by many American Indians, by some tribes of Eskimos, and by the Tibetans, as described by Sven Hedin, was that first practised by man—*viz.* carrying the corpse a short distance from the encampment, and there depositing it on the surface or upon a platform where it is soon dismembered by birds and animals. Similarly, the Masai, the Wakamba, and other African tribes deliberately leave the bodies of their dead to be food for the hyænas. Equally callous is the Mashona treatment of criminals; for although the command of a chief—'Throw him to the crocodiles,' or 'Give him to the hyænas'—is interpreted in the first place as an order for immediate death by a spear or a club, yet it also indicates the ultimate destiny of the corpse. The Hindu practice of committing the dead to the waters of the sacred Ganges had probably a like origin, although latterly accompanied by the most reverent rites. The same may be said of burial at sea, which, in certain phases, was nothing more than the getting rid of a corpse by tossing it overboard, but which, as practised nowadays, is a solemn and devout ceremony. Akin to these is the Malay usage, by which a man, recognizing the near approach of death, puts out in his boat alone to sea; which bears some resemblance to the Viking (man of Vik, or Scardinavian sea-rover) practice of putting a corpse aboard a ship which was set on fire, though the more usual custom was to bury it under the warrior's ship, or to build a mound over it on some sea headland. The Parsee custom is to expose the corpse on a tower, there to have the flesh devoured by vultures, thus avoiding the greater horror of putrefaction. Analogous, but not obviously with the same aim, is the method,

followed by the Siberian Yakuts and the Indians of the South Pacific coast of America, of placing the dead in a covered coffin, which is then hung up between two trees. Cremation, once more coming into vogue, was formerly a widespread practice, and urns containing incinerated remains are frequently disinterred in many parts of Europe. Burial in the earth, in mounds, and in stone vaults has been, and with little variation still is, the most usual European form of sepulture. These latter modes of burial ought perhaps to be regarded as a development of the practice among mound-dwellers of leaving the

in the other world; and in the case of a chief, his wives, slaves, and steed were killed at his grave, that they might bear him company, and serve him as in this life. Faint traces of such usages still survive in the customary British ceremonial at the funeral of an officer. The Hindu *sati*, or *suttee*, is another illustration of this idea. As a rule, corpses are and have been buried lying at full length; but in many early European and in modern Eskimo interments the body is doubled up. Embalming for purposes of preservation was the process adopted by the ancient Egyptians, and in a modified form it persists to the

market. Pop.(1903), all civilized, 1,627.

**Buriats**, a Mongol race inhabiting the district round Lake Baikal, Transbaikalia, and the south of government of Irkutsk, in Siberia. Originally nomads, they are now in part successful agriculturists. A sluggish, harmless race, they are really adherents of Shamanism, though they profess Lamaist Buddhism. They are estimated to number about 210,000.

**Buridan**, JEAN, a French philosopher of the 14th century, became rector of the University of Paris (1327). He was one of the most subtle dialecticians of his age, and his works consist of com-

Egyptian Funeral Ceremonies.

(By permission from the large facsimile sheets of the 'Book of the Dead,' published by the Department of Oriental Antiquities, British Museum.)

The upper part shows the mummy on a boat-shaped hearse drawn by oxen, the wife kneeling beside it, and a priest officiating in front. In the lower part the mummy is supported upright in front of the tomb by Anubis, the wife again kneeling; priests officiate at a table of offerings—one reads the funeral service, and one brings forward an offering; behind are mourners. The cow and calf symbolize the Rising Sun, and Heaven.

body of the deceased within the mound that had once been his house, and closing the entrance. In the Aleutian Isles it was customary to close merely that compartment which has been the dead man's special retreat, while his kinsfolk continued to inhabit the other parts of the mound-dwelling as before. (See Lord Avebury's *Prehistoric Times*, 1900, pp. 124-129.) Similar in nature is the hut-burial of the Maoris and of various tribes in Africa and S. America. In some cases the corpse is merely buried underneath the floor of the hut; in other cases the door is closed, and the hut becomes a tomb. Among primitive nations it was often the custom to place beside the corpse his weapons and utensils, for use

present day. **Endocannibalism** (see CANNIBALISM) may also be regarded as a burial custom. See *Archeology*, *Barrows*, and *Mounds*.

**Burias**, isl. Masbate prov., Philippine Is., between the S. end of Luzon and Masbate I. Area, 258 sq. m. It lies N. of an important ship passage to Manila, has two lights, and is surrounded by innumerable islets and shoals. It is mountainous, the highest point (853 ft.) being at the S. extremity, and is covered with valuable timber which has not been worked. It produces tobacco, hemp, sugar-cane, chocolate, rice, and coconuts. Fishing is the chief occupation, but bayones and sacks of the buri palm are manufactured, and some live stock is raised for the Manila

mentaries on Aristotle (1447-9 and 1518). 'Buridan's ass' is a phrase well known as an illustration in argument regarding free will. It supposes the case of an ass who, standing equidistant between two bundles of hay and finding difficulty in making choice of either, starves to death. His works were published by J Dullard in 1516.

**Burin**, tn. and port of Newfoundland, cap. of Burin dist., 125 m. S.W. of St. John's, on W. side of Placentia Bay, on an inlet which forms an excellent harbor. The chief occupations are afforded by fishing and navigation. Pop. 3,000.

**Buriti**, or MIRITI, PALM (*Mauritia flexuosa* or *vinifera*), two of the largest S. American

fan palms (100–125 feet high), growing on swampy land from Brazil to the West Indies. From the sap the natives obtain, by fermentation, an intoxicating liquor; while the pulp of the fruit is eaten, and is preserved in sugar. The leaf fibres are used for cords, mats, etc., the pith as cork, and the stem yields a kind of sago.

**Burke**, EDMUND (1729–97), English statesman and political philosopher, was born in Dublin. In 1743 he entered Trinity College, Dublin. Being destined for the English bar, he proceeded to London in 1750, to attend at the Middle Temple, but he took to literature instead. In 1756 he published the *Vindication of Natural Society*, a satire upon Bolingbroke; and the *Philosophical Inquiry into the Origin of Our Ideas of the Sublime and the Beautiful*, an important contribution to the study of aesthetics. In 1757 appeared *An Account of the European Settlements in America*, written by Burke with the assistance of his cousin, William Burke. This work shows his early interest in America, and reveals his knowledge of the conditions in the colonies at that time.

When in 1759 Dodsley founded the *Annual Register*, Burke, to whom the plan of the book was due, became its editor, and continued a contributor until 1788. In 1761 he accompanied W. G. Hamilton to Ireland. 'Whiteboyism' was then breaking out, and Burke sketched a fragment on the Irish penal laws. He always advocated a generous policy toward Ireland and her religion. On his return to London (1763), he mixed in literary society, and made lasting friendships with Johnson and other members of the Literary Club, to which he was himself admitted in 1764.

Burke's public life now began. Lord Rockingham was called to the Premiership in 1765, and Burke became his private secretary. At this time Parliament was controlled by the 'king's friends,' a body of men who stood outside the old party groups, and in effect represented the parliamentary influence of the Crown. They acted under the royal orders, and were able for a time to make the king's will supreme. The disturbances arising out of the election of Wilkes for Middlesex (1768), and his rejection by the House of Commons, marked the extent of the evil; and in *Thoughts on the Cause of the Present Discontents* (1770) Burke denounced the system, and demanded a return to regular party government.

His sane and generous views on the rebellion of the American Colonies, and the disastrous policy of the ministry of Lord North (1770–82), found expression in his speeches on *American Taxation* (1774) and on *Conciliation with America* (1775), also in the *Letter to the Sheriffs of Bristol* (1777). In their union of sound statesmanship and lasting political wisdom these treatises form 'the most perfect manual in our literature for one who approaches the study of public affairs, whether for knowledge or for practice' (Morley's *Burke*). In 1771 he was appointed agent of the colony of New York, with a salary of £700, a position he held for but a short time. In 1774 he exchanged the constituency of Wendover, which he had represented since 1765, for that of Bristol; but his independent attitude in regard to the restriction on Irish trade and the relief of Catholics cost him the seat in 1780, and after that he sat for Malton (1780–94).

Burke in 1780 brought forward his *Plan of Economical Reform*, designed to check extravagance in the administrative departments. Two years later Lord Rockingham returned to power, and Burke became paymaster-general; but in three months the ministry was dissolved by the death of Rockingham. Burke and Fox refused to serve under his successor, Lord Shelburne, and by an alliance with their old enemy, Lord North, formed the coalition ministry (1783) under the Duke of Portland, in which Burke was again paymaster-general. The defeat of the ministry (December, 1783) on Fox's, or rather Burke's, East India Bill closed the latter's brief tenure of office.

His eloquent speech on the East India Bill was the prelude to his great crusade against the abuses of the East India Company. The speech on the *Nabob of Arcot's Debts* (1785), and the orations which were crowned with the impeachment of Warren Hastings (1788), reveal his profound knowledge of India.

The same reverence for established faiths and institutions urged him to write *Reflections on the French Revolution* (1790). In the proceedings of the National Assembly he saw a revolt against law and order which seemed to him to threaten an upheaval of the entire political systems of Europe. The publication of the *Reflections* proved to be an event of European importance, but in the Whig party it created a painful division, which was accentuated

by the *Appeal from the New to the Old Whigs* (1792).

Burke broke off his friendship with Fox, and severed the political ties of a lifetime, but he carried with him a number of the Whigs. His hatred of the revolution grew even to frenzy, and in the four *Letters on a Regicidal Peace* (1798) sobriety and good taste gave place to violent declamation. In retiring from Parliament in 1794 he was granted pensions amounting to \$18,500 a year, which his lifelong pecuniary troubles made welcome. He died on July 8, 1797, and was buried at Beaconsfield, in Buckinghamshire.

Burke ranks as one of the foremost orators and political thinkers of England. He had vast knowledge of affairs, a glowing imagination which kindled everything he touched, and a wide and passionate sympathy with the most remote and unfamiliar conditions of life, as shown in his great speeches on India. His views were lucid, comprehensive, and philosophic.

Among his other works are: *Hint for an Essay on the Drama; Account of the European Settlements in America* (1757); *Abridgment of English History* (1757); *Observations on the Present State of the Nation* (1769); *Address to the King* (1776); *Two Letters to Gentlemen in Bristol* (1778); *Letter to a Member of the National Assembly* (1791); *Observations on the Conduct of the Minis'try* (1793); *Remarks on Policy of Allies* (1793); *Report on the Lords' Journal* (1794); *Thoughts and Details on Scarcity* (1795); *Letter to a Noble Lord* (1795).

Burke's *Collected Works* have been published in numerous editions. Consult his *Correspondence*; Sir J. Prior's *Life* (the best); Morley's *Burke—an Historical Study*, and *Edmund Burke* (English Men of Letters Series); G. Chadwick's *Life* (1902); Pillans' *Edmund Burke* (1905).

**BURKE**, SIR JOHN BERNARD (1814–92), English genealogist, was born in London, and was called to the bar of the Middle Temple in 1839. He succeeded Sir J. Betham as Ulster king-of-arms (1853), and was knighted in 1854. He edited for many years, in succession to his father (1847), the annual issue of *Burke's Peerage*.

**BURKE**, MAURICE FRANCIS (1845), American Roman Catholic bishop, was born in Ireland, and was educated in Chicago and in Rome, Italy. Ordained priest in 1875, he was at St. Mary's, Joliet, Ill., from 1878 to 1887, when he was consecrated

bishop of Cheyenne, Wyo. He was transferred to St. Joseph, Mo., in 1893.

**Burke, ROBERT O'HARA** (1820-61), Australian explorer, was born in County Galway, Ireland. He led an expedition across the Australian continent which left Melbourne in August, 1860. Disensions early arose, and at Cooper's Creek several members returned; but Burke and Wills pushed on, and reached the tidal waters of the Flinders River. They died of starvation on their way back, but had achieved the distinction of being the first white men to cross Australia from south to north.

**Burke, THOMAS MARTIN ALOYSIUS** (1840-1915), American Roman Catholic prelate, born in County Mayo, Ireland, and was brought as a child to Utica, N. Y. He was graduated (1861) from St. Charles' College, Md. He studied theology at St. Mary's Seminary, Baltimore, and was ordained in 1864. The same year he was appointed an assistant at St. John's Church, Albany, N. Y., of which he became pastor in 1874, holding that position until consecrated bishop of Albany in 1894. He was also vicar-general of the diocese in 1887-94.

**Burke, THOMAS NICHOLAS** (1830-83), popularly known as 'Father Tom,' Irish Roman Catholic preacher, was born in Galway. He was ordained a priest in 1856, and founded the Dominican house of study at Tallaght, near Dublin. He was frequently called to Rome to preach during Lent, on account of his natural gift of eloquence. He visited the United States in 1871-3, and by his discourses in that country and Canada raised large sums of money for public charities. Interest in his visit was enhanced by a public controversy with the historian Froude, who was lecturing in the United States at the time, in regard to certain of Froude's statements concerning the Irish race. His lectures in reply to Froude were published as *English Misrule in Ireland*. Consult Fitzpatrick's *Life*.

**Burke, WILLIAM** (d. 1798), born in London, was a kinsman of Edmund Burke (q. v.), whom he assisted with the *Account of the European Settlements in America* (1757), and in 1759 came into notice by his *Remarks on the Letter to Two Great Men*—a reply to Lord Bath's letter to Pitt and the Duke of Newcastle. Attempts have been made to prove his authorship of the letters of Junius.

**Burke, WILLIAM** (1792-1829), the accomplice of William Hare

in a series of infamous murders, was born in Orrery, County Cork, Ireland. In 1827 he lived in Tanner's Close, Edinburgh, in a lodging house kept by Hare. The two men used to inveigle wayfarers into their house, make them drunk, and then suffocate them in such a manner as to leave no sign of violence (this has subsequently been known as burking), with the object of selling their bodies for dissection. Burke and Hare were arrested; the latter turned king's evidence, and Burke was executed.

**Burkett, ELMER JACOB** (1867), American legislator, was born in Mills county, Ia. He was graduated at Tabor (Ia.) College in 1890; studied law at the State University of Nebraska; and was admitted to the bar at Lincoln, Neb., in 1893. He was a member of the State legislature in 1896-8, and of Congress in 1899-1905; and was U. S. Senator from Nebraska for the term 1905-11.

**Burleigh, BENNET** (d. 1914), British war correspondent, was born in Glasgow. He fought in the American Civil War, and was twice sentenced to death. After 1882 he was on the staff of the London *Daily Telegraph*. He was war correspondent during the first Egyptian War (1882), the French campaign in Madagascar, the desert campaign from Korti to Metammah, the Ashanti, Atbara, and Omdurman expeditions, the Boer War, the Russo-Japanese War, and the Italian campaign in Tripoli (1911-12). He wrote accounts of his campaigns, and *The Empire of the East* (1905).

**Burleigh, or BURGHLEY, WILLIAM CECIL, LORD** (1520-98), English statesman, was born in Bourne, Lincolnshire, the son of a wealthy squire. In 1547 the Protector Somerset made him master of requests, and subsequently his secretary; but when Somerset fell, Burleigh was imprisoned for two months in the Tower. His merits were so conspicuous, however, that in 1550 he was appointed secretary of state, and shortly afterward knighted. His domestic policy was salutary and enlightened. He assented to, without approving, Northumberland's scheme for altering the succession; and when Mary came to the throne he conformed to the Catholic religion, and became friendly with Cardinal Pole, although remaining at heart a Protestant. Consequently, on the accession of Queen Elizabeth, he was appointed chief secretary of state; and from 1558 till his death he practically guided the destinies

of England. It was largely owing to Burleigh's sagacity, combined with the talents of the great soldiers and admirals who carried out his policy, that the age of Elizabeth became so illustrious in history.

In 1560 Burleigh went to Scotland as commissioner to end the war. His foreign policy was anti-Spanish. He desired to form a Protestant confederacy against the Catholic powers. The execution of Mary Queen of Scots he ceaselessly advised, as absolutely necessary for the safety of his own sovereign and country. He was created Baron Burghley in 1571, and Lord High Treasurer (1572), which post he held until his death. He was buried in Westminster Abbey. From his eldest son came the Exeter branch of the Cecils, and from his second son the Salisbury branch. Consult *Burghley Papers*, edited by Murdin; *Macaulay's Essay*; *Nare's Memoirs of Lord Burghley*; *M. A. S. Hume's The Great Lord Burghley*; *A. Jesopp's William Cecil, Lord Burghley* (1904).

**Burleson, ALBERT SIDNEY** (1863), American Cabinet officer, was born in San Marcos, Tex. He was graduated at the University of Texas in 1884, and was admitted to the bar in 1885. He acted as assistant district attorney of Austin (1885-90), and as attorney for the 26th judicial district of Texas (1891-8). He was a member of the House of Representatives from the 56th to the 62d Congress (1899-1913), where he rendered conspicuous service as a member of the Committees on Agriculture and Appropriations. He was elected to the 63d Congress in November, 1912. In March, 1913, he was appointed Postmaster-General in President Wilson's Cabinet.

**Burlesque** (from Italian *burla*, 'mockery,' 'jesting'), a composition treated in a way to excite laughter. Its favorite method is to set forth its subject in a ludicrous light, by emphasizing its incongruities, its oddities, its inconsistencies; but it differs from satire in that it is neither inspired nor shaped by moral condemnation or *sava indignatio*. Burlesque is closely allied with *burletta*, a comic opera interspersed with songs, corresponding with the entertainment styled in France a *vaudeville*. Although pure burlesque originated in the time of Aristophanes, modern burlesque, so called, was an Italian invention—its two greatest exponents, Berni and Gozzi. The best of English burlesques, far behind those of Italy,

are Chaucer's *Rime of Sir Thopas*, Beaumont and Fletcher's *Knight of the Burning Pestle*, Buckingham's clever ridicule of the contemporary play-writing entitled *The Rehearsal*, Smith's *Rejected Addresses*, a burlesque on the opening of Drury Lane Theatre, supposed to be written by famous writers of the time, and Butler's *Hudibras*. Scarron is perhaps the most distinguished French writer in this vein, and Cervantes, of Spain, is the author of what is probably the best burlesque ever written, *Don Quixote*. There is a distinct note of burlesque in the comic operas of W. S. Gilbert. Burnand's burlesques (*Strapmore*, *The Colonel*, *Black-eyed Susan*) also deserve mention. Parody (q. v.) is a form of burlesque. Consult Hamilton's excellent collection of *Parodies*; Adam's *Book of Burlesques*; and *Burlesque Plays and Poems*, in Morley's 'Universal Library.'

**Burlingame**, ANSON (1820-70), American diplomatist, was born in New Berlin, N. Y. He was graduated from the University of Michigan (1841) and from Harvard Law School (1846); practised law in Boston; was elected to the Massachusetts Senate in 1852, and was a representative in Congress (1855-61), first as an American or 'Know-Nothing' and later as a Republican. He was sent by Abraham Lincoln to China as U. S. minister (1861); and on his return (1867) Prince Kung, regent of the empire, requested him to act as special Chinese envoy to the United States and the great European powers. His success was marked by the treaty (1868) with the United States in which China first officially accepted the principles of international law and by similar treaties with Great Britain, Prussia, Denmark, Sweden, and Holland. He died in St. Petersburg, whither he had gone to negotiate a treaty between China and Russia.

**Burlington**, city, Iowa, county seat of Des Moines county, is situated on the Mississippi River, and on the Chicago, Burlington, and Quincy, the Chicago, Rock Island, and Pacific, the Muscatine, Burlington, and Southern, and the Toledo, Peoria, and Western Railroads; 166 miles northwest of St. Louis. The residential section of the city is built on high bluffs overlooking the river, which is spanned at this point by a railroad bridge of the Chicago, Burlington, and Quincy, and by an automobile bridge. Crapo Park, of nearly 100 acres in the southern part of the city, is famed for its beauty. Burlington has a courthouse, library, opera house, hospitals, Y. M.

C. A., Y. W. C. A., and College of Commerce, and is the seat of Burlington Institute. It is a prosperous wholesale market, and manufactures furniture, mattresses, brooms, screens, tools, soap, flour, caskets, and Corliss engines, and boilers. It has also the car and engine shops of the Chicago, Burlington and Quincy Railroad. It has an important river commerce. Government is vested in a commission of five members headed by a mayor. Pop. (1910) 24,324; (1920) 24,057.

**Burlington**, city, Kansas, county seat of Coffey county, is situated on the Neosho River, and on the Atchison, Topeka, and Santa Fé, and the Missouri, Kansas, and Texas Railroads; 88 miles southwest of Kansas City, Kansas. It is in an agricultural region, rich also in natural gas. There are flour mills, grain elevators, cigar and carriage factories, and tile works. Pop. (1910) 2,180; (1920) 2,236.

**Burlington**, city and port of entry, Burlington county, New Jersey, is situated on the Delaware River, nearly opposite Bristol, Pa., and on the Pennsylvania Railroad; 19 miles northeast of Philadelphia. The city has a public library and opera house and is the seat of St. Mary's Hall for girls, the oldest church school for girls in America. Dairying and market gardening are extensively carried on and there are manufactures of canned goods, boots and shoes, stoves, carriages, structural iron, silk, and carbon paper. Pop. (1910) 8,336; (1920) 9,049.

**Burlington**, city, Alamance county, North Carolina, on the Southern Railroad; 21 miles east of Greensboro. Cotton, coffins, hosiery, overalls, and steel bridges are manufactured. Pop. (1910) 4,808; (1920) 5,952.

**Burlington**, city and port of entry, Vermont, county seat of Chittenden county and largest city in the State, is situated on the eastern shore of Lake Champlain at its widest point, and on the Central Vermont and the Rutland Railroads; 35 miles northwest of Montpelier and 300 miles north of New York. The residential section occupies a hill overlooking the lake and is well laid out with broad, tree-shaded streets. Ethan Allen Park, north of the city, has a fine tower erected in honor of Col. Ethan Allen (q. v.) and a well equipped playground. Other parks are City Hall, College, and Battery parks, the last named containing a statue of Gen. Wm. Wells. Green Mount Cemetery, overlooking the Winooski Valley, contains the grave of Ethan Allen with an imposing monument.

Important buildings are the

Fletcher Library, post office, courthouse, Masonic Temple, Roman Catholic Cathedral, and Edmund's High School. Burlington is the seat of the University of Vermont and State Agricultural College, whose buildings occupy a commanding site overlooking the town. Among the finest of these are the Billings Library, Williams Science Hall, and the Medical Building, Bishop Hopkins Hall, an Episcopal School for girls, is about a mile from the city. Charitable and benevolent institutions are the Providence Orphan Asylum (R. C.), Howard Mission, Home for Destitute Children, Home for Friendless Women, Home for Aged Women, Fanny Allen Hospital, and Mary Fletcher Hospital.

Burlington has a good harbor and is connected by steamship line with other lake ports. It has a large trade in lumber, there are marble and building stone quarries near by, and cotton and woollen goods, patent medicine, furniture, spools and bobbins, confectionery, blinds, refrigerators, brushes, paper boxes, toys, and children's clothes, are manufactured. The city was settled in 1763, was a garrisoned post during the war of 1812, and was chartered as a city in 1865. Pop. (1910) 20,468; (1920) 22,779.

**Burlington**, city, Racine county, Wisconsin, is situated on the Fox River, and on the Chicago, Milwaukee, and St. Paul, and the Minneapolis, St. Paul, and Sault Ste. Marie Railroads; 30 miles southwest of Milwaukee. It is in a rich dairying region and includes among its manufactures condensed milk, woollen goods, bricks and tiles, blankets, and baskets. Pop. (1910) 3,212; (1920) 3,626.

**Burlington**, ENGLAND. See BRIDLINGTON.

**Burlington House**, an old mansion situated in Piccadilly, London. The original building was erected about 1695 by Richard, Lord Burlington, and was purchased, with its gardens, by the Government in 1854. New buildings were erected in the garden and a top story and façade were added to the old building. In 1866 the Royal Academy of Arts leased quarters there, and in 1868-9 a block of exhibition galleries was added. In 1872 New Burlington House, the home of the Royal, Geological, Chemical, Astronomical, and Linnæan Societies, and the Society of Antiquaries, was completed.

**Burlus**, boor'lus, LAKE, a shallow lake in the Nile delta, east of Rosetta, Egypt; it is 40 miles long by 16 miles wide, and abounds in fish.

**Bur'ma**, a province of British India, stretching along the eastern side of the Bay of Bengal between 10° and 28° N. lat. It is bounded on the north by Assam and China; on the east by Yunnan and Siam; on the south by Siam; and on the west by the Bay of Bengal, except at the northwest corner, where it touches the petty states of Tipperah and Manipur. The total area of the province, including the native states, is 238,700 square miles, of which Burma proper occupies 168,573 square miles. It is 1,200 miles in length and 575 miles in width at its broadest point. See map of INDIA.

**Physical Features.**—The province falls into three natural divisions: Arakan, a strip of country bordering the Bay, from Cape Negrais to the Bengal Presidency, barren and hilly in the north, but rich and fertile in the south and west; the Irawadi basin forming the main division and consisting of hills and plateaus in the north, lowlands in the centre, and fertile plains in the south; the old province of Tenasserim, a narrow strip of land along the Bay of Bengal, between it and Siam, mountainous and well watered. Burma is encircled on three sides by mountain ranges; the Arakan Yomas, on the west extend northward, joining the Chin and Naga hills; the Pegu Yomas, much lower, follow a parallel course on the east; while in the south the Tenasserim hills cover practically all of the region of that name. Liklang, the highest point of the Arakan Yomas, reaches nearly 10,000 feet. The most important river is the Irawadi, nearly 1,000 miles long and navigable as far as Bhamo, 900 miles from the sea. The only other large stream is the Salwin, which flows into the Gulf of Martaban.

The climate for at least half the year is humid and depressing, due to the abundant rainfall. That of Upper Burma is typically sub-tropical, that of Lower Burma tropical. There is a wet season from June to September and a dry one from October to May. Much of the province is clothed with dense forests containing fine dye and cabinet woods, teak wood being a particularly valuable product. Palm, cocoanut, and bamboo trees abound; bananas, pineapples, and many garden vegetables are grown. The rivers teem with fish, crocodiles, and turtles, and aquatic birds are numerous. The elephant, rhinoceros, tiger, bear, leopard, and many species of deer haunt the jungles.

The extent of the mineral wealth of Burma is unknown.

Petroleum is found along the banks of the Irawadi, the annual yield being nearly 300,000,000 gallons. There are important amber deposits and marble quarries, and from the ruby mines, situated about 60 or 70 miles from Mandalay, some of the finest specimens of these precious stones have been taken. Gold, silver, and coal have been discovered in the country towards the northeast, but are not yet exploited. Salt, tin, iron, lead, copper, and antimony also occur.

**Industry and Trade.**—Nearly three fourths of the population of Burma are engaged in agriculture. In 1918 over 15,000,000 acres were under cultivation, of which much the greatest part was devoted to rice. It is the staple food of the inhabitants and large quantities of it are exported. Other important crops are millet, sessamum, wheat, cotton, tobacco, and tea. Except for the rice mills, nearly all the manufactures of Burma are carried on in the homes. Among them are cotton and silk weaving, shawl and carpet making, wood carving, cheroot rolling, and pottery making.

Foreign trade is chiefly with Great Britain. Exports include rice, teakwood, petroleum, cotton, and precious stones, and in 1919 amounted to about \$83,000,000. Imports are cotton, silk and woollen goods, sugar, and metal products, amounting in 1919 to about \$35,000,000. Akyab and Rangoon are the chief seaports. Internal communication is carried on chiefly by water. The principal railway traverses the province from Rangoon to Myitkyina on the Irawadi and has several branches. Another road runs from Rangoon to Prome.

**Population, Religion and Education.**—The population in 1911 was 12,115,217, consisting of Burmese, Karens, Arakanese, Kachins, Talaings, Taungthus, Shans, and Chins. The Burmese are Buddhists. At Mandalay there is a small community of Mohammedans. Except among the hill tribes, little success has attended the efforts of Christian missionaries.

Burma stands first among the Indian provinces in its proportion of literates. There are many monastic schools, several government schools, and a college at Rangoon. A conservative, light-hearted race, callous of life and jealous of their faith, the people are ordinarily of a kindly disposition. Under provocation they are apt to become vindictive, and to resort to acts of revolting cruelty.

**Government.**—Burma is under the political control of the

government of India, and is ruled by a lieutenant-governor, appointed by the Governor-General of India, with the approval of the king. For administrative purposes the province is divided into two parts—Lower Burma (81,200 sq. mi.; capital, Rangoon) and Upper Burma (nearly 87,500 sq. mi.; capital, Mandalay). The native states comprise about 68,000 square miles. Though no part of Burma can be said to be under native rule, the petty chieftains in the Shan States and in the Chin, Arakan, and Kachin hills have considerable influence over their sometimes turbulent followers.

**History.**—The earliest European connection with Burma was in the sixteenth century, when the Portuguese concluded a treaty (1519) with the King of Pegu, and the Dutch secured possession of the island of Negrais. About the middle of the century owing to a dispute between the Burmese governor of Pegu and the Dutch, all European merchants were expelled. British merchants returned, however, and settled in Pegu, Negrais, and Basseni. In 1795 the British found themselves called upon to repel an invasion of Bengal by Burmese troops, and this led to the first Burmese War, which began in 1824 and lasted two years. Peace was unbroken until 1852, when political and commercial complications again drove the British into war, which, however, terminated in less than twelve months. As a result the whole of the territory now known as Lower Burma passed into the possession of the crown. Upper Burma maintained its independence until January, 1886, when, gross misrule and barbarous cruelties having led to war (1885) with the Indian government, Thebaw was deposed and his kingdom annexed.

**Burma: Language and Literature.** Burmese, an isolating language, is composed of mere roots incapable of composition or inflection, and altered by affix and prefix into different parts of speech. It prevails throughout Burma, except in coastal villages where Talaing is taught in Buddhist monasteries. The alphabet, consisting of ten vowels and thirty-two consonants, is a circular variety of the ancient Deva Nagri, introduced from Ceylon (A.D. 450) by the Buddhist missionary Buddhagosa ('Voice of Buddha'). Buddhist doctrine, at first oral, was subsequently written in Pali, the language of the sacred books. Burmese is akin to the Tibetan tongue, and Talaing to Monda or Kól, the dialect of the aboriginal Indian

tribes of the north-east—the former being soft and labial, as Italian; the latter harsh and guttural, as Arabic. The order of words in Talaing is natural, in Burmese inverted. Thus Csoma de Koros, in his Tibetan grammar, gives the order of words in the phrase 'in a book seen by me' as 'me by seen book a in.' Burmese is monosyllabic, except in words of Pali origin, and is written from left to right, without any division between the words. The symbol '5' is used before beginning an epistle, alluding to the five commandments (*Pegnytseng*), supposed to be borne in mind by the writer. Many words of similar spelling and slightly different pronunciation render the language good for punning, but difficult of acquisition. Sex is indicated by an affix, and vowels combined with consonants by symbols. In combining a noun and a numeral the genus is added. Thus, 'two oxen' is expressed, 'oxen two animals.' Burmese literature is divided into sacred and secular, the former written in Pali, the latter in Burmese. The two great metaphysical works of Indian origin are the *Bee-da-gat thoon-bon*, or *Piakatayan* (The Three Baskets), and the *Baideng*. The former contains the three great divisions of the Buddhist scriptures, and is voluminous, being made up of *Thuttan* (The Rule), sermons of Gautama; *Winiya* (Discipline), rules for the priesthood; and *Abhidhamma* (Pre-eminent Truths), expressed in short dogmatic sayings. The *Baideng*, in four parts, one of which has been lost, treats of mathematics and astronomy, or rather astrology. The secular writings comprise chronological history, medicine, topography, ballads, and romances purer in sentiment than those of India. The drama, a national institution, is immensely popular. The dialogue is chiefly recitative, and solos, choruses, and dancing are interspersed, the music being sweet and attractive. Burmese war-boat songs are stirring and lively, the steersman (*pai-neng*) delivering the recitative, and the crew joining in the refrain, to which their oars keep time. Books, composed of leaves of the Palmyra palm joined at the ends by string, are bound between wooden covers, gilt, and lacquered in colored devices. The letters are engraved with an iron stylus, and rendered visible by means of a mixture of charcoal and fragrant gum, the latter acting as a preservative against insects. See Fytche's *Burmah, Past and Present* (1878); Wheeler's *History of India and Burma* (1880); *The British Burma Gazetteer* (1880); Mason's *Burma: its People and*

*Productions* (1882); Phayre's *History of Burmah* (1883); Murray's *Handbook for India and Burma* (1894); Forchhammer's *Notes on the Languages and Dialects of Burma* (1884); Slack's *Manual of Burma* (1888); *Anglo-Burmese Grammatical Reader* (1889); St. John's *Burmese Reader* (1894); Judson's *English and Burmese Dictionary* (1894).

**Burmans**, a learned Dutch family, of whom the most distinguished members were FRANZ BURMANN (1628-79), theologian, born at Leyden. He wrote several commentaries on books of the Old Testament. His son, PETER BURMANN THE ELDER (1668-1741), a famous member of the Dutch philological school, was born at Utrecht. He became professor of rhetoric and history at Utrecht in 1696, later of Greek literature and politics, and in 1715 professor of rhetoric at Leyden. His works, chiefly editions of the Latin classics, include *De Vectigalibus Populi Romani* (1694; new ed. 1737), *Sylloge Epistolarum* (1727), and editions of Horace (1699), Petronius (1709), Velleius Paterculus (1719) Quintilian (1720), Justin (1722), Valerius Flaccus (1724), Ovid (1727), *Poetæ Minores* (1731), Suetonius (1736), Lucan (1740).

**Burmeister**, RICHARD (1860), German-American pianist and composer, was born in Hamburg, Germany, and studied under Liszt, 1881-4. From 1883 to 1885 he was also occupied in giving concerts in various parts of Europe, and in the latter year was selected to take charge of the department of the piano at the Peabody Institute, Baltimore, Md. He removed to New York (1897), where he was director of the Scharwenka Conservatory for two years, and he gave concerts generally in the U. S. until his appointment (1903), as chief of the department of the piano at the Royal Conservatory of Music at Dresden. His compositions were principally for the piano, but he composed also for the voice and orchestra.

**Burnaby**, FREDERICK GUSTAVUS (1842-85), English cavalry officer and traveller. A man of enormous physical strength, he was especially distinguished by his extraordinary intrepidity and love of perilous adventure and of battle. His unusual knowledge of languages helped him in many adventurous journeys. He travelled in equatorial and South America; acted as *Times* correspondent with the Carlist forces in 1874; in the following year followed Gordon to the Sudan; attempting, that winter, to reach Central Asia, he 'rode to Khiva,' where he was stopped by a wire from the Duke of Cambridge. In 1876 he went 'on horseback through

Asia Minor' to study Turkish administration; commanded, in 1877, a Turkish brigade in the war with Russia—always, in Burnaby's view, Britain's chief enemy; engaged in adventurous aeronautic expeditions, one of which, in 1882, was 'a ride across the Channel'; was wounded at El Teb (1884) under Graham; and in 1885 met his death from an Arab spear at Abu Klea, where he fought, under Sir Herbert Stewart, as a volunteer. See *Ride to Khiva* (1876); *On Horseback through Asia Minor* (1877); *A Ride across the Channel* (1882); also Ware and Mann's *Life* (1885).

**Burnand**, SIR FRANCIS COWLEY (b. 1836), English dramatic author and editor of *Punch*, from 1880 until 1906, when he resigned. He is the author of nearly one hundred dramatic pieces, chiefly burlesques and comedies. 'Mokeanna,' his first contribution to *Punch* (1868), was followed by the 'Happy Thoughts' series, containing many amusing hits on leading novelists—such as 'Strapmore,' a parody on Ouida's *Strathmore*, and issued since in book form. Among his best-known dramatic productions are *Black-eyed Susan*, *The Colonel*, and the libretto of Sullivan's opera *The Chieftain* (1894). He was knighted in 1903. In that same year appeared his *Records and Reminiscences*.

**Burne-Jones**, SIR EDWARD, BART. (1833-98), British artist, of Welsh descent, was born in Birmingham. A fine classical scholar, he went to Oxford (1853) to study for the church. A sudden awakening of his genius came from his friendship with his fellow-undergraduate William Morris, and with Rossetti. Thenceforth he devoted himself absolutely to art. At first he studied (1856) under Rossetti, and worked with him on the walls of the Oxford Union. Together with Rossetti and Morris he has profoundly affected the renaissance in England of decorative art proper and the artistic crafts. He designed stained-glass windows for churches in England, America, India, Germany, France; and the mosaic decorations in the apse of the American Church, Rome, are his. The earlier paintings show the influence of Rossetti; but individuality was asserted in *The Merciful Knight* (1864). During a visit to Italy in 1862 with Ruskin, Burne-Jones learnt much from Botticelli and something from Mantegna. His draughtsmanship is fine and clear; his composition shows indefatigable scholarship and exhaustless fancy; his typical figures of brooding melancholy symbolize the underlying truth of all myths—the struggle of the human soul

with destiny; his color is rich and suggestive, his finish elaborate and expressive. An associate (1864) of the Royal Society of Painters in Water Colors, he resigned (1870) owing to a misunderstanding, and later was re-elected. Down to about 1875 he worked principally in water colors, but after that date most of his pictures were done in oils. In 1885 he was elected A.R.A., but exhibited one picture only, and resigned in 1893. He was created baronet in 1894. Among his paintings are *The Mirror of Venus*, *Pan and Psyche*, *The Beguiling of Merlin* (1877), *Perseus and Andromeda*, *The Days of Creation* (1877), *Love Among the Ruins*, and *The Briar Rose* (1890). The Tate Gallery possess *King Cophetua and the Beggar Maid* (1884); Manchester, *The Sibylla Delphica*; Liverpool, *Sponsa di Libano*; Birmingham, *The Star of Bethlehem* (1891), thirty cartoons for windows, and several studies and sketches. In 1903 were published a series of twenty-five designs by him entitled *The Beginning of the World*. See 'Sir Edward Burne-Jones,' by Julia Cartwright, in *Art Annual* (1894); Malcolm Bell's *Burne-Jones: Life and Work* (new ed. 1901); Ruskin's *The Art of England* (1884) and *The Mythic Art* (1883).

**Burnell, ARTHUR COKE** (1840-82), English Sanskrit scholar, born at St. Briavels, Gloucestershire. He was in the Indian civil service from 1857-68, and afterward became an authority on Sanskrit and S. Indian dialects, his principal work being *Classified Index to the Sanskrit MSS. in the Palace at Tanjore* (1880). He has also published *Catalogue of a Collection of Sanskrit MSS.* (1869), *The Law of Partition and Succession* (1875), *Brāhmanas of Sāmaveda* (1873-8), *Handbook of S. Indian Palaeography* (1874), *The Aindra School of Sanskrit Grammarians* (1875). A translation of the *Ordinances of Manu* appeared two years after his death.

**Burnes, SIR ALEXANDER** (1805-41), traveller in Asia, a native of Montrose, Scotland, entered the Indian army in 1821. His knowledge of languages led to his being employed as interpreter, then entrusted with special missions by the Indian government. In 1832-3 he explored, in disguise, Afghanistan, Bokhara, and Persia, and published *Travels into Bokhara* (1834), which proved very popular. In 1839 he was appointed political resident in Kabul, but two years later fell a victim to the Afghan mob.

**Burnet.** Perennial herbs (*Sanguisorba*) of the rose family. They have pinnate, serrate leaves. One (*S. Sanguisorba*), a salad plant of the Old World, has been

naturalized in dry soil, and has globose heads of apetalous, greenish flowers. Its foliage has the taste of cucumber, and the leaves were sometimes used to flavor drinks. The American burnet (*S. Canadensis*), is a striking plant of swamps and meadows. In late summer it shoots up tall stems, often 6 ft. high, bearing long, cylindrical spikes, crowded with small flowers, which, although without petals, are made conspicuous by the much exerted stamens, that have white filaments.

**Burnet, GILBERT** (1643-1715), bishop of Salisbury, was the youngest son of Robert Burnet of Crimond, Aberdeenshire, and was born in Edinburgh. In 1665 he was ordained by the bishop of Edinburgh, and appointed minister of the parish of Saltoun in East Lothian, where he remained until 1669, when he was elected to the chair of divinity in the University of Glasgow. In 1672 he published his *Vindication of the Authority, Constitution, and Laws of the Church and State of Scotland*. The first two volumes of his *History of the Reformation of the Church of England* appeared in 1679-81, but the third volume was only published the year before his death. Throughout his life Burnet exercised a great influence on British politics. His fearless criticism of Charles II. and his championship of Lord William Russell so aroused the displeasure of the king that, with unkingly spite, he deprived Burnet of both his chaplaincy and his lectureship. The revolution of 1688 had no stronger supporter than Bishop Burnet, who at length accepted the episcopal dignity under William of Orange, being consecrated bishop of Salisbury in 1689. His predilections were strongly Whig and anti-Catholic. In 1701 he was chairman of the committee for the final consideration of the Bill of Rights. He supported the Act of Toleration, and opposed the 'High Church and Sacheverell' party; but his unvarying loyalty to the Church of England was nowhere more practically manifested than in his organization (1704) of Queen Anne's bounty. He was also a warm supporter of the policy of carrying out a legislative union between England and Scotland. His most famous achievement, *Bishop Burnet's History of his Own Time*, a history of great and lasting value, was not published until 1724-34, and even then not without mutilations; the first complete version was issued by Dr. Routh at Oxford, in 6 vols., in 1823 (newer ed. 1897). See the various editions of his *Histories*, the *Lives* by Le Clerc and Flaxman, Wyon's *Reign of Queen*

*Anne*, and Guizot's *Notice sur Burnet*—a masterly criticism.

**Burnet, JACOB** (1770-1853), American jurist, was born in Newark, N. J., the son of a Revolutionary patriot, and graduated (1791) at Princeton. He studied law with Judge Boudinot, was admitted to the New Jersey bar in 1796, and removed the same year to Ohio, where he took a leading part in the development of Cincinnati, then a new town. He was a member of the territorial legislative council until the state government was organized, and served in the Ohio Legislature. From 1821 to 1828 he was a judge of the Supreme Court of Ohio, and he was U.S. Senator from that state, 1828-31. Judge Burnet took an active interest in the organization of Cincinnati educational institutions; and in 1821, through his instrumentality, Congress passed a law relieving the western and southwestern settlers from back interest on their enormous debt to the U. S. government, and permitting them to relinquish as much of the land entered as they were unable to pay for. He published *Notes on the Early Settlement of the Northwestern Territory* (1847).

**Burnet, JOHN** (1784-1868), engraver and painter, was born at Musselburgh, near Edinburgh. He went to London (1806), where he was welcomed by Wilkie, illustrated the *Novelist*, and executed large plates of Wilkie's works—e.g. *The Blind Fiddler* (1806-10). He painted many landscapes; his *Greenwich Pensioners* is well known. Among his publications are *A Treatise on Painting* (1827), *Rembrandt and his Works* (1849), and, with Allan Cunningham, *Life and Works of Turner* (1852).

**Burnet, THOMAS** (?1635-1715), master of Charterhouse, is remembered for two books, eloquent and fine in style, but fanciful in matter—*Telluris Theoria Sacra* (1681-9), an attempt to account for the shape of the earth as a gigantic egg whose shell was crushed at the deluge; and *Archæologia Philosophica* (1692), an attempt to reconcile this theory with Gen. i. See *Life* by Heathcote, prefixed to 7th ed. of *Theoria* (1759).

**Burnett, FRANCES HODGSON** (1849), English novelist, spent her early life in Manchester, and there gained her knowledge of Lancashire scenes and dialect. In 1865 her parent removed to the United States, and Miss Hodgson began to write stories for the American magazines. She lived in Tenn. previous to her marriage to Dr. S. M. Burnett, an oculist of Washington, but since then has lived in Washing-

ton and New York, and has also spent several years in Europe. She was divorced from Dr. Burnett in 1898 and married Stephen Townsend in 1900. She was made famous by her story 'That Lass o' Lowrie's,' published in *Scribners'*, and then separately (1877). It was followed by *Harworth's* (1879), and *A Fair Barbarian* (1881). *Little Lord Fauntleroy* appeared in 1886, and both as novel and as drama achieved exceptional success. Several of her stories have been successfully dramatized and presented in New York and other cities of the U. S.; among the number are *Esmeralda*, written in 1881 with W. H. Gillette, and *A Lady of Quality* (pub. 1896), with the help of Stephen Townsend. Other novels are *His Grace of Osmonde* (1897), and *The Making of a Marchioness* (1901).

**Burnett, JAMES.** See MONBODDO.

**Burnett, PETER HARDEMAN** (1807-95), first civil governor of Cal., was born in Nashville, Tenn., and worked as a trader and lawyer in Tenn. and Mo. until 1843, when he removed to Ore., where he served as legislator and judge, helping also to organize the territorial government. In 1848 he took part in the rush to the Cal. gold mines, and the following year assumed charge of the Sutter estate at New Helvetia, then much involved. He was an earnest advocate of statehood for Cal., accomplished in 1850, and was the new state's first governor, resigning, however, the following year to resume the practice of the law. He was a justice of the Supreme Court of Cal. (1857-8), and was president of the bank afterward known as the Pacific Bank of San Francisco (1863-80), retiring with a fortune. He published, among other books, *Recollections of an Old Pioneer* (1878), a valuable record of early days in California.

**Burney, CHARLES** (1726-1814), English musician, was born at Shrewsbury, and became a pupil (1744-7) of Dr. Arne; organist at Lynn (1751-60), and at Chelsea Hospital (1783-1814). Wrote a *History of Music* (1776-89).

**Burney, FRANCES, MME. D'ARBLAY** (1752-1840), English novelist, was born at King's Lynn, where her father, Dr. Charles Burney, was then organist. She accompanied her father to London in 1760, and at his house met the most cultured society of the day, including Johnson, Garrick, and the Thrales. *Evelina*, or *the History of a Young Lady's Entrance into the World*, was published anonymously in 1778. It achieved an immediate success. *Cecilia*, or *the Memoirs*

*of an Heiress*, followed in 1782, with even greater éclat. In 1786 she became second keeper of the robes to the queen; but her health broke down under the restraint of court life, and she retired on a pension in 1791. Two years later she married General D'Arblay, a French refugee. In 1795 she produced *Edwy and Elgiva*, a tragedy, which proved a failure. *Camilla*, or *a Picture of Youth*, her third novel, appeared in 1796, and *The Wanderer*, or *Female Difficulties*, her last, in 1814. Much of her married life was spent in France (1802-12); thereafter she lived chiefly in England. Her *Diary* (published with her letters, 5 vols., in 1842 and 2 further vols. in 1846) form an almost continuous narrative from 1778 to 1800, and, in its brilliant sketches of court life and society, exhibits at their best her signal powers of satire and observation. The simplicity of theme which marked *Evelina* gave way in *Cecilia* to a more ambitious but less successful plot; and the fresh style of her earliest novel deteriorated more and more, till in the *Memoirs of Dr. Burney* (1832) all is stilted rhetoric and pompous sentiment. In 1890 Mrs. Ellis edited Fanny Burney's *Early Diary, 1768-78*, 2 vols. See Boswell's *Life of Johnson* (ed. Birkbeck Hill, 1886); Macaulay's *Essay on Madame D'Arblay*; *Evelina* and *Cecilia* (1881 and 1882), L. B. Seeley's *Fanny Burney and her Friends* (1895).

**Burnham, HENRY EBEN** (1844), American legislator; was born at Dunbarton, N. H.; graduated at Dartmouth in 1865; admitted to the bar in 1868; was judge of probate of Hillsboro co. in 1876-79; elected U. S. Senator (Rep.) for the term 1901-13.

**Burnham, SHERBURNE WESLEY** (1838), American astronomer, was born at Thetford, Vt., studied stenography, worked as a shorthand reporter in New York and at New Orleans, and removed to Chicago (1867), where he followed the same occupation for twenty years. As early as 1860 he procured a small telescope in London and began to educate himself as an observer. In 1869 he obtained a Clark six-inch telescope, and, favored with exceptionally clear vision, initiated his discoveries of double stars. In 1894 he was awarded the gold medal of the Royal Astronomical Society of London for his discoveries up to that year, numbering 1,274. Mr. Burnham was one of the astronomers of Lick Observatory from 1888 to 1892, resigning in the latter year. In 1897 he was associated with the Yerkes Observatory, and subsequently became professor of practical as-

tronomy at the University of Chicago.

**Burnham Beeches**, a picturesque part of an ancient forest in Buckinghamshire, England. In 1900 some fine patches of the ancient forest were purchased by the corporation of London for a public recreation ground. Burnham Beeches was a favorite resort of the poet Gray. Dropmore, a seat 2 m. N.W. of Burnham village, is noted for a magnificent avenue of cedars of Lebanon, both planted by Lord Grenville. See Sheahan's *Hist. of Buckinghamshire*, p. 815.

**Burnie**, a port on the shores of Emu Bay, Tasmania, the terminus of the Western Ry., connecting with Launceston and Hobart. Pop. (1901) of tn. 1,548; of dist. 7,000.

**Burning.** See COMBUSTION.

**Burning Bush**, several deciduous and evergreen ornamental shrubs of the genus *Euonymus* and order Celastrineæ, with scarlet fruits.

**Burnley**, mrkt. tn., munic., par., and co. bor., E. Lancashire, England, 21 m. E. of Preston. Ac. of par. bor. 3,981; of munic. bor. 4,005. The public buildings include Victoria Hospital, mechanics' institution and school of science, and technical school. There are fine public parks and numerous recreation grounds. Cotton spinning and weaving, iron-founding, the making of weaving machinery, coal-mining, and stone and slate quarrying are among the chief industries of town and neighborhood. The Leeds and Liverpool and other canals facilitate transport. Pop. (1911) of munic. bor. 106,337; of par. bor. 104,331.

**Burnouf.** (1.) JEAN LOUIS (1775-1844), French philologist, born at Urville, became assistant professor of rhetoric at the Lycée Charlemagne in Paris, and was soon afterwards presented to the chair of rhetoric at the Lycée Imperial, which he held till 1826. He was professor of Latin rhetoric at the Collège de France and president of the Ecole Normale (1811-22). From 1830-6 Burnouf was inspector-general of studies, and on his retirement was made librarian of the university. The *Méthode pour Etudier la Langue Grecque* (1814) and *Méthode pour Etudier la Langue Latine* (1840) are his most important works. (2.) His son EUGÈNE (1801-52), born at Paris, devoted himself to the study of Oriental languages; in 1826 published an *Essai sur le Pali*, and from that date was a constant contributor to the *Journal Asiatique* and the *Journal des Savants*. He is remembered for his deciphering of the Zend mss. brought to Paris by Anquetil Duperron, his litho-

graphed edition of the *Vendidad-Sadé* (1829-43), and his *Commentaire sur le Yacna* (1833-4), which first made Zoroastrianism known to the West. Other works include an edition of the *Bhâgavata Purâna* (Sans. and Fr., 1840), *Introduction à l'Histoire du Bouddhisme* (1845), and *Lotus de la Bonne Loi* (pub. posthumously, 1852). In 1832 he succeeded Chézy as professor of Sanskrit in the Collège de France, and the same year was elected a member of the Académie des Inscriptions. See *Lives* by Barthélemy Saint-Hilaire (1892) and Berger (1893). (3.) EMILE LOUIS (1821), Orientalist, cousin of the preceding, published *Méthode pour Étudier la Langue Sanscrite* (1859), *Dictionnaire Classique Sanscrit-Français* (1863-4), *La Mythologie des Japonais d'après de Koku-si-Ryakel* (1875), *Mémoires sur l'Antiquité Latine* (1877).

**Burns, ANTHONY** (c. 1830-62), fugitive slave, was born in Va., and escaped from slavery in that state and made his way to Boston, Mass., where he was at work in the winter of 1853-4. He was discovered and arrested by a U. S. marshal in accordance with the fugitive-slave law, just at the time of the repeal of the Missouri Compromise, in May, 1854. Public feeling in Boston, already excited by the action of Congress, was violently stirred up, and a meeting was called at Faneuil Hall. Simultaneously an unsuccessful attempt was made to rescue Burns (then confined in the Boston Court-house) led by Thomas W. Higginson, who was wounded with others of the attacking party. On the following day, an examination was held by U. S. Commissioner Loring, who decided, on the evidence, that Burns must be returned to his master. Burns was sent on board a government cutter, a riot at the wharf being narrowly avoided by a clergyman's call to prayer, and the incident was ended, although it did more to crystallize public opinion in the North than any one occurrence save the hanging of John Brown. BURL afterward became a Baptist minister, and settled in Canada. See Stevens's *Anthony Burns: A History* (1856).

**Burns, SIR GEORGE.** See INVERCLYDE, LORD.

**Burns, JOHN** (1858), English labor leader and M.P. for Battersea (London), began his public career as an aggressive leader of the extreme labor movement, and a prominent member of the Social Democratic Federation. In 1886 he was prosecuted for using 'seditious language and inciting to riot,' but was acquitted. The assertion of the right to hold public meetings

in Trafalgar Square in defiance of the public authorities brought him (1887) a short term of imprisonment. He was, in those days, the head and front of every strike or lock-out or labor agitation of any importance in the country, and figured with special prominence in the London dock strike of 1889. He advocates the nationalization of land, railways, and mines. As a boy he worked at a candle factory and an engine works. He was working at a printing-machine establishment when he was first elected to the London County Council in 1889. He still retains his seat in that body, and sits in the House of Commons for Battersea, to which he was first elected in 1892. In 1905 he was appointed president of the Local Government Board in the cabinet of Sir Henry Campbell-Bannerman.

**Burns, ROBERT** (1759-96), Scottish poet, was the son of a gardener, and was born at Alloway, near Ayr, Scotland. In order to keep his family together, William Burns left Alloway, where he had tried market-gardening, when his son Robert was about seven, and took the small farm of Mount Oliphant, about two miles distant. Burns employed no servant, and his sons had to work incessantly in the fields; the hardship of his early life broke Robert's health, and produced a tendency to hypochondria.

Farming at Mount Oliphant was a heart-breaking failure; and in 1777, when the poet was eighteen, the family removed to the farm of Lochlea, in the parish of Tarbolton. Before that time a juvenile love affair and resentment at his father's hard lot had inspired him to poetical composition. At Lochlea life was easier at first. Robert read less, but mixed more freely in society, became a noted philander, and wrote verses on his loves; he was also an active member of a bachelors' club or debating society. After a brief stay in the town of Irvine for the purpose of learning flax-dressing, where he met 'acquaintances of a freer manner of thinking and living than he had been used to,' he returned to farming at Lochlea, and wrote more industriously.

On the father's death (in difficulties), in 1783, Robert and Gilbert took the farm of Mossiel, in the parish of Mauchline, two or three miles from Lochlea. But for them, as for William Burns, farming was a losing game. Industry was of no avail against adverse circumstances, and Robert submitted more and more readily to his destiny as a poet. The song *Mary Morison* was a product of the Tarbolton period. The *Epistle*

to Davie was the prelude to an output of poetry from Mossiel, which in a year or two furnished forth the contents of that treasure of the bibliophile, the Kilmarnock Burns. The birth of an illegitimate child brought Robert under ecclesiastical discipline, and an inherited liberalism in theology impelled him to use his talent in the battle, which was then at its height, between 'Old Lights' and 'New Lights' (afterwards Moderates and Evangelicals) in the Church of Scotland. The result was a series of satires which brought him the friendship of a number of the liberal clergy, irritated the others, and, being circulated in manuscript, made for the poet a wide reputation for latitudinarianism. To this period belong *The Twa Herds*, *Holy Willie's Prayer*, the *Address to the Unco Guid*, *The Holy Fair*, and the *Address to the Deil*. To the winter of 1785-6 are assigned the last of these, and also *To a Mouse*, *Hallow E'en*, *Man was made to Mourn*, *The Cottar's Saturday Night*, *The Jolly Beggars*, *To James Smith*, *The Vision*, *The Author's Earnest Cry and Prayer*, *The Twa Dogs*, *The Ordination*, and *Scotch Drink*.

The poet had reached his full stature. Then a moral slip drove him to publication and fame. In the spring of 1786 it became necessary for him to acknowledge as his wife Jean Armour, a Mauchline girl, and in order to support her he thought of going to Jamaica to seek his fortune. To procure money for his passage, he threw the best of his work into a volume which was published at Kilmarnock in July. The Armours had previously cast him off—he was not considered good enough for the daughter of a master mason—and, according to tradition, he made love to and would have married, but for her sudden death, Mary Campbell, a Highland servant, whose personality has been a will o' the wisp to his biographers, and who was the subject of some of his most exquisite poems. But the publication of the Kilmarnock volume changed the current of his life. The gentry of Ayrshire were proud to cultivate the author; the Jamaica venture was abandoned when Jean Armour made him a father; Dr. Blacklock, the blind poet and critic, eulogized the poems in the *Edinburgh Magazine*; and before the year was out, Burns, who had made £20 by the sale of 600 copies of his book, was in Edinburgh arranging for the publication of a second edition.

He was welcomed warmly by two social sets—the literary and fashionable circle (including the Duchess of Gordon and the Earl

ROBERT BURNS. FROM THE PORTRAIT BY NASMYTH IN THE NATIONAL PORTRAIT GALLERY, EDINBURGH.

*(Photo by Walker.)*

of Glencairn), of which the chief ornaments were Dugald Stewart, Blair, Robertson, Henry Erskine, Henry Mackenzie, and Lord Monboddo; and another circle of lawyers' apprentices and their peers, who made for him a social habitat of the same order as he had frequented in the Tarbolton bachelors' club and Ayrshire masonic lodges. In the society of lords, judges, and professors he found himself at once at home, behaved with native dignity, and impressed all with the strength of his personality and the originality of his mind. The first Edinburgh edition of his poems was published in 1787 by subscription, and ultimately he gained some £500 by it. He spent the latter part of the year 1787 in a series of tours through Scotland and a second short stay in Edinburgh, where, the novelty of the plough-man-poet having worn off, he was less cultivated by the great; then, too, he formed a connection with a grass widow, a Mrs. Macle hose, who kept up for some time a 'Sylvander and Clarinda' correspondence with him.

In February, 1788, he went home to Mossyiel, and finding Jean Armour on the point of again making him a father, married her. He had taken a lease of the farm of Ellisland, in Dunscore parish, Dumfriesshire, and by the end of the year he was settled there. But Ellisland was as refractory a farm as Mount Oliphant. The poet sank his little capital in it without hope of redemption, and in order to live became an exciseman. The double labor of farming and 'gauging,' however, proved too severe, and by the end of 1791 he was glad to break the lease and remove to Dumfries, where he spent the rest of his life in the service of the excise. At Ellisland he wrote a great many songs, including *Mary in Heaven*, *Auld Lang Syne*, and *Ye Banks and Braes*, for Johnson's *Scots Musical Museum*, to which he had begun to contribute during his stay in Edinburgh; also *Tam o' Shanter*, *The Whistle*, and *The Kirk's Alarm*. He was a welcome guest at the tables of the Dumfriesshire lairds. On his removal to Dumfries, however, politics hurt his prospect of advancement. He had written Whig skits—*The Five Carlins*, for example—at Ellisland, and the editor of the London *Star* had offered him a permanent appointment, which he declined. He continued to produce election literature, but the French Revolution claimed his sympathy more and more. Yet on the threat of invasion he became a volunteer, and wrote *Does Haughty Gaul Invasion threaten?* Tradition and unverified gossip have loaded the

memory of his later years with moral declension. He died after rheumatic fever in 1796. He wrote songs to the last—for instance, *Duncan Gray* and *O wert thou in the Cauld Blast*.

Burns was the greatest of the Scotch vernacular poets, from whom—as Hamilton and Semple, through Ramsay and Fergusson—he took his forms and metres. In the vernacular he was at his best, a supreme artist in words and an unequalled song-writer. See *The Life and Works of Robert Burns*, by Robert Chambers, revised by William Wallace (ed. 1896); Henley and Henderson's *The Poetry of Robert Burns* (ed. 1896); Carlyle's *Essays*, vol. ii., (1869); Leslie Stephen, in the *Dict. of Nat. Biog.*

**Burns and Scalds** are considered together, as, for practical purposes, their effects are the same, and differences in treatment depend only upon the extent of injury and the amount of sepsis (bacterial infection) present or to be feared.

The danger of a burn is proportionate to its superficial extent, and depends also partly upon its position. Death may be expected if half the surface of the body is affected, even though there be no depth of tissue destroyed. Burns on the trunk are more dangerous than those on the limbs, and children succumb more readily than adults. It cannot always be said what is the immediate cause of death. Shock, no doubt, accounts for many deaths, and sepsis for others. Exhaustion following profuse suppuration is another cause; and there are cases in which death has ensued owing to the direct effect upon the blood of great heat. Another danger is deep-seated inflammation, when the seat of the burn is over important organs. There is also a risk of dangerous swelling of the tissues of the throat after swallowing boiling or corrosive fluids. Shock, and the exhaustion consequent on it, must be combated by stimulants, blankets, and hot bottles. The exhaustion consequent on suppuration, which may come later, must be met by suitable dressings, and by the continued and careful use of stimulants. When the throat and oesophagus are affected, feeding may be carried on by the stomach-tube or by enemata; and difficult respiration may require tracheotomy.

The local treatment of burns depends to some extent upon their position, depth, and extent. The aim is to counteract sepsis, or to prevent it; to relieve pain; and to prevent scarring, or, if that be impossible on account of the depth of burn, to make it as slight as possible, and to guard to the

utmost against deformity by contraction. Thus, we first cleanse the burned surface with antiseptic lotion (sometimes under chloroform), and then apply suitable dressings, which are left undisturbed as long as it is safe. A burn on a limb may sometimes render amputation necessary. In cases of burns covering large surfaces, some recommend the continuous warm antiseptic bath, especially for children. Further, if the whole thickness of skin has been destroyed, attempts must be made to supply the deficiency by means of skin-grafting. The burned surface is first carefully purified, and for that purpose some use boracic lotion, some weak carbolic, while others use a two per cent. solution of picric acid. For after application, as dressing, orthoform and aristol are among the newer recommendations; but the dressing most in favor is picric acid, first advocated by French surgeons. A one per cent. solution is often enough, and that strength is practically a saturated solution. Strips of gauze, lightly wrung out in this lotion, are so placed as to cover the cleansed surface, and are themselves covered with antiseptic wool and a bandage. The dressing should be left undisturbed as long as possible, and may prove efficient for from four to six or seven days. It must be changed if suppuration soaks through, or if there are signs of sepsis. Pieces adherent should not be dragged off, but should have the picric acid solution poured on them. The part, if a limb, may be kept at rest by a splint. Picric acid is a poison, and so should be kept secure.

**Burnside**, AMBROSE EVERETT (1824-81), American soldier, born at Liberty, Ind. He graduated at West Point in 1847, but resigned from the army in Oct., 1853, and devoted himself unsuccessfully to the manufacture of a breech-loading rifle which he had invented. In the Civil War he was one of the most prominent generals on the Federal side, rising rapidly in the volunteer service from the rank of colonel (May, 1861) to that of brigadier-general (Aug., 1861) and of major-general (March, 1862). He commanded a brigade in the first battle of Bull Run, organized the 'coast division,' captured Roanoke Island (Feb. 8, 1862) and Newbern, N. C. (March 14), and assumed command of the newly organized Ninth Corps, which became part of the Army of the Potomac, then under Gen. McClellan. Burnside commanded the Federal left in the battle of Antietam (Sept. 16-17), and on Nov. 7 was placed in command of the Army of the Potomac—a position which he had

twice declined and for which he felt himself unfit; the appointment, indeed, is now generally considered to have been ill advised. After thoroughly reorganizing the army, he impetuously attacked Lee, then occupying a position of great strength at Fredericksburg, Va. (Dec. 13, 1862), and was disastrously defeated (see FREDERICKSBURG, BATTLE OF). While preparing for a second attack he was superseded by Hooker (Jan. 26, 1863).

Soon afterward Burnside was placed in command of the Department of the Ohio, with headquarters at Cincinnati, in which capacity he issued (April 13) his famous General Order No. 38 for the suppression of treason in any form, and caused the arrest of Clement L. Vallandigham (q. v.), the leader of the 'Copperheads.' He prohibited the circulation of books 'containing sentiments of a disloyal tendency,' forbade the circulation of the *New York World* in his department, and suppressed the *Chicago Times*. For these high-handed measures he was vigorously criticised, and his suppression of the *Times* was overruled by Lincoln. He was later besieged for some time in Knoxville, Tenn., by Longstreet, and once more at the head of the Ninth Corps of the Army of the Potomac, he took part in the Virginia campaign of 1864. Owing largely to friction with his superior, General Meade, he resigned in April, 1865.

After the war Burnside was governor of Rhode Island (1866-9) and U. S. Senator (1875-81). While in Europe during the Franco-Prussian War (1870) he acted as a medium of communication between the hostile armies. Consult *Life* by Poore.

**Burnt Island**, brûnt-î'land; locally brunt-î'land, town, Fifeshire, Scotland, on the Firth of Forth; 20 miles by rail (*via* Forth Bridge) from Edinburgh. It is an important coaling port, with large docks, and a summer resort for golf and sea bathing. Pop. 4,800.

**Burnt Stones**, antique gems of carnelian, sometimes engraved, found in Roman ruins. They appear to have undergone firing, to make a thin surface layer semi-opaque and give them a resemblance to sardonyx (q. v.).

**Bur Oak**. See OAK.

**Burr**, AARON (1716-57), American clergyman and educator, father of Aaron Burr (q. v.) was born in Fairfield, Conn., and was graduated from Yale (1735). He was pastor at Newark, N. J., for many years, and the head of a boys' school. From 1748 until his death he was president of the College of New Jersey (Princeton College), and was its principal organizer and developer.

He gained a high reputation both for his preaching and for his dignified and gracious bearing.

**Burr**, AARON (1756-1836), American political leader and Vice-President of the United States, was born in Newark, N. J., son of Aaron Burr (q. v.) and of Esther, the daughter of Jonathan Edwards. The boy's father died in 1757, his mother in 1758, and he was reared by an uncle at Elizabethtown, N. J. In 1766 he vainly attempted to run off to sea. In 1772 he was graduated from Princeton; and thereafter he studied, in turn, theology and law. He served with marked ability in the American Revolution; took part in Benedict Arnold's Canadian expedition (1775); rose to the rank of lieutenant-colonel (1777); and was a member first of Washington's and then of Putnam's staff (1776). He commanded a brigade in the Battle of Monmouth (1778), and from January, 1779, until his resignation from the army in March was in command of the American lines in Westchester county, N. Y.

In 1782 Burr was admitted to the bar at Albany, N. Y.; and in 1783 he removed to New York City, where he soon became a political leader, and showed himself a master of all the devious arts of the 'practical politician.' He served in turn as a member of the State assembly (1784-5 and 1798), attorney-general of New York (1789-90), and U. S. Senator (1791-7). In the national campaign of 1800 he was the candidate of the Democratic-Republican Party for the Presidency; and he and Thomas Jefferson having received the same number of electoral votes, the choice devolved upon the House of Representatives. Jefferson, largely through the aid of Federalists, influenced by Alexander Hamilton (q. v.), was chosen President; and Burr became Vice-President (1801-5). He failed to secure a renomination, and in 1804 was defeated for the governorship of New York, Hamilton, as always, vigorously opposing him. Burr, deeply angered, then forced a duel upon Hamilton, whom he fatally wounded at Weehawken, N. J., on July 11, 1804.

This rendered Burr practically an outcast in New York, where, as also in New Jersey, he was indicted for murder. On this account, and also to recuperate his fortunes, he turned to the rapidly developing West and Southwest, and devoted himself for the next two years to what has become known as the *Aaron Burr Conspiracy*. The traditional view that he planned a disruption of the Union and the establishment of a separate government in the

Mississippi Valley has been largely supplanted by the more reasonable view that, with the aid of the Westerners, he intended to strike at the Spanish possessions in the Southwest, and particularly to seize and govern Mexico—a plan based in part on the belief then current that a war between the United States and Spain was imminent. Burr's conduct, however, was marked by the grossest duplicity, and in the midst of his preparations he was arrested on a charge of treason. After a notable trial at Richmond, in 1807, he was acquitted. Soon afterward he was tried on a charge of misdemeanor, and was again acquitted, the Government, in each case, exerting itself to procure his conviction.

Burr then went abroad (1808), largely to secure aid in the further prosecution of his designs. He was expelled from England; tried in vain to obtain assistance from Napoleon; and after enduring many privations and insults, returned to America (1812), and thereafter lived in New York City. He died at Port Richmond, N. Y., and was buried at Princeton.

The personality of Burr offers a curious and interesting study. Endowed with intellectual gifts of a high order, magnetic, holding men, and more especially women, with a peculiar fascination, a politician of consummate ability, he was unscrupulous, an intriguer, and a profligate in his personal habits, and his natural endowments were vitiated by his lack of moral character. In 1782 he married Theodosia Prevost, widow of a British officer, who bore him one child, Theodosia Burr (q. v.); and in 1833 he married Mme. Jumel. Consult Parton's *Life and Times of Aaron Burr*; Davis' *Memoirs of Aaron Burr*; Merwin's *Aaron Burr*; McCaleb's *The Aaron Burr Conspiracy*; Adams' *History of the United States*; Tompkins' *Burr Bibliography*; Todd's *The True Aaron Burr*.

**Burr**, THEODOSIA (1783-1813), only child of Aaron Burr (q. v.) and Theodosia Prevost Burr, was born in New York City. She was educated by her father, and became widely known for her beauty, accomplishments, and charm of manner. She married Joseph Allston, who became governor of South Carolina. Through all the disasters which befell her father she showed intense devotion, and assisted in securing a favorable hearing for him during his prolonged trial at Richmond. She was drowned in the *Patriot*, while on a voyage to New York.

**Burr**, WILLIAM HUBERT (1851- ), American civil engineer, was born in Watertown,

Conn., and was educated at the Rensselaer Polytechnic Institute. He was professor of mechanics at Rensselaer Polytechnic Institute (1876-84), engineer of the Phoenix Bridge Company (1884-91), professor of engineering at Harvard (1891-2), and professor (1893-1916) and professor emeritus (after 1916) of civil engineering at Columbia University. He served as a member of the 1899 and 1904 Isthmian Canal Commissions, and of other Federal, State, and municipal commissions. He has published: *Stresses in Bridge and Roof Trusses* (1879); *Ancient and Modern Engineering and the Isthmian Canal* (1902); *The Graphic Method by Influence Lines for Bridge and Roof Computation* (with M. S. Falk, 1905); *Suspension Bridges, Arch Ribs, and Cantilevers* (1913).

**Bur'ra**, or KOORINGA, town, South Australia, on Burra Creek; 100 miles by rail northeast of Adelaide. It contains the once famous Burra Burra copper mine, discovered in 1844, now deserted. Pop. 2,600.

**Burrard Inlet**, 9 miles long, Strait of Georgia, British Columbia, north of the mouth of the Fraser River. Vancouver (q. v.) stands on the south shore.

**Burr Conspiracy**. See BURR, AARON.

**Bur'rell**, DAVID JAMES (1844- ), American clergyman, was born in Mount Pleasant, Pa., and was graduated from Yale (1867). He prepared for the ministry at the Union Theological Seminary, and after four years' missionary work in Chicago was pastor of Presbyterian churches in Duquesne and Minneapolis. In 1891 he accepted the pastorate of the Marble Collegiate Church in New York City. He has published a number of religious volumes, including: *For Christ's Crown and Covenant* (1896); *The Early Church* (1897); *The Wonderful Teacher* (1902); *Christ and Men* (1905); *Evolution of a Christian* (1906); *The Cloister Book* (1909); *In David's Town* (1910); *At the Gate Beautiful* (1911); *The Home Sanctuary* (1911); *The Old-Time Religion* (1913); *The Church in the Upper Room* (1913); *We Would See Jesus* (1914); *The Apostles' Creed* (1915); *Why I Believe the Bible* (1917).

**Burriana**, boor-ré-á'ná, town, province Castellón, Spain; 8 miles southwest of Castellón de la Plana. Vegetables, fruit, and grain, and especially oranges and melons, are exported. Pop. 14,250.

**Burrillville**, town, Providence county, Rhode Island, on the New York, New Haven, and Hartford Railroad; 23 miles northwest of Providence. Its

chief industries are the manufacture of woollen and cotton goods. Wallum Lake is a popular summer resort. Pop. (1910) 7,878; (1920) 8,606.

**Burritt**, ELIHU (1811-79), American peace advocate and author, known as 'the learned blacksmith,' was born in New Britain, Conn. While working as a blacksmith he devoted his leisure to study, especially to mathematics and languages. In the latter field his range was very wide, embracing more or less Latin, Greek, Hebrew, Arabic, and other oriental tongues, and almost all modern European languages. In 1842 at Worcester, Mass., he established *The Christian Citizen*, a weekly journal devoted to the anti-slavery cause, peace, temperance, and self-culture. Visiting England (1846-9), he was one of the organizers of an international association, the 'League of Universal Brotherhood,' which aimed at the abolition of war and the promotion of brotherhood among nations. He was also instrumental in organizing the First International Peace Congress at Brussels, in 1848, and the Second at Paris, under the presidency of Victor Hugo, in 1849; and he subsequently attended various other peace congresses. In 1852 he became editor of *The Citizen of the World*, Philadelphia, in which he urged the compensated emancipation of slaves. In 1865-7 he was U. S. consul at Birmingham, England. For many years he was a prominent advocate of ocean penny postage.

Among his publications are: *Sparks from the Anvil* (1848); *Olive Leaves* (1850); *Thoughts of Things at Home and Abroad* (1854); *A Walk from London to John O'Groat's, with Notes by the Way* (1864); *A Walk from London to Land's End and Back* (1865); *Thoughts and Notes at Home and Abroad* (1868); *Walks in the Black County* (1868); *Lectures and Speeches* (1869); *Ten-Minute Talks on All Sorts of Subjects, with Autobiography* (1874); *Chips from Many Blocks* (1878). Consult *Life*, by C. Northend.

**Burro**, a small donkey used as a pack animal in the mountainous districts of the Southwestern United States and Mexico.

**Burroughs**, bur'rōz, GEORGE (c. 1650-92), American clergyman, was graduated from Harvard (1670). In 1676 he was a preacher at Falmouth (now Portland), Me., and in 1680-5 at Salem, Mass. He subsequently lived at Falmouth and Wells until his accusation of witchcraft at Salem in 1692, where he was charged with tormenting Mary Wolcott and others by wicked arts—a charge supported by the evidence of self-confessed witches

—and was executed on Aug. 19. Burroughs was the only clergyman convicted during the witchcraft excitement, and it is presumed that his differences with his former parishioners were the occasion of his accusation and arrest. See WITCHCRAFT.

**Burroughs**, JOHN (1837-1921), American naturalist and writer, was born in Roxbury, N. Y., where his father was a farmer. He worked on the farm, received a common-school education, and when seventeen years old removed to Olive, in Ulster county, where he taught school for several years. He was appointed to a position in the U. S. Treasury Department at Washington in 1863, and subsequently became chief of the organization division in the bureau of national banks. In 1872 he left Washington, and two years later established himself on a farm at West Park on the Hudson, where he devoted himself to the cultivation of small fruits and the writing of his essays on nature.

Burrough's first article was published in *The Atlantic Monthly* for 1860. His first published volume, *Notes on Walt Whitman as Poet and Person* (1867), grew out of his personal acquaintance with 'the good, gray poet' at Washington, of whom he was always a supporter. It was followed by *Wake Robin* (1871); *Winter Sunshine* (1875); *Birds and Poets* (1877); *Locusts and Wild Honey* (1879); *Pepacton* (1881); *Fresh Fields* (1884); *Signs and Seasons* (1886); *Sharp Eyes* (1888); *Indoor Studies* (1889); *Riverby* (1894); *A Study* (1897); *The Light of Day* (1900); *Squirrels and Other Fur Bearers* (1900); *Literary Values* (1902); *Far and Near* (1904); *Ways of Nature* (1905); *Bird and Bough* (1906); *Camping and Tramping with Roosevelt* (1907); *Leaf and Tendril* (1908); *Time and Change* (1912); *The Summit of the Years* (1913); *The Breath of Life* (1915); *Under the Apple Trees* (1916); *Field and Study* (1919). In these books he shows himself a keen and accurate observer as well as the master of a peculiarly direct and graceful literary style. Consult *Barrus' The Retreat of a Poet Naturalist and John Burroughs, Boy and Man* (1920).

**Burrowing Owl**. See OWL.

**Burrows**, JULIUS CÆSAR (1837-1915), American legislator, was born in Northeast, Erie county, Pa. He served in the Civil War as an officer in the Union army, and at the close of hostilities opened a law office in Kalamazoo, Mich. He held various local offices, and was five times elected to Congress. In 1894 he was elected U. S. Senator, serving for sixteen years.

**Burrstone**. See BUHRSTONE.

Checked  
Dec 4  
1926

**Bur'rus**, AFRANIUS, a Roman soldier of distinction under Claudius and Nero. In 52 A.D. he was appointed sole commander of the praetorian guards. With Seneca he conducted the education of Nero, and it was mainly owing to his influence that Nero was declared emperor. Burrus did his best to prevent Agrippina's cruelty after Nero's accession, and later tried to save Agrippina herself, and Octavia, from the emperor. Weary of his control, Nero caused him to be poisoned in 63 A.D.

**Bur'sa**, a synovial sac interposed between muscles, tendons, or skin and bony prominences, whose function it is to lessen the friction to which these parts are exposed. Bursæ are composed of a layer of dense cellular tissue, lined internally with a layer of flattened endothelial cells, which secrete a lubricating fluid called synovia. Some bursæ are constantly present, but others are developed as the result of occasional friction of muscles against each other or adjoining parts. Inflammation of a bursa is known as *bursitis*, and occurs in several forms, of which 'housemaid's knee' and 'miner's elbow' are familiar.

**Bur'sar**, a name given to the treasurer or subtreasurer in English and many American universities. In Scotland the term is used also for the recipient of a bursary or annual allowance similar to English and American scholarships.

**Burschenschaft**, böörsh'en-shäft, a student organization in German universities whose aim is threefold: moral character and breeding, good fellowship, and patriotism. The first association was formed at Jena (1815). Two years later, on the occasion of a festal gathering in honor of liberty at the Wartburg, near Eisenach, certain irresponsible students burned the works of contemporary writers whose tendencies were obnoxious to them. This and the murder of the dramatist Kotzebue, in 1819, by a Jena student (Sand), led the governments of Central Europe to suppress the organizations, but they soon revived, only to be proceeded against once more in 1830-3. All special restrictions against the *Burschenschaft* societies were withdrawn in 1848, and they still flourish and are generally considered to exert a good influence in developing frankness, simplicity, and graciousness.

**Bur'sera'ceæ**, a family of tropical plants occurring in both hemispheres. There are more than 300 species, the best known of which is the Gumbolimo (*B. gummitifera*), a tall tree found in Florida and the West Indies, which yields a sweet aromatic

balsam, known as chibou, sometimes used medicinally.

**Bur'slem**, parliamentary and municipal borough and market town, England, in Staffordshire, on the Grand Trunk Canal; 17 miles west of Stafford. It is in the potteries district and the making of china, glass, and porcelain is the chief industry. Features of interest are the Wedgwood Institute, opened in 1869, and the town hall with a lofty clock tower. Burslem is the birthplace of Josiah Wedgwood. Pop. (1921) 41,566.

**Burstenbinder**, ELIZABETH. See WERNER, ELIZABETH.

**Bur'ton**, JOHN HILL (1809-81), Scottish historian and author, was born in Aberdeen. He was graduated from the University of Aberdeen, studied law, and was admitted to the bar in Edinburgh, but devoted himself to literature. He contributed to the *Westminster Review*, the *Cyclopædia of Universal Biography*, *Blackwood's* and other periodicals, but first gained real distinction by his biography of David Hume (1846). His *History of Scotland* was completed in 1870, in 7 volumes, and some of his contributions to *Blackwood's* were published as *The Book-Hunter* (1860) and *The Scot Abroad* (1862). He was historiographer of Scotland.

**Burton**, MARION LE ROY (1874-1925), American educator, was born in Brooklyn, Iowa, and was educated at Carleton College, Minn., and at Yale. He was teacher of Greek in Carleton College (1899-1900), principal of Windom Institute, Minn. (1900-03), and assistant professor of systematic theology at Yale (1907-8). He was president of Smith College, Northampton, Mass., from 1910 to 1917, when he became president of the University of Minnesota. From 1920 until his death he was president of the University of Michigan. He is the author of *The Problem of Evil* (1909); *The Secret of Achievement* (1913); *Our Intellectual Attitude in an Age of Criticism* (1913); *Life Which is Life Indeed* (1914); *First Things* (1915); *On Being Divine* (1916).

**Burton**, RICHARD (1861- ), American man of letters, was born in Hartford, Conn. He was graduated from Trinity College, Conn., in 1883, and taught in Johns Hopkins University in 1888. He was managing editor of *The Churchman*, N. Y. (1888-9), literary editor of the *Hartford Courant* (1890-7), professor of English, University of Minnesota (1898-1902), and editor for the Lothrop Publishing Company (1902-4). In 1906 he became head of the English department at the University of Minnesota, a position which he resigned in

1925 to devote himself to writing and lecturing. He is a member of the National Institute of Arts and Letters. His literary works include *Dumb in June, and Other Poems* (1895); *Memorial Day, and Other Poems* (1897); *Literary Likings* (1898); *Lyrics of Brotherleafhood* (1899); *John Greenleaf Whittier* (1901); *Forces in Fiction, and Other Essays* (1902); *Message and Melody—A Book of Verse* (1903); *Literary Leaders of America* (1904); *Three of a Kind* (1908); *Masters of the English Novel* (1909); *How to Know a Play* (1910); *The American Drama* (1913); *Bernard Shaw* (1915); *Charles Dickens—How to Know Him* (1919); *American Drama* (1926).

**Burton**, SIR RICHARD FRANCIS (1821-90), British traveller, linguist, and author, was born in Hertfordshire. Entering the East India service in 1842, he explored the Nilgiri Hills, served for five years in Sindh with Sir C. Napier, and in 1851 published his first important work, *Sind, or the Unhappy Valley*, supplemented by a volume describing the races inhabiting the valley of the Indus. Having returned to England, he set out for Arabia in 1853, and assuming the character of a wandering dervish, succeeded in reaching the holy shrines of Mecca and Medina. The account of his adventures, entitled *Narrative of a Pilgrimage to El Medinah and Meccah*, appeared in 1855-6. He next turned his attention to Africa, and after a perilous journey to Harar in Somaliland, started in 1856 with Captain Speke from Zanzibar, penetrated to the lake regions of Central Africa, and discovered Lake Tanganyika (1858). He published his *First Footsteps in East Africa, or an Exploration of Harar* in 1856, and *The Lake Regions of Central Africa* in 1860. Subsequently he was successively British consul at Fernando Po (1861), Santos in Brazil (1865), Damascus (1869), and Trieste (1871). His later publications included *Wanderings in West Africa* (1863); *Abeokuta and the Cameroon Mountains* (1863); *Explorations of the Highlands of Brazil* (1869); *The Book of the Sword* (1884); *Camoens: his Life and his Lusians* (5 vols. 1880-84); and a new and literal translation of the *Arabian Nights*, under the title of *The Thousand Nights and a Night* (16 vols. 1885-8), of which an expurgated edition for popular perusal was issued by his wife (1886). In his later travels Burton was accompanied by his wife, Isabel, Lady Burton, who assisted him with his writings, and herself published *Inner Life of Syria, Palestine, etc.* (1875), and *Arabia, Egypt, India* (1879). Burton was knighted in 1886.

Consult Hitchman's *Early, Public, and Private Life of Sir R. F. Burton* (1887); Lady Burton's *Life of Captain Sir R. F. Burton*; Stisted's *The True Life of Sir R. F. Burton*; Dodge's *The Real Sir Richard Burton*.

**BURTON, ROBERT** (1577-1640), English scholar, was born in Lindley, Leicestershire. He became (1599) a student of Christ Church and obtained the college living of St. Thomas, in Oxford, in 1616. About 1630 a private patron gave him that of Segrave in Leicestershire, but he continued to reside mostly in Christ Church. In 1606 he wrote a Latin comedy called *Philosophaster*, which was acted in Christ Church hall in 1618. It is a witty picture of an imaginary university (in Spain) of charlatans, and is much above the average of neo-Latin plays. In 1621 Burton published that singular medley of erudition and nonsense, the model of Sterne's *Tristram Shandy* and Southey's *Doctor, the Anatomy of Melancholy*.

*died Oct 28 1929*  
**BURTON, THEODORE ELIJAH** (1851- ), American legislator, was born in Jefferson, O. He was graduated from Oberlin College in 1872, was admitted to the bar in 1875, and settled in Cleveland to practise. He was member of Congress (Republican) in 1889-91, 1895-1909 and 1921- , and a U. S. Senator in 1909-15. He was chairman of the Inland Waterways Commission and a member of many important committees. He is the author of *Financial Crises and Periods of Industrial and Commercial Depression* (1902); *Life of John Sherman* (1906); *Corporations and the State* (1911); *Some Political Tendencies of the Times and the Effect of the War Thereon* (1919); *The Constitution; Its Origin and Distinctive Features* (1923).

**BURTON, WILLIAM EVANS** (1804-60), Anglo-American actor and dramatist, was born in London, England. He made his debut as an actor at the Pavilion, in London, in 1831, and in 1834 went to the United States and appeared at the Arch Street theatre in Philadelphia. His first performance in New York was given in 1837, as Guy Goodluck in *John Jones*. Of his many parts, some of the best remembered are Micawber, Sam Weller, Captain Cuttle, Mr. Toodles, Aminidab Sleek, Sir Toby Belch, Caliban, Bottom, and Falstaff. He wrote several plays, of which *Ellen Wareham* was the most successful, edited a *Cyclopaedia of Wit and Humor* (1858), and founded and edited *The Gentleman's Magazine*.

**Burton-on-Trent**, municipal and county borough, England,

in Staffordshire, on the Trent; 11 miles southwest of Derby. There are scanty remains of an eleventh-century Abbey but the town's main interest lies in its huge breweries, which have been in existence for centuries. There are more than a dozen of these breweries, employing over 7,000 people, the largest being Bass and Allsop's. There are also engineering works. Fire clay is found in the neighborhood, and plaster and cement are made. The town has frequently suffered from Trent floods. Pop. (1921) 48,927.

**Burtscheid**. See AIX-LA-CHAPELLE.

**Buru**, bōō'rōō, BURO, or BULU, island, Dutch East Indies, in the Molucca group, situated between Ceram and Celebes, and almost entirely surrounded by coral reefs; area, 3,425 square miles. It is extremely mountainous, reaching an altitude of 8,250 feet in Mount Tumahu. The principal products are cajeput oil, sago, bamboo, rattan, betel nuts, tobacco, and coffee. The capital is Kajeli. Pop. about 20,000, mostly heathen Alfurans.

**Burujird**, bōō-rōō-jēr'd', town, Persia, in the province of Irak-Ajimi; 70 miles southeast of Hamadan. It is surrounded by a mud wall pierced by five gates, and is a thriving business centre. The chief industry is the manufacture of printed calico, stamped with native designs, and felt goods. Pop. 20,000.

**Bury**, ber'i, municipal and county borough and market town, England, in Lancashire, on the Irwell; 10 miles west of Manchester. Features of interest are the Art Museum, containing the valuable Wrigley art collection, and monuments to Robert Peel and John Hay, the inventor of the fly shuttle. Once an important centre for woollen manufactures, introduced by the Flemings in the time of Edward III., Bury is now a busy cotton town, with spinning and weaving mills, calico-printing works, bleach and dye works, foundries, and engineering establishments. Coal mines and freestone quarries are numerous in the neighborhood. Pop. (1921) 56,426.

**Bury, JOHN BAGNELL** (1861- ) Irish historian, was educated at Trinity College, Dublin, of which he was fellow from 1885 to 1902. In 1893-1902 he was professor of modern history in Dublin University, and in 1902 succeeded Lord Acton as regius professor of modern history at Cambridge. Among his numerous publications are: *History of the Later Roman Empire from Arcadius to Irene* (1889); *History of Greece to the Death of Alexander the Great* (1900); his justly-renowned edition of Gibbon's *Decline and Fall*

(7 vols. 1896-1900); *Life of St. Patrick and his Place in History* (1905); *The Ancient Greek Historians* (1908); *History of the Eastern Roman Empire from 802 to 867* (1912); *The Idea of Progress* (1920); *The Hellenistic Age* (1923). He also edited the *Neuman Odes of Pindar* and Freeman's *History of Federal Government in Greece and Italy* (1893).

**Bury, RICHARD DE**. See AUNGERVILLE.

**Burying Beetles** (*Necrophorus*), insects of the family Silphidae, so-called from their habit of making excavations under the dead bodies of small vertebrates, in order to bury them. The females lay their eggs in the buried carcasses which furnish an abundant food supply for the emerging larvæ. Burying beetles are widely distributed, particularly in the cooler zones.

**Bury St. Edmunds**, town, England, in West Suffolk, on the Lark; 28 miles east of Cambridge. It owes its importance to the shrine of the martyred Edmund, last king of East Anglia, which was long a noted place of pilgrimage. The Benedictine Abbey erected in the eleventh century, with its Norman Tower, a fine example of early Norman, and Moyses Hall, now a museum, are among the features of interest. The chief commercial interest of the town lies in the corn and cattle markets.

**Bury St. Edmunds**, or Saint Edmundsbury, as it was called in early times, was a place of importance in the Saxon period. It is said to have been the Roman Villa Faustina. It contains many interesting antiquities. Pop. (1921) 15,941.

**Busa**, bōō'sa, or BUSSA, town, West Africa, in the British protectorate of Northern Nigeria, on the west bank of the Niger. Near this town, in 1805, Mungo Park was drowned in the Niger. Pop. about 15,000.

**Busch**, böōsh, JULIAN HERMANN MORITZ (1821-99), German publicist, called 'Bismarck's Boswell,' was a native of Dresden. In 1851 he visited the United States and, returning early in 1852, published an account of his travels in *Wanderungen zwischen Hudson und Mississippi* (1853), and *Die Mormonen* (1857). Next year he made extensive travels in the Near East, descriptions of which are to be found in *Eine Wallfahrt nach Jerusalem* (1860; 3rd ed. 1881), *Bilder aus dem Orient* (1862) and *Bilder aus Griechenland* (1863). From 1856 he was a constant contributor to the *Grenzboten*, the organ of the Nationalist party, and in 1866 entered the service of the Prussian government. Called to Berlin in 1870, he became one of Bismarck's press

agents, and held this position throughout the Franco-German War. His memory rests upon his works on Bismarck, which include *Bismarck und seine Leute während des Krieges mit Frankreich* (1878), in the form of a diary (Eng. trans. 1879); *Unser Reichskanzler* (1884; Eng. trans. 1884); and *Tagebuchblätter* (Eng. *Memoirs of Prince Bismarck, 1870-93*, 3 vols. 1899), a diary kept during twenty-five years' close intimacy with the chancellor.

**Busch, WILHELM** (1832-1908), German cartoonist, was born in Hanover. He first attracted attention about 1859 by his illustrations in the well known weekly, *Fliegende Blätter*, later collected as *Bilderbogen* (1875). He also wrote and illustrated a number of tales in doggerel, of which the most famous is *Max and Moritz* (1865), and published a volume of poems, *Kritik des Herzens* (1874), and a short story, *Der Schmetterling* (1893), which related how the idealist chased a butterfly and became a cripple. His works were collected and published under the title of *Humoristische Hausschatz*.

**Büsching, bűsh'ing, ANTON FRIEDERICH** (1724-93), German geographer, was pastor of the German Protestant church at St. Petersburg (1760-5), and, later, director of the gymnasium of the Greyfriars' Monastery in Berlin. His chief work is an unfinished *Neue Erdbeschreibung* (11 vols. 1754-92), from which a translation of his description of Europe was published in London (6 vols. 1762).

**Büsching, JOHAN · GUSTAV GOTTLIEB** (1783-1829), German man of letters, was born in Berlin. He was royal archivist in Breslau (1811), and professor of antiquities there (1817). With Von der Hagen he edited *Deutsche Gedichte des Mittelalters* (1808-25), *Sammlung deutscher Volkslieder* (1807), *Grundriss zur Geschichte der deutschen Poesie* (1802), and other works; and alone, *Erzählungen, Dichtungen, Fastnachtsspiele und Schwänke des Mittelalters* (1814).

**Buschmann, böösh'män, JOHANN KARL EDUARD** (1805-80), German philologist, was born in Magdeburg. After a voyage to Mexico (1827-8), he assisted the Humboldts in the preparation of their works, and became librarian of the Royal Library at Berlin (1853), and a member of the Academy of Science (1851). He is remembered for his philological researches in Malay-Polynesian and South American languages. His most important works (exclusive of those with the Humboldts) are *Ueber die aztekischen Ortsnamen* (1853), *Die Spuren der aztekischen Sprache im nördlichen Mexico* (1859), *Die*

*Völker und Sprachen Neumexikos* (1858), *Der Athapaskische Sprachstamm* (1856), and *Das Apache und der Athapaskische Sprachstamm* (1860-63). After the death of Wilhelm von Humboldt he edited and completed that author's well known work, *Ueber die Kavisprache*, the third volume of which was entirely his own work.

**Bush, IRVING T.** (1869- ), American business man, was born in Ridgeway, Mich. He received his academic training in the Hill School, Pottstown, Pa., and at the age of nineteen entered the Bush and Denslow Manufacturing Company, of which he became secretary the following year. He early interested himself in the relief of business and traffic congestion in New York City, and in 1895 established a number of warehouses which led subsequently to the founding in Brooklyn, N. Y., of the Bush Terminal, with 123 warehouses, 8 piers, 16 industrial buildings, and facilities for receiving, storing, selling, and shipping manufactured goods. The terminal serves some 350 manufacturing and wholesale establishments.

**Bush Antelope, BOSCHBOK, or BUSH BUCK** (*Tragelaphus sylvaticus*), a small harnessed antelope of South Africa, of which there are several varieties, hunted in bushy districts. They are brilliantly colored, with harness-like markings.

**Bush-Brown, HENRY KIRKE** (1857- ), American sculptor, was born in Ogdensburg, N. Y. He studied at the National Academy of Design, New York City, and in Paris and Italy (1886-9). His works include equestrian statues of *General Meade*, *General Reynolds*, and *General Sedgwick*, and the *Lincoln Memorial*, all at Gettysburg; the *Indian Buffalo Hunt*, World's Columbian Exposition (1893); a group representing *Truth*, Pan American Exposition (1901); decorative figures in the Hall of Records, New York; statue of *General Anthony Wayne*, for Valley Forge, Pa.; *The Spirit of '61*, Philadelphia; the *Union Soldiers' Monument*, Charleston, W. Va., and the *H. B. F. Macfarland Memorial*, Washington, D. C.

**Bushel.** See WEIGHTS AND MEASURES.

**Bushido**, the creed of the *bushi* or *samurai* (q. v.), the warrior and gentry class of feudal Japan. It required that the samurai be sober, frugal, and industrious, that he cultivate learning, loyalty, and filial devotion, and that he be willing not only himself to meet death, even by his own hand, for his country's sake, but, if necessary, to sacrifice the lives and honor of those nearest and dearest to him.

**Bushire**, böö-shēr', BUSHAHR, ABUSHEHR, or BANDAR BUSHIRE, seaport city, Persia, situated on the eastern shore of the Persian Gulf; 125 miles southwest of Shiraz. Originally a fishing village, it was chosen by Nadir Shah as a naval port and dockyard, and to it was transferred the East India Company's station from Gombroon. The climate is sultry, and the town suffers from lack of a good water supply. It has extensive bazaars and an important caravan trade, but the streets are narrow and dirty. The harbor is shallow, open, and unprotected. The chief exports are opium, raw cotton, carpets, tobacco, mother-of-pearl, and hides and skins. Cotton goods, sugar, tea, and spices are imported. Bushire is the seat of several European consuls. Pop. (est.) 20,000.

**Bushmaster** (*Lachesis mutus*), a large and extremely poisonous snake of Northeastern South America, closely related to the rattlesnakes, but with a spike at the end of the tail in place of a rattle.

**Bushmen**, native tribes formerly spreading from the Cape as far north as the Zambezi River, but at present chiefly confined to the Kalahari Desert and the northern parts of Southwest Africa. They were known to the Dutch as 'Bosjesmen,' and to the Hottentots as 'San' or 'Sonqua.' They range from about 4 feet 6 inches to 5 feet in height, are yellow-brown in color, and have black hair, flat faces, and small, narrow, slit-like eyes. They dwell mostly in caves or rock shelters and live by trapping and hunting. Their weapons of war and the chase are bows and arrows, the latter smeared with vegetable poison. The Bushmen are still savages, with no tribal organization and scarcely any household goods or permanent homes. They wear almost no clothing, and are exceedingly dirty in their habits. Their language is harsh and characterized by an abundance of peculiar sounds known as 'clicks.' Paintings and chip-pings found in their caves, depicting incidents of the chase, war scenes, and animal life, give evidence of a considerable degree of rude artistic talent. Consult Stow's *Native Races of South Africa*; Bleek's *Bushmen Folklore*; Dorman's *Pygmies and Bushmen of the Kalahari* (1925).

**Bushnell**, city, Illinois, McDonough county, on the Chicago, Burlington and Quincy, and the Toledo, Peoria and Western Railroads; 47 miles southwest of Peoria. The manufactures include carts, agricultural implements, cisterns, tanks, fencing, cigars, and bricks. Pop. (1910) 2,619; (1920) 2,716.

**Bushnell, HORACE** (1802-76), American theologian, was born in Litchfield, Conn. He was graduated from Yale (1827), took the divinity course there, and was pastor of the North Congregational Church, Hartford, from 1833 to 1859. His book, *God in Christ* (1849), denying the adequacy of language to

three-quarters of the nineteenth century. The earlier bushrangers were mostly escaped convicts, who had taken to the bush, and maintained themselves by preying on lonely settlers. Later, these brigands banded together and became so serious a menace as to necessitate the Bushranging Act of 1830

alive and afterwards hanged. Other famous bushrangers were John Whitehead, Michael Howe, Brady, and 'Mosquito.' Consult Boxall's *Australian Bushrangers*; Dunbabin's *The Making of Australasia* (1922).

**Bushwhacker**, originally one accustomed to beat about or live in the woods, applied specifically in the United States, during the Civil War, to irregular troops in the Confederate States engaged in guerrilla warfare. They seldom fought in the open but confined their actions to cutting off small parties and to raiding. Kansas was the chief scene of their activity.

**Business Education.** See COMMERCIAL EDUCATION.

**Busi'ris**, a mythical king of Egypt, reputed founder of the city of Zeus, or Thebes, was killed by Hercules. Milton (*Paradise Lost*, i. 307) applies his name to the Pharaoh who was overwhelmed in the Red Sea. The name was also used of a city of ancient Egypt, now identified with the modern Abusir, in Lower Egypt, not far from Alexandria.

**Busk, HANS** (1815-82), English barrister, was called to the bar at Middle Temple (1841), and was high sheriff of Radnorshire (1847). He took a prominent part in the institution of the army volunteer system, the success of which was due largely to his practical treatises, especially *The Rifleman's Manual* (1858; 7th ed. 1860), *Company Drill* (1860), and *Rifle Volunteers* (1859; 7th ed. 1860). He was the first to advocate lifeboat stations, and in 1859 published *The Navies of the World*, containing suggestions for the development of the British navy.

**Bus'kin**, a kind of high boot laced to the ankle and lower part of the leg. In early times it was worn particularly by the actors of tragedy, whence the use of the word as a synonym for tragic drama.

**Busoni, FERRUCCIO BENVENUTO** (1866-1924), Italian pianist and composer, was born in Empoli, near Florence. He was educated in Austria, and at the age of fifteen made a concert tour of Italy. In 1890 he taught music at the Moscow Imperial Conservatory, and the following year began his professorship at the New England Conservatory of Music in Boston. In 1907 he succeeded for a year to the direction of Sauer's master class in piano at the Vienna Conservatory. From 1920 until his death he served as professor in the Berlin Music Academy. He was a member of the Royal Academy of Music, Bologna, and was especially known as an interpreter of the works of Bach. His compositions include chamber music,

Bushmen

1. Bushman drawings. 2. Types: man, boy, and woman 3 Family group

express spiritual truth, brought against him a charge of heresy, which, however, was not sustained, and to which he replied in *Christ in Theology* (1851). Another important work is *Nature and the Supernatural* (1858). An edition of his works appeared in 1876-7. Consult biographies by Cheney and by Munger.

**Bushrangers**, a term applied in Australia to the brigands or outlaws who infested outlying settlements during the first

(renewed in 1834), a drastic measure which put a stop to bushranging on a large scale. Among the most notorious of these desperadoes were the Kelly brothers, who began their career of crime as cattle-stealers. They pillaged Jerilderie, New South Wales, in 1879, and repeated the exploit in 1880 at Genrowan, Victoria; but were shortly after brought to bay, and though wearing coats of mail, were shot down, the leader being captured

orchestral scores, and works for the piano.

**Busra.** See BASRA.

**Bussa.** See BOUSSA.

**Bussanga.** See BORGU.

**Bussey**, bus'i, BENJAMIN (1757-1842), American merchant and benefactor, was born in Canton, Mass. He served in the Revolutionary army, and at twenty-two established himself as a silversmith at Dedham, Mass. In 1782 he removed to Boston and entered the foreign trade, in which he amassed a fortune said to have been equal to \$350,000. He bequeathed all of this to Harvard, after the death of certain relatives, one-half for the endowment of a school of agriculture and one-half for the support of the law and theological schools. In accordance with the terms of his bequest the Harvard authorities in 1869 established a school of practical agriculture and horticulture on Mr. Bussey's former farm at Jamaica Plain.

**Bussora.** (BASSORA). See BASRA.

**Bust.** See SCULPTURE.

**Bustard**, a name applied to birds of the family Otididæ in general, but especially to *Otis tarda*, the Great Bustard, which

Great Bustard

is one of the largest of land birds, the wing span being eight feet or more. It still exists in the central and southern parts of Europe, in North Africa, and in Asia. Other varieties include the Little Bustard (*O. tetrax*), the Long-beaked Bustard (*Eupodotis*), the Hubara (*Hubara undulata*) of Northern Africa, and the Pink-collared Bustard (*Heterotetrax vigorsii*). The birds are hunted for their excellent flesh.

**Busto Arsizio**, bōōs'tō ār-sēd'zi-ō, town, Italy, in the province of Milan, 20 miles northwest of Milan. In the church (1517-22) is a fine altar-piece by Gaudenzio Ferrari. Linen and cotton goods are manufactured. Pop. 18,000.

**Bus Transportation**, the public conveyance of passengers in the modern automotive highway motor coach or motor omnibus. It is difficult to determine when

the first motor bus was used. In 1829 a steam omnibus was patented in England by Walter Hancock, and he was one of the first persons to run a steam carriage for hire. In 1833 there were 20 steam carriages built, or in process of construction, in London alone, but the hostility of stage-coach drivers, breeders of horses, farmers, and others, resulted in laws unfavorable to this new mode of transport, and further development was prevented.

In France, Amédée Bollée built a twelve-passenger steam car in 1873, and an improved omnibus, *La Nouville*, in 1880. This last vehicle in 1895, in the famous race from Paris to Bordeaux and return, made the 745 miles in 90 hours and 3 minutes.

The real development of the motor bus did not come about, however, until the introduction and perfection of the gasoline motor. The first motor bus to be operated on a regular schedule in America was put in service on Fifth Avenue, New York City, in 1907, by a company which had commenced operations with horse-drawn stage coaches in 1885, and which in 1926 was operating a fleet of about 400 motor coaches. Except for the Fifth Avenue buses, and their counterparts in London, Paris, and other cities, there were comparatively few important bus operations prior to 1920.

The years following 1910 saw the introduction in many American cities, of the so-called 'jitney bus,' taking its name from the five-cent fare usually charged. This was usually a five- or seven-passenger touring car, frequently bought second-hand by the operator. It differed from the taxicab in that it ran ostensibly on a regular route. In most cases, there was at first little regulation, and when control by the public authorities was established, and bonds and other evidences of responsibility were required of the operators, the jitney usually disappeared.

The first motor buses, beside the New York Fifth Avenue coaches, had a body or passenger-carrying compartment, patterned somewhat after a street-car, holding about twelve or fifteen passengers, and mounted on a motor truck chassis. An earlier development had been the sight-seeing car with cross seats, with or without a top, and differing in design chiefly as the vehicle was used in cities or over longer interurban routes. The modern bus may be said to represent a combination of earlier bus design with the idea represented in the sight-seeing car.

The essential feature of the bus of the present is that it is in

most respects a distinctive vehicle as compared either with the pleasure automobile or the motor truck. Thus, in the motor and chassis design, there are required more weight, power, and sturdiness than are available in the pleasure car, and more flexibility, speed, and comfort than are permissible in the usual truck. Bus chasses and motors are manufactured, however, by builders of both pleasure cars and trucks, as well as by concerns that specialize in bus manufacture. The bodies are often supplied separately.

There are now three recognized types of buses, designated respectively as the school, street-car, and parlor-car types. The school buses are mostly adaptations of earlier designs. The street-car type, as the name indicates, is designed for urban service and the parlor-car type for interurban or long distance service, although in the present stage of the art the designs are not as yet clearly defined, nor are the buses always used in the designated service. Buses of the street-car type are usually higher off the ground than those of the parlor-car type; the body also is higher, and so arranged as to permit standing and more ready entrance and exit. Besides being more elaborately outfitted, the parlor-car types are designed for greater speed; they may have less aisle space to allow for wider and more comfortable seats, and the low centre of gravity, desirable in the interests of speed, does not usually allow a body of such height as to make standing feasible. Some buses have cross seats with separate doors for each seat. Others have seats facing forward, two on each side of an aisle or two on one side and one on the other. Some of the street-car buses have seats extending along either side of the vehicle, or a combination of cross and longitudinal seats. Dining-car service is offered on a few long-distance runs. There are also available for the enterprising operator, vehicles equipped with observation platforms. Double-deck buses are in use for city operation in New York, Chicago, Philadelphia, and other cities, and there are instances of long-distance double-deck bus operation. (For illustration see MOTOR CARS.)

The capacities of buses range within fairly wide limits. Buses of the street-car type accommodate from 16 to 29 passengers, averaging about 25; the parlor-car buses from 10 to 33, the more common number being 25 to 29. The double-deck bus usually has about 60 seats.

The bus motors may be four- or six-cylinder. A new feature

is the so-called gas-electric bus, having a gasoline motor which drives an electric generator. Current from the latter is used to operate motors directly connected with the two rear wheels. Greater flexibility of operation, more even acceleration, and increased economy of operation are claimed for such vehicles. Four-wheel brakes are sometimes used, as are also brakes operated by air. Six-wheel buses—two wheels forward and four in the rear—are made by one company, while another company has proposed to build buses with eight wheels arranged like the wheels of a railway car.

It has been estimated that there were in service in the United States on Jan. 1, 1926, a total of 70,000 buses, as compared with 60,000 a year earlier. Of these, about 32,000 were owned by independent, common-carrier bus operators or bus-operating companies. About 27,000 were used by schools. Hotels owned about 1,000, and sight-seeing and tourist companies about 2,500. There were 1,100 devoted to industrial use, including real estate, department store, garage and factory service. Railroad terminal companies carrying passengers from one large station to another operated about 250. Electric railways operated 5,358 buses and the steam railroads about 375. The number of passengers carried in 1925 was estimated to be over 4 billion. The rapid growth of the industry was further shown by the production, in 1925, of 17,500 buses.

An interesting feature in connection with bus operation is the operation of such vehicles by the street railways. At the beginning of 1926, according to estimates by the *Electric Railway Journal*, there were operated by street railways, or in their interest, 5,358 buses, as compared with 2,462 at the beginning of 1925 and 1,200 at the beginning of 1924; the number of companies operating buses on January 1, 1926, was 251, or 35 per cent. of the total number; the total mileage of street railway bus routes on Jan. 1, 1926, was 13,000, and the number of passengers carried in 1925 was 800 million. Passengers on the street railways in the same year totalled about 16 billion. The Public Service Railway of New Jersey, then operating 809 buses, was the largest bus operator in the country, and the third largest in the world, being exceeded only by the London General Omnibus Company and the *Compagnie générale des omnibus de Paris*.

Bus operations of street-railway companies have been classi-

fied as follows: (1) Extensions into unserved territory which has developed some distance from the rail facilities; (2) replacement of trolley service on routes where the revenue is low and where large expenditures would be required for track and overhead rehabilitation; (3) between terminals where the highway offers a shorter route than the rail line which was built along a circuitous route to serve the greatest amount of intervening territory.

The policy of the street railways in regard to bus transportation is expressed in a statement by the Executive Committee of the American Electric Railway Association in which they declare that though no medium has yet been developed which can alone take the place of the electric railway, there is a place for the bus as an auxiliary and in some cases a substitute for electric lines; and state their conviction that electric railways supplying such service should be protected against competition, should be regulated by law as common carriers, and should bear proportionate taxes and other public obligations fairly chargeable to them as public carriers.

The steam railroads have not thus far engaged extensively in bus operation. Bus operation by steam railroads began in 1923 with small operations of two railroads. The New York, New Haven & Hartford, which now owns about 100 buses, began operations on a small scale in September 1925. Its policy at that time, as stated to the Massachusetts Department of Public Utilities, was as follows:

Where the operation of the motor coach thus becomes desirable or necessary, it will, so far as practicable, be operated: (a) as an extension of and in connection with rail service, making connections with important trains that may be desirable in the public interest; (b) parallel with and as feeders to rail service, thus enabling the rail service to be scheduled more rapidly and in consequence to become more attractive to the public; (c) for the filling of rail schedule intermissions where highway operation is justified but where passenger traffic is too light or freight switching too heavy to justify gas rail cars, and where through the operation of the highway service, these gaps in the rail schedule can be filled, and (d) for a highway service, connecting with the rail service so far as practicable, between certain populous centres where the rails handle passenger travel, but between which the construction of new or the improvement in

old highways has now created a situation in which the operation of the motor coach offers the only means of regaining former revenues now lost, and of more directly combining the two forms of transportation.

The operation of buses is so new that methods of public regulation are not yet fully developed. Legal means by which buses could be operated on highways, for hire, and between fixed termini were first determined in Massachusetts in 1916, in Connecticut in 1921, and in Rhode Island in 1922. Street railways were permitted to operate buses in Massachusetts in 1920, in Connecticut in 1921, and in Rhode Island in 1922. Steam railways in these States were not given authority to operate buses until 1925.

Most of the States have established some method of public regulation. The more common practice places this with the State public utilities commission, from which the prospective bus operator is required to procure a certificate of public convenience and necessity. The commission is empowered to alter or cancel such certificates, and has supervision over fares, schedules, and service. In most States having such regulation, the filing of an indemnity bond is required. In several of the States, permission of the municipalities through or in which the buses operate is a requisite. Up to January 1926 there was no regulation of interstate bus operations, the U. S. Supreme Court having held that the establishment of such regulation is a function only of Congress. A bill establishing interstate regulation, having the approval of the steam and street railway organizations, the bus operators, and the National Association of State Railroad and Public Utilities Commissioners, was then pending in Congress.

See MOTOR CARS. Consult Hauer and Scrogg's *Bus Operating Practice*; Grupp's *Economics of Motor Transportation*; *Bus Transportation* (periodical); *Electric Railway Journal*; *Railway Age*.

**Busuanga**, bōō-swāng'a, one of the Philippine Islands, in the Calamianes group. See CALAMIANES.

**Butan**. See BHUTAN.

**Bu'tane**, either of two isomeric paraffins having the formulæ  $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_3$  and  $\text{CH}_3\text{CH}(\text{CH}_3)_2$ . They are both inflammable gases, the first condensing to the liquid state at  $1^\circ \text{C}$ ., and the second at  $17^\circ \text{C}$ .

**Butcher**, SAMUEL HENRY (1850-1910), professor of Greek at Edinburgh University (1882-1903), was born in Dublin. He published *Prose Translation of the*

*Odyssey*, with Andrew Lang (1889); *Demosithenes* (1881); *Some Aspects of the Greek Genius* (1891, 1893); *Aristotle's Theory of Poetry and the Fine Arts, with a Critical Text and Translation of the Poetics* (1895, 1897); *Harvard Lectures* (1904).

**Butcher Bird**, a shrike (*Lanius*), so-called from the habit of impaling prey on thorns as butchers hang up meat. See SHRIKE.

**Butcher's Broom** (*Ruscus*), the popular name for a few species of European dioecious shrubs of the order Liliaceæ. *R. aculeatus* is interesting on account of its leaf-like stems, on which the

1. Male flower. 2. Female. 3. Berry.

flower appears. The fruit is a bright red berry, which when roasted has been substituted for coffee. The plant was formerly used by butchers to sweep their blocks.

**Bute**, *būt*, an island in the Firth of Clyde, Scotland, 15½ miles long and from 1½ to 6½ miles wide, with an area of 47 square miles. The surface is mostly grassy and hilly, with a few woods and plantations. The climate is mild, and the people are engaged chiefly in agriculture and fishing. Pop. (1921) 19,465.

**Bute**, JOHN STUART, THIRD EARL OF (1713-92), British statesman, said to have been the most unpopular minister who ever held office in England, was born in Edinburgh. He entered the service of Frederick, Prince of Wales, in 1747, and became groom of the stole to the son (George III.) of that prince in 1751, early acquiring great influence over him. Upon the accession of George III. Bute became the agent of the king in his opposition to Pitt, and after that

statesman's fall he succeeded to the office of prime minister (1762) till he was forced by popular feeling to retire (1763). The responsibility for the desertion of Frederick the Great, for the peace of 1763, and for the initiation of a new policy towards the American colonies, was not his, however, but his royal master's. Bute was a patron of literature, and gave Johnson an annuity of £300.

**Butea**, *bū'tē-a*, a genus of Indian and Chinese shrubs or small trees of the order Leguminosæ. The leaves are trifoliate and of a velvety texture, and the large flowers are deep scarlet in color. The resinous sap forms a gum of astringent qualities known as Bengal kino, and the seeds furnish an oil used as a vermifuge. The best known species (*B. frondosa*), called the Dhak Tree, grows to a height of 50 feet; the coarse fibrous material from the inner bark is used for caulking boats; the dried flowers furnish a yellow or orange dye.

**Bute'shire**, county of Scotland, comprising the islands of Bute, Arran, the Cumbraes, Pladda, Holy Isle, and Inchmarnock; area 139,658 acres. Rothesay is the capital. Pop. (1921) 33,711.

**Butler**, city, Pennsylvania, county seat of Butler county, on Coneynessing Creek, and on the Baltimore and Ohio, the Buffalo, Rochester and Pittsburgh, and the Pennsylvania Railroads; 28 miles north of Pittsburgh. The town is the centre of a rich oil, gas, coal and iron region, and has foundries, flour and steel mills, and manufactures of oil-well supplies, carriages, paints and varnish, farm lighting plants, railroad cars and equipment, gas engines, and white lead. According to the Federal Census for 1919, industrial establishments number 77, with products valued at \$44,476,790. Pop. (1900) 10,853; (1910) 20,728; (1920) 23,778.

**Butler**, ALBAN (1711-73), Roman Catholic biographer, was educated at Douay, where he became professor of philosophy and of divinity. From 1768 until his death he was president of the English College at St. Omer. His monumental work, *The Lives of the Saints*, the result of thirty years labor, was published in 1756-9. After his death appeared his *Moveable Feasts and Fasts* (1839), *Meditations and Discourses* (1791-3), and *The Life of Sir Tobie Matthews* (1795).

**Butler**, AMOS WILLIAM (1860- ), American ornithologist and sociologist, was born in Brookville, Ind., and was graduated from Indiana University. He was a founder of the Indiana

Academy of Science, became its president in 1895, and was ornithologist to the Indiana State department of geology and natural resources in 1896-7. He filled several important offices in the American Association for the Advancement of Science. From 1897 until 1922 he served as secretary of the Indiana Board of Charities. He published *The Birds of Indiana, A Century of Progress of Charities and Correction in Indiana*, and papers on sociology and natural science.

**Butler**, BENJAMIN FRANKLIN (1795-1858), American lawyer, was born in Kinderhook Landing, N. Y. He studied law with Martin Van Buren, and in 1817 was admitted to the bar. He was district-attorney of Albany county (1821-4), was a commissioner to revise the statutes of New York (1825-7), served in the legislature and in other public capacities, and from 1833 to 1838 was U. S. attorney-general under President Jackson. In 1836-7 he was also acting secretary of war, and from 1838 to 1841 was U. S. district-attorney for the southern district of New York. He prepared the plan for organizing the law department of the University of New York, and was its principal professor from 1837. Butler was for many years an influential Democrat, but left the Democratic party at the time of the repeal of the Missouri Compromise and thereafter voted with the Republicans. He was a thorough scholar and a distinguished lawyer. Some of his addresses were published as *Outlines of the Constitutional History of New York* (1847).

**Butler**, BENJAMIN FRANKLIN (1818-93), American political leader and soldier, was born in Deerfield, N. H. He was graduated from Waterville (now Colby) College (1838), and was admitted to the bar (1840). On the outbreak of the Civil War he became a brigadier-general of U. S. volunteers (April, 1861), and in May 1861 was made a major-general. He was at first in command at Baltimore, was then (May, 1861) transferred to the command at Fortress Monroe, and there received fugitive slaves into his lines, justifying their retention on the ground that they were 'contrabands of war.' Early in 1862 he commanded the land forces which accompanied Faragut in his expedition against New Orleans, and, after the surrender of that city, assumed command there (May 1, 1862), remaining in practically absolute control until superseded by General Banks on Dec. 17. His administration was vigorous and in many respects able, but he was charged, apparently with good reason, with having corruptly

aided his brother in the latter's illegitimate commercial speculations; he also angered the whole South by his notorious 'woman order' of May 15, which directed that 'when any female shall by word, gesture, or movement, insult or show contempt for any officer or soldier of the United States, she shall be regarded and held liable to be treated as a woman of the town plying her avocation.' This order aroused indignation in Europe as well as in America, especially in England, where it greatly increased the difficulties of Minister C. F. Adams. After Butler's summary execution (June 7) of W. B. Mumford, who had hauled down the U. S. flag, President Davis issued a proclamation (Dec. 23, 1862) calling Butler 'an outlaw and common enemy of mankind,' and directing that, if captured, he, or any commissioned officer serving under him, should be hanged without trial. This proclamation led Secretary Stanton to discontinue (Dec. 28) the exchange of commissioned officers. Subsequently (1864) Butler commanded the Department of Virginia and North Carolina, until he was relieved (Jan. 7, 1865) at the request of General Grant. After the war he was a Republican representative in Congress (1867-75 and 1877-9), being a leader in the impeachment trial of President Johnson. In 1879 he rejoined the Democratic party; in 1882-3 was governor of Massachusetts; and in 1884 was the presidential candidate of the Anti-Monopoly and Greenback parties, receiving a popular vote of 175,370. Consult his *Autobiography and Personal Reminiscences: Butler's Book* (1892); Parton's *General Butler in New Orleans and Rhodes' History of the United States from the Compromise of 1850*

**Butler, CHARLES** (1750-1832), English Roman Catholic and legal writer, a nephew of Alban Butler, continued and completed Hargrave's edition of *Coke upon Littleton*. His philological and biographical works (5 vols. 1817) contain dissertations on political and legal as well as ecclesiastical subjects, and his valuable letter-books are preserved in the British Museum. For many years he conducted an agitation to enlarge the freedom of English Catholics, but he was successfully opposed by Bishop Milner. Consult his *Reminiscences*.

**Butler, CHARLES** (1802-97), American lawyer, brother of B. F. Butler (1795-1858), was born in Kinderhook Landing, N. Y. He studied law with his brother and Martin Van Buren, at that time partners, was admitted to the bar in 1824, practised in Lyons and Geneva, N. Y., and

was for some time assistant district-attorney for Genesee county. He removed to Chicago (then Fort Dearborn) in 1833, and there laid the foundations of his fortune by buying land afterwards included within the limits of the city. He repeated the operation at Toledo, O., returning to New York City in 1835, where he subsequently busied himself with the development of Western railways. He was a founder (1835) and a liberal benefactor of the Union Theological Seminary, was for many years a member of the council of the University of New York, and interested himself in other educational and charitable institutions.

**Butler, CHARLES HENRY** (1859- ), American lawyer, was born in New York City, and was graduated (1881) from Princeton University. He practised law in New York for many years, and in 1898 was legal expert for the Anglo-American commission for the delimitation of the Alaskan boundary. In 1902 he was appointed reporter of decisions to the U. S. Supreme Court. He resumed the practice of law in Washington in 1916. He is the author of *Cuba must be Free* (1898), *The Voice of the Nation* (1898), *Our Relations with Spain* (1898), *Our Treaty with Spain* (1899), *Freedom of Private Property on the Sea* (1899), and *The Treaty-making Power of the United States* (1902).

**Butler, ELIZABETH SOUTHERDEN, LADY**, English military painter, daughter of Thomas J. Thompson, was born in Lausanne, Switzerland, and was married (1877) to Major-general Sir William Francis Butler. Among her works are *Missing* (exhibited Royal Academy, 1873), *Roll Call* (1894, purchased by Queen Victoria), *Bataclava* (1876), *Inkermann* (purchased for £3,000 by the Fine Art Society, 1877), *Listed for the Connaught Rangers* (1879), *Scotland for Ever and Defence of Rorke's Drift* (1881), *Floreat Etona* (1882), *Evicted* (1890), *The Camel Corps* (1891), *Hall in a Forced March* (1892), *Dawn of Waterloo* (1895), *Steady the Drums and Fifes* (1896), *Tent Pegging in India* (1902), *Rescue of Wounded* (1905), *A Cistercian Shepherd* (1908). Her writings include: *Letters from the Holy Land* (1903) and *From Sketchbook and Diary* (1909).

**Butler, ELLIS PARKER** (1869- ), American author, was born in Muscatine, Iowa. His writings include: *French Decorative Styles* (1906); *Pigs is Pigs* (1906); *The Incubator Baby* (1906); *Great American Pie Co.* (1907); *Confessions of a Daddy* (1907), *Cheerful Smugglers* (1908); *Thin Santa Claus* (1909); *Adventures of a Suburbanite* (1911); *Red Head*

(1916); *Dominie Dean* (1917); *Philo Gubb* (1919).

**Butler, HENRY MONTAGU** (1833-1918), English educator, master of Trinity College, Cambridge (1886-1918), was born in Northamptonshire. He was senior classic (1855) at Cambridge, headmaster of Harrow (1859-85), dean of Gloucester (1885-6), and vice-chancellor of Cambridge University (1889 and 1890). In 1912 he was appointed chaplain in ordinary to the king. Among his works are several volumes of sermons, *Ten Great and Good Men* (1909); *Lord Chatham as an Orator* (1912); *Some Leisure Hours of a Long Life* (1914).

**Butler, JAMES**. See **ORMONDE, EARL OF**.

**Butler, JAMES GLENTWORTH** (1821-1916), American clergyman, was born in Brooklyn, N. Y. He studied divinity at the Union Theological Seminary and the Yale Theological School, and was pastor of a Presbyterian church in West Philadelphia, Pa., from 1852 to 1868, and of a church in Brooklyn, N. Y., from 1871 to 1873. After 1874 he devoted himself to the preparation of his commentary, *Bible Works*, in eleven volumes (1874-93).

**Butler, JOHN** (?-1794), American soldier, was born in Connecticut. He commanded the Indians under Sir William Johnson in the Niagara campaign of 1759, and the Montreal expedition of 1760. He sided with the British in the Revolutionary War, and, after several minor raids, led the British force at the Wyoming Valley massacre (1778), and is said to have countenanced the most atrocious cruelties. At the close of the war, he sought refuge in Canada. His American property was confiscated, but he was liberally compensated by the British government.

**Butler, JOSEPH** (1692-1752), English theologian and apologist, was born at Wantage in Berkshire. In 1718 he became preacher at the Rolls Chapel, London, where he delivered the *Fifteen Sermons*, published in 1726. In 1721 he became a prebendary of Salisbury Cathedral. The bishopric of Bristol was conferred upon him in 1738, and that of Durham in 1750. About 1741 he suggested a plan for the establishment of bishops in the American colonies, which was, however, not adopted, although in 1763, some ten years after his death, his plan was again brought into notice by a controversy between Secker and the Rev. Dr. Mayhew of Boston. Butler's fame rests on *The Analogy of Religion, Natural and Revealed to the Constitution and Course of Nature*, which was published in 1736. In it he seeks to show that the results of observation of the facts of nature

fall in with the belief in a moral governor, for which our consciences call—i.e., that there is an 'analogy' between nature and what he calls natural religion. He further maintains that the facts of observation are consistent with the Christian 'revealed religion'; but in this phase of the question his arguments undoubtedly lack the cogency which characterizes his *apologia* proper.

An acute criticism of Butler's reasoning, from the agnostic point of view, will be found in Leslie Stephen's *English Thought in the Eighteenth Century*. Consult Gladstone's edition of Butler's *Works* (new ed. 1910).

**Butler, MATTHEW CALBRAITH** (1836–1909), American soldier and legislator, was born near Greenville, S. C. He distinguished himself as a Confederate cavalry leader; losing a leg at Brandy Station (1863), and opposing Sherman in South Carolina (1865); and rising from the rank of captain to that of major-general. He served in the State legislature (1866–77); and was a member of the U. S. Senate (1877–89), where he advocated enlargement of the U. S. Navy and civil service reform. During the Spanish-American War (1898–9) he was a major-general of volunteers, and after its close a member of the Cuban evacuation commission.

**Butler, NICHOLAS MURRAY** (1862– ), American publicist and educator, was born in Elizabeth, N. J. He was graduated from Columbia University in 1882 (A.M., 1883; Ph.D., 1884), and studied in Berlin and Paris. He was successively assistant in philosophy (1885–6), tutor (1886–9), adjunct professor (1889–90), and dean of the faculty of philosophy and education (1890), at Columbia University; and since January, 1902, has been both professor of philosophy and education and president of the University. He was a delegate to the Republican National Conventions of 1888, 1904, 1908, 1912, 1916, 1920, and 1924; chairman of the New York Republican Convention in 1912; received the Republican electoral vote for Vice-President in 1913; and was presented as candidate for President at the Republican National Convention of 1920 by the New York delegation, receiving 69½ votes. He was made an officer of the French Legion of Honor in 1906 (commander in 1912 and Grand Officer 1921), and has been honored by numerous other foreign governments. He is a member of the American Academy of Arts and Letters.

Dr. Butler has edited several educational series, and founded and edited *The Educational Review*. His published works in-

clude: *The Meaning of Education* (1898; new ed. 1915); *Education in the United States* (1900); *True and False Democracy* (1907); *The American As He Is* (1908); *Philosophy* (1911); *Why Should We Change Our Form of Government?* (1912); *The International Mind* (1913); *What is Progress in Politics?* (1913); *A World in Ferment* (1918); *Is America Worth Saving?* (1920); *Building the American Nation* (1923).

**Butler, PIERCE** (1866– ), American public official, was born in Dakota county, Minnesota. He was graduated from Carleton College, Northfield, Minn., in 1887 and was admitted to the bar in 1888. He was assistant (1891–3) and county (1893–7) attorney of Ramsey county, Minn., and after two years of general practice, became general attorney for the Chicago, St. Paul, Minneapolis, and Omaha railroads. He was counsel for the U. S. government in the prosecution of the Chicago meat packers for violation of the Sherman Act and in 1922 was appointed an associate justice of the U. S. Supreme Court.

**Butler, SAMUEL** (1612–80) English poet, was born in Strensham, Worcestershire, and was educated at Worcester Cathedral School. His first occupation was that of secretary to Mr. Jefferies, Earl's-Croome, Worcestershire, where he gained the friendship of the painter Samuel Cooper. He was next in the household of the Countess of Kent (1628), his duties associating him with John Selden; and then in the service of Sir Samuel Luke, a stern Presbyterian, and one of Cromwell's officers. After the Restoration he was secretary to the Lord President of Wales, under whom he was appointed steward of Ludlow Castle (1660). The legend that Butler was secretary to Buckingham when chancellor of Cambridge is scouted by Dr. Johnson, whose attitude is strengthened by the bitter tone of the 'Duke of Bucks' in the poet's posthumous *Characters*.

Butler published the first part of his famous *Hudibras* in 1663, the second in 1664, and the third in 1678, and in the end he had not finished his ridicule of fanatical Puritanism. Ostensibly a narrative, the poem owes nothing to the story. Its greatness rests on its droll, irresistible satire. It is a storehouse of pungent criticisms, terse epigrams, and wise saws, which have passed into the language of daily life. *Don Quixote*, the *Satyre Ménippée*, Cleveland's verses, and the *Musarum Deliciae* were all probably sources of inspiration; but direct and forcible originality everywhere prevails. *The Elephant in the Moon, Cat and Puss*, and

other works have merit, but fall far below *Hudibras*.

Butler died in Rose Street, Covent Garden, of consumption, and was buried in the churchyard of St. Paul's. In 1721 a monument was erected to him in Westminster Abbey. Aubrey described him as 'strong set, high colored, a head of sorrel hair, a severe and sound judgment—a good fellow.' Consult Johnson's *Lives of the Poets* and Henry Morley's *Character Writings of the Seventeenth Century*.

**Butler, SAMUEL** (1835–1902), British author, was born in Nottinghamshire, and spent several years of his early life in New Zealand. He exhibited a number of paintings at the Royal Academy (1868–76), and published several musical compositions; but his fame rests on his literary work. In 1872 he published *Erewhon*, a paradoxical Utopia abounding in humor and irony, in which he satirized the Darwinian theory; and in 1901 a sequel, *Erewhon Revisited*. He also wrote: *The Fair Haven* (1873); *Life and Habit* (1877); three other attacks on the Darwinian theory—*Evolution Old and New* (1877), *Unconscious Memory* (1880), and *Luck or Cunning* (1883); *Alps and Sanctuaries of Piedmont* (1881); *Ex Voto* (1888); *Life of Bishop Buller* (1896); *Authoress of the Odyssey* (1897); *Shakespeare Sonnets* (1899); *The Way of All Flesh* (1903), and *Essays on Art, Life, and Science* (1904)—the last two appearing posthumously. He translated the *Iliad* and the *Odyssey*.

**Butler, SIR WILLIAM FRANCIS** (1837–1910), British soldier and author, was born in Suirville, Tipperary. He served under Wolseley in Natal (1875) and in the Sudan campaign (1884–5); was brigadier-general in Egypt (1890–3); and was raised to the rank of major-general, and received a command at Aldershot (1893). He was commander of the troops at Cape Colony in 1898–9, but was recalled before the South African War because his views on the Transvaal difficulty were not 'Imperialist.' In 1877 he married Lady Elizabeth Butler (q. v.). He published: *The Great Lone Land* (1872); *The Wild North Land* (1873); *Akimfoo* (1875); *Far Out* (1880); *Red Cloud the Solitary Sioux* (1882); *The Campaign of the Cataracts* (1877); *Charles George Gordon* (1889); *Sir Charles Napier* (1891); *Life of Sir George Pomeroy Colley* (1899); *From Naboth's Vineyard* (1907).

**Butler, WILLIAM ORLANDO** (1791–1880), American soldier and political leader, was born in Jessamine county, Ky. He served in the War of 1812, taking part in the western campaign and the

Battle of New Orleans, for which he was brevetted major. Resigning from the army in 1817, he practised law at Carrollton, Ky., and was a member of Congress in 1839-43. In the Mexican War he served as major-general of volunteers; was second in command to General Taylor at Monterey, where he was severely wounded (Congress voting him a sword for gallantry); and from February to May, 1848, commanded the U. S. Army in Mexico. In 1848 he was the Democratic candidate for the Vice-Presidency. In 1861 he was a member of the Peace Congress at Washington. He published *The Boatman's Horn, and Other Poems*.

**Butler**, ZEBULON (1731-95), American soldier, was born in Lyme, Conn. He was in command of Fort in the Wyoming Massacre (July 3, 1778); accompanied General Sullivan on his expedition against the Indians in 1779; served in the French War; and was a colonel in the American Revolution.

**Butler College**, a coeducational, non-sectarian institution, under the control of the Disciples of Christ, situated in Indianapolis, Ind., and chartered in 1850 as the Northwestern Christian University. Its title was changed to Butler College in 1896, when it entered into affiliation with the University of Indianapolis. In addition to the usual college courses it has a Preparatory Department, Schools of Music and Art, and a Summer School. The Indiana Law School and Indiana Dental College are associated with Butler College. For recent statistics see Table of American Colleges under COLLEGE.

**Buto**, bū'tō, an Egyptian goddess, specially honored at Buto, northeast of Sais, her oracle being one of the most celebrated in Egypt. She was identified by the Greeks with Leto, the mother of Apollo. Her older name was Uto, and she was represented as a serpent, sometimes with wings, and wearing the red crown of Lower Egypt.

**Butomus**. See FLOWERING RUSH.

**Buton**, bū-ton', island of the Dutch East Indies, southeast of Celebes and separated from it by Tioro and Wowoni Straits. It is over 100 miles long and has an area of about 1,600 square miles. Pop. 100,000.

**Butt**, ARCHIBALD WILLINGHAM (1866-1912), American soldier, was born in Augusta, Ga., and was graduated from the University of the South. He received a commission in the regular army in 1901, and served as quartermaster in the Philippines, at Washington, D. C., and at Havana. He acted as personal aid

to President Roosevelt (1908-09) and to President Taft (1909-12), and was made a major in 1911. He lost his life in the *Titanic* disaster (q. v.).

**Butt**, CLARA (1873- ), English contralto, was born in Southwick, Sussex. She made her début at the Albert Hall, London, in 1892, where she was received with enthusiasm; studied in Paris under Bouhy and Gerster in 1895; and in 1900 married Kennerly Rumford, a baritone singer, with whom she subsequently appeared in concert work.

**Butt**, ISAAC (1813-79), Irish political leader, was born in Glenties, County Donegal. A successful barrister, he offered strong opposition to Daniel O'Connell; but about 1852 his political opinions changed, and in 1871 he was chosen leader of the Home Rule party. He wrote: *The Transfer of Land by Means of a Judicial Assurance* (1857); *Home Government for Ireland* (1874); *The Problem of Irish Education* (1875).

**Butte**, būit (Western United States), a knoll or isolated hill, the result of erosion, usually located in an arid or semi-arid plain, and therefore conspicuous for some distance. In California the term also signifies a high mountain.

**Butte**, largest city in Montana, county seat of Silver Bow county, on the Butte, Anaconda and Pacific, the Chicago, Milwaukee and St. Paul, the Great Northern, the Northern Pacific, and the Oregon Short Line Railroads; 73 miles southwest of Helena, the State capital. The Yellowstone Transcontinental Trail, the Vigilante Trail, and the Banff to Grand Canyon and National Park Highway all pass through Butte. It is situated in a picturesque region of the Rocky Mountains on the slopes of the continental divide at an altitude of 5,700 feet. Public institutions and buildings include the State School of Mines, public library, business college, high schools, Federal Building, churches, public and parochial schools, and several hospitals.

Extensive copper, gold, silver and zinc mines make Butte one of the greatest mining centres of the world, with an approximate annual production of 350,000,000 pounds of copper, 230,000,000 pounds of zinc, 50,000 ounces of gold. An idea of the magnitude of mining operations is conveyed by the fact that while Butte has on the surface 253 miles of streets, her underground workings aggregate no less than 2,700 miles. According to the U. S. Census of Manufactures for 1919, Butte has 115 industrial establishments, with \$4,018,888 capital and products valued at

\$5,261,592. Pop. (1900) 30,470; (1910) 39,165; (1920) 41,611.

**Butter** is the product obtained by churning milk (q. v.) or cream, and working the mass to remove the constituents other than fat (q. v.). Physically it is composed of a very great number of minute fat globules, which coalesce in churning and working but always hold a certain amount of moisture containing in solution traces of casein, sugar, and salt (qq. v.). The size of the fat globules varies greatly with the breed of cows, but it is estimated that a pound of butter contains from 720,000,000 to 180,000,000,000 of these globules.

Butter varies considerably in chemical composition, the most variable constituent being the moisture, which naturally affects the percentage of fat. An average composition may be said to be 12 per cent. of water, 84 of fat, 1 of casein, albumin, and sugar, and 3 of salt and other mineral matter. The percentage of water is quite largely in the control of the maker, and ranges from 7 or 8 up to 25, and even more. The food standards proclaimed by the U. S. Department of Agriculture call for not less than 82.5 per cent. of butter fat in butter, which would admit of not more than 15 per cent. of water.

Butter fat is made up of ten component fats, and is easily decomposed in spite of all known methods of preservation. It is almost completely digestible, and is especially adapted for human food. While butter can be made by churning the fresh milk, it is difficult to make a good product in that way, and in practice the cream is used. There are two general methods of separating the cream from the milk: (1) the gravity method, and (2) the centrifugal method.

(1) The *gravity method* is based upon the fact that the fat globules, being lighter than other constituents of the milk, tend to rise to the top on standing. The milk is placed in shallow pans, where it is allowed to stand for from eighteen to twenty-four hours, or is set in tall, narrow cans which are immersed in cold water. Cooling increases the difference in specific gravity between the fat and the milk serum (as the remainder is called), and makes the creaming more rapid and complete.

(2) The modern method of creaming now generally used in large dairies and creameries is the *centrifugal method*, in which the fat is removed by means of the cream separator. The fresh milk runs in a steady stream into a bowl which is revolving at the rate of 4,000 to 6,000 turns a minute, or more, and the force it is subjected to throws the heavier part, the water,

casein, etc., to the circumference, and collects the fat in the centre of the bowl. The skim milk and the cream, thus separated, are removed by means of tubes placed in the proper position, the operation being continuous. Hand-operated separators skim from 175 to 350 lbs. of milk an hour, and the power machines up to ten times the latter amount. In careful work the skim milk contains only about 0.05 per cent. of fat.

The cream may be churned at once, making sweet-cream butter, which is mild in flavor and does not keep long; or it may first be 'ripened,' the more common practice. The ripening process is one of carefully controlled fermentation and is usually accomplished by the addition of a 'starter' containing the desired organisms but no injurious forms. The cream is sometimes pasteurized before the starter is added. When the proper amount of acid has developed, the cream being kept meanwhile at a temperature of 60-70° F., the actual churning is done. This consists in subjecting the cream to violent agitation, so that the fat globules are collected in a granular mass. The butter is then washed, salted, worked, either by hand or with a butter worker, and made into prints or packed in tubs or boxes for the market. Some harmless coloring matter is usually added.

The quality of butter depends upon the feed given the cows, the season of the year (which affects both the feed and the fermentation of the cream), the care of the milk, the stage of lactation of the cows, and the skill of the butter maker. Scrupulous cleanliness in the stable and the dairy or creamery is essential. Even butter which is of good quality when fresh may develop an undesirable flavor if it is kept too long under unfavorable conditions. Stored in cool places, preferably in refrigerators, at temperatures of zero or lower, it may be kept for months.

The butter made at creameries is of more uniform and usually better quality than that made on farms. The creamery system has spread rapidly in all parts of the country, and a larger amount of butter is now made in factories than on farms. Much of the country-made butter is unfit for use, or does not find ready market, and is 'renovated,' and sold under the law as 'process' or 'renovated' butter. It is melted, clarified, and treated by mechanical and chemical processes which remove the rancidity and obnoxious flavors, and is then re-churned with the addition of a little milk or cream to give it flavor. It is produced under government supervision to insure

the employment of wholesome materials and processes. Other commercial substitutes for butter are oleomargarine, butterine and nut butters. Oleomargarine (q.v.) is a mixture of various animal and vegetable fats, churned with milk to impart a butter flavor. Butterine is oleomargarine mixed with more or less butter. The name, however, has no standing in law and is often applied to straight oleomargarine.

Nut butters are made of finely ground nuts, with or without the addition of water, oil, and salt, and have a homogeneous consistency similar to true butter. They are rich in fat and therefore easily become rancid.

Butter is one of the most important sources of fat in man's diet, as well as one of the most palatable and most digestible. It possesses a further superiority over other fats used as food in that it contains a considerable amount of Vitamin A (see VITAMINS). It supplies about 3,500 calories per pound. It is more wholesome raw than when heated, as in cooking.

Butter making has developed rapidly in the United States, spreading from New England and New York to the North-Central States, where the greatest centres of production are now found. More than 1,700,000,000 lbs. of butter are produced annually in this country, valued at nearly \$500,000,000 and requiring the milk of about 12,000,000 cows. Other important butter-producing countries are Canada, Denmark, the Netherlands, Argentina, and Australia.

Consult Wing's *Milk and its Products*; Guthrie's *The Book of Butter* (1918); Walker-Tisdale's *Butter and Cheese* (1920); Hunziker's *The Butter Industry* (1920).

**Butter, ROCK, or MOUNTAIN**, a combination of alum and iron, soft and greasy to the touch, and having the appearance of butter, which exudes from aluminiferous rocks.

**Butter-and-Eggs**, a common name for the Yellow Toadflax (q.v.).

**Butterbur**, or BOG RHUBARB, popular name of *Petasites vulgaris*, a genus of Compositæ, introduced into America from Europe, growing in swampy ground in Eastern Massachusetts and Eastern Pennsylvania. The attractive pink flowers borne on short, thick, erect stalks, appear in April and May, before the broad rhubarb-like leaves.

**Buttercup**, a name applied to various species of Ranunculaceæ with cup-shaped, glistening yellow flowers. See RANUNCULUS.

**Butterfield**, DANIEL (1831-91), American soldier, was born in Utica, N. Y. He was graduated from Union College in 1849

and entered the express business in New York City. At the outbreak of the Civil War he was colonel of the 12th New York militia and led his regiment to the front. He served with the Army of the Potomac, was wounded at the battles of Gaines Mills and Gettysburg, and served with such distinguished gallantry that he was commissioned colonel in the regular army, and brevetted major-general, U. S. A. He was in command of the forces in New York harbor (1866-9), and afterward was in charge of the U. S. sub-treasury in New York City (1869-70). He subsequently re-entered commercial life. He is the author of *A System of Calls, Packet and Outpost Duty, Corps Badges and Flags*.

**Butterfield**, KENYON LEECH (1868- ), American educator, was born in Lapeer, Mich. He was educated at Michigan Agricultural College, and after serving as editor of various agricultural publications, was president and professor of political economy and rural sociology at Rhode Island College of Agriculture and Mechanical Arts (1903-06). In 1906 he became president and head of the division of rural social science, Massachusetts Agricultural College, and in 1924 resigned this position to accept the presidency of Michigan Agricultural College. In 1904-16 he was collaborator in charge of the agricultural division, Department of Economics and Sociology, Carnegie Institute, Washington, D. C. His publications include *Chapters in Rural Progress; The Country Church and the Rural Problem; The Farmer and the New Day; A Christian Programme for the Rural Community*.

**Butterfish**, a local name for the harvest fish and some others which are noted for fatness. In England this name is given to a blenny, the gunnel (*Centronotus gunnellus*), very common in shore pools, on account of the elongated, slippery form, which makes it exceedingly difficult to catch.

**Butterflies**, a group of insects which, together with the moths, constitute the insect order Lepidoptera. They are known as Rhopalocera and are distinguished from the moths, which they closely resemble, chiefly by their club-shaped antennæ (for illustration, see MOTHS), absence of the hook-and-eye arrangement of interlocking wings characteristic of many moths, and the position of the wings (erect with the two upper surfaces in proximity) at rest. They are generally diurnal in habit, while most moths are nocturnal.

The body of the butterfly consists of three parts: the head, the thorax, and the abdomen. The head is globular, bearing large compound eyes, between which

are the antennæ or 'feelers,' which probably serve as organs of hearing and smell. The oval thorax consists of three closely united segments, to which are attached the three pairs of legs and the two pairs of wings. The abdomen consists of nine segments (ten in the male), the last carrying various appendages, mainly sexual in nature. The wings, which vary greatly in shape and size, are covered with beautiful scales, diversified in form and color.

Butterflies are both polymorphic and dimorphic; they display forms of albinism and melanism, and possess in large degree the quality of mimicry (q.v.). They are found almost everywhere, even in the high mountains of the colder regions, but most of them thrive best in the sunshine and warmth of the tropics and in temperate regions. Their life history is divided, as in most insects, into the period of incubation in the egg, the larval or caterpillar stage (see CATERPILLAR), the transformation into the pupa or chrysalis, and the final emergence as the imago, or perfectly developed insect.

The butterflies may be divided into five principal families, as follows: the Nymphalidæ, Lemoniidæ, Lycænidæ, Papilionidæ, and Hesperiidæ. The Nymphalidæ, or 'brush-footed' butterflies, form the largest of these families, containing as many as 5,000 species and having many subdivisions. The first pair of legs in butterflies of this family is either atrophied or greatly reduced in size and is carried folded on the thorax. Familiar species of Nymphalidæ are the Milkweed Butterflies, Fritillaries, Tortoise Shells, Painted Ladies, and Admirals. The Lemoniidæ, or 'metalmarks,' are confined chiefly to the tropics of the New World. They are rather small and brilliantly colored, with unusual spots and markings. The Lycænidæ include some of the gayest and most attractive members of the butterfly world. Among them are the well known 'Blues,' 'Coppers,' and 'Hair Streaks.' The Papilionidæ or 'swallow-tails' are a large family characterized by six perfect legs in both sexes. They include the largest species of butterflies; white, yellow and orange are the prevailing colors. The Hesperiidæ or 'skippers' are small stout insects possessing, with few exceptions, two pairs of spurs. They are found chiefly in South America and in many of their habits resemble the moths.

Consult French's *Butterflies of the Eastern United States*; Holland's *The Butterfly Book*; Soule's *Caterpillars and their Moths*;

Kellogg's *American Insects*; Miller's *Butterfly and Moth Book*; Dickerson's *Moths and Butterflies*; Weed's *Butterflies Worth Knowing* (1917); Eltringham's *Butterfly Lore* (1923).

**Butterfly Fish**, a carnivorous fish of the tropical seas, belonging to the family *Chaetodontidæ*. There are nearly 200 species, brilliantly colored and of great agility. The body is small, strongly compressed, and covered with small, smooth scales. Most of the species are of importance as food fish.

**Butterfly Orchis**, the popular name of two European orchids, *Habenaria bifolia* and *H. chlo-*

*Butterfly Orchis*

1. *O. papilio*. 2. *H. chlorantha*. 3. *H. bifolia*.

*rantha*. The flowers of *H. bifolia* are usually white, tipped with green, while those of *H. chlorantha* are of a pale greenish tint. *Oncidium papilio*, a large West Indian orchid, is also known as the butterfly orchid.

**Butterfly Weed**, ORANGEMILKWEED, or PLEURISY ROOT (*Asclepias tuberosa*), a North American plant of the milkweed family, flourishes in dry and sandy fields. It has stout, hairy stems, bearing lanceolate leaves and terminal corymbs of brilliant, orange-colored flowers (June to August), which are haunted by brown and yellow butterflies. The large tuberous root has medicinal qualities, being used as an expectorant, diaphoretic, and tonic in rheumatism, pleurisy, and bronchitis.

**Buttermilk**, a by-product resulting from the churning of cream to make butter. It consists of the milk remaining after the fat is removed, and its composition is approximately as follows: fat, 5 per cent., casein, 2.4 per cent., albumin, 6 per cent., lactose, 5.3 per cent., ash, 7 per cent., and the remainder, water. Chemically it differs little from

skim-milk. It is often prepared by the use of commercial cultures, and is considered a pleasant and nutritious beverage.

**Butternut** (*Juglans cinerea*), a large American tree belonging to the family Juglandaceæ. It is a short-trunked tree with spreading branches and rough grey bark, found along the Atlantic coast as far south as Georgia and westward to Dakota and Arkansas. The wood, dark yellow in color, takes a fine polish, and is used in cabinet work; the bark yields a brown dye, and the sap is sometimes added to maple sap in sugar making. The brown-husked, rugged nuts contain oil, and have a delicious flavor. When green, they are sometimes pickled as a table delicacy. For illustration, see JUGLANS.

**Butter Tree**, a name applied to various tropical trees, the pulpy fruit and seeds of which yield a quantity of oily fat used by the natives of India and Africa as butter and lamp oil, in soap-making, and for other commercial purposes. Most of so-called butter trees belong to the genus *Bassia*, the more important being *B. latifolia* and *B. longifolia* of India, from whose nuts mahwa butter, much used for cooking, is obtained; *B. parkii*, yielding shea butter, used both as an article of food and in the manufacture of soap and candles; *B. butyracea*, the source of ghee butter. See BASSIA.

**Butter Weed**. See ERIGERON. **Butterwort**, popular name of *Pinguicula*, a genus of plants

*Butterwort*

belonging to the Bladderwort family. They occur commonly

in bogs and among wet rocks in various parts of the world. The Common Butterwort (*P. vulgaris*), abundant in the temperate zone, is a small plant with radical, yellowish-green, fleshy leaves covered with small glands secreting a sticky digestive fluid by which insects are retained. The lovely blue, white, or lilac-colored flower is borne on a tall stalk rising from the centre. Butterwort has the power of coagulating milk; hence, perhaps, the name.

**Butterworth**, HEZEKIAH (1839-1905), American author, was born in Warren, R. I., and received a common-school education. He was an extensive traveller, and for many years published annual volumes under the title *Zig-Zag Journeys*, describing, in a literary form attractive to young people, the places which he visited. From 1871 to 1894 he was assistant editor of the *Youth's Companion*. He wrote, also, several volumes of verse, including *Poems for Christmas, Easter, and New Year* (1883) and *Songs of History* (1887), and many short stories embodying the romance and legend of New England.

**Butt Joint**, a joint (usually between iron plates) in which the two plates are brought to 'abut' together, and are then fastened together by cover-plates.

**Buttons**, devices of various shapes and sizes used either as a means of fastening together parts of garments or for purely ornamental purposes. Buttons as ornaments were common in ancient Egypt, and in China the button has long been the distinguishing badge of various castes and groups. In modern times, also, buttons have been used freely as society emblems, as well as for ornament and utility.

Originally buttons were the pure product of craftsmanship and so remained until modern times, but at present they are objects of mass factory production. Among the substances from which modern buttons are made are metals, celluloid, ebonite, shell, pearl, bone, glass, papier-maché, wood, jet, precious stones, vegetable ivory and porcelain. Metal buttons without shanks are made by stamping. Those to which metal shanks are fitted have the disks punched and trimmed, and then soldered to the wire shank. Cast buttons are made by pouring molten metal into a mould, the loop of wire which forms the shank being suspended in it. For covered buttons two thin sheet-iron stampings are used—one a circular disk, and the other a smaller black piece, or collet, with a hole in the centre and several sharp points at right angles on the edge. The stuffing, overlaid

with strong cloth, is placed on the disk, which is laid on the covering, the latter being gathered up over the materials. The collet is then forced down, the hooks holding it in position, while the stuffing forces the coarse cloth through the hole to form the shank, through which the needle is passed laterally. Shirt buttons are made of powdered steatite saturated with soluble glass; the mixture is forced into moulds, and is then baked and polished. Many other materials are moulded in a similar way. Buttons made from ivory, wood, and bone are turned on a button lathe. Mother-of-pearl buttons are cut out of shell by the tubular saw, split, and polished on the lathe.

Birmingham, England, is one of the centres of the button industry; pearl, metal, and linen buttons being produced there in large quantities. France is also a large producer; porcelain buttons, which at one time had a great vogue, being made in Briare and Montereau. Paris and Lyons also have large button industries. In the United States the manufacture of buttons dates from the beginning of the nineteenth century. Waterbury, Conn., is one of the chief centres of the metal button industry, and Muscatine, Iowa, of the pearl button industry. Covered buttons were first manufactured in 1827, and vegetable ivory buttons, made from the seed of a South American fruit, *Phytelphas macrocarpa*, first appeared in 1859. Consult Jones' *The Button Industry* (1924).

**Buttonwood**. See SYCAMORE.

**But'tress**, an abutment built outside a wall to relieve the latter of the outward thrust or pressure

Buttress and Flying Buttress

consequent on the weight of vault or arch. It has many forms, from that of a rectangular pier let into the wall, and usually extending outwards in terraces as it descends to the ground, to that of a free, arch-like structure, or 'flying buttress,' taking the pressure from the wall to solid foundations at a distance from the latter. The pinnacle was introduced to give weight to the buttress.

**Butuan**, bōō-tōō'an, pueblo, Mindanao, Philippine Islands, in Agusan province, on the Agusan River at the head of its delta; 101 miles south of Surigao. Gold is mined in the vicinity, and live stock, poultry, rice, and sago are produced. A monument has been erected here to Magellan, who landed on the site and celebrated his first mass in the Philippines. Pop. (1918) 9,136.

**Buturlinovka**, bōō-tōōr-lē-nōī'f-kā, or PETROVSKOI, town, Russia, in Voronej government, on an affluent of the Don; 85 miles southeast of Voronej. Industries include milling and tanning establishments. Pop. 38,000.

**Butyl Alcohol**, bū'til, or BUTANOL, is known in four isomeric varieties, two of which are finding wide use as solvents. Normal butyl alcohol,  $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$  (B.P. 117° C.), is obtained in immense quantities, along with acetone and ethyl alcohol, by the fermentation of solutions of corn starch by *Clostridium acetobutylicum*. It is used in large quantities as a solvent for nitrocellulose in lacquers and for the preparation of butyl acetate. Its cheapness (by fermentation) and high solvent power are largely responsible for the rapid expansion of the nitrocellulose lacquer industry. Tertiary butyl alcohol,  $(\text{CH}_3)_3\text{COH}$  (B.P. 83° C.), is made commercially from the gases obtained in cracking petroleum, and finds some use as a solvent. The other two varieties, iso-butyl,  $(\text{CH}_3)_2\text{CHCH}_2\text{OH}$  (B.P. 107° C.), and secondary butyl,  $\text{C}_2\text{H}_5\text{CH}_2\text{CHOH}$  (B.P. 102° C.), are unimportant commercially.

**Butyl Chloral**,  $\text{CH}_3\text{CHClC}_2\text{H}_4\text{CHO}$ , is prepared by passing chlorine through acetaldehyde. It is an oily liquid that unites with water to form a hydrate. The latter is of similar anæsthetic and soporific properties to chloral hydrate, but has a specific action in relieving tic douloureux.

**Butyric Acid**, bū-tir'ik,  $\text{CH}_3\text{CH}_2\text{CH}_2\text{COOH}$ , is a fatty acid occurring in butter fat and in several vegetable fats and oils. It may be prepared by the fermentation of sugar or starch, mixed with water, skimmed milk, and putrid cheese, from which the specific bacillus that causes the action is derived. It may also be prepared by the oxidation of normal butyl alcohol. It is a thick, colorless liquid, with a sour taste, and the odor of rancid butter. It is soluble in water, and gives rise to a series of salts and esters, the butyrates.

**Butyric Ether**, or ESTER, a general name for compounds formed from butyric acid by the substitution of an alkyl group for the hydrogen atom of the carboxyl group. Ethyl butyrate is commercially prepared by heat-

ing butyric acid, sulphuric acid, and alcohol, and is used by confectioners, as it has a strong pineapple odor.

**Butyrite**, or BUTYRELITE. See BOG BUTTER.

**Butzer**, MARTIN. See BUCER.

**Buxar**. See BAXAR.

**Bux'ton**, market town and watering place, England, in Derbyshire, on the Wye; 22 miles southeast of Manchester. It has long been celebrated for its natural hot mineral springs and its fine bracing climate. The town is surrounded on three sides by lofty green hills and comprises two sections, the old town and the new town, the former occupying a hill some 70 feet above the latter. The chief features of interest are the Crescent, which contains the natural or tepid baths at one end and the hot baths at the other; the Town Hall; Museum; Pavilion; concert hall; Devonshire Hospital, originally a riding school; and the beautiful gardens. Coal-mining, lime-working, and the manufacture of marble and spar ornaments are the leading industries. Pop. (1921) 15,651.

**Bux'ton**, SYDNEY CHARLES, FIRST EARL BUXTON (1853-), English politician and author, was educated in Clifton and at Trinity College, Cambridge. He served on the London School Board (1876-82), was member of Parliament for Peterborough (1883-5) and for the Poplar division of the Tower Hamlets (1886-1914), Under-secretary for the Colonies (1892-5), Postmaster General, with a seat in the Cabinet (1905-10), President of the Board of Trade (1910-14), and High Commissioner and Governor-General of South Africa (1914-20). He introduced penny postage to the United States and the Canadian Magazine post, and was responsible for the Copyright Act of 1911, for Part II. of the Unemployment Insurance Act of the same year, for the Pilotage Act of 1912, and for the Bankruptcy Act, and Extension of Trade Boards Act of 1913. He was created a Viscount (of Newtimber) in 1914, and an Earl in 1920. His publications include: *Handbook to Political Questions*; *Political Manual*; *Finance and Politics: an Historical Study 1783-1885*; *Handbook to the Death Duties*; *Mr. Gladstone as Chancellor of the Exchequer*; *The Fiscal Question*; *Fishing and Shooting*.

**Buxtorf**, books'torf, JOHANN (1564-1629), German Hebrew scholar, was born in Kamen, Westphalia. After completing his education in Heidelberg, Bâle, Geneva, and other cities, he travelled in Germany and Switzerland and in 1590 was appointed professor of Hebrew at Bâle. His earliest book was a

manual of Biblical Hebrew, containing a grammar and a vocabulary (1602); then appeared a work on the Jewish synagogue (1603), a lexicon of Rabbinical Hebrew (1613), and an important work on the abbreviations employed in this form of the language. The greatest of his works published during his lifetime was the folio Hebrew Bible, together with the Targum, and the commentaries of the rabbinical writers, Ben Ezra and Rashi (1618), to which was afterwards added (1620) *Tiberias, sive Commentarius Masoreticus*, giving an account of the Scripture text according to the Jewish tradition. Buxtorf's sudden death of plague left unfinished two important works, afterwards completed and published by his son and successor (see below)—a Concordance to the Hebrew Bible (folio, 1632), and a Chaldaic, Talmudic, and Rabbinic Lexicon (1639; new ed. 1866-74). Consult Diestel's *Geschichte des alten Testaments in der Christlichen Kirche*; Kautzsch's *J. Buxtorf der Aeltere*.

**Buxtorf**, JOHANN, THE YOUNGER (1599-1664), German Orientalist, was born in Bâle and succeeded his father as professor of Hebrew in the University there (1629). He engaged in a violent controversy with L. Cappel, claiming divine authority for the entire Masoretic text, vowels as well as consonants. These views were set forth in several treatises—*De Litterarum Hebraicarum Genuina Antiquitate* (1643), *Tractatus de Punctuorum Origine* (1648), *Anticritica* (1653), and *Latin Dissertations* (1664). He also edited and extended his father's writings, notably *Lexicon Chaldaicum, Talmudicum, et Rabbinicum* (1639) and *Concordantia Bibliorum Hebraicorum* (1632). In 1629 he edited Maimonides' *More Nevochim*.

**Buxus**. See BOX.

**Buys-Ballot**, bois-bâ-lô', CHRISTOPH HEINRICH DIEDRICH (1817-90), Dutch meteorologist and mathematician, was born in Kloetinge in Zeeland. He was educated in Utrecht University, where he became professor of mathematics in 1847, and of experimental physics in 1870. From 1854 he was director of the Royal Meteorological Institute, and in this capacity he was one of the pioneers of the present system of weather forecasting by means of collating observations at numerous reporting stations. He discovered the law relating to atmospheric depressions known by his name and was the inventor of the aeroklinoscope (q.v.).

**Buzau**, bö'ze-öö, or BUZAU, town and episcopal see, Roumania, on the Buzeu River; 60 miles east of Braila. It has trade in grain, hides, and petroleum.

It was the scene of desperate fighting in the Great War and was occupied by German forces in December 1916. Pop. (1914) 29,483.

**Buzuluk**, böö-zöö-löök', town, Russia, in Samara government; 107 miles east of Samara. There are tanneries and copper foundries and trade in horses, cattle, and cereals. Pop. 15,000.

**Buzzard**, a name applied to twenty or more species of birds of prey, widely distributed over the globe, constituting the subfamily Buteoninæ. They have short, rounded heads, strongly curved beaks, long, square tails, and a slow and rather heavy flight. They live chiefly upon small mammals, although they also eat reptiles, young birds, and insects. The Common European Buzzard (*B. vulgaris*), found practically everywhere in Europe, is about 22 inches long, and dark brown in color, with the under parts generally a yellowish white. Its prototype in America is Swainson's Buzzard (*B. obsoletus*), found in most parts of the country. Closely allied to the Buteoninæ are the Rough-legged Buzzards, the best known of which is *Archibuteo lagopus*, a European bird somewhat larger than the common buzzard and having the metatarsus feathered to the toes. The so-called Turkey Buzzard is not a buzzard, but a vulture (q.v.).

**Buzzards Bay**, an arm of the Atlantic Ocean indenting the southern coast of Massachusetts, dividing Barnstable county on Cape Cod from the mainland. It is about 30 miles long and has an average width of 7 miles. The Elizabeth Islands, which enclose it on the southwest, form one side of Vineyard Sound.

**By**, JOHN (1781-1836), English engineer, served in the Peninsular War, and in 1826 went to Canada, where he constructed the Rideau Canal, connecting the Ottawa River with Lake Ontario—a work which cost about \$5,000,000. By-town, named after him, was later called Ottawa.

**Byblos**, bib'los, a city of great antiquity on the Phœnician coast, between Berytus and Tripolis; it was the chief seat of the worship of Baal. See JEBAIL.

**Byes'ville**, village, Ohio, Guernsey county, on the Pennsylvania Railroad; 95 miles east of Columbus. Coal mining and the manufacture of glass, engines, and brick are the chief industries. Pop. (1910) 3,156; (1920) 2,775.

**Byker**, bî'ker, ecclesiastical parish, Northumberland, England. It has manufactures of chemicals, lead, glass, and pottery. Pop. 70,650.

**By-law**, a local regulation or enactment made by a subordinate legislative authority. Of

GENERAL JULIAN HEDWORTH BYNG, FIRST BARON BYNG OF VIMY,  
APPOINTED GOVERNOR-GENERAL OF CANADA, 1921.

this character are the laws and ordinances of minor municipal corporations, such as cities, counties, towns, villages, and the like, as well as the rules adopted by certain corporations, such as railway companies, under the authority of the State, to regulate their affairs and their relations with the public. All such regulations, whether of municipal or private corporations, have the force of law in so far as they are enacted under proper legal authority.

The by-laws of clubs and other voluntary associations are in the nature of 'gentlemen's agreements' for the regulation of their intercourse with one another, and are not usually enforceable at law. The term is usually applied to the minor regulations of an association or society, its forms of government, organization, etc., being comprised in a 'constitution,' to which the by-laws must conform. See CLUBS, LAW RELATING TO.

**Bylazora.** See KOPRULU.

**Byles, MATHER** (1706-88), a native of Boston, Mass., was graduated from Harvard, became pastor of the Hollis Street Congregational Church, Boston, and speedily acquired a pulpit reputation. During the Revolution he supported the British, and as a consequence his church was dissolved. Subsequently he was arrested and tried and imprisoned in his own house. He published many sermons and several poems. His son Mather Byles (1736-1814) was also a Congregational clergyman, but later entered the Established Church and with other Tory sympathizers emigrated to St. John, New Brunswick.

**Bylini**, bi-lé'né, a name given to the heroic ballads of Russian popular poetry. They are divided into several cycles, as those dealing with the legendary heroes; the cycle of Kiev, the chief heroes of which are Vladimir and the peasant Ilya Muromez, or Ilya from Murom—this is the principal cycle; the cycles of Novgorod, of Moscow, of Peter the Great, etc. The principal collections of *bylini* were made by Ribnikoff, by Kireievski, and by Sobolevsky. Avenarius has published an anthology of *bylini*. Consult Rambaud's *La Russie Epique*; Ralston's *Russian Folk-Tales and Songs of the Russian People*.

**Byng**, bing, GEORGE. See TORRINGTON, VISCOUNT.

**Byng, JOHN** (1704-57), English vice-admiral, a son of Admiral George Byng. In 1756 he fought the unsatisfactory action off Minorca, and being convicted subsequently by court-martial of not having done his best, was sentenced to be shot. He was ac-

cordingly executed on board the *Monarch*, at Portsmouth, on March 14, 1757. He suffered for too strict observance of forms, rules of discipline, and points of naval etiquette, the weakness of which was shown by his defeat. There was no imputation upon his honor or his courage.

**Byng, JULIAN HEDWORTH GEORGE, FIRST BARON BYNG OF VIMY** (1862- ), British army officer and governor-general of Canada, seventh son of the second earl of Strafford, entered the army in 1883 as a member of the 10th Royal Hussars; was promoted to the rank of major in 1898, to colonel in 1901, to major-general in 1909, to lieutenant-general in 1916, and to general in 1917. He served in the Sudan expedition in 1884 and in South Africa in 1899-1902; and was in command successively of the 10th Royal Hussars (1902-04), the Cavalry School at Netheravon, Salisbury Plain (1904-05), the Second Cavalry Brigade (1905-07), and the First Cavalry Brigade (1907-09). From 1910 to 1912 he commanded the East Anglian Division, and in 1912-14 led the British army in Egypt.

At the beginning of the Great War (1914-19) General Byng was with the British Expeditionary forces that fought at Antwerp, commanding the Third Cavalry Division that forced the Germans to retreat at Ypres, and in 1915 he succeeded General Stopford in command of the Ninth Army Corps at Sulva Bay, and was active in the Gallipoli campaign. He commanded the Canadian corps at the Battle of the Somme (1916), and in the capture of Vimy Ridge (April 9, 1917), led the Cambrai offensive of November, 1917, and was in command of the Third British Army. For his distinguished services in the Great War he received the Belgian Croix de Guerre, the Grand Cross of St. Vladimir from Russia, the Grand Legion of Honour from France, the White Eagle from Serbia, the French Croix de Guerre, and the Distinguished Service Order from the United States, and was thanked by Parliament and given £30,000 for meritorious service. In 1921 he was appointed Governor-General of Canada, the inauguration ceremonies taking place on August 11.

**By-Products**, substances or results obtained in the operation of a specific process, in addition to the substance or result primarily sought. Thus, in hunting game for food, the hides and the feathers are by-products; in hunting game for hides or pelts, the carcasses are by-products.

In the classification of the products of manufacture, three groups are recognized—*vis.*: *prin-*

*cipal product*, which is that product of an establishment manufacturing more than a single product that has the largest total value; *subsidiary product*, having a less total value; and *by-product*. A subsidiary product may be a utilized by-product, or it may be the product of an allied industry—as, for instance, bookbinding in a printing office, or compound-fertilizers in a cottonseed-oil mill. This last example is one of many occurring in factories where the by-product of the principal industry—in this case cottonseed meal—becomes the raw material for the manufacture of a subsidiary product.

The development and growth of manufactories using manufactured products as the raw material for further manufacture has not infrequently created such a change in the demand for the products of the primary establishment as to make one of its subsidiary products its primary product. A notable example of this is the Le Blanc process for the manufacture of soda products from common salt by the action upon it, in the first stage of manufacture, of sulphuric acid. In this operation, hydrochloric acid gas is given off as a by-product. At first this was allowed to escape into the atmosphere. To avoid the nuisance thus created, this gas was collected by dissolving it in water, and sold, thus becoming a subsidiary product; but with a greatly increased demand for this substance, and with the competition of electrolytic and other processes, through which the cost of the production of sodas was reduced, hydrochloric acid became in many cases the principal product of the Le Blanc factories.

The custom of utilizing by-products is a very ancient one in its origin, though in the newer countries, where raw material was abundant, and in the early development of industries, where the unit of production was small and competition was slight, by-products have generally been wasted, and frequently have become sources of nuisances. But with increasing density of population, through which the necessity for abating nuisances became urgent; with the increase in the unit of production; with a diminution in the quantity of raw material, or the ease with which it could be obtained, and with the increase in competition, additional attention has been given to the utilization of the by-products of manufacture, until to-day they have become of great importance in all industries.

Naturally, the by-products that were first to be utilized were those which were most readily

observed and whose uses were most obvious. The by-products which ran off in solution or passed away as gases, or forms of energy, such as heat, or those whose uses were remote or less readily apparent, have until very recent times been allowed to go to waste. The discovery of the first of the aniline coloring matters, mauve, in 1856, by the English chemist William Henry Perkin, and the fact that the aniline from which it is manufactured could be obtained in abundance from coal tar, gave an impetus to the utilization of the last enumerated by-product; and the rapid growth in commercial importance of the coal-tar products industry so concentrated attention on this phase of manufacture that the utilization of by-products has gone on with ever increasing expansion.

Some examples of industries, with their by-products, are the following:

**Coke and Gas Industry.**—Among the utilized by-products of the coke industry are gas, ammonia, and tar, all of which are wasted in coking coal in beehive ovens, but are recovered when by-product ovens are used. According to the U. S. Census of Manufactures for 1914, by-products of the coke industry were valued as follows: gas, \$6,009,583; tar, \$2,867,274; ammonium sulphate, \$4,696,590; anhydrous ammonia, \$2,300,137; ammonia liquor, \$658,497; others, mainly benzol, \$997,007. By-products of gas manufactures and their value (1919) were: coke, \$17,822,900; tar, \$4,661,300; ammonia liquor, \$1,677,200; ammonium sulphate, \$205,000; and hydrocarbons.

**Iron and Steel.**—The principal by-products of the blast furnace used in the iron and steel industry are gas and slag. Up to the last decade, the gases from blast furnaces were utilized to some extent in heating the 'stoves,' and burned to some extent under boilers, but much was wasted. They are now efficiently used in internal combustion engines for the production of power. Formerly, also, although some of the enormous quantity of slag running constantly from blast furnaces was used for minor purposes, as insulating material, paving blocks, road ballast, and roofing material, most of it went to the dump. It is now largely used in the manufacture of Portland cement. Slag from the basic processes of making steel is utilized abroad as a fertilizer under the name of Thomas slag or Belgian phosphate. Copperas is produced in the pickling of steel wire during the drawing process. Flue dust is utilized by briquetting and returning to the furnace.

**Slaughtering and Meat Packing.**—The utilized by-products include albumen, bristles, blood, bones, fertilizers and fertilizer material, gelatin, grease, glue, hair, hides, hoofs, horns, intestines, pancreatin, parotid substances, pepsin, skins, thymus, thyroids, and wool. (See PACKING INDUSTRY.)

**Smelting of Sulphide Ores.**—This process yields great quantities of smoke or fumes. The analysis of the smoke of one smelter in the United States, reported in 1907, showed an approximate daily output in the smoke sent into the atmosphere of 55,000 pounds of arsenic trioxide, 1,500 to 2,000 tons of sulphur dioxide, 150 tons of sulphur trioxide, 6,000 pounds of zinc, 5,000 pounds of copper, 6,000 pounds of lead, and 5,000 pounds of antimony. Various establishments are now collecting and utilizing these by-products, the sulphur oxides being converted into sulphuric acid by the contact process.

**Wood Distillation** is an example of an industry created by the utilization of by-products. When charcoal is produced by charring wood in mounds or meilers, the smoke is wasted by passing off into the atmosphere. When the wood is charred in kilns, ovens, or retorts, and the smoke is condensed and collected, there is obtained acetic acid, or acetate of lime, and wood alcohol, the charcoal together with gas and tar being by-products. According to the Census of Manufactures for 1919, there were thus produced in the United States 152,064,000 pounds of acetate of lime, having a value of \$2,682,200; 6,981,000 gallons of crude wood alcohol, having a value of \$5,593,500; 48,499,000 bushels of charcoal, valued at \$8,231,400; 1,521,000 gallons of turpentine, valued at \$1,207,200; 234,000 barrels of rosin, valued at \$2,742,600.

**Cyanide Industry.**—The simple and complex cyanides were originally, and to an extent are to-day, primarily produced by fusing together scrap leather, hoofs, or horns, which are by-products of the leather and slaughtering industries, with scrap iron, which is the by-product of a multitude of household and commercial industries, and potassium carbonate, recovered by lixiviation from the ash of wood, which is a by-product from the burning of wood as a source of heat energy. By lixiviating the fusion product, potassium ferrocyanide, commonly known as yellow prussiate of potash, is obtained; and from this, potassium cyanide and the multitude of simple and complex cyanides are made. To-day, primary cyanide material is also obtained

from spent purifying material of gas works, from blast furnaces, and, by the use of calcium carbide, from the nitrogen of the atmosphere.

**Explosives and Coal-Tar Color Industries.**—In these industries mixtures of nitric and sulphuric acids, known as 'mixed acid,' are used to convert alcohols, such as glycerine, cellulose, starch, and the like, into esters, such as the so-called nitroglycerine, guncotton, and nitrostarch, or hydrocarbons and phenols, such as benzene, toluene, and 'carbolic acid,' into nitro-compounds, such as nitrobenzenes, nitrotoluenes, and nitrophenols—picric acid being the best known example of the latter compounds. There are produced as by-products nitrogen oxides, which are evolved as orange-red fumes, and spent acid which is a mixture of diluted sulphuric acid with some unused nitric acid fouled by other products of the operation. The nitrogen oxides are recovered by means of a solution of sodium hydroxide, whereby sodium nitrite is formed, and this product is largely used in the diazotization processes by which the nitro-compounds are converted into more advanced derivatives of benzene. The nitric acid is recovered from the spent acid and converted into ammonium nitrate, which is largely used in compounding explosives, while the sulphuric acid is regained, concentrated, and again used in nitration.

**Natural Gas.**—In pumping natural gas from wells, through compression and expansion, with cooling, various petroleum hydrocarbons of the 'naphtha and gasoline' class are obtained as by-products. In recent years the industry built up on the recovery and utilization of these by-products had reached valuable commercial proportions when it was practically destroyed by a ruling of the Bureau of Explosives of the American Railway Association, which condemned the product as dangerous, and thereby prohibited its transportation by rail. In 1911 Dr. W. O. Snelling devised a method for dividing the original products into fractions, each of which is safe for transportation. One of these fractions is of particular interest as it is a liquefied gas which can be used as an illuminant in the same manner as the Pintsch and Blau gases, now in extensive use.

**Petroleum Refining.**—Originally the product sought in this industry was kerosene, all of the residue of the substance going to form by-products, much of which was wasted. To-day several score of subsidiary products are obtained in this process. They may be summed up as burning oils, coke, naphtha

and gasoline, neutral filtered oils, paraffin oils, paraffin wax, reduced oils, residuum, and vaseline. In 1925 light products of distillation including gasoline, benzene and naphtha, totalled 11,311,044,622 gallons, valued at \$1,268,647,929; illuminating oils totalled 2,365,301,739 gallons, valued at \$161,880,676; lubricating oils, 1,361,071,547 gallons, valued at \$252,104,578; fuel oils, 14,604,037,579 gallons, valued at \$488,957,806. In 1925, 739,489,345 barrels of crude oil and 1,165,824 short tons of sulphuric acid were consumed in refining.

**General.**—In *brewing*, the malt, after extraction, serves as food for cattle, the excess of yeast is available for baking, and the carbon dioxide set free in the fermentation can be collected and compressed for the manufacture of aerated waters, to force beer through service pipes, and similar purposes. In *distilling*, the disposal of the 'burnt ale' is a serious question. If run into streams it produces an objectionable pollution, while other methods of getting rid of it are costly and not thoroughly effective. Decomposition by bacteria has had but little success; the most hopeful method of disposal is by some process of evaporation, the product being used for manure. *Soap and candle works* produce considerable quantities of glycerin and salt as by-products; *wool-scouring* yields wool grease, employed in the manufacture of lanoline, soaps, and lubricants; the *pressing of seeds for oil* yields a 'cake' valuable for cattle food; the *fermentation of wine* is the source of tartaric acid; while the residues of the *beet-sugar industry* produce alcohol, potassium compounds, methyl chloride, and the like.

See BREWING; CANDLE; DISTILLATION; DYEING; SODIUM; SULPHURIC ACID; TAR; COAL TAR; SLAG; SOAP; SUGAR; WOOL. **Byrd**, bĕrd, RICHARD EVELYN (1888- ), American aviator and explorer, was born in Winchester, Va. He was educated at the Virginia Military Academy, the University of Virginia and the United States Naval Academy, being graduated from the latter in 1912. After four years' sea service he took up the study of aviation and during the World War commanded the United States naval air forces in Canadian waters and built up the naval aviation stations at North Sidney and Halifax, N. S. In 1925 he accompanied the MacMillan Expedition to Greenland under the auspices of the National Geographic Society and acting as flight commander flew more than 3,000 miles. In May, 1926, with his pilot, Floyd Bennett, he flew from Spitz-

bergen to the North Pole, circled it several times and returned to his starting point, covering 1,600 miles in 15½ hours. In June 1927, Commander Byrd flew to France with three companions. The weather was very bad and although they reached Paris they were unable to land on account of thick fog, but landed in Ver-sur-mer after a period of 43 hours and 20 minutes. Commander Byrd is not only a skilful and daring aviator, but also a scientist of high repute whose observations taken during his flights are most valuable.

**Byrd** (BIRD, or BIRDE), WILLIAM (?1538-1623), ENGLISH musical composer, was 'bred up to musick under Thomas Tallis.' He was organist of Lincoln Cathedral in 1563, and in 1569 succeeded to a vacant post in the Chapel Royal, London. He published a quantity of sacred music, including three masses; was an indefatigable composer of music for the virginals (e.g., *Parthenia*, about 1608, in conjunction with Bull and Orlando Gibbons); and in 1588 contributed the first English madrigals to a collection entitled *Musica Transalpina* (1588).

**Byrgius**, bŭr'ji-us, or BŪRGI, JUSTUS or JOOST (1552-1633), Swiss mathematician, was born in Lichtensteig, Canton St. Gall. He was for many years in the service of William IV., Landgrave of Hesse, for whom he constructed globes and a large number of astronomical instruments, and in 1603 entered that of the Emperor Rudolf II.

**Byrlaw**, bir'lo, the ancient code of laws by which rural communities were governed in minor affairs, such as the valuation of stock, the allocation of common land, or the limitation of boundaries. They were administered by local tribunals, whose jurisdiction and procedure were of customary origin. This system prevailed in Great Britain until the end of the eighteenth century, and is not yet absolutely extinct in Scotland. See BY-LAW.

**Byrnie**, bŭr'ni (Norse, *brynja*), the ringed coat of mail worn by the ancient Scandinavian warriors.

**By'ron**, GEORGE GORDON NOEL, LORD (1788-1824), one of the great poets and literary forces of the nineteenth century, was born in Holles Street, London. His father, Captain John Byron, nephew of the fifth or 'wicked' Lord Byron, having squandered his wife's fortune, died in Valenciennes in 1791, and Mrs. Byron settled in Aberdeen. In the year 1798 Byron succeeded to his granduncle's title and estates, and he and his mother settled at the family seat of the Byrons, Newstead Abbey, Nottinghamshire. Two years were now

spent in a school at Dulwich, and then he went (1801) to Harrow—his experiences at that famous school forming the subject, in later years, of his *Childish Recollections*. The year 1803 is marked by his passion for Mary Anne Chaworth of Annesley, a girl two years his senior. In 1805 Byron entered Trinity College, Cambridge, where he caused considerable anxiety to his friends and the authorities by his irregularities.

During this period his poetic impulses had begun to find expression, and in 1807 he published his *Hours of Idleness*. It was severely criticised by Brougham in the *Edinburgh Review*, and Byron retorted in 1809 with his satirical *English Bards*

Lord Byron

and *Scotch Reviewers*. On coming of age Byron went abroad, and spent two years in making a tour through Spain, Albania, Greece, Turkey, and Asia Minor. After publishing *The Curse of Minerva*—a poem now only valuable from its rarity—in 1812 he issued the first two cantos of *Childe Harold*. The success of this splendid poem was immediate. *The Giaour* and *The Bride of Abydos* both appeared in 1813, and in 1814 the fine ode to *Napoleon Buonaparte*, *The Corsair*, and *Lara*. The *Hebrew Melodies*, published in 1815, were written for a selection of melodies arranged by Braham and Nathan.

In 1815, he married Anne Isabella Milbanke, daughter of a wealthy Durham baronet. In January, 1816, she left him and with her daughter, Ada, returned to her parents. The true cause of this separation has never been ascertained, but it was final. Byron then went abroad, and settled for a time in Switzerland, where he wrote the third canto of *Childe Harold*, *The Prisoner of Chillon*, *The Siege of Corinth*,

*Parisina*, the *Dream*, and part of *Manfred*. While in Switzerland Byron met the Shelleys, and formed a friendship with the poet, and contracted an illicit alliance with Claire Clairmont, a connection of the second Mrs. Shelley. From Switzerland he passed on to Venice, where in 1819 he became acquainted with the Countess Guiccioli, in whose society in the following three years he spent most of his time, living successively in Ravenna, Pisa, and Genoa.

In 1817 he finished *Manfred* and in the same year produced *The Lament of Tasso*, *Darkness*, and the *Monody on Sheridan*. *Beppo* appeared in 1818, and *Ma-zepa* in 1819. The publication of *Don Juan* began in 1819, and continued for five years. To the year 1821 belong the *Letters to Murray* on Bowles' strictures on Pope, *Marino Faliero*, *The Prophecy of Dante*, *Sardanapalus*, *The Two Foscari*, and *Cain*. To the *Liberal*, a Radical periodical conducted for a brief period by Leigh Hunt, Byron, and Shelley, Byron contributed *The Vision of Judgment* (1823), a poetical parody upon a poem of that name by Southey. In 1823, *Heaven and Earth*, a dramatic poem by Byron founded on a passage in Genesis, also appeared in that periodical and *Werner* was published in 1822, the year in which Lord Byron fulfilled the melancholy duty of witnessing the cremation of Shelley's body. *The Island*, a poem suggested by some of the incidents in the mutiny of the *Bounty*; *The Age of Bronze*, a satire in heroic verse; and the first canto of the *Morganæ Maggiore di Messer Luigi Palei*, a translation, were published in 1823 and *The Deformed Transformed*, the last work by the poet, appeared in 1824.

Resolved to aid the Greeks in their struggle for independence, Byron sailed from Genoa, and on Jan. 4, 1824, arrived at Missolonghi. His physical powers proved unequal to the strain, and after three months of strenuous effort he died of rheumatic fever. His body was taken to England, and interred in the church of Hucknall-Torkard, near Newstead.

The keynote of Byron's character was an extraordinary and egotistical sensitiveness, which was a contributory cause of many of his troubles, and everywhere finds expression in his verse. He was capable of great generosity and high feeling, misanthrope and cynic though he was in some of his moods. 'The great poetic heart' asserts itself again and again, even in such a poem as *Don Juan*. And although he chose to simulate the rake and libertine, yet he has written several passages which are the out-

come of deep spiritual feeling. Byron's name and works exercised a wonderful fascination over his foreign contemporaries, and almost the whole of European literature was for a time under the influence of his inspiration.

The best edition of his works is that published in 1898-1901—the *Poetry* (5 vols.), edited by Ernest Hartley Coleridge; and the *Letters and Journals* (6 vols.), by Rowland E. Prothero. W. E. Henley's edition (1897) and the Cambridge edition of the *Poems* (1905) are also deserving of notice. His *Life* has been written by the poet Moore (1832-3); Elze (Eng. trans. 1872); Nichol (1880); Noel (1890); Ackermann (1901). Consult also memoirs and biographical works by Medwin, Leigh Hunt, Lady Blessington, Trelawney, Countess Guiccioli; Edgecumbe's *Byron, the Last Phase*. For criticism, consult Matthew Arnold's *Essays in Criticism*; Dowden's *Studies in Literature*; Jefferson's *Real Lord Byron*; Morley's *Literary Essays*.

**Byron**, HENRY JAMES (1834-84), English dramatist and actor, was born in Manchester. He is the author of nearly 150 pieces (comprising comedies, farces, burlesques, and pantomimes) produced in London between 1858 and 1882. His most popular play was *Our Boys*, which ran for more than four years at the Vaudeville Theatre (January, 1875, to April, 1879). His best piece of work, however, was probably *Cyril's Success* (Globe Theatre, 1868). He also wrote a play called *An American Lady*. His farces and comedies were characterized by a ready and homely humor, and in his extravaganzas he displayed great ingenuity in punning. He acted occasionally in his own plays, between 1868 and 1878, and at various times ventured upon theatrical management, usually with disastrous results. He was the first editor of *Fun*, and in 1865 published a novel entitled *Paid in Full*.

**Byron**, JOHN (1723-86), English vice admiral, was second son of the fourth Lord Byron, and grandfather of the poet. He accompanied Anson in his voyage round the world (1740-4). In 1761 he was given command of a small force which was dispatched on a new voyage of discovery. In the *Dolphin* (1764-6) he visited Madeira, Brazil, Patagonia, the Falkland Islands (of which he took possession), the Pacific, including the Society Islands, the Ladrões, Batavia, and the Cape, and reanchored in the Downs in May, 1766. In 1769 he was appointed governor of Newfoundland, and ten years later he was in command of a squadron in the West Indies, whither D'Estaing had gone, while assisting the Americans in the Revolutionary

War. In July, 1779, he fought an action with D'Estaing off Grenada, in which Byron was defeated. His views concerning the duties of the navy in connection with maritime exploration led to the voyages of Captain Cook.

**Byron Bay**, a wide bay on the eastern coast of Labrador, lat. 54° 40' N. and long. 58° W.

**Byssalith**, biz'mā-lith, an intrusion of igneous rock reaching toward the surface as a kind of massive plug through the overlying beds. The rock may be of any type, the form and origin being the essential features.

**Byssus**, bis'us ('flax'), the silky threads by means of which many bivalves attach themselves to a firm surface. The byssus threads are secreted in a gland in the foot which is the homologue of the mucous gland of the snail, and can be speedily renewed if

Byssus of Common Mussel

severed. They are seen in very simple form in the common edible mussel (*Mytilus*), which is always attached to its surroundings by a tuft of golden threads. In Lima the threads are used to fasten together stones, shells, and calcareous weed to form a nest, within which the animal lives. In some bivalves—e. g., the freshwater mussel (*Anodon*)—the byssus is present only in the young; in others it is always absent, while in some species the old byssus may be abandoned and a new one formed. In the south of Italy and in Sicily byssus threads are woven, mixed with silk, into gloves, or stockings. The name is also applied to an extraordinarily fine, transparent textile, woven in antiquity out of a delicate linen thread grown in Egypt and Syria. Hence there were two chief varieties, Alexandrine and Syrian, the latter woven at and near Antioch, and used as a head covering.

**Byström**, bü'ström, JOHAN NIKLAS (1783-1848), Swedish sculptor, was born in Filipstad. He studied under Sergell at Rome, whence he returned in 1816 with an almost complete portrait-statue of *Bernadotte*, the Crown Prince, as Mars. Among others, he executed the colossal statues of *Charles X.*, *Charles XI.*, *Charles XII.*, and *Gustavus Adolphus*; the altar

decorations *Christ with Faith, Hope, and Charity* in Linköping Cathedral, and the sitting *Linnæus* at Upsala. He succeeded best, however, with the figures of women and children—e.g. his *Juno with Little Hercules*.

**Bytown.** See OTTAWA.

**Byzantine Empire.** The formal foundation of the Eastern, or East Roman, or Byzantine empire took place in 395 A.D., when Theodosius the Great, at his death, permanently divided the empire between his sons Arcadius and Honorius. To the share of Arcadius fell the Asiatic portions, together with Egypt, Thrace, Mœsia, Macedonia, and Greece.

From 488 onward the Slavs became the molesters of the empire on its Danube frontier; but the emperors who succeeded Arcadius had rectified the mistake of Theodosius, and reorganized the army, making the native element more prominent. The consequence was that, while the Eastern was as much exposed as the Western empire to the barbarians, the Eastern empire was preserved intact, while the Western was broken up. Arcadius had been nominally succeeded by Theodosius (408–450), but really by Pulcheria, a sister of the young emperor, by whose advice Theodosius was content to be guided, and whom he designated as his successor. The three emperors who succeeded Pulcheria and her husband Marcianus (450–457), Leo (457–474), Zeno (474–491), and Anastasius (491–518), carried the Eastern empire safely through the storms which proved fatal to the empire of the West.

On the death of Anastasius the sceptre passed to Justinus, and in 527 to his nephew Justinian, who reigned for thirty-eight years, and dominated his century. Justinian received an intact and, on the whole, prosperous realm, which had not suffered from serious attack for forty years in its European provinces, while the Asiatic provinces had been free from invasion for a much longer period. Slavs and Bulgarians had crossed the Danube, but they made a very slight impression and did not remain. There had been insurrections in Asia Minor, but they were repressed and left but small trace of disturbance. But in spite of the brilliance of his reign, the empire was in a depressed condition when he died, in 565. This was due partly to the oppressive financial measures which his foreign policy rendered necessary, and partly to the terrible ravages of the plague in 542. Personally he is most celebrated as a legislator for his codification of the laws; he is also notable as the supporter, though not the originator, of Byzantine archi-

teature; but his foreign policy renders him not less noteworthy. His wife, Theodora, who had been an actress, and whom he married against the wishes of his uncle, Justinus, proved to be a capable helpmate and adviser. Justinian's domestic life was without reproach, and in his strict attention to the business of government he was a shining example to idle and dissolute successors. That his financial measures were so oppressive and weakening to the empire was due less to his conscious permission than to his ignorance of the elementary principles of equitable taxation, as well as to an administrative system under which it was impossible to apply them, and of which monopolies, tax farming by middlemen, and arbitrary dues seemed an inseparable part. After a five-years' indecisive war with Persia (which is notable chiefly because it revealed the generalship of the great Belisarius, who assisted also in the suppression of the Blue and Green factions in the capital, which, by the 'Sedition of Nika,' in 532, nearly drove Justinian from Constantinople), it was possible to direct the forces of the empire, under Belisarius and Narses, to the reconquest of the Western empire from its German invaders. As a result, Africa and Italy and a considerable portion of Spain were added to the Eastern empire. The attention of Justinian's successors, Justinus II. (565–578), Tiberius (578–582), and Maurice (582–602), all of them able administrators, was taken up with meeting the Slavic invasions; but in spite of their ability, the empire was steadily going downhill. Maurice was not able to make headway against the barbarians; and owing to his harsh and niggardly treatment of his army, a rebellion broke out against him, which resulted in his murder in 602.

Phocas, who was then raised by the army to the imperial throne, proved much more incapable than Maurice, and was deserted by his own troops, and Heraclius, in 610, took over the empire, then almost in the throes of dissolution. For twelve years Heraclius strove to reorganize the army and the finances of the empire, without much apparent success. Against the Persians he could not hold his own, till the blasphemous insolence of the Persian king, after his capture of Jerusalem, roused the empire to a holy war, and the churches supplied not only enthusiasm, but money, while Heraclius was able to stop the expenditure on corn for the doles to the citizens of Constantinople—an expenditure which, from 616, when Egypt was lost, had para-

lyzed the treasury. After a prolonged struggle with the barbarian Avars on his northern boundary he was able in 622 to take the field against Persia; and in six campaigns, in which he showed such skill that Gibbon compares him to Hannibal, he crushed its power completely, and in 628 concluded a glorious peace, which restored the empire to its former boundaries and recovered the cross. But his victory did not secure him rest. The exhausting taxation under Justinian and his successors had paralyzed commerce and industry. Mainly through the former's example, despotism had become complete; laxity in morals among high and low accompanied the general impoverishment. Besides, the great Saracen invasion was at hand; indeed, at the very moment of Heraclius' triumph Mohammed sent out his famous letter inviting the kings of the earth to embrace Islam. The Saracens quickly overran Syria and Egypt; and in 641 Alexandria alone of Egyptian territory remained in Roman hands.

After the death (641) of Heraclius things went from bad to worse, although the empire received a valuable respite, after twenty-seven years' war, by the civil war among the Moslems due to the contest for the caliphate. This respite enabled Constans II. (642–668) to reorganize the administration of the empire on practically a war basis. But the energy of the empire was unprofitably consumed in theological controversies, which did not cease even in the face of renewed activity on the part of the Saracens. In 673 the now united Saracens launched a fleet and an army against the capital itself, and for four years strove in vain to capture it. But this success against the Moslem was short-lived, and for a quarter of a century anarchy prevailed, and the empire lost most of its provinces in Asia to the Saracens, and in Europe to the Bulgarians, and was only saved from complete destruction by the energy and ability of Leo the Isaurian, one of the generals in the East, who in 716 seized the throne. In 717 Constantinople had to endure another siege by the Saracens; but they were repulsed with heavy loss, and, so far as danger to Europe was concerned, their power was broken. Leo, and not Charles Martel, really saved Europe from the Saracens, for he drove back the main army of advance. For three hundred years longer there was war on the borders, but before Leo's death, in 741, Asia Minor was clear of Saracens.

The history of the 8th century is chiefly remarkable for the controversy regarding image wor-

ship. It was begun by Leo the Isaurian, whose severe edicts against the use of images in worship were supported by his submissive friends, but roused the fierce opposition of the bishops and monks. The policy of most of his successors until nearly the 9th century was similar. They quoted against the 'image worshippers' the arguments and reproaches of the Mohammedans. The bishops of the European provinces were profoundly alienated, and the controversy largely caused the separation of Italy from the Byzantine empire. Moreover, the emperors and their

Down to 800 the West had, through the popes, acknowledged nominal dependence on the East; but when, in 800, Pope Leo III. crowned Charlemagne as Roman emperor, the division of East and West was firmly and permanently completed. Still, between 395 and 800, East and West had been more nominally than really distinct and separate. Even when there were two emperors, the 'empire' was, theoretically at least, one and the same Roman empire founded by the Caesars; but the crowning of Charlemagne made a Western empire, which was a rival of the Eastern Roman

days; but, except that the Russians made their first attempt on Constantinople in these reigns, nothing of decisive importance occurred. About the middle of the 11th century Isaac I. (1057-9) founded the Comnenian dynasty, which ruled to 1185. A new and more formidable enemy was gathering strength in the East while the drizzle of incompetent emperors continued through the 11th century. The Seljuk Turks had made themselves masters of Asia. An emperor of the Comnenian line, Alexius I., had asked aid against them of the Germans, and this in part gave rise to the first

'image-breaking' supporters were put out of sympathy with the priests and the populace of Constantinople. Meanwhile Crete and Sicily were lost to the Saracens, and the theological controversy was not brought to a close till the Council of Nice in 842 decided against the iconoclasts. So long as the Asiatic provinces supplied the emperors the controversy continued, and was not really ended till a European line, in the person of Basil the Macedonian (867-886), ascended the throne, and the European iconoclasts triumphed. The Macedonian dynasty which began with Basil continued, with some short interruptions, till 1056. It ruled over an empire which was now solely an empire of the East.

empire, whose name until that time had no real justification. The eighty years which followed the death of Basil in 886 are the most uneventful in the history of the empire. The empire of the caliphs was breaking up, and the Bulgarians were converted to Christianity, and thereafter gave but little trouble; and the Emperors Leo VI. (886-912) and Constantine (912-959) being men of letters rather than men of action, and being left in peace, did not seek war by committing aggression on their neighbors. A period of military glory under the successful general Nicephorus Phocas, who became emperor in 963, but was murdered by John Zimisces, who succeeded him in 969, revived the memory of earlier

crusade. The Seljuk Turks became the most powerful of the Mohammedan powers in the 11th century. The Arab dynasty at Cordova had disappeared, while the Fatimite caliphs of Egypt had declined in vigor, and those of Bagdad had been conquered by the Seljuks in 1058. This made them the foremost aggressors against Christendom, and especially the Eastern empire. They conquered Armenia, invaded Syria and Palestine, and established themselves in Asia Minor, where they founded the kingdom called Roum, extending from Mount Taurus to the Bosphorus. The forces of the empire, which should have been employed against the Seljuk Turks, were wasted in almost continuous civil wars; and

after the defeat of the Emperor Romanus by the Seljuk chief Alp Arslan at Manzikert in 1071, which may be regarded as the turning-point in the history of the empire, no serious effort was made to check the advance of the ruthless enemy. The Turks had reached the Hellespont, when the first crusade gave a much-needed relief. The Byzantine empire was too exhausted to make vigorous resistance, and would have fallen if the Latin and Teutonic Christians had not come to its relief. The enemy was driven back 200 miles, and was so badly beaten by the crusaders that for a hundred years he acted mainly on the defensive; and the empire recovered many of its richest Asiatic provinces, and, but for the faithlessness of Alexius I. (1081-1118) towards the crusaders, might also have recovered Syria, which, however, was divided up into Frankish kingdoms. The welter of obscure and incompetent emperors continued during the 12th century, and the empire began the 13th century with a Latin occupation (1204) by French and Venetian adventurers diverted from a crusade by the wily policy of Venice—an occupation which lasted for nearly sixty years, long enough to inflict irreparable injury upon the empire, which never recovered from the anarchy of this time. The feudal ideas of those adventurers, chief of whom was Baldwin, Count of Flanders, were rejected by most of the Asiatic provinces; and in these a succession of usurpers kept alive the idea of the empire till, in 1261, the Latins were driven out by Michael VIII., the founder of a new dynasty, the Palæologi, who ruled to 1282 with some energy and wisdom over a realm greatly shrunken in its European limits. In the interval the commercial importance of Constantinople, on which the prosperity of the empire had largely depended, had been reduced by the opening up, as a consequence of the crusades, of new avenues of trade with the East. Trading supremacy was transferred to the Italian cities, and much of the little energy that remained in the empire was dissipated in the fruitless struggle with Venice and Genoa. Thus the crusades, though embodying the Christian loyalty and zeal of that day, and in part preserving the Byzantine empire against the Turks, were in part injurious to those they primarily defended. The Greek emperors viewed the passing of the crusading hosts through their dominions with distrust. They looked upon some of the leaders as rivals and despoilers; their possessions were diminished; and they learned to

regard their deliverers as enemies, and the 4th Crusade (1204) as an expedition for plunder.

The restoration of the empire was, however, followed by renewed activity on the part of the Turks; and the Western allies whom the weakness of Andronicus II. (1282-1328) called in did more damage to the empire than to the infidel. In the meantime the Turks—now the Ottoman or Osmanli Turks—deprived the empire of all its Asiatic possessions except a narrow strip opposite Constantinople (1333). In the civil war the usurper John Cantacuzenus (1341-55) called in the Turks to his aid, and succeeded in preserving his own cause by destroying the empire at which he had aimed. Thereafter it was a matter of

siege, and after a heroic defence the city was captured by Mohammed II. on May 29, 1453.

The verdict of history has become more favorable to the Byzantine empire. For centuries it remained the bulwark of Christianity against the Saracens and then against the Turks. It kept alive the tradition of classical learning during the dark ages in Western Europe, and it bequeathed to Eastern Europe a treasury of ideas and attainment in art, architecture, and religious thought which has profoundly influenced the life of its governments and peoples. Its organization was purely despotic, with no check except the ambitions of its provincial administrators who might rise in rebellion. Its commercial ac-

*Mosque of St. Sophia (exterior).*

years only. In 1354 the Turks made their first permanent settlement in Europe by the capture of Gallipoli. In 1361 Adrianople was taken by Murad, but the capital remained for yet a century the sole remnant of the Eastern empire. The Turks devoted themselves to fighting the Serbians and the Bulgarians, and contemptuously allowed Constantinople to maintain a separate parochial history. For a moment in 1402 there was a prospect of relief, when the Tartar hordes under Tamerlane burst into Asia Minor, and the emperor of the East recovered, during the civil war which followed the defeat of the Turkish Bayazid at Angora, some of his ancient realms. But little use was made of the opportunity, and by 1444 Constantinople was again the limits of the empire. In 1452 came the final

tivity, resulting largely from its advantageous situation, linked East and West in beneficial intercourse for centuries until maritime discovery had mapped out new trade routes. The policy of the emperors was to destroy all local patriotism, and to remove from ambitious provincials the means of successful revolt. In this way the power of the empire to meet external attack was also weakened. In political development its achievement was small, its oriental cast of civilization being alien to the spirit of free institutions. See Gibbon's *Decline and Fall of the Roman Empire* (1827; new ed. 1903); Finlay's *Hist. of Greece* (1877); Bury's *History of the Later Roman Empire* (1889); Pears's *Fall of Constantinople* (1885); Rambaud's *L'Empire Grec au Xme Siècle* (1870); Heyd's *Histoire du com-*

*merce du Levant au Moyen Age* (1885); Krause's *Die Byzantiner des Mittelalters in ihrem Staats-, Hof-, und Privatleben* (1869), and C. W. C. Oman's *The Byzantine Empire* (1886).

**BYZANTINE ARCHITECTURE.** The foundation of a new and magnificent city gave a great impulse to architecture; and the meeting of East and West, Pagan and Christian, Greek and Roman, developed a new style in which the arch replaced the line of the architrave, and the universal use of vaulted roofs, especially in domical form, the flat roof of Greek temples, while the Roman basilica formed the basis of the whole, the dome rising from the centre of the cross. Thus the structural plan of Byzantine architecture remained fundamentally Roman, while the Roman method of construction in concrete with facings of brick and marble was exchanged for a more scientific system of building in brick alone, or alternately of brick and rubble, thus considerably reducing the areas of the supporting masses. The new style also exemplified the Gothic method of balancing thrusts by counterthrusts instead of by dead weight. Timber was never used in the vaulted roofs. 'The union of engineering skill with exquisite ornament,' such as marble paneling and mosaic, is characteristic. No less than seven forms of capital were evolved from the Greek columns by the Byzantine sculptors—the impost, melon, bowl, Byzantine Ionic, Byzantine Corinthian, bird and basket, and wind-blown acanthus. 'The union of the dome, on the grandest scale and in infinite variety, with arched ranges of columns in rows and in tiers—this was the unique triumph of Byzantine art, and nothing in the history of building has borne a fruit so rich.' The zenith of this art was reached under Justinian (526), when the architects Anthemius and Isidorus built the church of Sancta Sophia. The church of St. Sergius is also a famous example. Four periods may be noted: (1) 328 to 527 A.D.; (2) 527 to the end of the 8th century; (3) 9th to the 12th century; (4) 1204 to 1453 A.D. In W. Europe copies of Byzantine churches may be found at Ravenna (St. Vitale), Venice (St. Mark's), and at Monreale, near Palermo. From the 5th to the 11th century 'the Byzantine and Eastern world preserved the traditions and led the development of art in all its modes.'—*Mosaic*, especially *glass mosaic*—now being revived for mural decoration—was a strictly Byzantine art; so was *enamelling*, now the heritage of W. Europe. The Pala d'Oro at St. Mark's is of Byzantine

origin. *Ivory carving* and *jewellery* were produced abundantly, *miniature* and *fresco painting* cultivated with success. *Le Manuel d'Iconographie Chrétienne* (published 1845), found in the hands of the monks of Mt. Athos, and as old as the 11th century, describes fully the designs and processes. *Metal work* was highly artistic, as may be seen in the bronze doors at Amalfi. *Numismatic art* was considerable, if not supreme. *Silk and satin embroidery* was a Greek monopoly, and we read of a senator's robe adorned with 600 figures representing the life of Christ. And the Dalmatic of the Vatican is renowned. *Samite* is Greek for six-threaded stuff. *Cendal* is *σινδοον*, a kind of muslin or taffeta. *Imperialis* was stuff supplied only to the great. *Greek manuscripts*, though in lettering inferior to the Irish, are in miniature painting superior, and the Vatican and Paris specimens unsurpassed. In *music*, Greek notation was, during the first six hundred years of the Christian era, in universal use, and for the next four hundred with slight modifications, till the change introduced by Guido Arezzo in the 11th century. The Emperor Copronymus sent to Pippin the first organ seen in Western Europe.

**BYZANTINE LITERATURE.** 'The peculiar indispensable service of Byzantine literature was the preservation of the language, philology, and archæology of Greece.' From Proclus (5th century) there were never lacking students of the philosophy of Plato and Aristotle. Geometry and astronomy were kept alive, if not much improved. The architects of St. Sophia were mathematicians, and wrote on mechanics. Leo (9th century) lectured on geometry, and composed an essay on Euclid. Michael Pselus (11th century), 'prince of philosophers,' treated of mathematics and astronomy. From the 4th to the 11th century there was a regular series of writers on medicine, zoology, botany, mineralogy, and geography. (See Krumbacher's 1,200 pages.) Epigrammatists formed a class to themselves. Grammarians, scholiasts, lexicographers produced much useful work and the *Etymologicum Magnum*. Much of the best intellect of the times was absorbed in theological problems, and Chrysostom, Cyril, Methodius, the Patriarch Photius, Gregory of Nazianzus are great names in the Eastern Church. Amongst poets were Pisides, Theodosius, Leo, Tzetzes, and the Silentiary Paul, who wrote on St. Sophia. Civil law is represented by the great compendium

in sixty books inspired by Basil but published by Leo VI. Historians who wrote on universal history, or of their own city and its customs, are legion, and Gibbon is the only guide through a maze of names that include emperors, generals, and statesmen. Their works, first printed at Paris in thirty-six volumes by Labbé (1654-1711), and reprinted at Venice (1727-33), were incorporated in forty-eight volumes by Niebuhr and others, under the name *Corpus Scriptorum Historiæ Byzantinæ* (1828-53). Procopius wrote *Byzantine History*; Eusebius, *Universal History*; Proxagoras, *History of Constantine*; Zonaras, *Annals*; Nicetas Acominatus, *History of Byzantine Emperors*. Other names of authors, covering with their works the period 553-1463, are Agathias, Anna Comnena, Cinnamus, Nicephorus Gregoras, John Cantacuzenus (emperor), Michael Ducas, Chalcocondyles. They are valuable not for what they originate, but for what they preserve. Cinnamus and Ducas make some claim to philosophical history, Anna Comnena to artistic skill. See Harrison's *Byzantine History in the Early Middle Ages* (1900); Schlumberger's *L'Épopée Byzantine* (1896); Lethaby and Swainson's *A Study of Byzantine Building* (1894); Krumbacher's *Geschichte der Byzantinischen Literatur* (1897); Bayet's *L'Art Byzantin* (1892).

**Byzantium**, tn. on the Thracian Bosphorus, the forerunner of the modern Constantinople, founded by the Megarians in 667 B.C. Its situation was highly advantageous in many ways. It had a deep harbor, was without tides, and it commanded the grain trade between the merchants of the W. and the people on the N. shores of the Euxine Sea. During the 5th and 4th centuries B.C. it was for the most part included among the states subject to Athens, except that from 515 to 478 B.C. it was subject to Persia. From the middle of the 4th century B.C. until it was merged in the Roman empire the town enjoyed independence. Its inhabitants had almost from the first been of mixed character, and they were commonly regarded as of a profligate and frivolous disposition. In 196 A.D. it was destroyed by Severus, after a long siege. At first he treated the inhabitants with great cruelty, and put many of them to the sword, but he afterwards rebuilt part of the city, made baths, and improved the hippodrome. Its excellent site caused the emperor Constantine to choose it for the capital of the Eastern empire in 330 A.D., when it was called Constantinopolis. See **BYZANTINE EMPIRE**.

# C

**C.** Before the 3rd century B.C. there was no distinction between C and G; they were one letter, with the original value *g* (see G), and the later value *k*. After G came into use, C was left with the value *k*. With this sound it passed to Britain, and it is still so used in Welsh. But *k* is a sound very liable to change, under the influence of a consonantal *i*, which tends to slip in after it (dialectic English *cyar* = 'car'). Hence C in the alphabets derived from the Latin (English, French, German, Italian, etc.) has acquired a number of different sounds, such as *ts*, *ts*, *sh*, *s*. In the English name it is now pronounced *s*, and this is generally its sound before *e*, *i*, and *y*; it is a value largely due to French influence after the Norman conquest. Other English sounds are *z* and *sh* ('sacrifice,' 'officiate').

*Ch* is used in the alphabets derived from the Latin to express various sounds originating in *c* = *k*. In phonetics it is best to use it for spirant *k*, Greek  $\chi$ , its value in German and Welsh (*cf.* Scottish 'loch'). Its principal English value is that found in 'church, and is due to Old French influence. The modern French value also appears in English ('machine').

The form of C has varied very little since it was distinguished from G. Regarding *c*, see Z.

C, in music (called on the Continent DO or UT), is the tonic of the 'natural' scale—*i.e.* that which has neither sharps nor flats. The key of C minor flattens E and A.

**Caaba.** See KAABA.

**Caacate**, or CAACATI, tn., prov. Corrientes, Argentina, 77 m. S.E. of Corrientes. Pop. 5,000.

**Caal'ing Whale.** See CA'ING WHALE.

**Caazapa**, tn., Paraguay, 188 m. S.E. of Asuncion, and on a railroad through some of the principal cities. Pop. 12,000.

**Cab.** A kind of vehicle called a cabriolet (its springing motion was supposed to resemble that of a kid) was in existence about the middle of the 17th century in Paris, and by the middle of the following century cabriolets came into general use. The original vehicle was a hooded gig on two wheels with room inside for only one passenger, beside whom sat the driver. In the beginning of the 19th century an effort was made to introduce cabriolets into Great Britain, to supersede hackney carriages. It was not until 1823 however, that licenses were obtained for cabs. At first their number was limited to twelve. These were of an improved pattern with a folding

hood, and seated for two passengers, the driver being separated from them by a partition. In 1832 all restrictions were removed, and cabs came into popular favor. In 1836 a cab on four wheels, the precursor of the brougham, was introduced, and from this the present four-wheeler is descended. In 1834 a patent was taken out for an improved two-wheeled safety cab by Mr. Hansom, the architect of Birmingham town hall. The safety consisted in an arrangement of the framework which prevented the cab tilting backwards or forwards in case of accident. These cabs had a small body, hung between wheels of over seven feet diameter; but two years afterwards a fresh patent was obtained for an improved hansom, on the lines of the present vehicle. Great improvements have taken place both in the hansom and the four-wheeler as regards smartness, lightness, and convenience. By means of a folding framework cover both may be used open or closed, and since the introduction of india-rubber tires a remarkable degree of smoothness in running has been attained. Cabs in the United States are mostly under police or municipal regulation in the matter of fares, stands, etc., each city having its own by-laws on the subject. Motor cabs were introduced generally about 1900, and are extensively found in the large cities of the U. S.

**Cabal**, a secret understanding between the members of a clique or party, and by transference denoting the clique itself. Charles II.'s cabinet was (1667-73) styled the 'Cabal,' not only because the term was considered peculiarly appropriate, but also because the initials of the noblemen forming the cabinet (Clifford, Ashley, Buckingham, Arlington, Lauderdale) made the word *cabal*.

**Caballero**, FERNAN, pen-name of CECILIA FRANCISCA JOSEFA BOHLDE FABER (1796-1877). Spanish novelist, of German parentage, until recently one of the most popular novelists in Spain and largely read in England. Her best-known work is *La Gaviota*—'The Seagull' (1867); *Clemencia* also is well known. Any value her works may possess depends upon her pictures of rural life in Andalusia, which are very true and racy. Although not so popular as *La Gaviota*, the *Cuadros de Costumbres Populares Andaluces* (1852; Eng. trans., *National Pictures*, 1882) is probably the most attractive book.

**Cabanatuan**, pueb., Nueva

Ecija prov., Luzon, Philippine Is., 13 m. N. of San Isidro, on the Rio Grande de la Pampang, and on the main road. Pop. (1903) 7,109.

**Cabanel**, ALEXANDRE (1823-89), French artist, born at Montpelier; studied painting under Picot and in 1863 became professor at the Ecole des Beaux-Arts, Paris. His works include *The Agony of Christ*, *The Death of Moses* (1852), *The Christian Martyr*, *Michelangelo*, *The Birth of Venus* (1863), *Adam and Eve*, *Death of Francesca da Rimini* (in the Luxembourg, Paris), and *Scenes from the Life of St. Louis* (in the Pantheon, Paris). But he was chiefly famous for having painted women of the French aristocracy. Many of his pictures and portraits are owned in the U. S. His portrait of Miss Catherine Wolfe is in the Metropolitan Museum of Art, New York, and the *Birth of Venus* (replica), and his *Queen Vashi* and *King Ahasuerus* are in the same museum. The Corcoran Gallery at Washington contains his *Death of Moses*. See Stranahan's *History of French Painting* (1899).

**Cabanis**, PIERRE JEAN GEORGES (1757-1808), French physician and writer, was born at Cosnao (Corrèze). After being physician to Mirabeau, he was appointed clinical professor in Paris in 1767, and became a member of the Council of the Five Hundred, and, under Napoleon, of the Senate. His *Traité du Physique et du Moral de l'Homme* (1802) is imbued with the ideas of Locke and Condillac, and exercised considerable influence at the beginning of the 19th century. He also wrote several books on medicine—*e.g.* *Coup d'Œil sur les Révolutions et la Réforme de la Médecine* (1804).

**Cabatúan**, pueb., Iloilo prov., Panay, Philippine Is., 15 m. N.W. of Iloilo on a trib. of the Suague R. Rice and sugar cane may be raised at the greatest advantage, but native enterprise is at a low ebb. Pop. (1903) 16,497.

**Cabbage** (*Brassica oleracea* var., *capitata*), one of our most important vegetables. It is a native of Europe and is extensively grown in all temperate climates. It is eaten cooked in various ways, raw as a salad, and salted and cured as kraut. The edible portion consists of a head of densely packed leaves, which varies in weight from 3 to 10 or 12 pounds. The cabbage is a hardy plant, easily grown and does well on most any fertile, well drained, friable soil. Loams are preferred. They should be made rich by

heavy applications of well rotted stable manure. In market gardening sometimes as much as 80 to 100 tons per acre are applied. The crop does well after clover or other legumes. It should be grown in rotation with other crops to avoid certain diseases which affect it.

There are white cabbage, red cabbage, and crinkly leaved or Savoy cabbage, with early, medium, and late maturing varieties of each. Early Jersey Wakefield and Very Early Winningstadt are two of the best early white varieties. These mature in from 90 to 100 days from the time the seed is sown, and are of the best quality. The various strains of Flat Dutch and Drumhead varieties are among the best for late white cabbages. The Red Dutch is an excellent red variety. The Savoy cabbages, while the best in quality of all the cabbages, give a relatively light yield and hence are less extensively grown. Drumhead, Savoy, and Marvin Savoy are excellent sorts.

Cabbages are usually started in hotbeds, cold frames, or window boxes, and transplanted to the field as soon as weather conditions permit. In field culture the plants are set in rows 2½ ft. apart and about 2 ft. apart in the row. This distance permits of horse cultivation both ways, which should be shallow and frequent. In transplanting set the plants in the soil up to the first leaves, firmly pack the soil around the roots, leaving a little loose soil on top to retard drying out. Choose a cloudy day or late afternoon for transplanting and in dry weather, pour about a half-pint of water before setting in the hole made to receive the plant. The bulk of the cabbage crop should be marketed in the fall to avoid losses in rotting from storage. When storage is desirable, pull the cabbage when dry and not frozen, leaving the roots on. It keeps well in a cold, damp cellar, or stored in long, shallow, narrow trenches, out of doots. Place the heads down and the roots up, with not over 2 or 3 tiers of heads in one trench. Cover over with straw and dirt to prevent serious freezing. If there be any secret in successfully storing cabbage, it is to keep it cool and moist, but not wet.

Clubroot (*Plasmodiophora brassicæ*) and black rot (*Pseudomonas campestris*) are perhaps the most serious diseases of cabbage, and both are best controlled by rotation methods, but should not follow turnips, mustard, radishes, or related plants.

Paris green is an effective remedy against most of the insects which eat the leaves of cabbage. This is mixed in the proportion

of 1 part Paris green to 6 parts flour, and applied when the plants are moist with dew or rain.

**Cabbage Butterfly**, a large white butterfly (*Pieris brassicæ*), common in gardens in summer in both Europe and N. America.

Cabbage Butterfly, with larva and pupa.

There is also another smaller species. The eggs are laid on the under surface of the leaves of cabbages and other cruciferous plants, and hatch in about a fortnight, giving rise to bluish-green larvæ. These are exceedingly voracious, and very destructive to the host plants. When full fed the larvæ quit the host plant, and pupate on walls, trees, etc. The autumn brood remains in the pupa stage till spring, and then hatching gives rise to the early butterflies, whose offspring form the butterflies of full summer. In fine seasons there may even be three generations for the rate of development depends upon the weather.

**Cabbage Fly** (*Anthomyia*, or *Phorbia brassicæ*), a dipterous insect which in appearance closely resembles the common house fly. The larvæ attack the stalks of cabbages and other vegetables, and often cause great destruction.

Cabbage Fly, with larva and pupa.

Other closely similar species infest radishes, lettuce, etc., the genus being a very large one. Spraying with some insecticide is necessary to destroy the pest.

**Cabbage Palm**, or CABBAGE TREE (*Areca oleracea*), a native of the W. Indies, where it often attains a height of 100 feet, is a handsome tree with a trunk free from the remains of the leaf-sheaths of dead leaves. The terminal bud, the 'cabbage' and the interior of the stem are edible, pickled or boiled. The cabbage-palm of the Southern United States, whose head is also eaten, is the sabal-palmetto (*Sabalpalmetto*).

**Cabbala** (from Heb *qabbalah*, 'what is received,' 'tradition'), an ancient Jewish system of re-

ligious philosophy or theosophy, said to have been given by God to Adam. According to some, the system was lost at the time of the Babylonian captivity, but was subsequently revealed to Ezra; and it has been held that the famous cabbalistic volume *Sohar*, a mystic commentary on the Pentateuch, was the work of Simon ben Jochai (A.D. 72-110). Dr. Ginsburg and others, however, believe that, for the purpose of opposing the philosophical system of Maimonides, the Cabbala was founded by Isaac the Blind and his disciples, Ezra and Azariel of Zerona, between 1200 and 1230 A.D. Some of its dogma are akin to Christian tenets, and it was influenced in a considerable degree by Greek Neo-Platonism. The chief contention was that God is without end, and boundless, without will, intention, desire, or action; but that there have emanated from Him ten *sephiroth*, or intelligences, the first being called the Inscrutable

Cabbage Palm.

Height, the names of the others being, in order, Wisdom, Intellect, Grace, Power, Beauty, Firmness, Splendor, Foundation, and Authority. The Cabbala teaches the doctrine of the transmigration of souls, and has exercised great influence upon the intellectual development of the Jews. Raymond Lully, Pope Sixtus IV., Pico della Mirandola, and Reuchlin were all more or less interested in the Cabbala. See Ginsburg's *The Kabbalah* (1865); Knorr von Ro-

## President Harding's Cabinet, 1921

On March 4, 1921, following his inauguration as the twenty-ninth president of the United States, Warren G. Harding officially presented to the Senate the following names of men chosen by him to constitute his Cabinet, and they were immediately confirmed.

Secretary of State: Charles Evans Hughes of New York.

Secretary of the Treasury: Andrew W. Mellon of Pennsylvania.

Secretary of War: John W. Weeks of Massachusetts.

Attorney General: Harry M. Daugherty of Ohio.

Postmaster General: Will H. Hays of Indiana.

Secretary of Navy: Edwin Denby of Michigan.

Secretary of Interior: Albert B. Fall of New Mexico.

Secretary of Agriculture: Henry C. Wallace of Iowa.

Secretary of Commerce: Herbert C. Hoover of California.

Secretary of Labor: James J. Davis of Pennsylvania.

Brief biographies of these men follow. Their portraits appear on the next page.

**Hughes, CHARLES EVANS** (1862). Secretary of State, was Republican candidate for the presidency of the United States in 1916, but was defeated by Woodrow Wilson (q. v.). He was engaged in the practice of law from 1917 to 1921, when he was named by President Harding as Secretary of State. For a more detailed biography, see HUGHES, CHARLES E.

**Mellon, ANDREW WILLIAM** (1852). Secretary of the Treasury, banker, was born in Pittsburgh, and was educated at the University of Pittsburgh. He entered the banking business in 1874 and became president of the Mellon National Bank in 1902. He founded the town of Donora, Pa., where he erected some of the largest steel mills in the world, and, with his brother, established the Mellon Institute of Industrial Research

in Pittsburgh. He is a trustee of the University of Pittsburgh and is identified with many charitable and welfare organizations.

**Weeks, JOHN WINGATE** (1860). Secretary of War, served in the U. S. House of Representatives from 1905 to 1913 and in the Senate from 1913 to 1919. In the Republican National Convention of 1916 he received 105 votes for the presidential nomination. See WEEKS, JOHN W.

**Daugherty, HARRY M.** (1860). Attorney General, lawyer, was born in Washington Court House, Ohio, and was graduated from the University of Michigan in 1881, and later from Ohio State University Law School. He was elected to the Ohio State Legislature (1889) and served one term; was chairman of the Republican State Central Committee (1898); and was candidate for nomination for Governor of Ohio (1899), but was defeated. He has been a close friend and political advisor of President Harding for twenty years and has been extremely active in Ohio politics.

**Hays, WILL H.** (1879). Postmaster General, lawyer, was born in Sullivan, Indiana, and has practised law in his native town since 1900. He became chairman of the Republican National Committee in 1916. He is progressive in tendency and was for a time opposed by the reactionary forces of his party.

**Denby, EDWIN** (1870). Secretary of the Navy, was born in Evansville, Indiana, and in 1885 went with his father (then U. S. Minister) to China, where he was for ten years (1887-97) in the Chinese customs service. After his return to America he was graduated from the University of Michigan (LL.B.) and was admitted to the bar. In 1905 he was elected to Congress from the 1st Michigan district, and served for three successive terms. He served as a gunner's mate in the Spanish-American War and in the United States Marine

Corps during the World War. He is a member of the law firm of Chamberlain, Denby, Webster and Kennedy, of Detroit.

**Fall, ALBERT BACON** (1861). Secretary of the Interior, was born in Frankfort, Kentucky, and obtained his education in country schools. When a young man he taught school and read law and later was engaged in farming, ranching, and mining. He served in the New Mexico legislature and as associate justice of the New Mexico Supreme Court, and in 1912 was elected U. S. Senator from New Mexico, where he remained until chosen a member of the Harding cabinet.

**Wallace, HENRY C.** (1866). Secretary of Agriculture, editor and publisher, was born in Rock Island, Illinois, and was educated at Iowa State College, where he was professor of dairying from 1893 to 1895. He was engaged in farming and the breeding of livestock in Iowa (1887-91), was editor of the *Creamery Gazette* and *Farm and Dairy* (1893-5), and manager and associate editor (1895-1916) and editor (after 1916) of *Wallace's Farmer*. He was a member of the National War Work Council of the Y. M. C. A. and chairman of the Iowa State committee of that organization.

**Hoover, HERBERT CLARK** (1874). Secretary of Commerce, earned distinction during the World War and subsequently as chairman of the Commission for Relief in Belgium, U. S. Food Administrator, and chairman of the European Relief Council. See HOOVER, HERBERT C.

**Davis, JAMES JOHN** (1874). Secretary of Labor, was born in Tredegar, Wales, and began work, when a small boy, as a puddler in steel mills. In 1893 he went to Elwood City, Indiana, where he held several city and county offices. He was for many years president of the Amalgamated Association of Iron, Steel, and Tin Workers of America, and has been an active leader in union affairs.

**PRESIDENT HARDING'S CABINET, MARCH 4, 1921.**

1. Charles Evans Hughes, Sec'y of State. 2. Andrew W. Mellon, Sec'y of Treasury. 3. John W. Weeks, Sec'y of War. 4. Harry M. Daugherty, Attorney General. 5. Will H. Hays, Postmaster General. 6. Edwin Denby, Sec'y of Navy. 7. Albert B. Fall, Sec'y of Interior. 8. Henry C. Wallace, Sec'y of Agriculture. 9. Herbert C. Hoover, Sec'y of Commerce. 10. James J. Davis, Sec'y of Labor.

senroth's *Cabbala Denudata* (1677-78), and its English translation, *The Cabbala Unveiled*; Waite's *Doctrines and Literature of the Cabbala* (1907), and *The Secret Doctrine in Israel* (1913); Pick's *The Cabbala, and Its Influence* (1912).

**Cabeiri**, ka-bi'ri, or CABIRI, ancient mystic divinities chiefly worshipped at Samothrace, Lemnos, and Imbros, but also at Thebes, Pergamos, and elsewhere. They are identified by some with Demeter, Persephone, and Rhea; by others with the Dioscuri (Castor and Pollux); by others again with the Roman Penates.

**Cabell'**, JAMES BRANCH (1879- ), American author, was born in Richmond, Virginia. He was graduated from William and Mary College in 1898, and took up newspaper work. He was on the staff of the *New York Herald* (1899-1901), and the *Richmond News* (1901) and in 1902 began contributing to magazines and periodicals. Besides his own literary work he acted as genealogist to the Virginia Sons of the Revolution, and as historian to the Virginia Society of Colonial Wars and the Virginia Sons of the American Revolution. His published works include *The Eagle's Shadow* (1904); *The Cords of Vanity* (1909); *Domnei* (1913); *The Rivet in Grandfather's Neck* (1915); *The Cream of the Jest* (1917); *Beyond Life* (1919); *Jurgen* (1919); *Figures of Earth* (1921); *The High Place* (1923); *Straws and Prayer Books* (1924); *The Silver Stallion* (1926); *The Music from Behind the Moon* (1926); *Something about Eve* (1927).

**Cab'er**, Tossing the, a Scottish sport in which a large beam or young tree, heavier at one end than the other, is held perpendicularly balanced against the chest, small end downward, and tossed so as to fall on the heavy end and turn over, the farthest toss and straightest fall winning.

**Cabes**, kã'bes, or GABES (ancient *Tacapa*), port of Tunis, at the head of the Gulf of Cabes; 200 miles south of Tunis city. It exports esparto grass, dates and other fruits, henna and wool. Pop. 12,000.

**Cabet**, kã'bã', ETIENNE (1788-1856), French communist, was born in Dijon, and was educated as a lawyer. He was *procureur-général* of Corsica (1830-31), and deputy for the department of Côte-d'Or (1831). In 1833 he founded a radical Sunday paper, *Le Populaire*; and because of an article in it was obliged to flee to England. In 1839 he was again in Paris, where he published his *Histoire populaire de la révolution française* (1840), and *Voyage en*

*Icarie* (1842). The latter, advocating utopian and communistic ideas, resulted in the emigration of a French colony—mainly consisting of Parisian workingmen—to Texas in 1848, where the *New Icarian* community was founded (see COMMUNISTIC SOCIETIES).

**Cabeza del Buey**, kã-bã'thã del bõõ-ã, town, Southwest Spain; 95 miles southeast of Badajoz. It has tanneries and cotton and cork industries. Pop. (1920) 7,417.

**Cabinda**, kã-bẽh'dã, or KABINDA, district and seaport, Angola, Portuguese West Africa, north of the mouth of the Congo. Pop. 10,000.

**Cabinet**, the body of advisers to the head of a nation, who are usually charged also with the administration of various executive departments. The two principal types of cabinet are well illustrated in the cabinets of the United States and Great Britain.

**United States.**—The cabinet is composed of the heads of the executive departments, whose function is to advise the President upon important questions of policy, upon which advice he is under no legal obligation to act. The cabinet members are appointed by the President, at an annual salary of \$12,000, and are subject to confirmation by the Senate; they are responsible only to the President; and they may be removed by him at will. The cabinet meets at the White House, at the call of the President; no records of the meetings are kept; and the proceedings are not officially made public.

While no provision was made in the Constitution for the creation of such a body, the establishment of executive departments was evidently assumed in the statement providing that the President might 'require the opinion in writing of the principal officers in each of the executive departments, upon any subject relating to their respective offices.' Congress, accordingly, in 1789 created the Departments of State, War, and the Treasury. President Washington called for the written opinion of the heads of these departments; and from time to time assembled them together with the Attorney General, for consultation. Under John Adams the Navy Department was created, and the Secretary of the Navy was added to the cabinet. Jefferson developed the idea of systematic conferences, and emphasized party harmony, and during his administration the office of Postmaster-General was added. In 1849 the Secretary of the Interior joined the cabinet, in 1889 the Secretary of Agriculture, and in 1903

the Secretary of Commerce and Labor. In 1913 the Department of Commerce and Labor was divided into two departments, and their respective heads became members of the cabinet, bringing the total to ten.

**Great Britain.**—The cabinet is composed of the chief Ministers of the Crown, who sit in the legislature, and who are jointly responsible for the government of the country. The prime minister is appointed by the Crown, and the other cabinet members by the prime minister. The responsibility of the cabinet is to the House of Commons, an adverse vote of which on an important matter leads to the resignation of the cabinet as a whole.

The British cabinet dates from the time of William III. In Pitt's time (1783) it consisted of himself and seven peers. After this the number gradually increased; it is not fixed but is never less than eleven; in 1927 it was twenty-one. The cabinet invariably includes the prime minister and first lord of the Treasury, lord president of the council, chancellor of the exchequer, lord chancellor, and five secretaries of state (home affairs, foreign affairs, colonies, war, and India). Other members in 1927 were lord privy seal, first lord of the Admiralty, president of the Board of Trade, minister of health, minister of labor, secretary of state for air, minister of agriculture and fisheries, president of the Board of Education, secretary for Scotland, chancellor of Duchy of Lancaster, first commissioner of works, and attorney general.

Owing to the large numbers composing the British cabinet it is inevitable that the real conduct of government should fall into the hands of an 'inner cabinet.' During the Great War a small cabinet, consisting of the prime minister and first lord of the treasury, lord president of the council, four ministers without portfolio, and the chancellor of the exchequer—seven in all—formed the war cabinet, which directed hostilities and also served the purposes of an ordinary cabinet.

Consult Blauvelt's *Development of Cabinet Government in England*; Bryce's *American Commonwealth* (new ed. 1914).

**Cabinet Noir**, a former French government department, engaged in opening private letters and reading them. It was organized under Louis XIV., was disestablished during the Revolution, but again established by Napoleon, and existed in France until the last years of the restoration. A similar office existed in Imperial Russia.

**Cabiri**, ka-bi'ri. See CABEIRI.  
**Cable**, a large rope or chain of iron links, especially such as may be used for holding a vessel to her anchor. Rope cables are made of hemp, jute, coir, or wire; but these have been largely superseded by chain cables. The latter are usually of eight lengths of 15 fathoms each. Those used in the U. S. Navy have a swivel 5 fathoms from the anchor, and neither swivel nor shackle from that point to 45 fathoms.

As a measure of length at sea, a cable equals 100 fathoms, or the tenth part of a nautical mile. The term is sometimes used to signify a cable's length—viz., 120 fathoms. For Submarine Cables, see TELEGRAPHY. See ANCHOR; CHAIN; ELECTRIC CABLES.

**Cable**, GEORGE WASHINGTON (1844-1925), American author, was born in New Orleans, of New England and Virginia stock. He served in the Confederate Army during the Civil War; and was afterward a member of the New Orleans *Picayune* staff (1865-79). His literary reputation was established at this time by his sparkling and tender sketches of the Latin Quarter of New Orleans and of Southern plantation life, which first appeared in *Scribner's Monthly*. After 1885 he made his permanent residence in Northampton, Mass. He was a member of the American Academy of Arts and Letters. His published works include *Old Creole Days* (1880), a collection of his early sketches; *The Grandissimes* (1880); *Madame Delphine* (1881); *Dr. Sevier* (1883); *The Creoles of Louisiana* (1884); *Bonaventure* (1888), a collection of short stories; *John March, Southerner* (1894); *Strong Hearts* (1899); *The Cavalier* (1901); *Bylow Hill* (1902); *Kincaid's Battery* (1908); *Possom Jone' and Pere Raphael* (1909); *Gideon's Band* (1914); *The Amateur Garden* (1914).

**Cableway**. See ROPEWAYS.

**Cabot**, kab'ut, GEORGE (1751-1823), American public official, was born in Salem, Mass., and studied at Harvard. He went to sea as a cabin boy, and afterward became a successful shipowner. He was a member of the provincial congress of Massachusetts (1776); of the State constitutional convention (1779-80); and of the convention which ratified the Constitution of the United States. He was United States Senator from 1791 to 1796; and declined the appointment as first Secretary of the Navy (1798). He was a leader of the Federal Party, and an advocate of strong centralized government. In 1814 he served as president of the Hartford Convention (q.v.).

**Cabot**, JOHN, or GIOVANNI CABOTTO (c. 1450-98), discoverer

of the North American mainland, was a Genoese, naturalized in Venice, who settled about 1490 as a merchant in Bristol, England. Under letters patent from Henry VII. he sailed from Bristol in 1497, with two vessels, and on June 24 sighted Cape Breton Island and Nova Scotia. In 1498 he sailed again from Bristol, with a small fleet of five ships; but of the fate of this expedition nothing more was ever heard.

**Cabot**, SEBASTIAN (1474-1557), son of John Cabot (q.v.), was probably born in Venice. He is said to have accompanied his father on his first voyage of discovery (1497); and in 1499 he appears to have sailed with two ships in search of a Northwest Passage, and followed the American coast from 60° to 30° N. lat. He attained some fame in England as a cartographer, and in that capacity later entered the service of Ferdinand V. of Spain (1512). In 1519 Cabot was appointed pilot major by Charles V. of Spain, for whom, in 1526, he commanded an expedition which examined the coast of Brazil and La Plata, where he endeavored to plant colonies. The attempt ending in failure, he returned to Spain (1530), and was imprisoned for a year, and banished for two years to Oran, in Africa. In 1533 he obtained his former post in Spain; but in 1547 once more betook himself to England, where he was well received by Edward VI., who made him inspector of the navy, and gave him a pension. He was among the first to notice the variation of the magnetic needle in different places. In 1553 he was the director of the expedition of Merchant Adventurers which opened to England an important commerce with Russia.

**Cabot Strait**, between Newfoundland and Cape Breton Island, forms an entrance to the Gulf of St. Lawrence, 60 miles wide.

**Cabra**, ka'brä, town, Spain, in the province of Cordova; 32 miles southeast of Cordova. It is an ancient city, with an old castle, and has Jasper quarries. Its wine is much esteemed. Pop. 13,500.

**Cabral**, kä-bräl', or CABRERA, PEDRO ALVARE (c. 1460-1526), Portuguese navigator. In 1499 the king placed him in command of a fleet of 13 vessels, with 1,200 men, bound for the East Indies. He took a course too far westerly, fell into the South American current of the Atlantic, and was carried to the unknown coast of Brazil, of which he claimed possession for the king of Portugal. He then sailed for India; landed at Mozambique, of which he first gave clear information; and sailed thence to Calicut, where he made the first commercial treaty between Portugal and India.

**Cabrera**, kä-brä'rä, one of the Balearic Islands (q.v.), used as a penal settlement; area, 8 square miles.

**Cabrera**, RAMON, COUNT OF MORELLA (1810-77), Spanish general, was born in Tortosa, of humble parents. When the death of Ferdinand in 1833 gave the signal for civil war, he joined the partisans of Don Carlos, and during the next seven years valiantly but somewhat cruelly led the Carlist soldiers against the Christians. He overthrew the royal army at Buñol and at Burjasot, and threatened Madrid itself; but in 1840 he suffered a total defeat, and was driven across the French frontier. In 1845 he opposed Don Carlos' abdication, and in 1848 renewed the struggle; but early in 1849 was forced to recross the Pyrenees. He afterward lived in England.

**Cabriolet**. See CAB.

**Cabul**, kä'bööl or kä-bööl'. See KABUL.

**Cacao**, ka-kä'ö. See COCOA.

**Cacao Butter**, or OIL OF THEOBROMA, the concrete oil obtained by crushing and heating the seeds of *Cacao theobroma*. It is easily melted and is used medicinally to form suppositories.

**Caccini**, kat-ché'ne, GIULIO (1550-?1615), Italian musical composer, was born in Rome. After 1565 he was musician at the court of Florence, and took a leading part in the efforts to revive the dramatic music of the ancients. To this end he composed the dramas *Il Combattimento d'Apolline col Serpente* (1590), *Daïne* (1594), and *Euridice* (1600).

**Cacères**, kä'thä-räs, province, Estremadura, Spain, intersected by the River Tagus; area, 7,667 square miles. On the north of the river, fruit, wine, and oil abound; on the south, grain and pasturage. Pop. (1923) 409,148.

**Caceres**, city, Spain, capital of Caceres province, on the River Tagus; 50 miles northeast of Badajoz. It has manufactures of bacon, linen, woollens, and leather. The city, founded as *Castra Caecilia* by the Romans in 74 B.C., was taken from the Moors in 1225. Pop. (1920) 17,830.

**Caceres**, Philippine Islands. See NUEVA CACERES.

**Cachalot**, kash'a-lot, or SPERM WHALE (*Physeter macrocephalus*), one of the largest of living animals, is commonest in tropical and sub-tropical seas, especially toward the south, and is absent from both Polar seas. The diet consists mainly of cuttle-fish and the cachalot, a powerful swimmer, descends to great depths in search of them. It is said to remain under water as long as twenty minutes at a time. It

was hunted with great ardor during the earlier half of the 19th century, and has greatly diminished in numbers in consequence. The high commercial value depends upon (1) the quality of the oil (sperm oil) made from the blubber; (2) the spermaceti, a valuable oil contained in a cavity on the upper part of the great head; (3) the ambergris, a concretion formed within the intestine of the whale, and found both there and on the surfaces and beaches of the seas haunted by the cachalots. Ambergris is used as a basis in perfumery, and was formerly also employed as a drug. The teeth of the cachalot furnish valuable ivory. Consult F. Beddard's *Book of Whales* (1900); and for a popular description of the hunting methods, see F. T. Bullen's *The Cruise of the 'Cachalot'* (1898).

*The Cachalot, or Sperm Whale.*

**Cachar Plains**, a dist. in the Surma Valley division of Assam, India, between Sylhet on the w. and Manipur on the e. It is one of the great tea-producing regions of Assam, grows large quantities of rice, and exports timber to Bengal. Chief town Silchar. Area, 2,063 sq. m. Pop. (1901) 414,781. See also NORTH CACHAR.

**Cache**, riv., Ark., rises in Clay co., the N.E. corner of the state, and flows 230 m. in a general S.S.W. direction to Monroe co., where it joins the White R. near Clarendon.

**Cacheo**, riv., W. Africa, between Gambia and French Guinea. It is short, but has a wide estuary, on the s. bank of which stands the town and fort of Cacheo. Pop. about 15,000.

**Cachet**, LETTRES DE. See LETTRES DE CACHET.

**Cachexia**, a term usually applied to the general appearance, and especially the facial expression, which is characteristic of certain chronic diseases. The disease may exist without the cachexia, and the cachexia may be simulated in other diseases than that with which it is generally associated. The cancerous, the strumous, the syphilitic, and

the malarial are examples of the better-marked cachexia, and are dealt with under the diseases to which they belong.

**Cachoeira**, tn., Bahia, Brazil, 52 m. N.W. of Bahia, on the Paraguaçu R. Coffee and tobacco are the chief exports. Pop. about 15,000.

**Cacholong**, also called mother-of-pearl opal, and sometimes Kalmuck agate, a variety of opal, usually gray in color, milk white, or bluish white, and resembling mother-of-pearl. It is banded with layers of different colors, and makes a beautiful ornamental stone. It is found mostly in crevices in certain igneous rocks in Iceland, Faroe, and several places in Ireland, Carinthia, Nova Scotia, and elsewhere.

**Cacique**, or CAZIQUE, a title equivalent to prince or chief;

about 55 per cent. of arsenic, and can be used with advantage in all diseases in which arsenic has proved useful, the union with the alkyl making it less toxic, and therefore endurable in larger quantities and for longer periods. It has been recommended in skin diseases, early tuberculosis, and some mental affections.

**Cacomistle**, a small animal (*Bassariscus astutus*) of Mexico and adjacent parts of the United States, which is allied to the raccoon, has similar but more active and nocturnal habits, and is often made a pet by the people of the region, where it is known to Americans as 'civet-cat.'

**Cactus**. With very few exceptions, the cacti, to the number of 1,000 species, are natives solely of America. They are succulent plants, with small, awl-shaped deciduous leaves, and stem-joints which are flat or cylindrical, and often appear to be leaves. Vivid flowers and fruits are borne on these joints. They are usually armed with many spines. Their curious structure is specially adapted to arid plains and hillsides; their succulent stems are reservoirs for large quantities of water, and transpiration and evaporation are minimized by the small surface exposure in proportion to the total mass, and by the thick epidermis which covers the whole plant. These stores of water are often tapped by natives, and are occasionally utilized by cattle. The height of certain species is fifty feet or more, and the appearance of these prickly, almost leafless, roughly cylindrical masses, often with gaunt arms, is strangely grotesque. The prickly pear or Indian fig (*Opuntia*), is a member of this family. There are altogether some eighteen genera of cacti, those most familiar to horticulture being *Mamillaria*, *Phyllocactus*, *Cereus*, *Opuntia*, *Epiphyllum*, *Echinopsis*, and *Echinocereus*. Propagation is commonly effected by means of cuttings taken from the parent by means of a sharp knife and laid on a dry shelf till roots are formed. Cacti are not difficult to raise from seed, particularly in the case of the genera *Cereus*, *Mamillaria*, and *Echinopsis*. The flowers of most of the cacti are large and brilliant, and some, like those of the night-blooming cereus, are extremely fragrant and open nocturnally. When deprived of their thorns by burning, the *opuntias* form a succulent fodder; the same tribe have juicy fruits (the 'prickly pears,' or 'tuñas' of the West), which are not only a food about the Mediterranean, but part of the American Indian's diet also. The giant cereus (q.v.) is also valuable as a food. For a description of the Spineless Cactus, see BURBANK.

confined to the native tribes of Hayti, Cuba, Mexico, Peru, and the west side of S. America.

**Cacodæmon**. See DEMON-OLGY.

**Cacodyl**, tetramethyl diarsine ( $As_2(CH_3)_4$ ), is a compound prepared by heating cacodyl chloride with zinc. It is a colorless, ill-smelling liquid that is insoluble in water, and very easily catches fire in the air. It is also obtained mixed with cacodyl oxide by the distillation of arsenious anhydride with potassium acetate as a spontaneously inflammable liquid, known as 'alcarsin,' or 'Cadet's fuming liquid,' from which the chloride can be obtained by the action of hydrochloric acid. Cacodyl acts very like a simple metallic element, the group  $As(CH_3)_2$  uniting with oxygen, sulphur, chlorine, etc., just like a metal. When acted on by mercuric oxide, cacodyl oxide yields cacodylic acid,  $As(CH_3)_2O_2H$ , a sour-tasting, odorless, crystalline solid, which with some of its salts, especially the cacodylates of sodium and of magnesium, has lately been much used in the treatment of skin diseases, being administered through the alimentary canal, or hypodermically. Sodium cacodylate contains

Barrel Cactus, Colorado Desert.

**Cacus**, a son of Vulcan, inhabited a cave in the Aventine Mount, one of the seven hills of Rome. When Hercules was returning with the oxen of Geryon, Cacus stole some of them, dragging them backward by their tails into his cave in order to elude pursuit. But Hercules heard their lowing, and after a struggle defeated and slew Cacus.

**Cada Mosto**, ALOIS, or LUIGI DA (1432-77), a Venetian who explored the west coast of Africa as far south as the Rio Grande, discovering (1457) Cape Verde Islands. His narrative has been translated into French, *Rélation des Voyages à la Côte, Occidentale d'Afrique d'A. de Cada Mosto* (1897).

**Caddis-flies**, insects regarded as forming the order Trichoptera. The wings are more or less clothed with hair, and the posterior pair are larger than the anterior; the antennæ are thread-like; the mandibles are absent, and the metamorphosis is well marked, the larvæ ('caddis-worms') being caterpillar-like, and usually inhabiting cases which they have themselves constructed. Almost all small, of feeble flight, and inconspicuous in appearance, the perfect insects have always attracted much less attention than the larvæ, which are common in fresh water, and are often kept in aquaria. The eggs are surrounded by jelly and dropped into the

water. Immediately after hatching, the larvæ begin to make cases by spinning together with silk minute stones, fragments of shell, grains of sand, twigs, pieces of water-weed, or any other material which may be at hand. The case in most species is open at each end, and from it the anterior end of the larva is protruded ready to catch the minute animals upon which it feeds. When larval life is over, the creature passes into the pupa stage within its case, which is at this time closed with silk. Within the case the nymph—a form strongly resembling the perfect insect—is developed. It possesses strong mandibles, and with these cuts through the case, and swims to some body such as a water-plant, by means of which it can climb from the water. The nymph-skin then bursts, and the imago emerges, and flies away to begin the short life of reproduction. See Needham, *Aquatic Insects of the Adirondacks* (1901); W. S. Furneaux's *Life in Ponds and Streams* (1896).

**Cade**, JACK (d. 1450), the leader of the Kentish insurgents of 1450, who were roused to arms by the fiscal exactions of the royal officials. The insurgents constituted a well-organized force, and utterly defeated the detachment of the royal army sent against them by the king (Henry VI.), who was obliged to retreat upon London, and, a few days later, to Kenilworth. Thereupon Cade took possession, on July 2, of London, where he was received favorably by the citizens. On the following day Cade ordered the arrest of Lord Say-and-Sele and his son-in-law, Crowmer, sheriff of Kent, who were regarded as the chief causes of the recent oppressive taxation. Both were beheaded, with little show of trial. The city now became alarmed at the excesses of the insurgents, between whom and the citizens a bloody struggle took place on the night of July 5. As a result of this, terms were arranged, and the Kentishmen retired from London. A reward being offered for the capture of Cade, he was taken prisoner on July 12, but died from wounds received in the struggle.

**Cadell**, FRANCIS (1822-79), Australian explorer, was born at Cockenzie, Scotland; took part in the Chinese War of 1840-1, being present at the siege of Canton and the capture of Amoy and Ningpo. In 1848 he visited Australia, where a series of expeditions culminated in the successful navigation of the Murray, Edward, and Darling rivers. During a trading voyage to the Spice Islands he was murdered by his crew.

**Cadell**, ROBERT (1788-1849), Scottish publisher, born at Coc-

kenzie, Scotland, became (1811) a partner in the house of Constable & Co., Edinburgh. After the bankruptcy of the firm in 1825, he was chosen by Scott as the sole publisher of his subsequent novels. In 1827 he began to issue the successful 'Author's Edition' of the Waverley Novels. See Lockhart's *Life of Scott* (1860).

**Cadenabbia**, vil. and health resort, Italy, on w. shore of Lake Como, nearly opposite Bellagio; is visited chiefly in spring and autumn. Here is the beautiful Villa Carlotta (1747), adorned with sculptures by Thorwaldsen and Canova.

Caddis-fly.

1, Larva; 2, case of larva.

**Cadence**, in music, is the name given to the closing—usually last two—chords of a phrase. The many varieties of cadence may all be classified as forms of perfect, imperfect, or interrupted cadences. The *perfect* must have its last chord on the tonic; when the penultimate chord is on the dominant, it is called an 'authentic'; when on the subdominant, a 'plagal' cadence. The harmony of the *imperfect* is often that of the dominant perfect reversed. The *interrupted* is a progression of chords leading the ear to expect a tonic chord, but another is substituted for the latter, and the effect is often as charming as it is unexpected.

**Cadency**, that department of heraldry which treats of the symbols (marks of cadency) borne on their shields by the younger members and branches of a family to distinguish their arms from those of the head of the house and of each other. See HERALDRY.

**Cadenus.** See SWIFT, JONATHAN.

**Cadenza**, ka-den'za, in music, an ornamental passage introduced before the close of a section of a musical composition. At one time cadenzas were left to the improvisation of the performer, but now they are usually written out in full by the composer.

**Cader Idris**, kad'er id'ris, a mountain ridge in Wales, in Merioneth; 4 miles southwest of Dolgelly. Its summit (2,929 feet), affording a beautiful view, is a favorite resort of tourists.

**Cadet'**, originally a younger son; now a pupil in a military school, as the U. S. Military Academy (q.v.) at West Point. The term is sometimes applied, also, to young men in naval training, though students at the U. S. Naval Academy are now known as midshipmen, and to graduates of technical schools acting as engineering apprentices for various public utilities companies.

**Cadi**, kã'dë, or KADI, a judge of first instance under the Mohammedan system of law, possessing both civil and criminal jurisdiction. His powers under the latter branch include the infliction of the capital penalty. He has, further, various administrative functions; and being of necessity an ecclesiastic—for Mohammedan law is based upon the Koran—he sometimes performs purely religious duties. He must be a scholar of blameless life, conversant with all phases of the sacred law, and if appointed to office is bound to accept, regardless of his own wishes.

**Cadillac**, kad'i-lak, city, Michigan, county seat of Wexford county, on Lakes Cadillac and Mitchell, and on the Ann Arbor and the Pennsylvania Railroads; 98 miles north of Grand Rapids. It is located in a popular resort district and there are two State parks within the city limits. It is also an important lumber centre, crude lumber being manufactured into a wide variety of finished products. Industrial establishments include machine shops, iron plants, lumber mills, a motor truck plant, chemical works, and furniture and veneer factories. Cadillac was settled in 1871. Pop. (1910) 8,375; (1920) 9,750.

**Cadiz**, kad'iz; *Span.* kã'dëth, province, Southern Spain, one of the richest and busiest in the kingdom, including not only the great peninsular city of Cadiz, but also the important commercial centres of Jerez, San Lucar, Puerto de Santa Maria, and San Fernando; area 2,834 square miles. Wine, fruit, and fish are the chief natural products of the province. It furnishes practically the world's supply of

sherry. Manufacturing is actively carried on. Pop. (1920) 547,827.

**Cadiz**, city, Spain, capital of the province of Cadiz, and one of the most important cities of the kingdom, is situated on a long narrow peninsula, projecting into the Atlantic; 95 miles southwest of Seville. The harbor is spacious and strongly fortified and contains the arsenal of San Fernando. The city is surrounded by walls and with its gleaming white buildings presents a striking appearance. The streets are narrow but well paved and well lighted, and the houses are mostly of the Moorish type, flat-roofed, surmounted by towers. Features of interest are the two cathedrals, one of the 16th and one of the 18th century; the Alameda de Apodaca, a beautiful promenade on the water front; the Parque Genoves; the church of Santa Catalina, containing Murillo's *Marriage of St. Catharine*; and the Academy of Fine Arts, with a good picture collection.

The commercial importance of the city has declined in the past few decades. There are ship-building yards and salt works, and sherry, olives, figs, and fruits are exported.

Cadiz was founded by the Phœnicians in 1100 B.C. It passed to the Carthaginians about 500 B.C. and was captured by the Romans after the Second Punic War, being known as Gades. In the fifth century it was occupied by the Goths, and in 1262 was taken by the Christians. Sir Francis Drake burned the shipping in the harbor in 1587, and in 1596 the city was sacked and ruined by Essex. In the eighteenth century a monopoly of Spanish-American trade brought great prosperity, but with the loss of the Spanish colonies in America this soon declined. It was here that the liberal constitution of 1812 (see SPAIN) was proclaimed. Pop. (1920) 76,718.

**Cadiz**, BATTLE OF. On July 21, 1640, at about fifteen leagues from Cadiz, a French squadron, under Armand de Brézé, defeated a Spanish convoy. In this action tactics much in advance of the time were made use of by De Brézé, who detached part of his force, under Rear-Admiral de Coupeauville, to leeward of the enemy, while he engaged him to windward, thus putting the Spaniards between two fires. The result was indecisive; but the Spaniards lost five vessels and about a thousand men, while the French loss was small.

**Cadiz**, BAY OF, an inlet of the Atlantic Ocean on the southern coast of Spain. It is divided into two parts; the larger and outer,

with a breadth of 7 miles, is exposed to the southwest, and has on the north the town of Rota, and on the south Cadiz. At the northern extremity is La Carraca, noted for its arsenal and shipyards; on the island of Leon stands the observatory of San Fernando. Salt is obtained from the neighboring marshes.

**Cad'man**, CHARLES WAKEFIELD (1881- ), American composer, was born in Johnstown, Pa., and received his musical education in Pittsburgh, where he studied harmony, orchestration, and the organ. He was for a time music critic on the Pittsburgh *Despatch* and was organist in various churches in Pittsburgh until 1910, when he removed to Los Angeles. He made a special study of American Indian music. In addition to piano pieces, chamber music, and orchestral selections, his works include *American Indian Songs*; *Idylls of the South Sea*; *The Sunset Trail*; *The Morning of the Year*; *The Garden of Mystery* (one-act opera); *Shanewis*, an opera based on an Indian theme, the first American opera to have been given two consecutive seasons at the Metropolitan Opera House, New York; *A Witch of Salem*, produced by the Chicago Civic Opera Company in 1926.

**Cadman**, S. PARKES (1864- ), American clergyman, author, and lecturer, was born in Wellington, Shropshire, England. He was graduated from Richmond College (Wesleyan Methodist), London, and went to America, serving as pastor in Millbrook, N. Y. (1890-93), Yonkers, N. Y. (1893-5), and at the Metropolitan Temple, New York City (1895-1901), which he left to assume the pastorate of the Central Congregational Church, Brooklyn. He was lecturer on the Shepard, Carew, and Cole Foundations at Bangor, Hartford, and Vanderbilt University Theological Seminaries, and was a special delegate to the Tercentennial of the Mayflower, Plymouth, England, in 1920. He acquired wide popularity both as a lecturer and preacher. His published works include: *The Victory of Christmas*; *William Owen, a Biography*; *The Three Religious Leaders of Oxford*; *Charles Darwin and other English Thinkers* (1911); *The Religious Uses of Memory* (1912); *Ambassadors of God* (1920); *Christianity and the State* (Lectures at the Pacific School of Religion, Berkeley, Cal., 1922); *Imagination and Religion* (1926).

**Cad'mium** (Cd, 112.4), a metallic element, compounds of which occur in small quantities associated with zinc. It comes off earlier than zinc in the preparation of that metal by distilla-

tion, condensing as a brown oxide which can be reduced by distillation with charcoal. Cadmium is a soft, bluish-white metal, malleable and ductile. Its specific gravity is 8.6; it melts at 320° C., and boils at 778° C. It tarnishes slightly in air, and burns when heated in it, forming a brown oxide. It forms a series of salts, of which cadmium sulphate, CdSO<sub>4</sub>, a white, crystalline, soluble solid, is typical, and which are characterized by forming a bright yellow sulphide on addition of hydrogen sulphide. Cadmium is a component of easily fusible alloys, and is alloyed with silver in electroplating; cadmium sulphide is used as a pigment, different shades being produced by altering the acidity of the solution from which it is precipitated.

**Cad'mus**, son of Agenor, king of Phœnicia, and brother of Europa, who was carried away by Jupiter disguised as a bull. At the command of his father, Cadmus undertook a search for his sister. Failing in this, he consulted the oracle of Apollo, which bade him give up his efforts, follow a cow which he would find in a field, and found a city where the animal should lie down. He obeyed, and eventually came to Bœotia, where he established the city of Thebes. Upon his arrival, wishing to sacrifice to Jupiter, he sent his servants to seek pure water, but though they found a gushing fountain, they were all slain by the dragon who guarded it. Cadmus thereupon slew the dragon and sowed its teeth, which sprang up as armed men; a conflict ensued and only five survived, from which the Thebans claimed descent. Cadmus wedded Harmonia, and with his wife was changed into a serpent by Zeus, and removed to Elysium. He is said to have introduced the alphabet into Greece, a legend which would indicate that the ancient Greeks traced the art of writing to the Phœnicians, a theory which is still accepted.

**Cadogan**, ka-dug'an, GEORGE HENRY CADOGAN, FIFTH EARL (1840-1915), British statesman, was born in Durham, and educated at Oxford. He was under-secretary of war (1875-8); under-secretary for the colonies (1878-80); Lord Privy Seal (1886-95); and lord-lieutenant of Ireland (1895-1902).

**Cadomum**. See CAEN.

**Cadorna**, ká-dor'ná, COUNT LUIGI (1850- ), Italian general, was born in Pallanza. He entered the army in 1866 and became chief of the general staff in 1914. On Italy's entrance into the Great War, he was made commander-in-chief of the Italian armies in the field. He was

transferred, after the Italian disaster at Caporetto, in October 1917, to the Allied War Council at Versailles and in 1918 was retired from the army. Although General Cadorna's military policy was the subject of adverse criticism, he is regarded by many as having showed great strategic skill and is counted among the foremost of Italy's military men. He published *La guerra alle fronte italiana* in defense of his leadership.

**Cadoudal**, ká-dōō-dál', GEORGES (1771-1804), French royalist leader, the most brilliant figure in the Chouan War, was born near Auray, in Lower Brittany, the son of a peasant proprietor. On the breaking out of the royalist insurrection in La Vendée, he joined the Vendéan army (1793) and during the next six years carried on a determined and vigorous resistance to the forces of the republic. His arrest for conspiracy against Napoleon, at Paris, on March 9, 1804, was followed by his execution on June 25.

**Cadoxton**, ka-duks'tun, town, Wales, in Glamorganshire; 7 miles southwest of Cardiff. It has coal mines and tin-plate works. Pop. 20,000.

**Caduceus**, ka-dū'si-us, originally an enchanter's wand, and later a herald's staff, is most familiar in the hands of Hermes.

Mercury and Caduceus

Its first form was three shoots, of which two were intertwined, while the third formed the handle. The fully developed form has, besides the rod itself, a pair of wings either at the top or in the middle, and two serpents intertwined.

**Ca'dy**, J. CLEVELAND (1837-1919), American architect, was born in Providence, R. I. He was educated in Plainfield Academy and at Trinity College, Hartford, and in 1870 began the practice of architecture. He designed the Brooklyn Art Association building, several buildings for Yale University, Williams, Wesleyan, and Trinity Colleges, and various commercial buildings and homes in different parts of the United States.

**Cadzow**. See HAMILTON.

**Cællius Statius**, sē-sil'i-us stā'shi-us, a Roman comic poet, a native of Milan, and originally a slave. He was the immediate predecessor of Terence, dying in 168 B.C. As a writer he is classed with Plautus and Terence. Only a few fragments of his plays survive.

**Cæcum**, sē'kum (Lat. 'blind'), a dilatation, about 2½ inches long, at the junction of the small and large intestines. It communicates with the small intestine by means of the ileocecal valve, and the vermiform appendix is attached to it by the so-called meso-appendix (for illustration see *INTESTINES*). The cæcum is sometimes the seat of inflammation—typhlitis, perityphlitis. See also APPENDIX.

**Cædmon**, kad'mon, English poet of the seventh century, about whose life little is known. He was a servant of the monastery at Whitby, and well on in years, according to Bede's *Ecclesiastical History*, when he had a vision in which a heavenly visitant commanded him to sing 'the beginning of created things.' Bede continues that he sang all the principal events in sacred history, from the creation to the day of doom.

There are extant two series of poems which correspond closely with several of the subjects said by Bede to have been sung by Cædmon: the first, *Genesis, Exodus*, and *Daniel*; the second, *Fallen Angels*, the *Harrowing of Hell*, and *Temptation*, collectively *Christ and Satan*. The second series, however, is probably of too late date to be by Cædmon, and even the first series may have been written in part or in whole by his successors or disciples. A Cædmon memorial cross was erected at Whitby in 1898.

The only complete text of the 'Cædmonian poems' is in Grein and Wülker's *Bibliothek der angelsächsischen Poesie* (1883). The only complete translation is Thorpe's *Cædmon's Metrical Paraphrase* (1832). Consult Wülker's *Grundriss zur Geschichte der Angelsächsischen Literatur* and Brooke's *English Literature from the Beginning to the Norman Conquest*.

**Caen**, kân (anc. *Cadomum*), city, France, capital of the department of Calvados, on the river Orne, about 10 miles from its mouth; 124 miles northwest of Paris. It is a famous centre for the study of Norman art, having two of the finest Romanesque churches in France: St. Etienne's, containing the tomb of William the Conqueror, now empty, and La Trinité, founded in 1062 by Matilda as a nunnery for noble dames, and containing her tomb. Other features of

Dried  
Dec 21, 1928

interest are the university, the church of St. Pierre, and the Musée, housed in the Hôtel de Ville. Caen is an important commercial city and has large exports of iron and building stone (Caen stone). It manufactures lace, cotton, oil, and chemicals. It was the favorite residence of William the Conqueror. In 1417 it was captured by Henry v. and remained in English hands until 1450. Pop. (1920) 53,743.

**Cære**, se'rē, ancient Etruscan city, 20 miles northwest of Rome. When Rome was captured by the Gauls, many Romans sought refuge at Cære. See CERVETRI.

**Caerlaverock.** See CARLAVROCK.

**Caerleon**, kär-lē'un, town, England, in Monmouthshire, on the river Usk; 2½ miles northeast of Newport. Under the Romans it was called *Isca Silurum*, and was the capital of Britannia Secunda (Wales). Numerous Roman remains have been found here, including walls, baths, an amphitheatre (16 feet high, and 222 by 192 feet), and a large mound known as King Arthur's Round Table. Geoffrey of Monmouth connects the place with King Arthur. Pop. (1921) 2,285.

**Caermarthen.** See CARMARTHEN.

**Cæsalpinia**, ses-al-pin'i-a, a genus of beautiful tropical leguminous trees and shrubs of some economic importance by reason of the tanning material and dyes obtained from them. There are some thirty species, chief among which are *C. pulcherrima*, known also as 'Barbados pride,' 'flower fence,' and 'dwarf poinciana,' a beautiful evergreen shrub with brilliant, red or yellow flowers; *C. japonica*, with yellow flowers and red stamens, a hardy species which can be grown out of doors in the Southern States; *C. sappan*, an Asiatic tree valued for its wood; *C. coriaria*, the pods of which are known as divi-divi (q.v.). They are all easy to propagate by seeds, which should be soaked in warm water twelve hours before being sown.

**Cæsalpinus**, ses-al-pī'nus, ANDREAS (1519-1603), Italian botanist, was born in Arezzo, and became professor of botany at Pisa. He was one of the first to attempt a comprehensive classification of plants upon a natural system, and Linnæus made considerable use of his *De Plantis Libri XVI.* (1583-1603) in framing his artificial system.

**Cæ'sar**, the cognomen of a famous Roman family of the Julian clan. It was of patrician rank, and claimed to trace its descent back to Iulus, the son of Æneas. Augustus (q.v.) took the name as the adopted son of Julius Cæsar (q.v.), and from him it passed

to Tiberius, Caligula, Claudius, and Nero, who were all by descent or adoption connected with the family. Later emperors also used the title, prefixing it to their own names—e.g., Emperor Cæsar Domitianus Augustus. When Hadrian adopted Ælius Verus, he allowed him to take the name of Cæsar; and thenceforward it was borne by the intended successor to the imperial throne, the reigning emperor reserving the designation 'Augustus' for himself. The following members of the family are also worthy of note:

(1) **LUCIUS JULIUS CAESAR** was consul in 90 B.C., in which year he passed a law which granted Roman citizenship to all the allies who had not openly taken up arms against Rome (*Lex Julia de Civitate*). He was censor in 89 B.C., and, being a member of the aristocratic party, fell in the massacres under Marius in 87 B.C.

(2) **GAIUS JULIUS CÆSAR**, STRABO VOPISCUS, brother of the above, was curule ædile in 90 B.C. With his brother, he was murdered in 87. He was famous as an orator and a poet, and as such Cicero introduces him as a character in the *De Oratore*.

(3) **LUCIUS JULIUS CÆSAR**, son of (1), was consul in 64 B.C., and in 52 was one of Cæsar's legates in Gaul. Though originally of the aristocratic party, he attached himself to Cæsar, and accompanied him to Italy at the outbreak of civil war. In 47, during Antony's absence, he was prefect of the city of Rome. After Cæsar's death he joined the senatorial party against Antony, who for this reason put him on the list of the proscribed in 43. He was saved by the intercession of his sister Julia, the mother of Antony.

(4) **LUCIUS JULIUS CÆSAR**, son of (3), joined Pompey in the civil war, and in 49 B.C. was sent to Cæsar with peace proposals. In 46 he served under Cato at Utica, and after the latter's death advised the inhabitants to surrender. He was murdered by Cæsar's troops.

**Cæsar**, **GAIUS JULIUS** (102-44 B.C.), the great Roman dictator, was born on July 12, probably in the year 102 B.C., though the year is usually given as 100 B.C. He was made priest of Jupiter in 87 B.C., by Marius, the husband of his aunt, Julia; and this connection with the head of the popular party marked him out as a leader of the people, a position which was strengthened by his marriage (83 B.C.) with Cornelia, daughter of Cinna, Marius' successor in the popular leadership. When Sulla returned from Asia, and became omnipotent at Rome, he ordered Cæsar to

divorce Cornelia. Cæsar, however, refused to obey, was proscribed, and forced to conceal himself in the Sabine country. In 81 B.C., having been pardoned, he went to Asia, where he served with distinction in the Roman army. Returning to Rome after Sulla's death, he distinguished himself in 77 by his prosecution of Cnæus Dolabella for extortion in Macedonia. Subsequently he retired to Rhodes, and on his return to Rome in 74 or 73, supported a popular measure brought forward by Aurelius Cotta, which deprived the senators of the exclusive control of the jury courts. In 68 he obtained the quaestorship; in 65 the ædileship, in which office he spent enormous sums on public games and buildings; and in 63 was elected pontifex maximus, the chief priest of Rome.

In 68 Cornelia died, and in 67 Cæsar married Pompeia, daughter of Q. Pompeius Rufus and granddaughter of Sulla, further proving his attachment to the Pompeian house by supporting the Gabinian and Manilian laws, which conferred extraordinary power on Pompey.

He was prætor in 62, and in the next year went as proprætor to Farther Spain. This enabled him to pay his debts, and to gain some military reputation by victories over the Lusitanians. He was elected consul for 59 B.C., and in that year formed with Pompey and Crassus the first triumvirate. In spite of the opposition of his colleague in the consulship, Bibulus, a thorough aristocrat, he put through an agrarian law; he also obtained easier terms for the knights in regard to the farming of the taxes of Asia, and the ratification of Pompey's actions in the East. For himself, overriding an arrangement made by the senate, he obtained the province of Cisalpine Gaul and Illyricum for five years, to which the senate added Transalpine Gaul.

At about this time Pompey married Cæsar's daughter Julia, and Cæsar married Calpurnia, having divorced Pompeia in 62 on account of the scandal connected with Clodius' desecration of the mysteries held in his house as prætor.

In 58 he went to his province, where he remained for nine years, during which time he subdued the whole of Transalpine Gaul, conquering the Helvetii, the Germans led by Ariovistus (58), the Belgian tribes (57), the Veneti and other tribes on the west coast (56), and the invading German tribes, the Usipetes and Tencteri (55). In 55 he invaded Britain for the first time, but returned after effecting a landing and demanding hostages from

the tribes which resisted. The following year he again crossed the channel and forced Cassivelaunus, king of the Trinobantes, to pay tribute to Rome.

In 55 a new arrangement with Pompey and Crassus had secured for Cæsar the extension of his command for five more years—from Jan. 1, 53, to Dec. 30, 49. But Pompey was growing jealous; the death of his wife Julia in 54 dissolved one of the few ties between the two leaders; and the death of Crassus at Carrhæ in 53 left them without a mediator. Pompey, therefore, joined the aristocratic party, and after being sole consul in 52 B.C., secured the government of Spain for five years. Cæsar, determined to obtain a position at least equal to Pompey's, demanded election as consul for the year 48 in absence, while he still held power as governor of Gaul. This, however, was opposed by the senate, and in consequence Cæsar crossed the Rubicon, on or about Jan. 12, 49, with the words, *Iacta est alea* ('The die is cast'). Pompey's troops flocked to his command; he was welcomed everywhere; and after pursuing Pompey and his adherents to Brundisium, whence they sailed to Greece, he set out for Spain, where he defeated Pompey's armies. Returning to Rome, where he had been appointed dictator, he held the consular elections and was himself elected consul for 48. In that year he crossed to Greece, and after some fighting near Dyrrhachium, in which he was worsted, routed Pompey's forces near Pharsalus, in Thessaly, on August 9. Pompey fled to Egypt, but was murdered before Cæsar reached there.

Upon Cæsar's arrival in Egypt he became involved in a war against the guardians of the young king, Ptolemy, in behalf of the rights of the latter's sister Cleopatra. This war was brought to a close in March, 47, and Cæsar next marched through Syria and Asia Minor, defeating Pharnaces, son of Mithridates the Great, who was an ally of Pompey's, at the battle of Zela. The ease with which this battle was won inspired the great commander's famous despatch to the senate, *Veni, vidi, vici* ('I came, I saw, I conquered'). He reached Rome in September, 47; sailed before the end of the month to Africa, and on April 6, 46, defeated the Pompeians, under Scipio and Cato, at Thapsus. He now returned to Rome, undisputed master of the Roman world. He was at once appointed dictator for ten years, and the following year was made perpetual dictator; in 44, at the festival of the Lupercalia, An-

tony offered him the kingly diadem, but he refused.

Meanwhile Pompey's sons, Gneius and Sextus, had collected fresh forces in Spain. Advancing to meet them, Cæsar had routed them at Munda, not far from Cordova, on March 17, 45. But his power and influence had made him an object of jealousy and suspicion, and already the conspiracy against his life had been formed. Cassius was ring-leader, and Marcus and Decimus Brutus, Casca, and sixty others were implicated. Although Cæsar received many warnings, he neglected them all, and met his fate in the senate house on the Ides (15th) of March, 44. Casca struck the first blow. Cæsar resisted, until Marcus Brutus also smote him; then, with the words, *Et tu, Brute!* ('Even thou, Brutus!') he fell.

Cæsar's reforms aimed at making all the provincial governors, military commanders, and even the magistrates of Rome, responsible to his central authority. He had not time to do much for the provincials himself, but it is clear that Augustus and his successors simply followed the lines which he had laid down. His domestic policy tended to free the people from the unconstitutional dominion of the senate.

Cæsar's honesty, his patriotism, his devotion to the welfare of the poorer classes and the provincials, his unprecedented moderation toward his opponents, his extraordinary power of work, his statesmanship, and his eloquence are testified to by both his friends and enemies. His military genius is proved by an exact study of his campaigns, and has been admitted by the greatest critics of modern times. In private life he was affable, witty, generous, and devoted to his mother, his successive wives, and his friends. He had his share of weaknesses: he was ashamed of being bald, and valued highly the privilege accorded him of wearing a laurel wreath, which concealed his lack of hair. As an author, he was placed in the highest rank by his contemporaries. He was particularly noted for the purity of his style, and published a careful study of the Latin language, which, however, has been lost. His only extant work is the *Commentaries*, or *Diary of the War in Gaul* (the books on the civil and African war usually attached to it are not his). Editions of the *Commentaries* are innumerable; those of Mensel (1894), Rheinhard and Herzog (1892), Peskett, Allen and Greenough (1886), Benoit and Dosson (1892), are all standard.

Consult also Mommsen's *History of Rome*; S. J. Delorme's

*Cæsar et ses contemporains; Lives by Napoleon III., Froude, and Fowler; Baring-Gould's Tragedy of the Cæsars; Holmes' Cæsar's Conquest of Gaul.*

**Cæsarea**, *ses-a-rē'a*, or *sez-a-rē'a*, now KAISARIEH, a name given to several ancient cities. (1) CÆSAREIA AD ARGÆUM, formerly Mazaca, was given the name when Cappadocia became a Roman province, in 18 A.D. It was destroyed by an earthquake. (2) CÆSAREIA PHILIPPI, or Paneas, now Baniyas, a city in Palestine, below Mt. Hermon, on the Jordan, was founded by Philip the Tetrarch in 3 B.C. It was here that Jesus questioned his disciples: 'Who saye ye that I am?' and that Peter made his great confession (Matt. xvi. 13-20). (3) CÆSAREIA PALÆSTINÆ, on the borders of Samaria and Galilee, was named in honor of Augustus by Herod the Great (13 B.C.), who also fortified and adorned it. Here Peter preached to Cornelius the centurion (Acts x.) and here Paul was imprisoned.

**Cæsarean Section**, *sē-zā'ri-an*, the procedure for delivery of the fetus by means of an incision through the abdominal and uterine walls instead of by the natural route. It is indicated in marked cases of pelvic contraction and certain other conditions which render normal delivery impossible. The operation is an exceedingly ancient one, taking its name from Julius Cæsar, who is said to have been thus born. It was formerly performed only upon women who had just died or whose death was imminent, solely in the interests of the child. The first operation upon a living woman was done in 1491. The maternal death rate under favorable conditions is not high.

**Cæsena**. See CÆSINA.

**Cæsium**, *sē'zi-um* (C s, 133), an alkaline metal discovered by Bunsen in 1860, by spectral analysis, in the mineral water of Dürkheim, in the Palatinate. It occurs also in a rare mineral pol-lux, and is best isolated by the electrolysis of its fused cyanide. Cæsium is a soft metal closely resembling potassium, and is characterized by a spectrum containing two bright blue lines, along with others in the red, yellow, and green.

**Cæsura**, *se-zū'ra*, a metrical pause in the middle of a line of verse, generally defined as the point at which a reader would pause to gather breath; and while it may also coincide with a grammatical pause, it need not do so. There may be more than one cæsura in a line; on the other hand, verses shorter than the decasyllable need have none at all. The cæsura most commonly occurs in English heroic measure after the fourth or sixth foot;

GAIUS JULIUS CÆSAR

but the most subtle effects are produced by a studied variety of usage. See BLANK VERSE.

**Café.** See RESTAURANT.

**Caffeine,** THEINE or METHYLTHEOBROMINE ( $C_8H_{10}N_4O_2$ ), an alkaloid which forms the stimulating principle in coffee (where it amounts to 1.5 per cent.), in tea (where it forms 2 to 4 per cent.), in the S. American *maté* (an infusion of the leaves of *Ilex paraguayensis*), and in the kola nut of Africa. It crystallizes in long, silky, colorless needles, and dissolves very slightly in cold water, but readily in hot water or alcohol. It is obtained from a strong infusion of boiled tea, from which the tannin is precipitated by excess of lead acetate; it is then filtered, the excess of lead is thrown down by hydrogen sulphide; this is again filtered, the liquid is evaporated down, and neutralized by potassium hydroxide when the caffeine crystallizes out. It is used medicinally in very small doses as a heart stimulant. In larger doses it makes the heart's action irregular, and in lethal doses causes narcotism, and arrests the heart. Habit weakens the effect of both tea and coffee on the nervous system. Caffeine is also a diuretic, acting much more markedly on some individuals than on others. Both on account of its action on the heart and blood-vessels, and also because of its stimulating action on the kidney cells, it is used in dropsy; it has been recommended for pneumonia, and its action on the brain is taken advantage of in cases of migraine. It is often of great value in counteracting the effect of poisonous doses of opium, alcohol, or other narcotics.

**Caffraria.** See KAFFERS.

**Cagayan.** (1.) Prov., Luzon, Philippines, N.E. corner of the isl., bounded on the s. and w. by Isabela, Lepanto-Bontoc, Abra and Ilocos Norte. Area, with dependent isls., 5,291 sq. m. Its mountains represent three systems, the Grande Oriental, the Norte and the Central. The highest peak is Pacsan, 7,330 ft., on the w. border. The Rio Grande de Cagayan, the largest river of Luzon, flows through one of the most promising regions of the archipelago. The province is scarcely rivalled in the production of tobacco, and the fertility of the soil is such that sometimes one piece of land will yield in addition to the regular staple two crops of corn in a twelvemonth. The bulk of the foodstuffs is generally imported. Tuguegarao, the capital, is 211 m. N. by E. of Manila. Pop. (1903) civilized, 142,825; wild, 13,414. (2.) C. DE MISAMIS, pueb. Mindanao, Philippines, cap. of Misamis prov., 2½ m. from the coast,

on riv. of same name. A lively traffic with neighboring coasts is carried on by native boats. The anchorage is exposed on the N.W. Gold is found in the region. Pop. (1903) 7,108. (3.) C. DESULU, or JOLO, an isl., and group with its dependent isls., in the Sulu Sea off the coast of Borneo, about half-way between Palawan and the Sulu Is. Area, 43 sq. m.; group, 46½. Of the usual volcanic and coral formation, and with an exceptionally wet climate, they have many features of scientific interest as well as striking scenic beauty. The large island has three wooded peaks, highest alt. 1,105 ft., and contains two circular lakes separated by a narrow dike, one of which is fresh water, but the other is connected with the sea. Hemp-palm, tobacco, sugar cane, yams, bananas, fruit and vegetables are raised, but fishing and coconut gathering are the chief occupations. Distance from Manila, 540 m. Pop. (1903), all wild, 2,000.

**Cage-birds** are birds kept in confinement for the sake of their beautiful plumage, their agreeable song, their lively disposition, or for the interesting study of their habits. The favorite cage-birds are the songsters. Among birds remarkable for the beauty of their plumage are the parrots, parrakeets, and cockatoos. The hardest talking parrot is the yellow-faced Amazon, the well-known African gray being exceedingly difficult to acclimatize in northern countries. The cockatoos, though very showy birds, are noisy, and do not make good talkers. Far less attention is given to catching and caging native birds in America than in Europe, the mocking-bird and redbird (or Virginia nightingale) being those most often seen. The bird-stores are supplied, therefore, almost wholly with foreign songsters, mostly European and African finches, thrushes, starlings and larks. The canary (q.v.) is a cosmopolitan favorite.

The maladies of cage-birds are mostly due to overfeeding, unsuitable food, and want of exercise. For ordinary ailments a drop of castor oil, administered on the point of a quill, is generally efficacious. As most birds are very delicate, they should never be allowed to remain in a draught. It is equally bad to expose them unprotected to the rays of the sun, or to keep them in an overheated room. Moulting is a critical period for all birds. At such times great care is necessary; stimulating food should be given, and a rusty nail in the drinking water is a good tonic.

Important books are Bech-

stein's *Cage and Chamber Birds* (1864), Greene's *Notes on Cage-Birds* (1899), and Holden's *Book of Birds* (1897).

**Agli,** tn. and episc. see of Italy, prov. Pesaro and Urbino, 13 m. s. of Urbino. Pop. (1901) 18,244.

**Cagliari.** See VERONESE, PAOLO.

**Cagliari.** (1.) Province of Italy (area, 5,184 sq. m.; pop. [1901] 483,548), coincident with the s. half of the island of Sardinia. (2.) Tn., and cap. of prov. of Sardinia, on s. coast, at the head of the gulf of the same name. Among the more important buildings are the citadel (13th century), the university (1596), the cathedral (14th century). The town also possesses a Roman amphitheatre, and Carthaginian-Roman necropolis. The harbor, naturally good, has been improved by the construction of two breakwaters. Cotton, woollens, biscuits, soap, and salt are the principal products of the industry; large quantities of wine are made in the vicinity. Pop. (1901) 53,057.

**Cagliostro,** ALNESSADRO, COUNT (1743-95), an *alias* of Giuseppe (son of Pietro) Balsamo, was born at Palermo. After a wild youth he left Palermo, and in company with Althotas, a Greek chemist, travelled through the Archipelago, till the latter died at Rhodes. From Turkey, Persia, Arabia (where he was entertained at Mecca and Medina as a man of repute), he returned with money (1773), and married the beautiful Lorenza Feliciani, with whom he resumed his travels and adventures. At Strassburg (1780) he gained notoriety by his cures, and by vending the 'elixir of life.' In London he established a cult of freemasonry (Egyptian), but had to flee to Paris. Here he revived his Egyptian cult, adding the lodge 'Isis.' Intimate with Cardinal de Rohan, and implicated in the affair of the diamond necklace, he was put in the Bastille, and then exiled. In St. Petersburg his frauds were detected by Rogerson, the Anandale physician; at Basel he was visited by Lavater (see Mirabeau's *Letters on Cagliostro and Lavater*, 1786). Venturing to Rome (1789), he was tried (1790) for freemasonry and sorcery, and imprisoned first at San Angelo, then at San Leone, in the duchy of Urbino, where he died. His *Life*, compiled from his trial, was published at Rome (1791). Goethe saw him, and wrote a play (*The Grand Coptite*) on his life; Dumas père, in his *Mémoires d'un Médecin* and Carlyle, in his *Cagliostro and the Diamond Necklace*, have treated the theme.

**Cagnola,** LUIGI, MARQUIS (1762-1833), Italian architect.

born at Milan. His works include the magnificent triumphal arch, Arco della Pace (begun in 1807 and finished about 1837, of white marble), the chapel of St. Marcellina in the church of Sant' Ambrogio, and the Porta di Marengo, all at Milan. He also built the campanile at Urgano, near Bergamo.

**Cagots**, the French name (Sp. Agots) for an outcast people in the Western Pyrenees. From the accounts cited by De Rochas, it seems clear that leprosy was originally one of the causes of their proscription. The descendants of the Cagots appear to have thrown off all hereditary disease, and to present no marked physical differences from the neighboring population, unless in the fact that fair hair and blue eyes are common among them—a fact sometimes cited in support of the belief that they are descended from the Visigoths. Certain references, identifying them with the Albigenses, Christians, and *Bons-hommes*, suggest that their religious belief was the chief cause of the persecution which they suffered; and it is noteworthy that *cagot* implies 'bigot'. There is no evidence that they ever used a separate language. The etymological question is specially dealt with by Michel in his *Histoire des Races Maudites de France et d'Espagne* (1846). See also De Rochas, *Les Parias* (1876); Webster, *Bulletin de la Société Ramon* (1867); Tuke, *Jour. Anthropol. Inst.* (1880).

**Caguas**, tn., Guayama, Porto Rico, 18 m. s.s.e. of San Juan, on the road to Ponce. Hot springs are found in the region and sedimentary rock, including marble and limestone. Manufacture of tobacco is the chief industry. Pop. (1910) 10,354.

**Cahors** (anc. *Divona*), cap. of dep. Lot, France, on a rocky peninsula on the r. bk. of the Lot, 60 m. n. of Toulouse. It is an episcopal see, with a Romano-Byzantine cathedral and the palace of Pope John XXII. (1316-34), who was a native, and founded (1331) the university (closed 1751). Textiles, earthenware, malt liquors, dyestuffs, and shoes are manufactured, and corn, wine, brandy and fruits are exported. Clément Marot was born here in 1495, and Gambetta (bronze statue) in 1838. Pop. (1901) 14,018.

**Caibarien**, sept., Santa Clara prov., Cuba, 190 m. e. by s. of Havana. As the port of Remedios, 5 m. distant, it assumes some importance. Sponge-fishing and the sugar trade are the chief industries. Pop. (1899) 7,013.

**Caicos and Turk's Islands**, isls. s. of Bahamas, W. Indies, are under the government of Jamaica; consist of more than

thirty small cays, of which only eight are inhabited. The largest are North, East, and Grand, the last being the seat of government. Turk's Island is included with Caicos. The total area is 165½ sq. m. The most important industry is salt-making (\$110,868 exported in 1901). There are also a sponge industry and an export of turtle-shell. Sisal hemp is cultivated on W. Caicos. Climate healthy, but enervating to Europeans. Pop. (1901) 5,350.

**Cailliaud**, FRÉDÉRIC (1787-1869), French explorer, was born at Nantes. During an expedition to Egypt in 1815 he succeeded in locating the ancient emerald mines of Jebel Zubara, and made other important archaeological discoveries in the oases of Siwah. See his *Voyage à Méroé au Fleuve Blanc*, etc. (1826-7), *Voyage à l'Oasis de Syouah* (1823), and *Recherches sur les Arts et des Anciens Peuples de l'Égypte, de la Nubie et de l'Éthiopie* (1831-7).

**Caiman**, a name given to five species of alligator found in Central and S. America, which differ

Ca'ing Whale, or Pilot Whale.

in minor points from the alligators of the coast of the Gulf of Mexico, but little in habits. See ALLIGATOR.

**Cain** (Heb. 'acquisition'), the first-born of Adam and Eve. He became a husbandman, and slew his shepherd brother Abel. In the land of Noe, Cain founded the first city, and there is a Jewish tradition that he was accidentally slain by his descendant Lamech. See C. F. A. Dillmann's *Genesis* (1881; trans. by W. B. Stevenson, 1897), on ch. 4; and CAINITES.

**Caine**, THOMAS HENRY HALL (1853), novelist and dramatist, was born at Runcorn, Cheshire, but his early years were spent in the Isle of Man. He is a very successful and prolific writer, his works including *Sonnets of Three Centuries*, *Recollections of Rossetti* (1881), *Life of Coleridge*, *Cobwebs of Criticism*, and the novels *The Shadow of a Crime* (1885), *A Son of Hagar* (1887), *The Deemster* (1887; dramatized as *Ben-my-Chree*), *The Bondman* (1890), *The Scapegoat* (1891), *The Little Manx Nation* (1891),

*Cap'n Davy's Honeymoon* (1892), *The Manxman*, *The Christian*, *The Eternal City* (1901), and *The Prodigal Son* (1904), *The Manxman*, *The Christian*, and *The Eternal City* have also been dramatized and produced in various cities in the U. S. *The Prodigal Son* was presented in New York in 1906. Mr. Caine went to Canada to negotiate terms with the Dominion government with regard to Canadian copyright, and drafted a bill on the subject. He also visited the U. S. in 1895-96. See Kenyon's *Hall Caine: the Man and the Novelist* (1901).

**Ca'ing Whale**, PILOT WHALE, or BLACKFISH (*Globiocephalus melas*), a cetacean about twenty feet in length, common in the N. Atlantic, and perhaps identical with similar cetaceans of southern seas. It is met with in large herds or 'schools,' does not display great ferocity, and lives chiefly on cuttle-fish. The color is an almost uniform black, and there are small conical teeth in each half of the upper and under jaws. It yields a consider-

able quantity of oil, and the flesh and blubber are eaten in Scotland, both fresh and salted. The name is Scottish, and is derived from the fact that these whales can be 'ca'd' or driven like herds of cattle.

**Cainites**, a Gnostic sect, agreeing generally with the Ophites. Their distinctive feature seems to have been their approbation of the black sheep of Scripture—e.g. Cain, Esau, Korah, the Sodomites, and even Judas Iscariot, whom they held to have possessed an enlightenment and spirituality higher than those of their respective antagonists.

**Ca ira** ('It will go on'), a popular French song of 1789. The words were by Ladré, a street singer; the air was by Bécourt, an obscure musician. The refrain became the party cry of the revolutionists, and was prohibited by the Directory in 1797.

**Caird**, EDWARD (1835), Scottish philosopher, was born at Greenock; was fellow and tutor of Merton College, Oxford, from 1864 to 1866; professor of moral

philosophy at Glasgow University from 1866 to 1893, and master of Balliol from 1893 to 1906. In 1891-2 he was Gifford lecturer at St. Andrews, receiving the corresponding appointment at Glasgow in 1900. His published works include *Critical Account of the Philosophy of Kant* (1877); *Hegel* (1882); *Religion and Social Philosophy of Comte* (1885); *Critical Philosophy of Immanuel Kant* (1889); *Essays on Literature and Philosophy* (1893); *The Evolution of Religion* (1893); *Essays on Literature* (1909).

**Caird**, JOHN (1820-98), Scottish theologian, was born in Greenock. He was educated at the University of Glasgow and was successively minister of Newton-on-Ayr (1845-7), of Lady Yester's, Edinburgh (1847-9), and of Errol, Perthshire (1849-57). In 1855 he preached before Queen Victoria the famous sermon 'Religion in Common Life,' which gave him a world-wide reputation. He was minister of Park Church, Glasgow (1857-62), and in 1862 became professor of theology in the university, and in 1873 its principal. In 1890 his university made him its Gifford lecturer. His published works include *Introduction to the Philosophy of Religion* (1880; 2d ed. 1900); *Spinoza* in Blackwood's 'Philosophical Classics' (1888); *University Addresses* (1889); *University Sermons* (1873-98). Caird's Gifford lectures, edited with a Memoir by his brother, master of Balliol, were published in 1900 as *The Fundamental Ideas of Christianity* (2 vols.).

**Cairn**, kárn or kârn, in archaeology, a mound of stones raised over prehistoric interments, particularly common in Scotland and Wales, and akin to the English barrow (q.v.). Ancient cairns are of two types—chambered, belonging to the stone age, and unchambered, of the bronze age. The chambered cairns are of two types, long cairns and horned cairns. The latter are found over the British Isles, but the former exclusively in the northeast of Scotland. The essential constructive features of these stone-age cairns are a definite ground plan, and a passage leading from the bounding stones to the central enclosure of chambered tombs, megalithic in character, and implying family or tribal sepulture. Consult Anderson's *Scotland in Pagan Times: the Bronze and Stone Ages*.

**Cairnes**, kárnz or kárnz, JOHN ELLIOTT (1823-75), Irish political economist, was born in Castle Bellingham, County Louth. He was graduated from Trinity College, Dublin, and in 1856 won by competitive examination the Whately professorship of

political economy at that institution. In 1859 he was appointed professor of political economy and jurisprudence in Queen's College, Galway, and in 1866 became professor of political economy in University College, London. His last years were ones of invalidism, although marked by great intellectual vigor. His published works include *The Character and Logical Method of Political Economy* (1857), his first course of professorial lectures; *The Slave Power* (1862), a masterly defence of the North in the American Civil War; *Political Economy* (1873); *Leading Principles of Political Economy, Newly Explained* (1874). Cairnes, although in the main a follower of John Stuart Mill, was, nevertheless, an original thinker and one of the foremost economists of his day.

**Cairngorm**, kárn or kárn'gorm, brown, yellow, and smoky varieties of quartz obtained principally near the Cairngorm, a summit of the Grampians, Scotland. The crystals are formed in cavities in the granite and are found in the loose material which accumulates when the rock decomposes. The mineral is also found in beautiful crystals near Pike's Peak, Colorado, in other western districts, in the Mourne Mountains in Ireland, in the Scottish island of Arran, and in Switzerland. The value of the stone depends on its color and its freedom from flaws and enclosures. Coarse specimens are almost valueless. When pale yellow, it is known as citrine, or false topaz; when brown, as cairngorm, or smoky quartz; when black and almost opaque, as morion. In Scotland it is much used in the making of jewelry.

**Cairns**, HUGH M'CALMONT CAIRNS, FIRST EARL (1819-85), Lord High Chancellor of Great Britain, was born in Cultra, Ireland. He was educated at Trinity College, Dublin, and prepared in England for the bar, to which he was called in 1844, becoming q.c. in 1856. He entered Parliament as member for Belfast (1852); was appointed solicitor-general by Lord Derby, and knighted (1858); became attorney-general (1866), and was made Lord High Chancellor (1868). He was created Viscount Garmoye and Earl Cairns in 1878. Cairns was an accomplished orator, lucid in argument, but cold in manner.

**Cairo** (*El-Kahira*), kī'rō, capital of Egypt, largest city in Africa, and an archiepiscopal see, is situated on the right bank of the Nile, about 12 miles south of the point where the river divides into the Rosetta and Damietta, and 130 miles south-

east of Alexandria. It has rail connection with Jerusalem and Damascus.

Cairo covers an area of 11 square miles, with the barren Mokattam Hills to the west, on the outskirts of the desert. Suburbs are Masrel-Atika, Shûbra, Gezireh, Zeitun, and Albariyeh, of which the last three have a large and increasing English population. There are two noted health resorts in the vicinity—Mena House, about 7 miles distant, specially favorable for pulmonary trouble; and Helwan, 15 miles (railway), celebrated for its sulphur baths and saline and chalybeate springs.

The city of Cairo consists of two main sections, the Arabian or native quarters, and the modern or foreign quarter known as Ismailiyeh. The central point of modern Cairo is the Ezbekiyeh Garden, covering an area of more than 20 acres and containing a great variety of rare and beautiful trees. To the south are the opera house, the khedive's palace, and the army barracks; to the west is the fashionable quarter, also the seat of foreign trade, with hotels, banks, English churches, consulates, and theatres. The main thoroughfare in the Arabian quarters is the Muski, lined with bazaars which, though inferior to those of Constantinople and Damascus, nevertheless contain much of novelty and interest to foreign travellers. The streets throughout the Arabian quarters are narrow, dirty, and crooked, and on market days are almost impassable. The finest of the city's many mosques is the Gami Sultan Hassan, built in 1356-9, in the form of an irregular pentagon in which the cruciform shape of the original *medresch* (school-mosque) has been incorporated; its southern minaret is said to be the loftiest in Egypt. The most ancient mosque is the Gami Amra, scarcely a trace of whose original structure now remains; others of interest are the Gami el-Mu'ayyad, the Mardani Mosque, one of the largest in Cairo, the Gami Mohammed Ali, and the Gami Ibn Tulun, the second oldest in Cairo, erected in 876-9. Other features of interest are the Museum of Geology; the Arabian Museum; the citadel, to the southeast of the city, said to have been built in 1179 with stones from the small pyramids of Gizeh; the Egyptian Museum founded in 1857 and containing Egyptian and Greek antiquities found in the Nile Valley, and the tombs of the caliphs and the Mamelukes.

The chief educational institution is the university, converted from the mosque of el-Azhar in 988; it is the most important educational centre in Islam and

### CAIRO, EGYPT

1. Bank of the Nile, showing 'dhows,' small vessels of Arabian origin used in river and coastwise traffic. 2. The Citadel, said to have been built in 1179, and the Mosque of Mohammed Ali.

has students from all parts of Egypt, averaging annually from 8,000 to 14,000 in number. It is supported by endowment, and tuition is free. There are also the Université Egyptienne, many English schools, missionary schools, schools of art and medicine, and the Khedival Library containing more than 75,000 volumes, many of great rarity and value. Manufactures include textiles, metal ware, perfumes, confectionery, and cotton goods. Pop. (1917) 790,939.

When Amr-ibn-el-As conquered Egypt in 640 A.D., he built a town upon the site of the Roman Babylon (Masr-el-Atika), and called it El-Fostât. This town gradually spread north and northeast until it extended to the citadel, where Ahmed-ibn-Tulun erected a new town called El-Kata'i. Gôhar, the general of the Fatimite caliph Mu'izz in 969 A.D. erected the present town north of El-Kata'i. It prospered and grew until the fourteenth century, when it reached its zenith. Subsequently it suffered greatly from revolutions, rapine, and insurrections, and at length on Jan. 26, 1517, was seized by the Turks. Bonaparte occupied the city in 1800, but in 1801 the French garrison was forced to capitulate to the grand vizier. Under Mehemet Ali, Cairo began to assume its present modern aspect. See EGYPT. Consult Bénédict's *Cairo and its Environs*; Sladen's *Oriental Cairo, the City of the Arabian Nights* (1911); Devonshire's *Rambles in Cairo* (1917).

**Cairo**, kâ'ro, city, Illinois, county seat of Alexander county, at the junction of the Mississippi and Ohio Rivers, and on the Cleveland, Cincinnati, Chicago and St. Louis, the Illinois Central, the Missouri Pacific, the Mobile and Ohio, and the St. Louis Southwestern Railroads; 125 miles southeast of St. Louis, Mo. A railroad bridge 2 miles long crosses the Ohio at this point. Features of interest are the terminal of the Federal barge line (Mississippi-Warrior Service) operating between Cairo (all year) and St. Louis (part of the year) and New Orleans, the public library, and St. Mary's Infirmary. Manufactures include ready-cut houses and other lumber products, work clothing, leather goods, and cotton oil products. The city is the centre of a cotton-growing district. Cairo is the Eden described in Dickens' *Martin Chuzzlewit*. Pop. (1910) 14,548; (1920) 15,203.

**Cairolli**, kî-rô'lê, BENEDETTO (1825-89), Italian soldier and statesman, was born near Pavia. In 1848 he took part in the war against Austria and after some years of exile in Piedmont, ac-

companied Garibaldi to Sicily (1859). He was severely wounded at Palermo (1860), was again with Garibaldi in the Tyrol (1867), and fought at Mentana. He became leader of his party when the Left came into power (1876), and the following year, on the fall of the Depretis-Nicotera ministry, formed a new cabinet with a Francophile and Irredentist policy. In 1878 he was severely wounded while endeavoring to protect King Humbert from attempted assassination by Giovane Passanante. In 1879 he formed a coalition ministry with Depretis, retaining for himself the premiership and the foreign office, but because of the unpopularity of his policy in regard to the conduct of affairs in Tunis, he resigned in 1881.

**Caisson**, kâ's'on, from French *caisse*, or Italian *casone*, 'box,' a term used in military circles for a case to hold ammunition or a

entrances to dry or graving docks used for the inspection and repair of hulls of ships are called caissons. They are hollow steel structures, which may be pumped full of water or emptied at will. When empty, they float upright, like a ship, and are floated into place across the entrance to the dock. The caisson is built with a flat edge along the bottom and up the two sides. To close the dock the empty caisson is floated into position; after the edges have been brought to a bearing against the sill and side pieces of the dock entrance, water is admitted to the caisson, sinking it in place. As the water is pumped from the dry dock, the pressure of water acting against the outside of the caisson forces it tightly against the dock opening. Some forms of dock caissons are made to slide across the entrance and when the dock is open are housed

*Open Caissons: Vertical Section and Plan of Rectangular and Circular Open Caissons for the Anchorage of the Philadelphia-Camden Bridge*

The rectangular caissons are 40 ft. by 140 ft. Each caisson has 12 dredging wells in two rows of 6, each 10 ft. by 11 ft. The outside walls are 6 ft. thick, the central longitudinal wall 8 ft., and the interior transverse walls 9 ft. thick. The caissons were sunk to about 50 feet by dredging through the water-filled wells. After being sunk to full bearing on the rock with the cutting edge sealed into the rock, the wells were pumped out and filled with concrete. (Courtesy of Ralph Modjeski, Chief Engineer, Delaware River Bridge Joint Commission. From Engineering News-Record, New York.)

cart on which the ammunition for a field gun is transported; and in civil engineering with several other meanings, as follows:

(a) The gates which close the

in a recess built in the dock structure for that purpose.

(b) To raise or float sunken vessels, a platform fitted with hollow chambers which may be

filled with water or emptied at will is sometimes used. This is termed a caisson or pontoon. The caisson is sunk by admitting water to the chambers attached to the sides of, or placed below, the vessel to be raised. The water being blown out of the chambers, the caisson rises, lifting the vessel with it. Floating dry docks are made on this principle.

(c) In building dock walls, harbor walls, or breakwaters, hollow boxes with bottom and four sides and open at the top have been used and termed caissons. Such caissons are built on land and towed empty to the place they are to occupy. They are then sunk by filling with earth, rock, or concrete. They are best built of reinforced concrete. When of large size they are divided into cells or compartments by longitudinal and lateral interior walls. A variation is sometimes made whereby the caisson as built ashore has a strong reinforced concrete bottom built on a timber platform, while the sides of the box are of timber and are detachable from the timbers of the platform. The box is floated to place, and sunk by filling with concrete. The timber sides are then detached. This type has been used largely for bridge piers, where the size of the caisson in plan is not excessive.

(d) A well or open caisson is used for making foundations for buildings or bridges. The caisson consists of a vertical hollow box, open at both ends, with a sharp cutting edge of steel or hard wood at the bottom. It is sunk through the ground by excavating within it, the box sinking as the excavation proceeds. It may be of any shape in plan and may be of timber, brickwork, cast iron segments bolted together, structural steel, or reinforced concrete. Large caissons may be subdivided by interior partitions. The caisson may be built to its full height before beginning to sink it, or it may be built up in successive *lifts* as the sinking proceeds. If the ground is dry, the excavation may be done by men standing on the exposed ground at the bottom. If water is present, dredging may be done.

In suitable soils there is no limit to the depth to which such an open caisson may be sunk. Through water-bearing ground, depths of 200 feet have been reached by this process. The resistance to sinking due to the friction between the earth and the outer surface or skin of the caisson, may be overcome by introducing vertical jets of water under pressure around the skin and by loading the top of the caisson with cast iron weights or *kentledge*. The caisson is kept

in vertical position by adding extra weight on the high side. The frictional resistance varies with the nature of the earth, the material of the caisson, the quantity of water present, and the depth. Its recorded range is from 100 to 7,000 lb. per square foot. Perhaps 600 to 1,000 lb. per square inch may be considered a normal range. The method is especially applicable to soils of uniformly small texture, as sand and clay; logs or boulders under the cutting edge hinder sinking, and their removal under water of any depth is problematic.

When the caisson has been sunk to the depth required, it is filled with concrete. Sometimes such a caisson is sunk through water-bearing ground where the excavation has to be done by dredging methods but comes to rest with the cutting edge embedded or sealed with impervious ground. It may then be pumped out and the concrete filling placed *in the dry*. If not, the concrete can be placed in water by means of a *tremie*, which is a tube 8 to 24 inches in diameter. The lower end of the tube is kept on or in the concrete which is being deposited in the bottom of the caisson. The upper end is kept above the water and the concrete is poured down the tube, which is kept full of the flowing mass.

Bagged concrete is sometimes used under water, especially for the bottom layers. The bags are of cloth or of paper and are only partially filled. They pack together after they are sunk and are often arranged in place by divers.

(e) The hydraulic caisson is used for putting down foundations in ground which can be washed out, or *jetted*, with water under pressure. A caisson of this type consists of a cylindrical steel shell, to the bottom end of which is attached a heavy iron cutting edge of hollow triangular section with a series of small holes along its lower edge. This hollow edge is connected by pipes with a force pump on the surface. In sinking, water from the pump is forced through the cutting edge and escapes through the small holes. This washes the ground away from under the cutting edge, and the cylinder is sunk by weighting it on the top. As it sinks, successive lengths are added at the top. When the cylinder has reached the full depth, it is filled with concrete, in the dry if it is possible to pump out the water; if not, by *tremie* under water.

**The Pneumatic Caisson.** The principle of the pneumatic caisson is as follows: Water exerts a pressure of 0.4335 lb. per square inch on any point for

every foot of depth which that point lies below the surface of the water. The pressure is directly proportional to the depth or *head*, so that for a ten-foot hydraulic head the pressure is 4.335 lb. per square inch, and for a 100 foot head it is 43.35 lb. per square inch. If, at the bottom of a caisson being sunk through water-bearing ground, air can be placed, which has been compressed to a pressure, in excess of that of the normal atmosphere, equal to that due to the head of water at the bottom of the caisson, a perfect resistance is interposed to the flow of the water, carrying the ground with it, into the bottom of the caisson, and the excavation may be done in the dry and without the movement of the surrounding earth into the caisson. In order to introduce the compressed air to the bottom of the caisson and to hold it there, a solid air-tight floor or deck is built across and toward the bottom of what would be, otherwise, an open caisson. This deck is high enough above the bottom for a man to stand upright. Through the floor means of access for men and materials are provided, as well as pipes connected with air-compressing machinery on the surface. Air at the proper pressure above the normal atmosphere is sent from the compressors through these pipes into the space below the air-tight floor to balance the pressure due to the head of water on the bottom of the caisson. As the caisson descends, the hydraulic head increases and consequently the pressure of the air introduced into the space, the *air chamber* or *working chamber*, below the air-tight floor must be increased. Pipes connecting with the outside air, telephone and electric light cables, water pipes and other utilities pass down from the surface and through the air-tight floor to the working chamber.

The history of the pneumatic caisson dates back to 1778, when Smeaton used a pump to introduce fresh air at pressure into a diving bell being used in repairing the foundations of a bridge at Hexham, across the River Tyne, England. This seems the first actual use of compressed air in foundation work. In 1820, at Howth, near Dublin, Ireland, where the method was again used with a diving bell, a Russian doctor, Hamel, made observations on the effect of air, on himself and on the men, at a pressure of 7 lb. per square inch above normal. In 1830 Cochrane patented an arrangement by which subaqueous shafts and tunnels could be built in the dry by the introduction within them of

compressed air combined with the device later known as the *air-lock*. (See TUNNELS AND TUNNELLING). The first practical application of the Cochrane invention was made in 1839 by the French engineer, Triger, who sank a coal pit of 3 feet 4 inches diameter at Chalons-sur-Loire to a depth of 65 feet through water-bearing strata to coal measures known to exist but hitherto unreachable.

In 1845, Triger had another similar work on his hands and

The piers for these bridges were sunk by caissons under compressed air. The number of caissons sunk for bridge piers is now very great, some of them running to large size.

The first use of pneumatic caissons to form the foundations of a building was in 1893, for the Manhattan Life Building. Since then hundreds of buildings have had their foundations made in this way, and thousands of caissons have been sunk for this purpose. Buildings of the

An essential part of the pneumatic caisson is the *air chamber* or *working chamber*. This is the bottom part of the caisson, in which the work of excavation is done and in which the air is kept artificially at a pressure high enough above that of the normal atmosphere to balance the pressure of the water. The air chamber is a bottomless box with side walls and roof. The edges of the side walls are formed in a cutting edge to help the caisson sink. Above the air-

*Pneumatic Caisson: Vertical Section of a Caisson during the Sinking Process*

This shows the men at the bottom in the working chamber, which is full of compressed air which keeps out the water. In the middle is the vertical pipe or tube, with an air-lock at the top, through which the men pass to and from the outer air, and the working chamber. The lock-tender on his platform may be seen and a man entering the lower door of the lock. On either side of the man shaft are the shafts through which the excavated material is hoisted to the surface. Each of these has an air lock at the top. Next to these shafts are the blow-out pipes, through which fine material, such as sand, can be blown out to the surface by the compressed air when a valve is opened. The derrick scow on the right is hoisting a bucket of excavated ground or 'muck'; that on the left has the bucket in the working chamber, where the men are filling it. A derrick on the left, in the background, is delivering a 'skip' of concrete to the men who are filling the 'crib' or 'cofferdam' of the caisson with concrete, thus adding to its weight and helping it to sink. When the lower edge (the cutting edge) of the caisson has reached the bed rock, it is sealed tightly with clay or sacks of cement. Then the working space is filled solid with concrete, the shaftways are next filled, and the result is a solid mass of concrete, forming an artificial island on which the pier of a bridge may be founded. (Courtesy of Ralph Modjeski, Delaware River Bridge Joint Commission).

was convinced that the compressed air method was suitable, also, for subaqueous tunnelling. In England, the foundations of the Chepstow Viaduct were taken down to a depth of 70 feet in the years 1843 to 1851; and in 1852, J. L. Fleming sank hollow cast iron bridge piers in Georgia under compressed air.

In the 1870's, there was a great boom in railroad building in the United States involving the bridging of such rivers as the Mississippi and the Missouri,

sky-scraper type, being of such enormous weight, must be bedded on the solid rock. In Lower New York City, for example, rock lies at depths from 50 to 80 feet below the surface. Above the rock comes a boulder-laden glacial deposit, known as hardpan, and above this, extending to the surface, a layer of quicksand 20 feet or more thick. These formations would make the sinking of open caissons a hazardous or even impossible task on a site surrounded by heavy buildings.

tight floor rise the sides, or cofferdam, of the caisson itself. Sometimes the caisson is built to its full height before sinking is begun. Sometimes it is built up, section by section, as the downward excavation proceeds and the caisson sinks. The cofferdam may be of wood, structural steel, or reinforced concrete. Giving access for men and materials between the working chamber and the open air, is the air shaft. This is a vertical pipe or tube provided with a

ladderway and extending the whole height of the caisson. Its lower end passes through the air-tight floor or deck; the upper end terminates in the *air lock*. This is a steel vertical cylinder provided at each end with a door which may be closed against the air pressure. In coming out of the air, *locking-out*, the lower door of the lock is open and the upper one is closed. The men enter the air lock, close the lower door, and then open a valve within the lock which permits the compressed air inside the lock

air shaft and one lock. In large ones separate shafts and locks are used.

As the excavation proceeds and the caisson sinks, it may be filled gradually, above the air-tight floor, with masonry, brickwork, or (usually) concrete, or the filling may not be done until the caisson has been sunk to its full and final depth. Sometimes, water has been introduced as a weighting material above the deck. Since the frictional resistance tends to prevent the caisson from sinking as the excavation

may be used. This is a pipe connecting the working chamber with the surface and provided with a valve in the working chamber. The sand is heaped around the lower end of the pipe in the chamber, the valve opened, and the resultant rush of compressed air up through the pipe carries the sand out to the surface.

The air or working chamber remains unfilled until the caisson has been sunk to its final depth. Then it is filled solidly with concrete up to the roof by means of concrete passed down through the shaft. After the working chamber has been filled, the air shaft and other passageways, or other vertical openings through the caisson may be filled so that the finished structure is a solid mass of masonry. Improved arrangements and devices have been introduced whereby the deck and the lining of the air shafts, etc., are eliminated, thus removing steel and timber, liable to decay, from the finished work.

Caissons may be of any shape in plan and may vary in size from an area of a few square feet for the foundations of building columns, to the great caissons which form bridge foundations, or the shafts of tunnels. The caissons for Eads' Mississippi Bridge at St. Louis (1867-74) were of boiler plate and measured 60 by 82 feet. Roebling's for the Brooklyn Suspension Bridge (1869-83) were of wood and measured 102 by 170 feet. Modjeski's for the Camden-Philadelphia Bridge (1921-5) were of steel and reinforced concrete and measured 70 by 128 feet. Holland's at the New Jersey pierhead, for the vehicular tunnel across the Hudson at New York (1921-6) were of steel and measured 37 feet 3 inches long by 50 feet 3 inches wide and 108 feet 6½ inches high.

A caisson may be built of wood, cast iron, structural steel, or reinforced concrete. Most of the early ones were of course of timber caulked and bolted; some were of cast iron plates bolted together through internal flanges. The modern tendency is toward structural steel and reinforced concrete. A great tensile stress is occasioned on the cofferdam by the frictional resistance when sinking.

An important development in the application of caissons to tall buildings is that whereby the caissons which support the outside wall columns have been made to form a continuous watertight wall or dam sealed into the rock and enclosing the whole area of the building. The building site being thus hermetically sealed from the inflow of sand, the interior foundation piers may

The Outside of a large Caisson to be sunk by Pneumatic Process, for a Bridge Pier

This shows the caulking of the timber cofferdam of Caisson A of the Philadelphia-Camden Bridge before launching at the shipyard of the New York Shipbuilding Corporation at Camden, N. J. The steel caisson, with its timber cofferdam, was built in the slipway of the shipyard, launched like a ship, towed to the site, and sunk to the river bed by pouring concrete over the roof of the working chamber. When the cutting edge reached the river bed, the excavation proceeded in the working chamber under compressed air until bed rock was reached. This was 60 ft. below water at Philadelphia and 85 ft. at Camden. Each caisson at launching weighed some 1800 tons. (Courtesy of Ralph Modjeski, Chief Engineer, Delaware River Bridge Joint Commission.)

to escape until the pressure is reduced to that of the normal atmosphere. The upper door now may be opened and the men pass out. *Locking-in* is the reverse process. The lock may be at the bottom, or part way up or on the top of the air shaft. The higher it is the more opportunity there is for the men to escape in case of emergency. Materials are lowered and the excavated ground is hoisted through the air pipe in narrow buckets small enough to pass through the air pipe and the air lock. In small caissons men and materials are served by one

proceeds, it is useful to do the filling as it sinks. In order to help it sink, cast iron weights are piled on the top of the caisson. If the caisson gets *hung up*, *i.e.*, if it does not settle after a depth of excavation has been made, the pressure of the air in the working chamber is allowed to *blow-out*, *i.e.*, it is reduced a few pounds. This usually starts it. Sometimes, caissons have sunk so rapidly that the whole chamber has been filled with earth, forcing the men to flee up the air shaft. The ground, if hard, is removed by pick and shovel. If it is sand, a sand lift

be built in open caissons or cofferdams. The caissons used to form the dam are generally not over 30 feet in length, and are sunk close together, end to end.

Several devices have been used to close the gaps between the successive caissons. One method, known as stock ramming, consists of jetting pipes down between the adjacent caissons until hard pan is reached and then filling the pipes with clay cartridges rammed down by a pile driver. The pipes being gradually raised, the clay is forced into the gaps. By another

2,912,000 cubic feet. The lowest floor is 80 feet, and the deepest pier is 118 feet below the sidewalk.

In the Hudson Terminal Building (1906-07) of the Hudson and Manhattan Railroad in New York, the volume below street level is 6,000,000 cubic feet. The area of 75,000 square feet is enclosed by 51 main dam caissons, each 8 feet thick and varying in length from 30 feet to 19 feet 3 inches.

Another use of caissons is to provide a foundation for dams. A most notable example is that

across and under a river or other waterway. The caissons are sunk near the shore line and are provided with circular openings, closed temporarily with steel plates, for the passage of the shields. The caissons having been sunk to the correct depth, the shields are erected within them, above the roof of the working chamber, which forms a floor on which the shield erection is done. When the shields have been assembled, a new air-tight deck is built across the caisson above the shield or shields. This deck is provided with air-locks

*Interior View of the Working Chamber of a Large Pneumatic Caisson, showing Steel Roof Construction and Steel and Concrete Cutting Edge.*

The lower ends of two shaft-ways are clearly shown in the roof. This view is of the New York River Shaft of the Holland Tunnel and was taken in the drydock of the Staten Island Shipbuilding Company's plant, Mariners Harbor, New York. The caisson, after launching, was towed to the site and sunk. (Courtesy of Ole Singstad, Chief Engineer, New York-New Jersey Bridge and Tunnel Commission).

method, the adjoining main dam caissons are sunk a foot or so apart with semi-circular or semi-octagonal recesses formed in their ends. After the main caissons have been sunk and concreted, small caissons are sunk in the slot or groove thus formed between the main caissons. In this way, the excavation between the main caissons may be carried to bed rock and a positive joint, extending to the full depth of the main caissons, may be made.

In the Federal Reserve Bank Building (1922), in New York City, the area enclosed is 182,000 square feet, and the volume

of the Hales Bar Dam across the Tennessee River near Chattanooga. This dam is founded on a limestone rock so honeycombed with caverns that secure foundations appeared impossible until pneumatic caissons were applied. The foundations were made by sinking a double row of caissons, varying from 30 by 32 feet to 72 by 54 feet in plan, along the line of the dam to various depths down to 34 feet below the natural river bed, where solid rock was found.

It is becoming the practice to sink large caissons formed of structural steel across the line of shield-driven tunnels to be driven

for men and materials. Compressed air is applied to the shield-chamber thus formed, the plates which closed the circular shield openings are removed, the shield is forced by its jacks through the opening, and tunnelling is begun.

Noteworthy examples of this type of caisson are those used on the Holland Tunnel (1921-6) for vehicular traffic across the Hudson River, between New York City and Jersey City.

As with tunnelling under compressed air, so with pneumatic caisson work, the physiological effects of compressed air impose a bar on the application of the

method beyond a depth of about 110 feet (see CAISSON DISEASE). The extreme depth reached so far appears to be 113 feet, in one of the caissons of the Municipal Bridge, St. Louis, in 1911.

**Bibliography.**—Consult W. W. Patton's *Foundations* (2d ed. 1909); Jacoby and Davis' *Foundations of Bridges and Buildings* (1914); Hool and Kinne's *Foundations, Abutments and Footings* (1923).

**Caisson Disease**, known also as BENDS and as DIVER'S PALSY, a disease due to the effects of compressed air, occurring among divers and workers in tunnels and caissons. It depends upon the fact that under the high pressure necessary for such work the nitrogen of the air dissolves in the blood and in the other fluids and tissues of the body, in amounts proportional to the pressure. With the rapid lowering of the pressure when the subject leaves the chamber of the caisson for the outer air, the dissolved nitrogen separates in bubbles in the blood, the synovial fluid of the joints, or the spinal cord or brain, inducing intense pain and even paralysis and death.

Physicians have studied the effects of compressed air on men and animals ever since Hamel constructed his compressed air diving bell in 1820. M. Pol at Douchy, France, was the first to suggest re-immersion in compressed air as a remedy for the condition. Dr. Jaminet, who was in medical charge of the men working on the St. Louis Bridge over the Mississippi, was the first to recommend a sliding scale of working hours (1851) the length of the shift to decrease as the air pressure increased; and Dr. Smith, who was in medical charge of the men working in the caissons of the Brooklyn Bridge (1871-2), was the first to examine men medically for work in compressed air and to formulate and attempt to enforce rules and regulations for their safety and health. He recommended and described the essential features of the hospital lock for the re-immersion (under medical supervision) of the sufferer from the disease. This device was first used in 1889 on actual work by E. W. Moire, then in charge of the work on the Hudson River Tunnel. It consists of a two-compartment horizontal air lock installed on the surface, so that a sufferer may be re-immersed as soon as symptoms appear, which is usually within an hour of decompression. Under recompression the nitrogen bubbles are reduced in size and their irritating effects correspondingly decreased, with a disappearance of symptoms in most cases. The patient is then cautiously decompressed.

Preventive measures consist in limiting the hours of work— from 8 hours in low pressure to 1½ hours in high pressures (43-48 lbs), with rest periods; employing only men with sound lungs and a sound heart; avoiding chilling as the men pass out of the compressed air; cooling the compressed air before it is sent into the working chamber, and supplying sufficient air so that it does not become foul.

**Caithness**, káth'nes, county, Scotland, in the extreme northeast; area 697 square miles. The greater part of it is moorland, and the coast is bold and rocky. The chief crops are oats, barley, and potatoes. Fish are abundant. The county town is Wick. Pop. (1921) 28,284.

**Caius**, kēz, JOHN (1510-73), English physician, best known by this Latinized form of his surname Key, was born in Norwich. He was educated at Cambridge and travelled and studied on the Continent, notably at Padua. He practised medicine in England; lectured on anatomy; and was physician to Edward VI., and afterward to Queen Mary. In 1557 he refounded Gonville Hall, Cambridge (founded in 1348 by Edmund Gonville, rector of Terrington, Norfolk), which henceforth was known as 'Gonville and Caius College.' In 1559 he was elected master of the college, an office which he held till his death, in London. He compiled a tract in English entitled *A Boke or Counseill against the Sweate or Sweating Sickness*, and wrote a number of books and treatises in Latin.

**Caivano**, kī-vā'nō, town, Italy, in the province of Naples, 7 miles northeast of Naples. It has a flourishing trade in fruit, wine, and olives. Pop. (1911) 12,986.

**Caius**, ká-ēks', NAPOLEONE (1845-82), Italian philologist, was born in Bozzolo, near Mantua. He became professor of ancient languages at Parma in 1869, and from 1873 until his death occupied the chair of Romance languages and comparative philology at Florence. His works, which deal with the Italian, Spanish, and Romance languages, are distinguished by their scientific method, and exhibit great ingenuity. His publications include: *Saggio sulla storia della lingua e dei dialetti d'Italia* (1872), *Studi d'etimologia italiana e romanza* (1878), and *Le origini della lingua poetica italiana* (1879), this last being the most important.

**Cajabamba**. See RIOBAMBA.

**Cajamarca**, kā-hā-mār'ká, city, Peru, capital of the department of Cajamarca, on the eastern slope of the Western Cordillera; 370 miles north of Lima. It is an ancient Inca city and in the

neighborhood are the thermal 'Baths of the Incas.' Manufactures include hats, textiles, and tobacco. Coal, copper, gold, and silver are found in the district. Historically the town is notable as the scene of the capture and death of Atahualpa (1533). Pop. 12,000.

**Cajatambo**, kā-hā-tām'bō, town, Peru, capital of the province of Catajumbo; 100 miles north of Lima. It produces cereals and textiles, and mining and cattle raising are carried on. Pop. 4,000.

**Cajeput**, kaj'e-put (*Melaleuca leucadendron*), an evergreen tree, bearing pendulous spikes of white flowers, found throughout Australia and South Asia, known in the former country as the tea tree. The bark, pale buff in color, peels off in thin layers and is useful in packing because of its durability and imperviousness to water.

*Oil of cajeput*, distilled from its leaves or from those of *Melaleuca minor*, is a greenish colored aromatic oil, pungent and volatile, resembling oil of cloves in its action. It is used externally as a stimulant and counter-irritant.

**Cajetan**, kaj'e-tan, JACOPO, known in religion as TOMASO DE VIO DI GAETA (1469-1534), Italian theologian, was born in Gaeta (Cajeta). He entered the order of the Dominicans in 1484, became professor of theology and philosophy at Brescia and Pavia, and in 1509 was elected general of the order. Leo X. made him a cardinal (1517), and sent him the following year on a fruitless mission to Germany to examine Luther and quiet the commotion raised by his schism. In 1530 he was summoned to Rome, where he was continually consulted by Pope Clement VII. In Clement's behalf he wrote the decision against the granting of a divorce to Henry VIII. from Catharine of Aragon. He was a steadfast opponent of the Reformation. His works (*Opera Omnia*, 1639) include a translation of the Bible, and commentaries upon portions of Aristotle and Aquinas.

**Calaban'ga**, pueblo, Luzon, Philippine Islands, in the province of Ambos Camarines, on the Calabanga River, 3 miles from the shore of San Miguel Bay. Pop. (1918) 7,953.

**Cal'abar Bean**, the poisonous seed of *Physostigma venenosum*, a shrub native to Western Africa, bearing violet-colored flowers and flattened pointed pods, each containing two or three of the reddish brown seeds or beans. The seed contains two alkaloids—calabarine and physostigmine or eserine. The latter, administered internally, increases glandular secretion and intestinal peristalsis. It has little effect on the cerebrum, but acts strong-

ly on the vital centres in the medulla, and on the spinal cord, where it produces feebleness of muscular movement, and slightly affects sensation. It is given both by the mouth and hypodermically, for the relief of tetanus, and to antagonize the action of atropine. Its chief value in medicine lies in its action on the third cranial nerve, through which it acts on the eye, causing contraction of the pupil and relief of ocular tension. It paralyzes accommodation for distant objects. It has been recommended in the conjunctivitis of infants, in ocular paralysis due to diphtheria, and in glaucoma and corneal ulcers. It is believed to stimulate all unstriated muscle, and to increase all secretions.

**Calabar, New**, town, Nigeria, Africa, on the New Calabar River, one of the most eastern branches of the Niger delta; 100 miles east of Old Calabar.

**Calabar, Old**, town, Nigeria, Africa, on the left bank of the Calabar River. The native quarter is known as Duketown. It is an important trade centre and exports large quantities of palm oil and palm kernels. In 1904 the name Old Calabar was officially changed to Calabar. Pop. about 15,000.

Calabar Bean

**Cal'abash**, the hard shell of the fruit of the calabash tree (*Crescentia cujete*), of the order Bignoniaceæ, native to West Africa, Tropical America, and the West Indies. It has large white flowers which grow on the trunk and on the older branches. The shell is used for cups, jars, pots, kettles, and other vessels. The rind of *Lagenaria vulgaris*, of the family Cucurbitaceæ, is also known as Calabash, or Bottle Gourd (q. v.).

**Calaboza**, kã-lã-bõ'zo, town, Venezuela, capital of the state of Guárico, on the Guárico River; 120 miles southwest of Caracas. It is the seat of a college and a bishopric, and is a shipping point for lumber and agricultural produce. Pop. about 8,000.

**Calabria**, kã-lã'bri-a, a territorial division of Southern Italy, comprising the provinces of Catanzaro, Cosenza, and Reggio, and occupying what is known as the 'toe' of Italy; area, 5,819 square miles. The southern extensions of the Apennines, 4,500 to 6,500 feet, traverse the region, except for the valley of the

Crati. In the central part is La Sila, a mountainous area, thickly wooded; in the extreme south, overhanging the Strait of Messina, are the heights of Aspromonte (6,420 ft.). Marble, alabaster, salt, and copper are found, and grain, fruit, hemp, and flax grow in abundance. Pop. (1921) 1,503,201.

Calabria (formerly Bruti) was colonized by the Greeks in the eighth century B.C., and was known as Magna Græcia, or Greater Greece. Among the settlements were the great cities of Croton, Sybaris, Thurii, Scylacium, Caulonia, and Rhegium, and, at a later date, Monteleone. In the Middle Ages, Calabria, as it came to be called, fell into the power of the Saracens, who in the eleventh century were expelled by the Sicilian Normans under Robert Guiscard. Henceforth Calabria was governed by Naples. In 1763, 1905, and 1908, stupendous earthquakes occurred in the district.

Until the end of the Byzantine supremacy (seventh century), the name Calabria was applied also to the peninsula on the northeast of Gulf of Otranto, on which stood the powerful Greek cities of Brundisium (Brindisi), Tarentum (Taranto), Hydruntum (Otranto), and Lupiæ (Lecce). Consult G. Gissing's *By the Ionian Sea*.

**Caladium**, a genus of plants belonging to the family Araceæ. They are grown chiefly on account of their beautiful foliage. The leaves are generally broad and arrow-shaped, often marked with shades of white, red, yellow, or purple. *C. bicolor*, a native of South America, and *C. picturatum* have supplied many of the fancy-leaved varieties. The variegated hybrids are numerous. Caladiums have large rhizomes, which can be kept through the winter in a tolerably warm place. An abundance of water, protection from bright sunshine, and warm, humid air are necessary for them.

**Calahorra**, kã-lã-õ'rã, city and episcopal see, Spain, in the province of Lagroño, 75 miles northwest of Saragossa. It is one of the oldest cities in Spain, and was the birthplace of Quintilian. The main feature of interest is the cathedral, which is a place of pilgrimage. Wine and agricultural produce are exported. Pop. (1920) 10,791.

**Calais**, ka-lã', seaport town and fortress, France, in the department Pas-de-Calais, on the Strait of Dover, 21 miles east of Dover, England, on the opposite shore. It is the chief port for passenger traffic between England and the continent. It consists of two parts, Calais-Nord, the old town, and Calais-Sud, the modern industrial section. Ca-

lais-Nord, which lies between the citadel and the harbor, has narrow, irregular streets and quaint old buildings; its chief features of interest are the old Hôtel de Ville, with a museum and art gallery, the church of Notre Dame, and the Hôtel de Guise, founded by Edward III. as a woolstaplers' guildhouse. Calais-Sud, much larger and more modern, contains the new Hôtel de Ville, the banks, theatres, factories, and shops. Calais has a fine harbor accessible to the largest vessels. It is an important fishing centre, and has extensive manufactures of lace and tulle. Pop. (1921) 73,001.

Calais was taken by Edward III. in 1347 and remained for two hundred years under English rule. In 1558 the Duc de Guise expelled the English garrison. Here Mary Stuart embarked for Scotland in 1561 and here Louis XVIII. landed in 1814 to assume the French crown. In the Great War Calais was an important British base for supplies. The town suffered severely from aerial raids in 1917-8.

**Calais**, kal'is, city and port of entry, Maine, in Washington county, on the St. Croix River, at the head of tidewater, 12 miles from Passamaquoddy Bay. It is on the Maine Central Railroad, and is accessible to the Canadian Pacific at St. Stephen, Canada, with which it is connected by bridge. It is the most northeasterly seaport in the United States. Features of interest are Memorial Park, the public library, and Calais Academy. The St. Croix furnishes good water power and there is a large lumber trade, as well as shoe factories, woollen mills, machine shops, quarries of granite and marble, lime kilns, and shipyards. Pop. (1910) 6,116; (1920) 6,084.

**Cal'amander Wood** (*Diospyros hirsuta*), the wood of a tree native to India and Ceylon, used as a cabinet wood and valued for its beauty. The prevailing tint is a fine chocolate, deepening into black, or fading into fawn, varied with rich shades of brown. It is known as variegated ebony.

**Calamba**, kã-lãm'bã, pueblo, Luzon, Philippine Islands, in the province of Laguna, on Laguna de Bay; 17 miles southwest of Santa Cruz. It is the birthplace of Dr. Jose Rizal y Mercado, the Filipino martyr. Pop. (1918) 18,062.

**Calame**, ka-lam', ALEXANDRE (1810-64), Swiss artist, was born in Vevey. He early evinced a taste for painting, and in 1829 became a student under Diday, of whom he later became a formidable rival. He traveled in France, Holland, and Italy, studying the works of the mas-

ters in those countries, but although they influenced his technique he remained always the painter of Alpine scenery and his native land. Among his best known works are *Le cours du Giffre* (1835); *L'orage a la Handegg* (1839); *Le Mont Rose* (1844); *Le lac des Quatre-Cantons*. His work is somewhat too decorative, but his coloring is fine and his perspective good.

**Calamianes**, kǎ'lǎ-mē-ā'nās, or CULION ISLANDS, group of islands, Philippines, in Palawan province, lying between the Mindoro and the China Seas and forming a connecting chain from Mindoro to Palawan. There are 98 islands in the group, with an area of 677 square miles. There are only two large islands, Busuanga (388 sq. m.) and Culion (176 sq. m.). The industries are cattle raising, and the collection of bamboo, edible birds' nests, sea-cucumbers, turtles and shells. The climate is unhealthy. Coron, Busuanga Island, the chief town, is 197 miles southwest of Manila. Pop. (1918) 7,570.

**Calamine**, kal'a-min, a name given to two common ores of zinc—the one being a hydrous silicate, hemimorphite, or electric calamine; the other the carbonate, more properly known as smithsonite. Both are frequent in veins which carry zinc blende, the commonest of the zinc ores, and seem to be derived largely from the decomposition of that mineral. They are pale yellow, pink, brown, blue, green, or colorless, and are often mixed in a fine yellowish powder, known to miners as 'dry bone.' Frequently they take the form of encrusting or stalactitic masses. They are found in New Jersey, Pennsylvania, Virginia, Missouri, and other parts of the United States, and in Germany, Belgium, England, Scotland, and Siberia.

**Cal'amint**, a genus of plants belonging to the order Labiatae, much resembling the thymes and sages. The species are mostly aromatic herbs with purplish or white flowers and are reputed to have medicinal properties. Several hardy species are known. The tiny *Calamintha glabella* and *C. alpina* are suitable for the rock garden, and the larger *C. grandiflora*, which flowers in June, is often used for a general border. *C. officinalis*, the common calamint of old herbalists, a plant used in domestic medicine, is a native of Europe.

**Cal'amite**, a well-known plant fossil which occurs in Carboniferous strata, and in external appearance somewhat resembles a reed. It is an extinct representative of the group Equisetaceae. The stems are often found to terminate beneath in a bluntly

conical, tapered point; while towards their apex they bear many branches, which arise in whorls from certain of the nodes. On these branches finer branchlets are planted in similar fashion, and the ultimate ramifications bear whorls of small linear leaves which are known as annularia, asterophyllites, and sphenophyllum. Calamite is not the stem of a plant, but a cast or impression of the pith cavity.

**Cal'amus**, a genus of Asiatic palms, all the species of which, some scandent, are of great beauty. Among the smaller species are the spiny *C. ciliaris*, in which the pinnate leaves are clothed with hairs, and *C. spectabilis*. The species *C. rotang*, *C. tenuis*, and *C. viminalis* furnish canes used for chairs, baskets, and mats, while *C. scipionum*, whose stems are thicker and larger, furnishes Malacca canes used for walking sticks. Some of the species are known as Rattan. See also DRAGON'S BLOOD.

**Calamus**. See ACORUS.

**Cal'amy**, EDMUND, THE ELDER (1600-66), English divine, was born in London. He was educated at Cambridge, became vicar of St. Mary's in Swaffham, prior in 1626, but the same year removed to Bury St. Edmunds, where he was lecturer until 1636. Because of his opposition to the *Book of Sports*, he left the Episcopal Church and became a Presbyterian. He was appointed in 1639 minister of St. Mary's, Aldermanbury, London, where he officiated for twenty years. He was one of the five authors of the work entitled *Smectymnuus* (1641), written in controversy of Bishop Hall's *Divine Right of Episcopacy*. After the Restoration he became chaplain-in-ordinary to Charles II. and was one of the representatives of the Presbyterians at the Savoy Conference. In 1662 he was ejected from his living by the Uniformity Act, and committed to Newgate for a short time. He wrote the *Godly Man's Ark* (1657) and compiled the *Souldier's Pocket Bible* for the use of the Commonwealth Army.

**Calamy**, EDMUND (1671-1732), English theologian, grandson of Edmund Calamy (q. v.), was born in London. He published forty-one works, vigorously upholding liberty of conscience as the foundation of non-conformity. The best known are his *Account of the Ministers Ejected after the Restoration* (1689) and his *Historical Account of My Own Life*, which was not published until 1829.

**Calandrinia**, kal-an-drin'i-a, a genus of plants of the rock purslane order (Portulacaceae). There are about sixty species, all of which are fleshy, with sprawling

or trailing habit and entire leaves. Some are annual and some perennial; but all are usually raised from seed, and treated as half-hardy annuals. The flowers open fully only in sunshine. Among the best known species are *C. discolor*, with pinkish purple petals and yellow stamens, and *C. umbellata*, which bears large, beautiful, crimson flowers.

**Calanthe**, ka-lan'thē, a genus of terrestrial orchids having broad, plaited leaves and long spikes of large white, lilac, or pink flowers. Some species are deciduous and some evergreen; the greater number of varieties grown by horticulturists are

*Calanthe vestita*

hybrids obtained by artificial crossing. Best known among the species are the white flowered deciduous *C. vestita*, with its varieties; *C. veratrifolia* and *C. veitchii*, with many varieties; and *C. masuca*, which bears violet flowers.

**Calapan**, kǎ-lǎ-pǎn', pueblo, Mindoro, Philippine Islands, capital of Mindoro province, on Calapan Bay; 85 miles south of Manila. There is no sheltered anchorage, and during the months of October, November and December, when a heavy surf is running, the mails cannot be landed. Hunting, fishing, and weaving are the chief occupations. Pop. (1918) 12,689.

**Calarasi**, kǎ-lǎ-rǎ'sē, or STIRBEY, town, Roumania, capital of the province of Jalomitsa, on the Borcea arm of the Danube, opposite Siliustria. Pop. 11,000.

**Calas**, ka-las', JEAN (1698-1762), Protestant merchant of Toulouse

who, his son, Mark Antony, having hanged himself, was accused of having strangled the youth to prevent him from abjuring Protestantism and adopting Roman Catholicism. On this charge the old father was condemned by eight judges to be tortured and broken on the wheel, and the sentence was carried out. Calas' other son was banished, his daughters were placed in convents, and his wife escaped to Switzerland, where Voltaire took up her case, and got the sentence annulled. Consult Voltaire's *Sur la Tolérance*; Dryandar's *Der Prozess Calas*.

**Calascibetta**, kā-lā'shi-bet'ta, town, Caltanissetta province, Sicily; 15 miles northeast of Caltanissetta. It is built on a steep and isolated height (2,880 feet), opposite Castrogiovanni. Wine, olive oil, and silk are produced. Pop. 9,000.

**Calash'** (French *calèche*), a light four-wheeled carriage with a folding roof or hood.

**Calasiao**, kā-lā-sē-ā'ō, pueblo, Pangasinan province, Luzon, Philippines, on the Tolon River and on the Manila road; 9 miles east of Lingayen. Many important industries are conducted in the district, including tobacco and hat manufacture and weaving. Pop. 17,000.

**Calafafimi**, kā-lā'tā-fē'mē, town, Trapani province, Sicily; 32 miles southwest of Palermo. In the vicinity are the ruins of the ancient *Segesta*; and about 2 miles to the southwest Garibaldi defeated the Neapolitans in 1860. Pop. 12,000.

**Calatayud**, kā-lā-tā-yōōth', city, Saragossa province, Spain, on the main railway to Madrid; 52 miles southwest of Saragossa. It is a curious ancient town on a rocky eminence, with a splendid ruined castle. It is the site of the ancient *Bibbilis*, and birthplace of Martial the Latin poet. Pop. 11,500.

**Calathea**, an American group of plants of the ginger family, which have beautiful leaves springing from a short, root-like stem.

**Calatrava la Vieja**, kā'lā-trā'vā lā vyā'hā, a ruined city of Spain, on the Guadiana, 12 miles northeast of Ciudad Real. Its defence against the Moors, undertaken by Raymond, abbot of Fitero, and Diego Velasquez in 1158, after it had been abandoned by the Templars, is famous on account of its having originated the Order of the Knights of Calatrava. Their almost uniform success against the Moors gave rise to rashness, and in 1197 they were defeated and nearly exterminated, the survivors transferring the seat to the castle of Salvatierra. Since 1808 the body

has been continued as an order of merit.

**Calauria**, a small island (now Poros) in the Saronic Gulf (now Gulf of Ægina), Greece. It contained a temple of Poseidon, which was regarded as an inviolable sanctuary. Demosthenes took refuge there from Antipater, and poisoned himself to escape arrest in 322 B.C.

**Calaveras**, kā-lā-vā'rās, county, California, situated near the middle of the State, with a picturesquely varied surface, including hills, canyons, prairies, and forests of oak and pine. The country is rich in granite, quartz, limestone, and slate, and copper and gold are mined. Its fame is due especially to its grove of *Sequoia gigantea* at Bigtrees (q.v.). Area 1,080 square miles. Pop. (1910) 9,171.

**Calaveras Skull**, a fossil skull found in the auriferous gravels of Calaveras county, California, in 1866, and believed by some to belong to the Tertiary period, thus indicating the presence of Tertiary man in that region. The skull is similar to those of modern Californian Indians, however, and many hold that it was obtained from a comparatively recent grave.

**Calbayog**, kāl-bā'yōg, pueblo, Samar Island, Philippines; 29 miles northwest of Catbalogan. The anchorage is exposed to the southwest monsoon. It has steamboat communication with Manila. Hemp export and fishing are its chief industries. Pop. 16,000.

**Calbe**, town, Germany. See KALBE.

**Calburga**. See GULBARGA.

**Calcaire Grossier**, kāl-kār'grō-syā', a richly fossiliferous series of limestones and marls which are developed in the Paris basin, and belong to the middle Eocene period. It is about a hundred feet thick, contains a great variety of fossil shells, and has yielded also numerous remains of mammals.

**Calca'rea**, or CALCISPONGIÆ, the group of sponges in which the skeleton consists of spicules of lime. See SPONGES.

**Calca'reous** (Latin *calx*), in chemistry, is a term applied to substances containing much lime. Thus *Calcareous Waters* are those which hold in solution much carbonate and sulphate of lime, and which are generally known as 'hard waters.' *Calcareous Rocks* (q.v.) are those in which lime forms the prevailing element. *Calcareous Soils* (q.v.) are produced from the disintegration of calcareous rocks.

**Calcareous Rocks** consist of carbonate of lime, whether in the form of calcite or aragonite. The majority have been formed in the sea, and are composed of the re-

mains of marine animals, such as corals, crinoids, brachiopods, molluscs, echinoderms, and foraminifera. Similar materials are accumulating in the sea bottom at the present day as banks of shells or as coral reefs. The lime salts which exist in solution in sea water are extracted by the living tissues of these animals, and deposited in the form of carbonate of lime by their shell-secreting membranes. Most limestones, in consequence, are of organic origin; as a rule, they contain numerous fossils which indicate this; but others have formed as precipitates by the evaporation of calcareous solutions. Stalactite and calc-sinter belong to this group, and many geologists believe that oolites are of similar derivation. (See OOLITE.)

Another series of calcareous rocks is crystalline, and may be called the marbles, as marble is a typical example. They are associated usually with the crystalline schists and with the contact rocks which are developed by the action of the heat, given out by great masses of granite as they cool, on the rocks surrounding them. Most geologists hold that they were originally limestones of organic origin, and that their present crystalline structure, and the absence of fossil remains, are due to the metamorphism, including recrystallization, which they have undergone, and which have obliterated all traces of their original character.

**Calcareous Soils**. Most highly calcareous soils are not noted for their fertility or agricultural value. They are apt to be very thin, and full of hard nodules of flint, the insoluble ingredients of the chalk or limestone beneath, and are more adapted for sheep pasture than for growing grain. But if in other respects the soil is good, the presence of a considerable amount of calcareous matter does no great harm; and soils which contain no carbonate of lime are invariably improved by the addition of chalk or some other lime compound. Many residual calcareous soils derived from limestones are very fertile, and are valuable especially for grasses, as in the famous blue-grass region of Kentucky. The acids generated by the decomposition of vegetable matter require to be neutralized, and for this purpose carbonate of lime is essential; hence peaty soils are much benefited by being dressed with chalk.

Calcareous soils are soft, friable, and 'light'; in other words, they are easily worked. They are comparatively dry, as they are more porous than clay soils, though less so than sands or sandy loams; and they retain a fair amount of water, so that

they are not so readily parched in dry weather. Owing to their light color, they absorb heat only slowly, so that in spring they do not warm so rapidly as dark soils, and are consequently somewhat late. They do not become acid or 'sour,' and are usually rich in phosphates which are a frequent ingredient of limestones; but, on the other hand, they are poor in potash. See SOILS.

**Calcareous Tufa.** See CALC-SINTER.

**Calcasieu,** kál'ka-shōō, river of Louisiana, draining the southwest corner of the State. It rises west of the centre of the State, near the Red River, flows southeast in Rapides county, and southwest in Calcasieu county, at the extreme end of which it enters Lake Calcasieu, which has a passage to the sea, known as Calcasieu Pass. The river is 230 miles long, and is navigable for boats of light draught for a large part of its course.

**Calcedony.** See CHALCEDONY.

**Calceola,** kal-sē'ō-la, or SLIPPER CORAL, a characteristic fossil of the middle Devonian, is so called from its resemblance to the toe of a slipper, being conical, slightly flattened on one side, curved, and tapering to a blunted point. It is abundant in the limestones of the Eifel, on the west of the Rhine, in Germany.

**Calceolaria,** a genus of plants, natives of South America, Mexico, and the West Indies, belonging to the order Scrophulariaceae. From a gardening point of view the genus may be divided into two classes, composed respectively of herbaceous and shrubby varieties. The herbaceous kinds are usually raised from seeds, which are sown in July on light soil composed of equal parts of sand, leaf mould, and loam. The flowering season is from May to July. The shrubby kinds are usually propagated by means of cuttings, preferably taken in September, and placed in a cold frame or greenhouse in a mixture of fine fibrous loam and silver sand, and kept shaded for a week. As soon as they are well rooted the young plants should be planted in small pots, and placed in a frame exposed to direct sun heat. At about the end of February the points should be pinched off, and the plants transferred to larger pots. As they grow, they should again be moved, until they are planted out in May.

The saccate flowers of *Calceolaria* resemble 'lady's slippers,' and are variously spotted and colored, with rich hues, generally combined with yellow. They occur in large clusters, and are much hybridized. *C. crenatiflora*, from Chile, is a spotted, yellow species; *C. purpurea*, vio-

let-flowered, comes from Peru; *C. integrifolia* is a shrubby species with small yellow flowers.

**Calchaqui,** kál-chá'kē, is a tribe of South American aborigines, now extinct, if the analogous people on the north coast of Chile be not a remnant. The tribe formerly inhabited the district around Tucuman, in North Central Argentine, and have left behind stone-built tombs, in which have been discovered mummies and gold and copper ornaments. They may therefore have been civilized by the Incas, who conquered them about the middle of the fifteenth century. Some details of their life and habits have been handed down to us, but we know little of their language.

**Calchas,** kal'kas, the famous soothsayer of the Greeks in the Trojan War, was the son of Thestor and Mycene. He foretold the length of the siege, and when the fleet was detained at Aulis by adverse winds, demanded the sacrifice of Iphigenia. He is said to have died at Colophon, from chagrin at being surpassed in soothsaying by one Mopsus.

**Califerous Formation,** a term used by American geologists for the lowest part of the Ordovician series. It is a great limestone group, sometimes dolomitic and at other times arenaceous, which is well developed in New York, New Jersey, Michigan, etc., as well as in Canada, while equivalents of it are found at many places within the Mississippi Valley.

**Cal'imine,** a composition of whiting or zinc white, glue, water, and sometimes pigments, for finishing plastered ceilings and walls.

**Calcina'tion,** a term used in metallurgy to denote the operation of roasting or burning ores or chemicals. The process varies according to the nature of the ore, and may have for its object to expel certain volatile constituents, such as sulphur, arsenic, or carbon dioxide, to produce an oxide. Chalk ( $\text{CaCO}_3$ ) is calcined in kilns to expel the carbon dioxide gas and produce quicklime ( $\text{CaO}$ ).

**Calcite,** one of the commonest and most important of minerals, composing such rocks as marble, limestone, chalk, and oolite, and assuming an extraordinary variety of colors and forms, as stalactites, veins, concretions, petrifactions, incrustations, etc. It is the principal ingredient of the shells of most marine animals, being obtained by them from sea water, in which compounds of lime exist in solution. (See ARAGONITE.)

Calcite often occurs in beautiful crystals (see DOUBLE RE-

FRACTION.) Over a thousand different forms and combinations of calcite crystals are known. Iceland Spar is clear transparent calcite. Two of the commonest forms are known to miners as Nail-Head Spar and Dog-Tooth Spar. Calcite is soft, and scratches easily with the knife (hardness = 3). It is easily dissolved in weak cold acid, and bubbles of carbonic acid gas are given off. It is a frequent product of decomposition in rocks, and occurs also as pseudomorphs after other minerals. In composition it is carbonate of lime, but that compound forms also another mineral, Aragonite (q. v.).

**Cal'cium,** a metallic element, fifth in abundance in the earth's crust, of which it forms 3.5 per cent., is a constituent of many compounds found in nature in enormous quantities, as Calcium Carbonate (chalk, marble, coral) and Gypsum. Other natural compounds are Dolomite, Fluorspar, Apatite, Alabaster, and Garnet. Calcium compounds are essential to life, being found in leaves, and in the bones, teeth, and shells of animals.

Calcium is prepared by electrolysis of the fused chloride. It has a yellowish lustre, is tough, and somewhat harder than lead. Specific gravity, 1.54; melting point,  $760^\circ$  c. Chemically it is one of the alkaline earth elements (see PERIODIC LAW). It tarnishes in moist air, and reacts readily with water. It burns with a brilliant crimson light. As it is basic, a calcium salt corresponding to any acid is possible—thus calcium nitrate corresponding to nitric acid. Many of these salts are of great importance. Following are the most important compounds:

**Calcium Bicarbonate,**  $\text{CaH}_2(\text{CO}_3)_2$ . Calcium carbonate is soluble in a water solution of carbonic acid. If carbon dioxide is removed as by heating, or by diminished pressure as in mineral waters, or by consumption by organisms, calcium carbonate is precipitated. These facts, as well as the temporary hardness of water, and boiler incrustation, find explanation in the supposed union of carbonic acid with calcium carbonate to form calcium bicarbonate, a compound unknown in the solid state on account of the large dissociation pressure of carbon dioxide at ordinary temperatures.

**Calcium Carbide,**  $\text{CaC}_2$ , is a hard, opaque solid, white when pure, ordinarily brownish or grayish, obtained by heating coke and lime to a high temperature. The commercial product smells of hydrogen phosphide, due to impurities. Specific gravity, 2.22.

Calcium carbide reacts readily

with water, forming acetylene and calcium hydroxide—1 pound yielding about 6 cubic feet. It is used in the generation of acetylene (see ACETYLENE), and the manufacture of calcium cyanamide (see below).

**Calcium Carbonate**,  $\text{CaCO}_3$ , a white crystalline solid, occurs as Limestone, forming whole mountains and strata of vast extent, Marble, Calcite, Aragonite, Stalactites, Stalagmites, Chalk, Shells, Coral, and Pearls. It is insoluble in water, but dissolves in water charged with carbon dioxide (q.v.). Specific gravity, 2.7–2.9. Calcium carbonate heated yields carbon dioxide and calcium oxide; this is the basis of lime burning. It reacts with acids readily, often with effervescence, yielding carbon dioxide, water, and the calcium salt of the acid. It is used as building material; in making lime, cement, glass, sodium carbonate; as a flux in metallurgical operations; as whitening; and in putty.

**Calcium Chloride**,  $\text{CaCl}_2$ , a white, deliquescent solid, is a by-product of several commercial processes, as the Solvay soda process. Specific gravity, 2.15. Solubility: 100 c.c. of water (20° c.) dissolve 74.5 grams. The crystallized form,  $\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$ , dissolved in water produces a temperature of  $-48^\circ\text{C}$ . It is used in refrigerating solutions; freezing mixtures; to mitigate dusty roads; and when incompletely dehydrated, as a desiccating agent.

**Calcium Cyanamide**,  $\text{CaCN}_2$ , a dark gray compound, is made by strongly heating calcium carbide and nitrogen, as in the electric furnace. It reacts with water to form calcium carbonate and ammonia. It is used as a fertilizer; in the preparation of ammonium compounds, sodium cyanide, dicyandiamide, artificial urea, guanidine, and some explosives; and in case-hardening steel.

**Calcium Fluoride**,  $\text{CaF}_2$ , occurs as fluorspar, colorless and transparent when pure, and insoluble. Specific gravity, 3.16. It is easily fused; does not act upon other substances easily, and therefore serves in metallurgical processes as a liquid medium in which reactions take place at high temperatures; and facilitates the formation of slags. It is the source of fluorine compounds—e.g., hydrofluoric acid, used in etching.

**Calcium Hydroxide**,  $\text{Ca}(\text{OH})_2$ , a white solid, of which slaked lime is an impure form, is made by allowing calcium oxide, as quicklime, to react with water, thus slaking it. Specific gravity, 2.08. Solubility: 100 c.c. of water (18° c.) dissolve 0.167 gram, the solubility decreasing

with rising temperature. The solution is lime water; milk of lime is a suspension in water.

Calcium hydroxide can be dehydrated by heating. It has an alkaline reaction with vegetable colors—e.g., turning litmus blue—and is the cheapest strong base, neutralizing acids, forming the calcium salt of the acid and water. When carbon dioxide (gas) is bubbled through lime water a white precipitate of calcium carbonate forms. This reaction serves as a test for carbon dioxide. It is used in the making of mortar and whitewash; in the manufacture of alkalis and bleaching powder; removal of hair from hides in tanning; purification of illuminating gas and beet sugar; softening water; and in medicine.

**Calcium Hypochlorite**,  $\text{Ca}(\text{ClO})_2$ , the calcium salt of hypochlorous acid, is unstable, decomposing into calcium chloride and oxygen. (See BLEACHING POWDER.)

**Calcium Nitrate**,  $\text{Ca}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$ , a colorless, crystalline, deliquescent, salt, is found in small quantities in the soil. Specific gravity, 1.82. It is formed through the action of nitrifying bacteria, sometimes abundantly as in the neighborhood of cow houses. It is readily taken up by plants. A basic salt, not deliquescent, is preferred as a fertilizer. (See NITROGEN, FIXATION OF.)

**Calcium Oxide**,  $\text{CaO}$ , Lime or Quicklime, is an amorphous solid, white when pure, made by decomposing calcium carbonate, as limestone, by heating. It reacts with water, slaking, and forming calcium hydroxide or slaked lime. Specific gravity, 3.1–3.4. Solubility: 100 c.c. of water (20° c.) dissolve 0.125 gram. Melting point above 3,000° c. It is used in the making of mortar; glass; calcium carbide; as heat-resisting material; and in the limelight (q.v.).

**Calcium Phosphate**,  $\text{Ca}_3(\text{PO}_4)_2$ , the tricalcium salt of orthophosphoric acid, is a white, insoluble solid occurring as phosphorite and in guano. (See APATITE.) It is the principal mineral constituent of bones, and of bone ash (83 per cent.). Basic slag, a product of iron smelting, consists largely of calcium phosphate. Specific gravity, 3.18. Soluble in dilute acids. Calcium phosphate and sulphuric acid yield an acid calcium phosphate,  $\text{CaH}_2(\text{PO}_4)_2$ , soluble in water, and the chief constituent of 'superphosphate' fertilizers. It is used in the preparation of fertilizers, phosphorus, phosphoric acid.

**Calcium Sulphate**,  $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ , the calcium salt of sulphuric acid, occurs widely distributed as gypsum, also as anhydrite,

$\text{CaSO}_4$ , and as alabaster, a granular form. It contributes to the permanent hardness of many natural waters, and is in sea water. Specific gravity, 2.96. Solubility: 100 c.c. of water (18° c.) dissolve 0.20 gram. It is used as fertilizer (land plaster); the material of plaster of Paris, kalsomine, and crayon; and in paper making.

**Calcium Sulphide**,  $\text{CaS}$ , a yellowish gray substance, is a by-product of the LeBlanc soda process. Specific gravity, 2.8. Some specimens, after being illuminated, shine for some time (phosphorescence), due to the presence of minute quantities of vanadium and bismuth as impurities. Calcium sulphide oxidizes in moist air, polysulphides and the thiosulphate forming. It reacts with warm water, forming calcium hydroxide and hydrosulphide. It is used in luminous paint, and as a depilatory.

**Calc-sinter**, or CALCAREOUS TUFFA, consists of carbonate of lime, and is a deposition from springs, streams, or underground water, from which it is precipitated partly by the escape of carbonic acid which acts as a solvent, and partly by evaporation of the water. It is usually white, creamy white, yellowish, or brownish in color, but other hues occur, and variegated and mottled varieties are not uncommon. It is of variable texture and consistency, some kinds being rather soft, brittle, and friable, and porous or cellular. The so-called 'petrifying springs' of Matlock, England, afford a good example of the formation of calcareous tufa. Along the River Anio, at Tivoli, near Rome, calcareous tufa occurs in masses many feet in thickness, and under the name of *travertine* (see TRAVERTINE) is used as a building stone at Rome. Calcareous tufa is abundantly deposited from thermal springs, as in the Yellowstone Region of North America. The calcareous incrustations so commonly seen in caverns in limestone rocks are varieties of calcareous tufa, and are known as *stalactites* and *stalagmites* (qq.v.).

**Calculating Machines** are largely used at the present time both to simplify the work of arithmetical calculation and to obtain accuracy of result. In the construction of mathematical and astronomical tables and the tabulation of functions they are the only means of producing perfectly reliable results; and they are also in general use in insurance, financial, and commercial houses. They vary in construction from the simple Slide Rule (q.v.) to complex cash registers and electric tabulators.

The first machine to directly

perform the operations of addition and subtraction was that invented by Pascal in 1642, and known as the *machine arithmétique*. Twenty years later, Leibniz attempted the construction of a machine for making elaborate astronomical calculations; and various other attempts were made in succeeding years, but with little success. Between 1822 and 1842 Charles Babbage (q.v.) designed his machine for calculating mathematical tables by the method of 'differences.' About 1850 Thomas of Colmar invented a successful calculating machine known as the Arithmometer, in which the numbers were inscribed on cylinders moved by trains of toothed wheels.

The elements of nearly all ordinary calculating machines are cylindrical discs, on the surface of which are placed the figures 0 1 2 . . . 9. These discs are so connected that when a number disc is rotated ten places, the number disc of the next order moves one place. This suffices for addition. For subtraction, the discs are rotated in the reverse direction. Multiplication and division, the extraction of the square root, etc., are also performed by these machines. The motion of the discs was formerly produced directly by the hand; now a lever is employed. The use of keys for setting the sums to be worked has resulted in speed and accuracy of movement.

Probably the most useful modern business machine is a combination of typewriter and calculating machine. It registers columns of dollars and cents corresponding to the keys struck, and by the motion of a lever prints them on paper. The pressure of a special key, combined with the operation of the lever, causes the total to be printed in proper position below the column added up. The Burroughs Adding Machine is one of the best known of this type. In many of these machines the mechanism is operated by an electric motor, and increased ease and speed of operation are thus obtained. Other machines add, but do not record the items during the process, such as Felt's Comptometer. During recent years a large number of machines for calculating have been devised. In the main, they can be divided into two classes, as they follow the Burroughs or Felt type.

Among the more specialized calculators are *Curvometers*, which measure the length of curves on roads or maps; *Planimeters*, which determine by mechanical means the area of any figure; *Integrators*, which evalu-

ate a definite integral; and *Harmonic Analyzers*, which determine the integrals of a curve with remarkable accuracy.

*Cash Registers* are a form of calculating machine which have come into almost universal use in retail establishments. The first practical machine of this kind was patented in 1879 by James Ritty of Ohio; many improvements have since been added. In the National Cash Register Company's 'detail adders,' the mechanism is operated by pressing registering keys, each of which is connected with a corresponding adding wheel inside the register, which shows the total amount of registrations made on that key.

In the electric tabulating machine used for recording and summarizing the United States Census returns, a keyboard of 240 characters perforates cards corresponding to the facts to be recorded; the perforated cards are fed into the machine; sorting boxes secure a combination of the facts recorded; and by means of electric connections the record is made. Similar machines have been adopted by many large business houses for cost keeping.

**Calculus**, or **STONE** (in medicine), a hard concretion formed within the animal body, in consequence of the deposition in the solid form of matters which usually remain in solution. The commonest are Biliary, Urinary, and Salivary Calculi, all of which may block the different ducts, and thus stop the flow of the secretion. The disorders caused by the passage or the impaction of a calculus, such as biliousness or hydronephrosis, result from the accumulation of secretion behind it, or from the irritation of the passage along which it is forced. For the treatment of Biliary Calculus, see GALL STONES; for that of Urinary Calculus, see URINARY CALCULUS.

The general course of procedure is to lessen the pain of the passage of a calculus by hot fomentations and baths, and by the administration of morphia or some other narcotic. Belladonna is another favorite drug. When a calculus is causing trouble by impaction, it is removed by operation. See LITHOTOMY.

**Calculus**, **DIFFERENTIAL** and **INTEGRAL**, also called the **INFINITESIMAL CALCULUS**, is the mathematical method which enables us to deal with quantities which are in process of change or growth—*varying quantities*, as they are called. The height of a child, the distance of a train from the last station passed, the speed of a ball as it passes through the air, the population of a country, are examples of varying quantities. As a con-

sistent method capable of general application, the calculus was first clearly formulated by Newton. Leibniz developed practically the same method a little later, and invented a notation which proved more suitable than Newton's for most purposes. This notation has been long in general use; but within the last fifty years writers on the differential and integral calculus have returned to Newton's method of laying the foundations of the calculus. In some of the higher applications, and especially in dynamical problems, Newton's notation is used with great advantage in association with that of Leibniz.

The ancients had no difficulty in measuring the area of figures (*e.g.*, fields) whose boundaries were built up of straight lines; but when the boundaries were partly curvilinear, the ordinary methods of geometry failed. It was soon recognized, however, that an approximate result sufficiently accurate for practical purposes could be obtained by regarding the curved line as polygonal—*i.e.*, as consisting of a great many very short straight lines meeting in a succession of points situated on the curve. The area of this polygonal figure could then be estimated by ordinary geometrical methods; and the greater the number and the shorter the individual lengths of the little straight lines, the more nearly did the result approximate to the true area of the original figure. It is in exactly this way that the mileage on a curved railway track is measured. The line is said to be curved, but the individual rails, which by being laid end to end give the curved track, are themselves straight.

In like manner, the mathematician, in estimating the length of a portion of a given curve, first imagines the curve constructed of *infinitesimal*—*i.e.*, excessively short—straight line bits, or 'elements,' as he calls them. He then forms their sum, and finds that as the elements are taken shorter and shorter, and therefore in greater and greater number, this sum gets nearer and nearer to a particular limiting value. It is this limit that measures the length of the arc. This process of summation is technically called *integration*, and the sum estimated in this way is called the *integral*.

The method just indicated is fundamentally identical with the method of exhaustions as practised by Archimedes and his successors, and greatly extended by Kepler (1615), and the method of indivisibles (Cavalieri, 1635; Wallis, 1655). Thus, historically, it was the integral calculus which first received partial develop-

ment. The fundamental notions underlying it are, however, those of the other branch of the subject—the differential calculus, or calculus of small differences or infinitesimal increments.

Consider, for example, a curve being traced out by a moving point—say, the point of contact of one of the wheels of an engine as it moves along a curved railway track. At any instant this point is moving in the direction of the tangent to the curve at the position momentarily occupied, and the direction is measured as that of the infinitesimal element described in an excessively short interval of time. The position of the moving point is a definite quantity, being measured along the curve by the distance from a chosen fixed point. This position is changing at a definite rate, known as the speed or velocity of the moving point. The conception of this rate of change or *fluxion* of the position is a perfectly familiar one; its measurement is accomplished by dividing the short space described in a short but finite period of time by the measure of this period, and then considering what this ratio becomes as the corresponding changes in space and time are taken smaller and smaller, until, in short, they become infinitesimals. Thus, the velocity is the fluxion of the arc which has been described up to that instant; and the arc is regarded as a *fluent* quantity, which may be obtained from the fluxion by a reverse process, the same process which we have already called integration.

As the point continues to describe the curve, the direction of motion is constantly changing, the direction at the beginning of any arc, large or small, being different from the direction at the end of the arc. When the curve is highly curved, this change of direction in a given length—say, one foot of the arc—is considerable, and becomes smaller if the arc is less curved. Now, the direction of the element at any point is a property of the curve; and it is a property which must change at a particular rate as the moving point travels along. In short, it has a fluxion just as truly as the length of arc has a fluxion; and the ratio of the fluxion of the direction, or *angular velocity*, to the fluxion of the arc described, or *linear velocity*, is the mathematical measurement of the curvature of the curve.

In this illustration we have taken time to be the quantity in terms of which the rates of change of other quantities are expressed. But that is not essential. For example, in measuring the curvature of a curve, we

really take the arc to be the so-called independent variable, and the change of direction of the tangent is then a function of the arc. Its rate of change per unit length of arc, or (to put it technically) its differential coefficient with regard to the arc, measures the curvature. When we know the rates of change, we are able, by aid of the methods of the integral calculus, to find the integral quantities, either quite accurately, or more or less approximately. It is always possible to differentiate an algebraic expression—*i.e.*, to find its rate of change in terms of the rates of change of the variable quantities involved; but to integrate a given expression—*i.e.*, to pass to the quantity of which it is the fluxion or differential coefficient—is possible in comparatively few simple cases. Every such integration involves the solution of what is known as a *differential equation*, involving not only the variable quantities themselves, but also their rates of change of the first and higher orders.

The importance of the infinitesimal calculus arises from the fact that all physical quantities are in a state of flux, and that it is impossible to discuss thoroughly their interrelations without taking full account of the laws governing the rates of change, and even the rates of change of these first rates of change themselves. It was in the attempts to get exact mathematical representations of the motions of the heavenly bodies, of the curve of equilibrium of a hanging cord, of the vibrations of a stretched string or drum-head, of the waves on water, of the flexure of a bar, and so on—it was in such attempts, in some instances only partially successful, that the immediate successors of Newton and Leibniz rapidly developed the method, which in these later times, in the hands of the pure mathematician, has been extended far beyond the demands of practical life. And yet there are many familiar phenomena which are only partially amenable to its methods as developed—*e.g.*, the spinning of a boy's top.

**Calcut'ta**, former capital of British India, chief city and capital of the province of Bengal, is situated on the east bank of the Hugli River (one of the many mouths of the Ganges), about 80 miles from the sea, in latitude 22° 35' N., and longitude 88° 27' E. The city extends for nearly 5 miles along the river, covering an area of about 7 square miles, and is from 16 to 18 feet above sea level. The average annual temperature is 77.9° F.; the average for the hot season, 83.3° F.; for the cold season, 68.3° F. The average annual rainfall is about 60 inches.

The city of Calcutta is divided into two sections, the northern or native city and the southern. Fort William, the largest fort in India, garrisoned by European and native soldiers, forms the nucleus of southern Calcutta. It is situated in a fine park known as the *Maidan*, which extends for 1¼ miles along the river, and which, with its beautiful drives and avenues, constitutes one of the features of the city. Facing the Maidan on the east and north are many fine residences and imposing public buildings; while on the west, extending northward along the river bank for over 2 miles, is the Strand, lined with a splendid series of jetties for ocean steamers. Attractive squares and gardens adorn the city, and broad streets connect it with its suburbs, which lie outside the native town.

There are many handsome public buildings in Calcutta—Government House, the former residence of the viceroy of India, being one of the finest palaces in the world. The principal churches are St. John's, for thirty-two years the cathedral of the diocese, and St. Paul's, the present cathedral. There are also a Roman Catholic cathedral, and numerous other places of worship. The most important Hindu shrine is that of the goddess Kali, at Kalighat, south of Calcutta. In the city itself the chief temple is 'Muddim Mohunjee,' where thousands worship daily.

Among the educational institutions are Calcutta University, an examining institution modelled upon the University of London; the government Presidency College, Sanskrit College, St. Xavier's College, Bishop's College for Christian natives, the government Engineering College, Medical College, College for Commercial Education, and School of Arts. There is an Imperial Museum, containing a splendid archaeological collection, and an Imperial Library.

On the opposite bank of the river, and connected with Calcutta by a floating bridge, is

HOWRAH, containing the government warehouses, large iron-works and timber yards, a number of the principal jute mills, and the great terminus of the East Indian Railroad, as well as the Royal Botanical Gardens.

Calcutta may be regarded as the great commercial centre of Asia. The river, adjacent to the city, varies in breadth from a quarter of a mile to nearly a mile; and ships of 5,000 tons ascend to Calcutta in the usual course, the main difficulty to shipping being the James and Mary shoal, half way down the river. The principal docks are in the suburb of Kidderpur. In recent years these have been extended so as to give nearly 10 miles of quay frontage, and the navigation of the Hugli has been greatly improved.

The total value of merchandise and treasure imported in 1912-13 was over \$200,000,000, while the value of exports exceeded \$300,000,000. The principal items of export are tea, jute (raw and manufactured), hides, opium, oil seeds, rice, indigo, lac, and wheat. As a great central depot for the richest parts of India, including the Ganges Valley and Assam, the city has also an extensive inland trade.

The municipal administration of the city is vested, since 1899, in a corporation composed of Europeans and natives, about seventy-five in number, who, however, delegate their powers in great part to a special committee of twelve. The bulk of the inhabitants are Hindus, but there is a large Mohammedan population and a small percentage of Christians. In 1911 the population of the city proper was 896,067, as compared with 847,796 in 1901. Including the suburbs and Howrah, the population in 1911 was 1,222,313.

**History.**—Calcutta was founded by Governor Charnock in 1686, by the removal hither of the factories of the East India Company. In 1700 three villages surrounding the factories were conferred upon the company by the Emperor Aurungzebe, and forthwith founded. In 1707 Calcutta had acquired some importance as a town, and was made the seat of a presidency.

In 1756, however, it was unexpectedly attacked by Suráj-ud-Daulá (Surajah Dowlah), the nawab of Bengal, and yielding after a two days' siege, was the scene of the tragedy of the 'Black Hole.' The nawab caused the whole of the prisoners taken, 146 in number, to be confined in an apartment 18 feet square. This cell had only two small windows, and these were obstructed by a veranda. The crush of the un-

happy sufferers was dreadful; and after a night of excruciating agony from pressure, heat, thirst, and want of air, there were in the morning only 23 survivors. The city remained in the hands of the enemy until seven months afterward, when Clive and Admiral Watson recaptured it, and concluded a peace with the nawab.

In 1772 Calcutta superseded Murshidabad as seat of the central government in India, and remained the capital of British India until 1911, when the government was removed to Delhi. Consult Cotton's *Calcutta Old and New* (1907).

**Caldecott**, kól'de-kut, RANDOLPH (1846-86), English artist, was born in Chester. He contributed frequently to *Punch* and *The Graphic*; and in 1882 he became a member of the Institute of Painters in Water Colors. He was without an equal as a draughtsman, and exponent of the humors and joys of the country house and hunting field. His picture books for children are inimitable in their subtle humor and in the quaint, tender insight which they give into human and animal nature. *Caldecott's Picture Books* began in 1878 with *John Gilpin* and *The House That Jack Built*, and ended the year before his death with the *Elegy on Madam Blaize* and *The Great Panjandrum Himself*. He also illustrated Washington Irving's *Old Christmas* and *Bracebridge Hall*, Mrs. Comyns Carr's *North Italian Folk*, Blackburn's *Bretton Folk*, and Mrs. Ewing's *Daddy Darwin's Dovecote* and *Jackanapes*. He died in St. Augustine, Fla.

**Calder**, SIR ROBERT (1745-1818), English admiral, took part in the battle of Cape St. Vincent in 1797 as first captain to Sir John Jervis. Previous to Trafalgar, when in command off Ferrol, he engaged a much superior force of French and Spanish ships, part of the fleet which had been chased by Nelson from the West Indies back to Europe, and captured two ships of the line. Public opinion, however, was not satisfied that he had done his utmost. He was consequently tried, convicted of an error of judgment, and severely reprimanded. He became a full admiral in 1810.

**Caldera**, kál-dā'rā, a large basin-like depression of volcanic origin—an extinct crater. These are sometimes extensive and well preserved and occupied by lakes, thus giving the remarkable phenomenon of a lake occupying the whole summit of a mountain. A famous example is Crater Lake, Oregon, which is 5 miles in diameter and 4,000 feet deep.

**Calderon**, Fr. kál-dā-rón', PHILIP HERMOGENES (1833-98),

Anglo-French painter of Spanish parentage, was born in Poitiers. From 1853 he was a regular contributor to the Royal Academy, of which he became an Associate in 1864, and an Academician in 1867. His earlier works were directly historical, but latterly he worked in almost every department of painting. His works include: *Renunciation of St. Elizabeth of Hungary* (National Gallery, London); *The Proposal*; *The Jailor's Daughter*; *Widow and Orphans at the Funeral*; *A phrodite*.

**Calderon de la Barca**, Sp. kál-dā-rón' dā lá bār'ká, PEDRO (1600-81), Spanish poet and dramatist, was born in Madrid. Although he is said to have written a play at the age of thirteen, he first became publicly known as a dramatist at the age of twenty. He appears to have served as a soldier in Italy and elsewhere from about 1623 to 1629; and on his return to Madrid, at the latter date, he at once became famous in the theatrical and poetic court of Philip IV. for his comedies and sacred plays. For the next ten years he produced a vast number of dramas, sacred and profane. Though more than one story exists of his early turbulence, he decided to become a priest, and was ordained in 1651. Ecclesiastical preferments were heaped upon him, and he became one of Philip's chaplains in 1663, dying as superior of the Congregation of San Pedro in 1681.

The reign of Philip IV. was the golden age of the Spanish theatre. Already Lope de Vega had turned into facile verse the romantic, chivalrous mysticism that was the keynote of the national character; but Calderon brought to them a nobler moral ideal than that furnished by the stories of lascivious intrigue which had formed the main stock of his predecessors. The profoundest thought, the most elevated of moral sentiments, were clothed by him in words so chaste and eloquent as to reach the understanding of the peasant as easily as they touched the intelligence of princes and ecclesiastics. In ingenuity and invention far inferior to Lope, Calderon surpassed him in profundity and grace.

His most famous secular dramas are *El Mágico Prodigioso*, *La Vida es Sueño*, *El Príncipe Constante*, and *El Alcalde de Zalamea*. The first of these is somewhat reminiscent of *Faust*, with a different ending. The best known of Calderon's plays in England, after *El Mágico Prodigioso*, is *La Vida es Sueño* ('Life is a Dream'). It is, however, in his sacred plays (*autos*) that Calderon stands absolutely supreme, and a fine specimen of

this species of drama may be seen in MacCarthy's English version of Calderon's *Encantos de la Culpa* ('The Sorceries of Sin'). MacColl has also translated *The Select Plays of Calderon* (1888); and Fitzgerald's (1877) and MacCarthy's (1873) versions of the *Mágico Prodigioso* and other dramas may be recommended, as well as *Six Plays by Calderon*, ed. Dr. Oelson (1903). The Calderon literature is very large, especially in Germany, where Calderon is placed by some authorities above Shakespeare. See Schack's *Geschichte der Dramatischen Literatur in Spanien* (1854-5); Menendez y Pelayo's *Calderon y su Teatro*; Archbishop Trench's *Calderon* (1880); Miss Hassell's monograph on the same subject (1879); Juan Eugenio Hartzenbusch's 'Obras de Calderon,' occupying vols. vii., ix., xii., and xiv. of the *Biblioteca de Autores Españoles* (1848-52).

**Calderwood, DAVID** (1575-1650), Scottish ecclesiastic and historian, was born at Dalkeith, Midlothian. He opposed the introduction of prelacy, and in 1617 was deprived of his charge, imprisoned, and banished. He went to Holland, where, in 1621, he published *The Altar of Damascus*, a defence of Presbyterianism, and a Latin version of it in 1623. After his return to Scotland in 1625, he assisted in drawing up the *Directory for Public Worship*, and wrote his celebrated *Hist. of the Kirk of Scotland* (1678). See T. Thomson's 'Life of Calderwood' in Woodrow's edition of his *History* (1849); Walker's *Scottish Theology and Theologians* (1887).

**Calderwood, HENRY** (1830-97), Scottish philosopher, born at Peebles; ordained a minister of the United Presbyterian Church (1856); became professor of moral philosophy in Edinburgh University (1868), and chairman of the first school board of that city (1873-7). His chief works are, *The Philosophy of the Infinite* (1854), *Handbook of Moral Philosophy* (1872; 14th ed. 1888), *Relations of Mind and Brain* (1879; 3rd ed. 1892), and *Evolution and Man's Place in Nature* (1893). See *Life* by his son (1900).

**Caldicott, ALFRED JAMES** (1842-97), English musician, was born at Worcester; studied under Moscheles, Reinecke, and Hauptmann at Leipzig; was organist at St. Stephen's, Worcester (1865-82); professor at Royal College of Music in 1882 and Guildhall School of Music (1890-2); and became conductor of the Comedy Theatre, London (1893). He composed the glee *Humpty Dumpty* (1878), *Winter Days* (1879), and the oratorio *The Widow of Nain* (1893).

**Caldwell.** See GEORGE, LAKE. **Caldwell, HOWARD WALTER** (1858), American historian, born at Bryan, Ohio. He removed to Nebraska in 1874, graduated at the University of Nebraska in 1880, and later became professor of American history and jurisprudence there. Among his publications are a *History of the United States, 1815-61* (1896); *Studies in History* (1897); *Some Great American Legislators* (1899); *Life of Henry Clay* (1899); *Expansion of the United States* (1900).

**Caleb,** the son of Jephunneh, was one of the spies sent by Moses to explore the land of Canaan. Num. ch. 13 and 14, which relate the incident, are a crucial instance of the composite structure of the Hexateuch. Thus, in ch. 14: 24 Caleb alone dissents from the timid report of his companions; while in ver. 6 and 30 Joshua is mentioned as his comrade in the advocacy of an immediate advance, and is associated with him in being the only survivors of the original exodus from Egypt who were privileged to enter the Promised Land. After the settlement, Hebron and its district were assigned to Caleb. See Commentaries on Numbers.

**Caledonia.** See SCOTLAND.

**Caledonian Canal,** waterway, partly natural, partly artificial, through the picturesque Glenmore, Inverness-shire, Scotland, connecting the Atlantic Ocean with the Moray Firth branch of the North Sea. It consists of Lochs Lochy, Oich, Ness, and Dochfour, united by 23 m. of cuttings. It is chiefly used by the fishing fleets, and by small steamers which afford tourists easy access to Fort William for Glen Nevis and Ben Nevis, Fall of Foyers on Loch Ness, etc. James Watt made a survey in 1773, but work was not begun till after Telford and Jessop made their estimate of \$2,309,305 in 1803. In 1822, when two-thirds finished, the canal was opened for navigation, and was completed in 1847. Total length, including lochs, 60½ m.; depth, at standard level, 17 ft.; breadth at surface 100 ft., at bottom 50 ft. The total cost up to May, 1849, was \$6,381,294. The canal is under the control of a government commission, and is worked at a small annual loss.

**Calendar.** The Roman calendar of Julius Cæsar was based on the solar year, which was assumed to be 365½ days long. As at present, the quarter-day was accounted for by the insertion of an additional day every fourth year (leap year); and the names of the months, and the number of the days in each, were the same, after a few small alterations had been made by Augustus, as they are in a modern European

calendar. The Julian solar calendar was defective, because it made the year more than eleven minutes too long. On the introduction of Christianity, some method of fixing the date of Easter, on which that of many other festivals of the church depended, became necessary. Much difference of opinion prevailed, and the Eastern churches commemorated our Lord's death on the fourteenth day of the moon after the spring equinox, and kept Easter two days later; while the Western churches celebrated Easter on the Sunday following the fourteenth day of the moon. The sect called Quartodecimans commemorated only the death of Christ, on the fourteenth day, the day of the Jewish Passover. At length, in A.D. 325, it was decided, at the Council of Nicæa, that Easter should be held on the first Sunday after the fourteenth day of the moon that occurred next after the vernal equinox, and that if the fourteenth day of the moon fell on the day of the equinox, the following Sunday should be Easter day. It was also declared that, in finding Easter, the vernal equinox should be considered to fall every year on March 21. Now the length of a lunation is very variable, and cannot be used in combination with the length of a solar year. It was therefore necessary to adopt a fictitious or calendar moon, of which a certain number of lunations would be equal in length to some number of solar years. Thus cycles were formed in which the dates of Easter recurred in the same order. It was not, however, till A.D. 533 that a scheme was propounded which found favor with the majority of churchmen. Victorious, bishop of Aquitaine, had brought into notice a period formed by a cycle of 28 solar years, combined with the lunar cycle of 19 years introduced into Athens by Meton. Meton made 235 mean lunations equivalent to 19 solar years of about 365½ days each, or 6,940 days. In the Calippic cycle of 76 years this number was reduced to 6,939½. In the Victorian cycle each year contained twelve ordinary lunations of 30 and 29 days alternately which together accounted for 354 days. The eleven remaining days of the year were carried forward till, at the end of three years, they amounted to 33 days, 30 of which were taken to form an embolismic or intercalary month; while the remainder, amounting in 18 years to 18 days, together with the 11 days of the 19th year, formed a seventh embolismic month of only 29 days. If the above be added up, it will be found that 4½ days are needed to make up the number 6,939½. These are the days in-

serted in the leap years, and are common to both lunar and solar years. The seven letters A to G are placed beside the days of the months in the calendar, A being affixed to Jan. 1, and the whole seven recurring in regular order to the end of the year. Their number being seven, the same letter always recurs on the same day of the week. The length of the periods in which the dates of the Sundays occur in the same sequence is 28 years ( $4 \times 7$ ). This cycle, combined with the lunar cycle of 19 years, forms the Victorian period of 532 ( $28 \times 19$ ) years, in which the dates of Easter Sunday follow an invariable order. In A.D. 533, Dionysius Exiguus, a Scythian monk, adopted the Victorian period, and fixed for it certain starting-points. For the era of his reckoning he took the birth of Christ, which he calculated to have taken place in A.U.C. 753. The following year therefore became A.D. 1; and though there is reason to suppose that Christ was born three years earlier, the Dionysian era has been retained. He also decided that the dominical letter in A.D. 1 was B, and that the same year was the tenth of a solar cycle. The golden number—*i.e.* the number of the year of the lunar cycle—was 2 in A.D. 1. From these data the golden number and the Sunday letter for every year may be found. The calculation is usually effected by assigning certain numbers to the letters, those in the Book of Common Prayer being A=0, G=1, F=2, etc. This method gives for leap year the second letter, used for finding Easter. To find the year of the lunar cycle, or the golden number, 1 is added to the number of the year, and the result divided by 19. The remainder is the golden number; but if there is no remainder, the golden number is 19. Accordingly, the golden number of 1265 is 12. A lunar cycle was reckoned by Alexandrian astronomers to begin on March 23, 323 A.D., the date of the vernal equinox in that year. Two months earlier (30 and 29 days), on Jan. 23, there would also be a new moon; and as the new moons are eleven days earlier every year, one would fall, in the third year of the cycle, on Jan. 1, 325, the year in which the Council of Nicæa was held—a fact which would also probably influence Dionysius in the choice of a starting-point. In the calendar the golden number was affixed to those days on which the new moons fell in that year of the cycle. It was therefore easy to find the fourteenth day of the moon that fell next after March 21, and the next day to which the Sunday letter of the year was affixed was Easter day. This

calendar was known as the Perpetual Julian Calendar, and from it tables were compiled to find Easter 'for ever.' But the solar year is 11 m. 14 sec. less than 365 $\frac{1}{4}$  days, and 235 mean lunations are about 1 hour 29 minutes less than 19 Julian years. As centuries passed, the defects of the calendar became more and more apparent, the true equinox occurring before March 21, and the real new moons also preceding the calendar new moons. Accordingly, Pope Gregory XIII. determined to reform the calendar, and entrusted the work to a German Jesuit, Christopher Schlüssel, generally known by his Latinized name of Clavius, who carried out a scheme planned by Aloysius Lilius, a Neapolitan physician and astronomer. In 1581 the true equinox fell on March 11, or ten days before the equinox of the calendar. To rectify this error, Oct. 15, 1582, in which year the reformed calendar was introduced, was made to follow October 4, the intervening days being omitted. The true new moons preceded the calendar new moons by four days; but Clavius moved the latter only three days back, in the hope of preventing Easter from falling at any time on the day of the Passover. That the solar error might not arise again, he decided to make all centennial years which did not contain a number of centuries divisible by 4, ordinary years. Thus 1600 was a leap year, but 1700, 1800, and 1900 were ordinary years. The lunar error in the Metonic cycle amounts to about eight days in 2,500 years, and therefore a day was to be omitted at the expiration of each of seven periods of 300 years each, and then at the end of a period of 400 years. This correction was first applied in 1800, and will again be applied in 2100, 2400, 2700, etc. Small errors still remain; but as that of the solar year amounts to one day only in about 3,520 years, its mode of application has been left to posterity.

In compiling his calendar Clavius made use of epacts. The epact of any year is the age of the moon at the beginning of the year. If there is a new moon on Jan. 1, 11 days remain over at the end of the year after the twelve ordinary lunations of 30 and 29 days alternately have been counted off: 11 is, then, the epact of the second year, and 22 of the third. At the end of the third year 33 days have thus accumulated, of which 30 days constitute an embolismic month, and 3 are carried forward as the epact for the following year. In 325, the third year of a cycle, there was a new moon on January 1, and therefore the epact of the year would be 30, or 0, which Clavius indicated by  $\star$ . Clavius

put the new moons three days back, and the days of the solar year ten days, which would bring the new moon in the third year of the cycle to January 8, seven days later than in the old calendar. 1800 was an ordinary year, but in that year the lunar correction was applied, so that the relation of the solar and lunar years was not disturbed, and therefore the new moons are now only nine days later than in 325. The first new moon in the third year of the cycle is therefore on January 10 instead of on January 1, and the epact for the year is 21 (30-9). By adding 11 for each succeeding year, and rejecting 30 when it occurs, the following series will be obtained:—

Golden												
Numbers.—	I.	II.	III.	IV.	V.	VI.						
Epacts.—	29.	10.	21.	2.	13.	24.						
	VII.	VIII.	IX.	X.	XI.	XII.	XIII.					
	5.	16.	27.	8.	19.	*	11.					
	XIV.	XV.	XVI.	XVII.	XVIII.	XIX.						
	22.	3.	14.	25.	6.	17.						

The last month of the cycle is the embolismic month of 29 days, so that the new moon of the next year is a day earlier than when found by the usual process. This is usually accounted for by adding 12 instead of 11 to the epact of the nineteenth year, and thus 29 is the epact for the first year of the succeeding cycle. The above series will remain in force till 2200, for 2000 will be a leap year, and in 2100 the lunar correction will again be applied. 2200 being the sixteenth year of the cycle, its epact will be 13, and the other epacts will be changed so as to form a new series. In the old calendar the new moons constantly returned to the same dates after the expiration of 19 years, and there were certain days on which a new moon could not fall, and to them no golden numbers were affixed. But under the new system every day of the year will in course of time become the first of a lunation, and must therefore have an epact attached to it. Clavius made his epacts recur throughout the year in descending order, beginning with  $\star$  on January 1, so that the epact showed the days on which the new moons occurred in the year of that epact. Consider the epact 27. The moon will be 30 days old on January 3, and a new moon will begin on January 4, to which the number 27 is affixed. In order to make the lunar months 30 and 29 days long alternately, the two epacts 25, XXVI. were printed opposite February 4, and XXV., XXIV. opposite February 5; and the same device was repeated in April, June, July, August, September, and November. The epact 25 was chosen for repetition in order that no two new moons in the same cycle might

occur on the same day of the year. If all the thirty possible series of epacts be written out, it will be found that 24, 25, and 26 never occur together in the same series; that when 25 and 24 are in the same series, 25 is the epact of a year the golden number of which is greater than 11; and that when 25 and 26 are in the same series, 25 is the epact of a year below 11. Hence, if the golden number of the year exceeds 11, 25 must be taken; in other cases, xxv. The epacts down to xxv. following one another in their proper places in February, the first month in the corresponding years will have 30 days, the second 29, the third 30, and so on. But 25, 24, and all the epacts following, are moved up one place, so that in the corresponding years the first month has 29 days, the second 30, and so on.

To find Easter, the difference between the epact and 30 is taken, and to this are added 59 days for the first two months, and 14 more because Easter comes after the fourteenth day of the moon. March 21 is the eightieth day of the year, and if the above sum equals or exceeds 80, as it will when the epact is 23 or less, the difference gives the number of days by which the Paschal 'full' moon, as it is inaccurately called in the English Prayer Book, follows March 21. If it be less than 80, a third month must be added, of 30 days if the epact be xxv., 26, or higher, and of 29 if the epact be 25 or 24. The year 1902 is the third year of the cycle, and its epact is 21. To find the Paschal full moon, we have 9 + 59 + 14 = 82. The Paschal full moon is therefore on March 23. The Sunday letter of the year is E, and will be found in a calendar opposite March 23. According to the rule, then, Easter fell on the next Sunday (March 30). The accompanying table shows the days on which Easter falls during the 300 years ending 2199. Having found the golden number of the year and the Sunday letter, look in the table for the number in the same horizontal line as the G.N. of the year, and in the vertical column headed by the Sunday letter. This is the date of Easter, the name of the month being the one next on the left. It should always be remembered that the moon in this reckoning is a conventional moon, not the moon of the heavens, and that, consequently, Easter may fall on the day of the real full moon, the fourteenth day of the real moon, or, in spite of Clavius' precaution, on the day of the Jewish Passover.

The New Style, as the Gregorian system was called, was adopted in most of the Roman

Catholic countries, and in Denmark and the Netherlands, in the year of its promulgation, 1582; by the Protestants of Germany and Switzerland in 1700 (Prussia in 1778); in Great Britain in 1752, when the eleven days between September 2 and 14 were omitted, and the beginning of the year moved from March 25 to January 1; and, lastly, in Ireland in 1782. The Dionysian calendar is still retained in the Balkan states and in Greece, while in Russia the New Style was adopted in 1902.

During the French revolution a new calendar was introduced. The first year, commencing on Sept. 22, 1792, was styled the first year of the republic. The year was divided into 12 months of 30 days each, and the five days over (Sept. 17 to 21) were celebrated as festivals dedicated to Virtue, Genius, Labor, Opinion, and Rewards respectively. The calendar, first used on Nov. 26, 1793, was discontinued on Dec. 31, 1805.

See YEAR; also MONTH; WEEK; DAY; EASTER; SEASONS.

7th, and the ides on the 15th; and in the remaining months, the nones on the 5th, and the ides on the 13th.

**Calendula.** See MARIGOLD.

**Calepino**, kā-lā-pē'nō, or DA CALEPIO, AMBROGIO (1435 - 1511), Italian lexicographer, and an Augustinian monk, was a native of Bergamo. He devoted his life to the compilation of a polyglot dictionary, first published at Reggio in 1502. The best edition is that of Facciolati (Padua, 1718).

**Calgary**, city, Alberta, Canada, the largest and most important city between Winnipeg and Vancouver, is situated at the junction of the Bow and Elbow Rivers, on the main line of the Canadian Pacific Railroad; 2,262 miles west of Montreal. It occupies a beautiful site (40½ square miles) at the entrance to the foothills of the Rocky Mountains, and is laid out with broad, well-paved thoroughfares and a park system including 10 public parks, covering almost 600 acres, and including a municipal golf course. Interesting features are the City Hall, completed in 1911; the Provincial Normal School; public library; Canadian Government elevator; the high-level concrete bridge; several schools and hospitals.

Calgary is situated in the heart

Table for Ascertaining Date of Easter for 300 Years Ending 2100.

**Calendering**, the process of finishing by pressure the surface of linen, other textile fabrics, and paper. A calender consists of from three to twelve cylinders, called 'bowls,' one or more of which is of paper or cotton pressed into a solid mass by hydraulic pressure, while the rest are of steel, chilled cast iron, or brass. Between these the fabric is passed under heavy pressure.

**Calends** (Lat. *Kalendæ*), the first day of each Roman month, which was divided into *calends*, *nones*, and *ides*. The calends always fell upon the first of the month; in March, May, July, and October, the nones on the

of one of the richest agricultural and stock raising regions of Canada and has a considerable trade, especially in livestock and grain. There are also valuable deposits of iron, lead, coal, oil, silicate, sandstone, and clay in the neighborhood. Manufactures include the large repair shops of the Canadian Pacific, lumber mills, iron and metal works, brick and cement works, meat packing establishments, soap works, and flour mills. The city government is of the combined commission and council form, with the mayor and two commissioners as the executive, and 12 aldermen as the legislative body. The initiative,

referendum, and recall are in operation, and municipal ownership of public utilities is an important feature. Calgary was incorporated as a town in 1884 and as a city in 1894. It is a station of the Royal Northwest Mounted Police and a Hudson's Bay Post, and is the headquarters of the largest irrigation project in America and the second largest in the world. Pop. (1911) 43,736; (1916) 56,302.

**Calhoun**, kal-hōn', JOHN CALDWELL (1782-1850), American statesman, was born, of Scotch-Irish descent, in Abbeville District, S. C., on March 18, 1782. He was reared on a farm, studied at Yale, graduating with high standing in 1804, and in 1804-7 studied law, in the famous law school at Litchfield, Conn., and at Charleston. He was admitted to the bar in 1807, but almost from the beginning devoted himself to politics. He served in the South Carolina legislature in 1808 and 1809, and from 1811 to 1817 was a Democratic representative in Congress. Like Henry Clay, he was an ardent supporter of the measures which led to the War of 1812 with Great Britain, and it was he who, as a member of the Committee on Foreign Relations, moved the formal declaration of war in the House. He advocated protection to American industries; favored a national bank; and urged the constitutionality of internal improvements to be made by the general government. In short, during this period his outlook was national rather than sectional; he was even, to some extent, a broad-constructionist in the interpretation of the Constitution, advocating measures and policies of which he was later to become the ablest and most thoroughgoing opponent.

From 1817 to 1825 Calhoun was Secretary of War in the cabinet of President Monroe, and as such showed conspicuous administrative talent; he reorganized and greatly increased the efficiency of the department; actively promoted internal improvements; and advocated an enlightened Indian policy. Showing himself more and more a national leader, he eagerly coveted the presidency now as for many years afterward, and strove for the nomination in 1824, but in this he was unsuccessful. He was, however, vice-president from 1825 to 1832, during the administration of John Quincy Adams and the first administration of Andrew Jackson. He incurred Jackson's strong personal displeasure, owing to his earlier denunciation of Jackson's high-handed course in the Seminole War (see JACKSON, ANDREW), and also to his opposition to

Jackson's championship of Mrs. Eaton (see EATON, MARGARET), while the political views of the two men gradually came to differ irreconcilably.

It was during Jackson's first administration that Calhoun's views underwent a marked change. The immediate occasion of the change was the policy of the government which led to the nullification movement of 1832-3 in South Carolina; and it was he who, in the draft of the famous South Carolina Exposition of 1828, and particularly in his *Address to the People of South Carolina* (1831) and in his letter of Aug. 28, 1832, to Gov. Hamilton, provided his State and the South with probably the ablest exposition ever prepared, an exposition which has become classic, of the theory of nullification and of state sovereignty generally. To support these views and to fight for the cause of his state, he resigned the vice-presidency (Dec., 1832) and entered the U. S. Senate, in which he served, except in 1844-5, until his death. With all the intensity of his nature he advocated the most extreme form of States' rights and opposed any form of liberal construction of the Constitution. In the Senate he made himself the foremost champion of the South; he was pre-eminently the great constitutional thinker of his section; he, more than any other man, furnished the 'slaveocracy' with its arguments and determined the political course which it was to pursue. He defended slavery as a positive good and bitterly assailed the Abolitionists and their propaganda.

He opposed national banks and internal improvements as unconstitutional, fought protectionism and as Tyler's Secretary of State (1844-5), did more than any other man to secure the annexation of Texas. He opposed the Mexican War; denied the power of Congress to prohibit slavery in the territories, fought the Wilmot Proviso, and attacked the doctrine of squatter sovereignty; and, finally, though weakened by illness, opposed the compromise of 1850. He died on March 31, 1850.

Consult Calhoun's *Collected Works* (1853-4), and his *Correspondence*, ed. by J. F. Jameson; Von Holst's *John C. Calhoun*; Gaillard Hunt's *John C. Calhoun* (1908); H. T. Peck's *American Party Leaders* (1914).

**Calhoun**, WILLIAM JAMES (1848-1916), American diplomat, was born in Pittsburg, Pa. He was educated at the Union Seminary, Poland, O., was admitted to the bar in 1875, and practised his profession at Danville and Chicago, Ill. From 1898 to 1900 he was a member of the Interstate Commerce Commission; in 1905, special commissioner for

the United States to Venezuela, and in 1909-13 minister to China.

**Call**, kā-lē', city, department of Cauca, Colombia, on a tributary of the Rio Cauca, 3,300 feet above sea level; 50 miles southeast of Buenaventura. It has a considerable trade, quinine being an important article of export. Copper, coal, and iron are mined in the neighborhood. Pop. 16,000.

**Calibo**, kā-lē'vō, or CALIVO, Pueblo, Capiz province, Panay Island, Philippine Islands, on the Aclan River; 3 miles from the northern coast, 30 miles northwest of Capiz. Tobacco, rice, and maize are grown, woven fabrics are made, and fishing is carried on. Pop. 15,000.

**Calibre**, the technical term for the diameter of the bore of a firearm. See GUNS.

**Calico Bass**, or GRASS BASS, a small, mottled, sunfish-like bass (*Pomoxys sparoides*) of the Mississippi Valley and Great Lakes, closely related to the Crappie.

**Calico Bush**. See KALMIA.

**Calico Printing**, or the art of imprinting colored patterns on cotton cloth, is of very ancient origin. The Egyptians prepared printed fabrics, and the art seems to have been known in India, Persia, and China long before it was heard of in Europe. It was introduced into England about 1675. The design may be cut out on a block or blocks of wood, but is more commonly reproduced on copper rollers. The printing machine itself consists of a large central drum, around the circumference of which the engraved copper cylinders are arranged, one for each color to be printed. An equal number of cloth-covered wooden rollers carry the color from the color boxes to the cylinders. As the central drum revolves, the fabric to be printed is pressed between it and the cylinders, each of which leaves its impress. In the earliest machines but one color was printed at a time, but machines are now made to print as many as sixteen in a single operation.

To fix the dye upon the cotton fibre, a 'mordant' is required, which has the double property of adhering to the fibre and of forming an insoluble compound or 'lake,' with the dye (see MORDANTS). The methods used in printing are known technically as styles. In the madder style, where alizarin is used, the mordant is printed by means of the copper roller on the fabric; and if more than one color is required, several mordants are used. Acetate of aluminum and alizarin produce pink and red colors, acetate of iron and alizarin give purple and black, and the mixture of the two yields a chocolate. Tin salts produce an orange; and by mixing and varying the strength

a great variety of colors is produced.

After the cloth is printed with the mordant it is 'aged' by passing it through a large chamber suitably heated and charged with moisture. The next process is that of 'dunting,' which formerly consisted of passing the cloth through hot water mixed with cow-dung, but is now effected by the use of chemicals such as sodium phosphate or arsenate. The object of these two processes is to decompose the acetate and precipitate the oxide of aluminium, iron, or tin on the fabrics. The cloth is then dipped in the alizarin, when the various shades of color appear, after which it is washed in soap and water to remove the dye from the unmordanted parts.

In another process, known as the pigment style, insoluble pigments, such as ultramarine, chrome, vermilion, etc., are mixed with a thickening paste and printed directly on the fabric, which is dried by passing over a hot roll.

The steam style, which has largely superseded the madder style, is employed for colors in which the mordant, dyestuff, and a thickening agent can be mixed cold or at a low temperature without the formation of a color lake. Tannic acid is commonly used as a mordant in this style, and the cloth is generally oiled slightly with 'oleine' before printing. The fabric is passed through a continuous steamer with the steam under 3 to 10 pounds pressure so that the acid vaporizes and a reaction is brought about between it and the dyestuff; the print is then washed in a soap bath to remove the thickening.

In the oxidation style, which is used chiefly for aniline blacks, the fabric is printed with a paste containing aniline salts, sodium or potassium chlorate, and vanadium salts, mixed with a suitable thickening agent, after which it is dried, passed through a potassium bichlorite solution and washed in a hot soap solution.

In the discharge style the dyed cloth is printed with a discharge paste, which destroys the color, leaving a white figure on a colored ground. Some color which is not affected by the discharge may be added to the paste and thus colored figures on a colored ground may be obtained. Stannous chloride, zinc dust, tartaric acid, and sodium bisulphite are common discharges.

In the resist style substances are printed on the cloth which render it impossible to fix the mordant or color in the printed parts, so that the pattern appears white on a colored ground.

A method of printing on cloth

by a lithographic process is of recent invention.

Consult Knecht and Fothergill's *Principles and Practice of Textile Printing* (1912); Blackwood's *Calico Engraving* (1913); Thorpe's *Outlines of Industrial Chemistry* (1920).

**Calicut**, seaport, of Malabar, Madras presidency, India, 50 miles north of Cochin. In the centre of the town is the European quarter with a Roman Catholic and an English church, the remains of an old palace, and a new palace, the Custom House, and the Club. In the Brahman quarter is a large and interesting temple. A textile factory manufactures the cotton cloth called calico, originally exported from Calicut by the Portuguese. Calicut was the first place in India visited by Europeans. Covilhão, the Portuguese adventurer, landed here about 1486, and Vasco da Gama in 1498. In 1792 the port came into the possession of the British. Pop. (1911) 78,417.

**Calif**, *kā'lif* (Caliph), a Western form of the Arabic *khaliifa*, 'a successor,' the title assumed and borne by the consecutive rulers of Islam, as 'successors' of their great prophet. Hence the term 'califate' or 'caliphate' became applied to this supreme office, and, in a wider sense, to the whole empire of the califs.

After the death of Mohammed (q. v.), in A.D. 632, his place as ruler and spiritual guide of Islam was at once filled by the father of his wife Ayesha, Abu-Bekr, who, by general consent and by the prophet's own choice, was recognized as better qualified than any other to be the first 'successor.'

Abu-Bekr's short reign (632-634) was marked by the extension of the bounds of Islam. Khalid, surnamed the 'Sword of Allah,' Abu-Bekr's greatest general, carried the Moslem warriors to victory again and again, in their battles with the Persians in the east, and against the Romans (636) under Heraclius in Syria. By the year 642 the conquest of Persia was complete; and as early as 638 Omar, Abu-Bekr's successor, had founded the two cities of Basra (Bussorah) and Kufa, in the Euphrates valley. Damascus, Antioch, and Jerusalem had all been surrendered by the Romans in 636, and Syria had become wholly Moslem two years later. The conquest of Egypt, begun in 640, was achieved in the following year. Thus, when Omar perished by the hand of an assassin, in 644, the Arab dominion had extended to the Nile and the Levant on the west, and to the farthest limits of Persia on the east. (See OMAR, IBN AL-KHATLAB.) The next calif, Othman, reigned

from 644 to 656; and he was succeeded in turn by Ali (656-661), who made the new city of Kufa, on the Euphrates, his capital.

The accession of Mo'awiya I. to the califate in 661 marked the beginning of the hereditary period, and led directly to the great schism in the Mohammedan world which persists to the present day—*viz.*, the Sunnites, who recognize and obey the line of the califs as history determined them, and the Shiites, or those (*e.g.*, the Persians) who consider that the califate belonged legitimately to the family of Ali. Hitherto the califs, although autocrats, had been the nominees of an oligarchy. In the person of Mo'awiya, however, began the dynasty of the Ommayyads, or Ommyades, who reigned as follows: Mo'awiya I. (661-680), Yazid I. (680-683), Mo'awiya II. (683), Merwan I. (683-685), Abdul-Melik (685-705), Walid I. (705-715), Soliman (715-717), Omar II. (717-720), Yazid II. (720-724), Hisham (724-743), Walid II. (743-744), Yazid III. (744), Ibrahim (744), Merwan II. (744-750).

During this period the Moslem empire was extended northeastward across the Oxus, Afghanistan and Baluchistan being also included within its borders. Not only did the whole of the north African coast provinces, from the Nile to the Atlantic, fall under the sway of the califate, but a further advance northward into Europe was made. In the reign of Walid I. Spain fell wholly under Arab dominion. Pushing still further north, the Arabs overran Southern and Central France and threatened to become the dominant power in Western Europe, when the splendid victory won by Charles Martel near Tours, in 732, turned the tide of Islamism, and forced the Moslems to retreat across the Pyrenees. The Ommayyads, establishing themselves at Cordova in 755, in the person of Abdur-Rahman I., prolonged their rule in Spain until the year 1009, quite independent of the califate of the East. Thereafter the kings of Taifas, the Almoravides, the Almohades, and, lastly, the kings of Granada, successively upheld Islamism in Spain, though yielding ground with every century, until at length the conquest of Granada by the Spaniards, in 1492, drove the Moslems finally across the Strait of Gibraltar into Morocco.

Meanwhile Islam had been distracted by a long and violent struggle between the Ommayyads and the rival house of the Abbases, who were descended from Abbas, Mohammed's uncle. Under the leadership of Abu'l-Abbas, this family vehemently

asserted its superior claim to the califate; and the question was finally fought out (750) in a decisive battle from which the Abbasides emerged victorious. This was followed by a massacre of the whole clan of the Ommayyads, with the exception of Abdur-Rahman, who escaped westward and founded the independent califate of Cordova.

The califate, carried through the line of the Abbasides, included the following rulers: Abu-'l-Abbas (750-754), Al-Mansur (754-775), Al-Mahdi (775-785), Al-Hadi (785-786), Haroun al-Raschid (786-809), Al-Emin (809-813), Al-Mamun (813-833), Motasim (833-841), Vathek (841-847), Motawakkil (847-861), Montasir (861-862), Al-Mostain (862-866), Al-Motadi (866-870), Al-Motamid (870-893), Al-Motadid (893-902), Al-Moktafi (903-908), Al-Moktadir (908-932), Kahir (932-934), Radi (934-940). With Radi the true califate ended; for though he was succeeded by other nominal 'successors' of the prophet, such power as they had once exercised passed to other dynasties, and even in the regions where their authority was still recognized the real power was in the hands of influential subjects. At length their empire was extinguished by the Mongol conquest of Bagdad in 1258.

The title, however, continued to be used by the descendants of the Abbassides until 1517, when it was assumed by the Sultan Selim I. upon his conquest of Egypt. After that time it was borne by the Turkish Sultans, though their right to the office was not acknowledged in Morocco, Tunis, Algiers, or India, nor by the Shiah sect. After the sultanate was abolished, the heir apparent, Abdul Medjid, was proclaimed calif, but in March 1924 the Turkish National Assembly voted the abolition of the califate and deposed and exiled Abdul Medjid as spiritual head of the Moslem world.

Consult Redhouse's *Vindication of the Ottoman Sultan's Title of Caliph*; Heiborn's *Droit public et administratif de l'Empire Ottoman*; Pears' *Turkey and Its People*.

**California** (popularly called the 'Golden State'), a Pacific State of the United States, situated between the parallels of 32° 40' and 42° N. It ranks second among the States in area, with a total surface of 158,297 square miles, including a water area of 2,645 square miles.

**Topography.**—The State has two extensive mountain systems—the Sierra Nevada in the eastern part, and the Coast Range in the western part—which combine in the northern section, forming a

rugged and picturesque country. The Sierra Nevada averages about 50 miles in width, and in Mount Whitney (14,501 feet) has the loftiest peak in the United States, exclusive of Alaska. There are several other peaks in this range with altitudes of more than 12,000 feet: Mount Lyell (13,090 feet), Mount Shasta (14,380 feet), Mount Corcoran (14,093 feet), and Kaweah Peak (13,752 feet). All of these are in the southern part of the range except Mount Shasta, which is in the extreme northern part, and which is often classified as belonging to the Cascade Range, a northern continuation of the Sierra Nevada. The Sierras, while abrupt on their eastern face, fall in long, gradual slopes toward the west into the central valley. Noteworthy features are the many deep gorges, prominent among them being the Yosemite Valley (q. v.).

The Coast Range begins with the San Jacinto Range in the south, and includes the Santa Ana, San Bernardino, San Gabriel, Sierra Madre, San Rafael, Coast (a local name), and Monte Diablo ranges. The highest peaks of the Coast Range are in Southern California, and include San Bernardino (10,630 feet), San Jacinto (10,805 feet), and Tehachapi (9,214 feet). To the east of the San Bernardino Range is a depressed and arid region comprising Death Valley and the Mohave and Colorado Deserts.

The Great Valley between the Sierra Nevada and the Coast Range is about 450 miles long and 40 miles wide, and is remarkable for its fertility. Its northern basin is drained by the Sacramento River flowing southward, and its southern basin by the San Joaquin River flowing northward. These two rivers almost meet in the 1,600 square miles of alluvial delta opposite the gap in the Coast Range at San Francisco, and empty into San Pablo Bay, through Suisun Bay. The northern part of the Coast section is drained by the Klamath and Eel Rivers, noted for their salmon.

**Climate.**—The vast extent of the State, together with the wide variation of its physical features, has given California a greatly diversified climate. In the mountainous regions of the north the winters are severe, and in the northern sections west of the Coast Range fogs often prevail. In the southern part of the State the winters are extremely mild, except upon the mountain ranges; this section contains many popular winter resorts, such as Santa Barbara, San Diego, Los Angeles, and Monterey. The average mean temperature of San Francisco is 51° F.; of the valleys in

the central part of the State, 64° F. San Diego, in the extreme south, has a mean winter temperature of 54° F. and a mean summer temperature of 68° F. Along the coast there is in summer a brisk ocean breeze blowing inland, tempering the seasonal heat. At night the movement is reversed, the cool air from the mountains flowing seaward. The climate of the State, taken as a whole, is dry and invigorating, and corresponds closely to that of the Mediterranean region of Europe.

The rainfall varies greatly, being about 60 inches at Eureka, on the northern coast, and less than 10 inches at San Diego. In general, there is a gradual decrease in rainfall from north to south.

**Geology.**—The main axes of the Coast Range and of the Sierra Nevada probably belong to the Archaean. They are flanked by Jurassic and Triassic formations. In the northern part of the State occur lava beds, dating back to the Miocene, and volcanic cones are found in various sections.

**Mining.**—California ranks fifth among the States in the value of mineral products, with a net value, in 1919 (according to the U. S. Census Report), of \$162,894,492, an increase of 168.7 per cent. over 1909; 22,201 persons (19,344 wage earners) were engaged in mining industries.

California ranks first among the States in placer mining, first in quicksilver production, third in the value of petroleum and natural gas, third in the mining and milling of gold- and silver-bearing ores, and seventh in copper output. Petroleum and natural gas production is the leading industry of the State, with a value in 1919 of \$139,018,663, or 84.9 per cent. of the total value of mineral products. Production was reported principally from Fresno, Kern, Los Angeles, Orange, Santa Barbara, and Ventura counties.

The value of other important mineral products in 1919 was: gold and silver from lode mines, \$8,773,757; gold from placer mines, \$7,937,654; copper, \$2,397,610; quicksilver, \$1,217,077; magnesite, \$677,661; basalt, \$635,588; granite, \$563,485; limestone, \$540,987; lead and zinc, \$261,454; clay, \$177,246; sandstone, \$65,074; abrasive materials, \$61,313; chromite, \$58,366. Asbestos, asphalt, barytes, feldspar, graphite, iron ore, manganese, marble, mineral pigments, pyrite, lignite, tungsten, silica, talc, soapstone, and precious stones are also found.

State estimates of the mineral production for 1921 include the following items: gold, \$15,800,-

#### CALIFORNIA

Lake Tahoe, a well-known summer resort of the Sierra region, is one of the largest lakes in the world at its altitude (6,300 feet). This beautiful lake, walled in by snow-clad mountain peaks, was discovered in 1844 by the American explorer, John C. Frémont,

000; silver, 3,500,000 fine ounces, \$3,500,000; copper, 11,700,000 pounds, \$1,477,710; lead, 800,000 pounds, \$36,880; zinc, 850,000 pounds, \$43,520; quicksilver, 2,400 flasks, \$113,800; platinum, 500 fine ounces, \$45,000; petroleum, 114,000,000 barrels, \$182,400,000; natural gas, \$3,900,000; magnesite, 54,000 tons, \$540,000; brick, cement, building stone, crushed rock, etc., \$27,000,000.

**Forestry.**—There are seventeen National Forests in the State, with a total area of 20,339,337 acres. The largest forests are: the Sequoia (2,626,590 acres); Santa Barbara (2,014,960 acres); Trinity (1,746,000 acres); Sierra (1,743,000 acres); Klamath (1,688,720 acres); Shasta (1,586,880 acres); Modoc (1,578,200 acres); and Cleveland (1,571,800 acres).

The principal trees are the redwood, western yellow pine, sugar pine, Douglas fir, white and red fir, and incense cedar. The pine regions, excluding National Park lands, comprise about 14,000,000 acres, and contain approximately 203 billion feet of timber. The redwood (*Sequoia sempervirens*), occurs only in California and, with the *Sequoia gigantea*, the largest tree in America, constitutes a characteristic feature of the flora of the State (see SEQUOIA). The redwood region, covering about 1,400,000 acres, has a stand estimated at 85 billion board feet. The average annual cut of timber in California is 1½ billion feet.

**Fisheries.**—The total yield of the fisheries of California in 1920 amounted to 212,635,075 pounds. The principal products were as follows: pilchards, 118,517,729 pounds; albacore and tuna, 36,114,340 pounds; salmon, 11,077,014 pounds; bonito or skipjack, 8,614,581 pounds; flounders, 7,792,626 pounds; rockfishes, 5,503,187 pounds; barracuda, 4,584,476 pounds. Other products are shad, sharks, skates, rays, shrimps, squid, spiny lobster, oysters, and cockles. In 1918, 34,436 cases of salmon were canned.

**Agriculture.**—California has an immense area of fertile soil; and though for a time mining offered greater attractions than agriculture, the latter industry has rapidly developed until it has become pre-eminent. The great central valley, formerly a pasture for sheep, then a vast grain field, is now the site of farms, orchards, and vineyards. In variety of agricultural products the State is unsurpassed, situated as it is in both the temperate and subtropical zones.

In the census year 1920 there were 117,670 farms in California, with a total acreage of 29,365,-

667, of which 11,878,339 acres were improved. The total value of all farm property was \$3,431,021,861.

The introduction of irrigation has given an impetus, not only to fruit growing, but to dairy and general farming also. In 1920 irrigation was practised on 57.3 per cent. of the farms in the State, the number of acres actually irrigated being 4,219,040. The final cost of existing enterprises was estimated at \$225,799,123, an increase of \$141,406,779 over 1910.

According to the Federal census the acreage, production, and value of the principal crops in 1919 were: hay and forage, 2,202,583 acres, 4,494,940 tons, \$96,121,846; wheat, 1,086,428 acres, 16,866,882 bushels, \$36,938,477; barley, 987,068 acres, 21,897,283 bushels, \$35,035,654; dry beans, 471,674 acres, 6,552,951 bushels, \$30,798,869; rice, 130,367 acres, 6,926,313 bushels, \$20,432,627; white potatoes, 63,305 acres, 8,217,937 bushels, \$18,901,258; cotton, 87,308 acres, 46,418 bales, \$9,237,182; sugar beets, 88,257 acres, 666,866 tons, \$8,669,258; kafir and milo, 167,814 acres, 4,051,086 bushels, \$6,886,848; hops, 8,118 acres, 12,610,055 pounds, \$6,557,229; corn, 116,740 acres, 3,448,459 bushels, \$5,862,383; oats, 146,889 acres, 2,966,776 bushels, \$2,966,776; sweet potatoes, 7,632 acres, 867,300 bushels, \$1,994,790.

The principal horticultural products are oranges, grapes, peaches, prunes, and lemons. Walnuts, apples, apricots, pears, almonds, cherries, figs, and olives are also largely grown. The orchard product in 1919 was valued at \$267,817,846, while the estimated value to the grower in 1921 was \$181,488,000. Shipments of fresh fruit in 1919 comprised 19,018 cars of grapes and 10,743 cars of deciduous fruits, exclusive of apples. The output of dried fruit in 1921 reached 397,000 tons, of which 135,000 tons were prunes, 182,500 tons raisins, 34,000 tons peaches, and the remainder, apples, apricots, figs, and pears. Olive culture is one of the oldest fruit industries of California, but no reliable figures for its production are available.

**Stock Raising.**—During its early history California ranked among the leading States in the number of sheep raised and in the amount of wool produced. In 1920 they numbered 2,400,151, valued at \$25,906,445—an increase of 210.6 per cent. over 1910. The 1919 wool clip was 15,216,957 pounds; and the wool and mohair clip was valued at \$6,805,621. Cattle numbered 2,008,037, valued at \$120,681,446—an increase of 128.6 per cent.

over 1910. Horses numbered 402,407, valued at \$35,416,507; mules, 63,419, valued at \$7,221,930; the ratio of decrease being 24.8 per cent. and 19.8 per cent., respectively, in the decade. Swine numbered 909,272, valued at \$13,850,907, an increase of 171.2 per cent. The dairy industry is growing, the product in 1919 reaching a value of \$55,642,649, half of which represents the butter output of 44,758,171 pounds.

The poultry industry flourishes under the favorable climatic conditions, and is carried on scientifically in several sections. The output of eggs for 1919 was 57,659,313 dozen, valued at \$28,337,111.

The honey product (1919) was 5,501,738 pounds, valued at \$1,100,351.

**Manufactures.**—Although agriculture and mining are the principal industries of California, the State shows a marked growth in manufactures during the last fifty years. The gross value of products per capita of the total population increased from \$119 in 1869 to \$578 in 1919. California ranked sixteenth among the States in 1869 in gross value of manufactured products, but had advanced to eleventh place in 1909 and to eighth in 1919.

In 1919 the State had 11,943 manufacturing establishments, which gave employment to an average of 296,999 persons during the year, and paid out \$380,135,000 in salaries and wages. These establishments turned out products to the value of \$1,981,443,000, to produce which materials costing \$1,218,890,000 were utilized. The value added by manufacture was thus \$762,553,000. The totals do not include the statistics for the U. S. Navy Yard at Mare Island.

According to State figures, the leading industries, with the value of their products, in 1920 were as follows: petroleum products, \$194,000,000; dairy products, \$100,000,000; lumber and timber products, \$60,000,000; canning and preserving, \$52,000,000; slaughtering and meat packing, \$45,000,000; foundry and machine-shop products, \$30,000,000; railroad car and shop construction, \$25,000,000; bread and bakery products, \$24,000,000; flour-and-grist-mill products, \$22,500,000.

The chief industrial centres are San Francisco, Los Angeles, and Oakland.

**Railways.**—In 1920 there were 16,068 miles of steam railway in California, a greater mileage than that of any other Pacific State. The first trans-continental railway to enter California was the Central Pa-

cific, first operated in 1868. Other important lines are the Southern Pacific, the Atchison, Topeka, and Santa Fe, the Western Pacific, and the Union Pacific. There are also 28 electric railways, operating 1,888 miles of road.

**Commerce.**—The value of the merchandise trade carried on by the three customs districts of Los Angeles, San Diego, and San Francisco in the calendar year 1920 was \$487,349,223, comprising imports, \$235,396,253, and exports, \$251,952,970. Of this, \$238,027,065 represented imports to San Francisco, and \$240,517,739 exports therefrom.

California, owing to its geographical position, controls a great part of the trade between the United States and Asiatic countries; and the increasing prosperity of Alaska, with which the State is connected by steamship lines, has materially advanced its commercial importance.

**Finance.**—The receipts of the treasury for the year ending June 30, 1920, were \$71,857,133, and the disbursements \$72,805,374. At the close of the fiscal year there was a balance on hand of \$14,140,478. The chief items of revenue were the general property tax, railroad taxes, San Francisco harbor collections, and the collateral inheritance tax. The total bonded debt, on June 30, 1920, was \$50,255,500, nearly all of which was held by the State school and university funds; outstanding warrants amounted to \$4,654,592. The assessed valuation of all taxable property in 1921 was \$4,929,479,508.

**Banks.**—On June 30, 1920, the national banks in California numbered 305, with a combined capital of \$66,005,000; a surplus of \$35,330,000; a circulation of \$39,819,000; deposits of \$660,926,000; loans of \$624,677,000; and total assets of \$1,092,956,000. The State, savings and private banks, and loan and trust companies numbered 420, with a combined capital of \$84,188,000; a surplus fund of \$38,683,000; deposits of \$1,204,028,000; loans, \$815,211,000; and aggregate resources and liabilities of \$1,402,360,000.

**Population.**—In the census year 1920 California had a population of 3,426,861, an increase of 44.1 per cent. over 1910. The 1920 total included 38,763 negroes and 123,387 of other races. The native white population formed 75.4 per cent. of the total. Of the total population, 68.04 per cent. was urban and 34.98 per cent. rural. The population of California by decades has been as follows: 1850, 92,600; 1860, 379,900; 1870, 560,200; 1880,

864,700; 1890, 1,208,100; 1900, 1,485,000; 1910, 2,377,549.

The largest cities of the State in 1920 were: Los Angeles, 576,673; San Francisco, 506,676; Oakland, 216,261; San Diego, 74,683; Sacramento, 65,908; Berkeley, 56,036; Long Beach, 55,593; Pasadena, 45,354; Fresno, 45,086; Stockton, 40,296; San José, 39,642; Alameda, 28,806.

**Education.**—The executive power of the public school system is dual, being vested in a Superintendent of Public Instruction, elected every four years, and a State Board of Education, consisting of seven members, appointed by the governor. The Superintendent of Public Instruction is, *ex officio*, secretary of the State Board of Education and Director of Education. In the latter capacity he has charge of the Teachers' Colleges, the School for the Blind, the School for the Deaf, and the State Polytechnic School. County executive power rests in a county superintendent, while incorporated cities have city superintendents. The district is the unit of school government with a district board of school trustees. Financial support for the public schools is derived from State, county, and district taxes.

In 1921 the total enrollment in kindergartens, elementary, and secondary schools was 776,031, and the average daily attendance therein, 541,475. The teachers numbered 23,749. The total expenditure for school purposes was \$73,221,951, and the value of all school property, \$133,201,087.

Of the institutions for higher learning, the most important are: the University of California (q. v.), at Berkeley, with a southern branch located at Los Angeles; Leland Stanford Junior University (q. v.), at Palo Alto; the University of the Pacific (M. E.), near San José; Pomona College (Cong.), at Claremont; Throop Polytechnic Institute (q. v.), at Pasadena; Occidental College, at Los Angeles; the University of Southern California (q. v.), at Los Angeles; and Mills College (for women), at Oakland. Lick Observatory (q. v.), on Mount Hamilton (near San José), is a part of the University of California. There are seven State teachers' colleges, located at San José, Chico, San Diego, Santa Barbara, Fresno, San Francisco, and Arcata. In the technical class there are two State institutions—the University Farm School at Davis and the State Polytechnic School at San Luis Obispo.

**Charities and Corrections.**—The State penal and charitable institutions are in charge of a

State Board of Charities and Corrections, consisting of six members, appointed by the governor for a term of four years. These institutions include State prisons at San Quentin and Redress; the Preston School of Industry, at Waterman; the Whittier State School, at Whittier; hospitals for the insane at Agnew, Stockton, Napa, Talmage, Norwalk, and Patton; the Sonoma State Home, at Eldridge, and Pacific Colony, at Spadra—homes for the feeble-minded; the Industrial Home for Adult Blind, at Oakland; California School for Girls, at Ventura; and the State Industrial Farm for Women, at Sonoma. The State Board of Charities and Corrections also has under its supervision numerous children's institutions, some under sectarian, others under non-sectarian, control.

**Government.**—The constitution now in force was adopted in 1879. Amendments require a two-thirds vote of each branch of the legislature and the approval of the electorate. Constitutional amendments establishing the initiative, referendum, and the recall of all elective officers, including judges, were ratified Oct. 10, 1911. Women were enfranchised on the same date.

The executive power is vested in a Governor, Lieutenant-Governor, Secretary of State, Controller, Treasurer, Attorney-General, and Surveyor-General, all of whom are elected for four years, and in six administrative departments under the governor. The legislature consists of a Senate, composed of 40 members, elected for four years, and an Assembly of 80 members, elected for two years. Sessions are held biennially, and no pay is allowed members for a longer time than sixty days. No bill can be introduced after fifty days from the commencement of the session without the consent of two-thirds of the members.

The judicial power is vested in the Senate, sitting as a court of impeachment; in a Supreme Court, consisting of a Chief Justice and six Associate Justices, elected for a term of twelve years; District Courts of Appeal, Superior Courts, and Justices of the Peace.

The State has a direct primary law, first exercised in August, 1910; an employers' liability law; and a child labor law which prohibits the employment of children under fourteen, and of those under sixteen between 10 P.M. and 6 A.M.

Under the Congressional apportionment founded on the Thirteenth U. S. Census, California has 11 Representatives in

Congress. Sacramento is the State capital.

**Recent Legislation.**—Important legislation enacted during the past decade includes an act providing for a State railroad commission, an amendment to the primary election law, establishing presidential primaries and the initiative and referendum in counties, cities, and towns, and an act providing for protection of horticulture (1912); alien land laws for the purpose of eliminating Japanese as owners of land, a mother's pension law, a minimum wage law for women and minors, and laws extending the scope of the workman's compensation act, and establishing an eight-hour law for underground workers (1913); measures relating to the administration of justice, provision for absent voting by those in the national service, and amendments to the insurance laws (1917); a compulsory part-time education law, a law providing an industrial farm for the rehabilitation of fallen women, amendments to the child labor laws, a law creating a Department of Agriculture, and ratification of the Federal prohibition amendment (1919); an anti-alien land leasing law (1920); a bill centralizing the government into six administrative departments, and a State prohibition enforcement act (1921).

**History.**—The name California was first used in a book by Garcia Ordoñez de Montalvo (*Las Sergas de Esplandian*), published in Spain in 1510. It was applied by Cortes to his colony at La Paz (Lower California) in 1537.

The first European who is known to have visited what is now California was Juan Rodriguez Cabrillo, who voyaged along the coast as far north as Pt. Conception, discovered San Diego Bay, and visited many of the islands along the coast. Other early explorers include Francis Drake (1579), Francisco de Galli (1584), Thomas Cavendish (1587), Sebastian Rodriguez de Cermeñon (1595), and Sebastian Vizcaino (1602). San Diego was occupied by Spanish missionaries in 1769; and later, other missions were established farther north at Monterey in 1770 and San Francisco in 1776. The first of the pueblos was founded in 1777 at San José, and four years later another was established at Los Angeles. The missions increased rapidly in number, and at the close of the eighteenth century had been founded a day's journey apart.

The entire situation was changed when, in 1822, Mexico became independent of Spain. California passed under Mexican control, and in November of that

year a provincial legislature chose Don Luis Argüello as the first Mexican governor. California was allowed considerable freedom in matters pertaining to local government, but its growth was checked for some time by the restrictions placed upon foreign trade.

At first the relations between California and Mexico were pleasant; but about 1830 a spirit of unrest and dissatisfaction began to pervade the province. This feeling was augmented in 1835, when the able governor, Figueroa, died; and the following year a movement headed by Alvarado succeeded in obtaining control of the province, with the exception of the region about Los Angeles and San Diego, which was not brought under subjection until 1837. Alvarado's idea was to make California a sovereign state, and at the same time maintain a federal union with Mexico. In 1838 the Mexican government recognized him as constitutional governor of the department of California; and his position was assured in 1845, when, after a final attempt to install a Mexican governor, the forces of Alvarado, in a bloodless engagement, compelled the Mexican army to capitulate.

About this time a considerable American immigration started, and American settlements sprang up throughout the province, notably in the Sacramento Valley. In June, 1846, an American surveying party under the leadership of John C. Frémont (q. v.) inaugurated the 'Bear Flag Revolt,' captured the town of Sonoma, and on July 4 issued a proclamation declaring California independent. This movement was in opposition to the policy of the United States toward California, and was officially discredited; but on July 7, acting under instructions from the U. S. Government, then engaged in war with Mexico, Commodore Sloat took possession of Monterey and San Francisco (known as Yerba Buena). Frémont then put his company under the orders of Sloat. Further operations on the part of the United States soon brought about the complete occupation of California, and on Aug. 15, 1846, it came into the Union as a free and sovereign State, with its own constitution, governor, and legislature.

Two years later, on Jan. 24, 1848, gold was discovered at Sutter's Mill, Coloma, and immigrants to the number of many thousands flocked to California from all parts of the world. A very large proportion of these immigrants were lawless and irresponsible, and the conditions in the State, until the better

element by drastic measures succeeded in establishing law and order, were such that life and property were in continual jeopardy. (See FORTY-NINERS.)

A State constitution prohibiting slavery was approved by the electorate in 1849, and the following year California was admitted to Statehood under the provisions of the Omnibus Bill (q. v.).

During the period of 1870-90 local politics were strongly influenced by the question of restricting Chinese immigration; and the Workingman's Party, headed by Denis Kearney (q. v.), elected its candidates in many of the cities, and was largely responsible for the enactment of the present radical constitution.

In 1906 the exclusion of Japanese students from the public schools of San Francisco raised a State-wide discussion and resulted in international negotiations between the United States and Japan. Again in 1913 the passing of anti-alien land laws, designed to prevent Japanese settlers from owning land in the State, caused much discussion, and Secretary of State Bryan visited California in an attempt to aid in framing a law which would be acceptable to the people and yet not disturb international relations with Japan. The result was the Webb bill, which went into effect in August, and a series of negotiations between Japan and the United States which were not made public.

California lies in an earthquake belt. The earliest recorded severe shock occurred in 1812, destroying mission buildings in Los Angeles and Santa Barbara counties and killing about forty persons. In 1851 San Francisco was considerably damaged; and there were other shocks in 1855, 1856, 1865, and 1918. On April 18, 1906, the State was visited by the worst earthquake in its history, extending over about 190 miles and centring in San Francisco (see SAN FRANCISCO EARTHQUAKE).

On the morning of Oct. 1, 1910, the Los Angeles *Times* building was destroyed by an explosion, and twenty-one of the workers in the building were killed. Suspicion was fastened on John J. McNamara, secretary of the International Association of Bridge Workers, James B. McNamara, his brother, and Artie McManigal, and the three eventually confessed to the crime.

In 1914 and in 1916 serious floods in the southern part of the State caused serious property loss.

In national politics California is usually Republican. The Democrats were in control up to 1860, however, and also carried the State in 1880, 1892, and 1916,

**Bibliography.**—Consult Bancroft's *History of the Pacific States of North America*; Hittell's *History of California* (4 vols.); Royce's *California* (in 'American Commonwealth Series'); James' *In and Out of the Old Missions of California*; Peixotto's *Romantic California* (1910); Muir's *Mountains of California* (9th ed., 1911); Richman's *California under Spain and Mexico* (1911).

**California**, city, Missouri, county seat of Moniteau County, on the Missouri Pacific Railroad; 25 miles west of Jefferson City. It has manufactures of woollen goods, men's work garments, harness, crockery, vehicles, ice, cream products, and carbonated water. Pop. (1910) 2,154; (1920) 2,218.

**California**, borough, Pennsylvania, in Washington County, on the Monongahela River, and on the Pennsylvania Railroad; 27 miles southeast of Pittsburgh. It is the seat of the State Normal School. Coal is mined in the vicinity. There is steamboat connection with Pittsburgh. Pop. (1910) 2,230; (1920) 2,480.

**California, Gulf of** (called also PURPLE SEA—*Mar Bermejo*—and SEA OF CORTES), an arm of the Pacific, 700 miles long and 60 to 150 miles broad, which separates the peninsula of Lower California from Mexico. It contains numerous islands. The chief ports—La Paz, Loreto, Santa Rosalia, and others—have good harbors. The Colorado River debouches at its head, its extensive deposits causing shallows in the northern part. The depth at the southern end is about 6,000 feet. Pearls, coral, and sponges are the principal commercial products.

**California, Lower**, territory of Mexico, occupying the peninsula of that name, which runs southeast from California, United States. Its width, which varies greatly, averages 75 miles, its length is about 800 miles, and its area is 58,328 square miles. Cape San Lucas (lat. 22° 52' N.) is the southern extremity. Four-fifths of the area is covered with mountains, largely of granite formation, running north and south, and rising from 3,250 feet to 10,075 feet in the San Pedro Martir Range. Gold, silver, copper, iron, sulphur, manganese, gypsum, coal, onyx, and salt are found, and there are indications of the presence of petroleum and of precious stones. Fossil remains are abundant in some localities. The Colorado forms the northeastern boundary for 125 miles; the other rivers of importance are the Hardy and the Purisima. There are occasional springs. The rainfall is scanty;

the climate dry and healthy. The flora consists chiefly of cactuses, yuccas, mimosas, and other forms characteristic of dry regions.

The level parts of the territory are largely desert. There is little irrigation, except in the rapidly developing section opposite the Imperial Valley in Southern California. Grain, legumes, henequen, sugar cane, hemp, tobacco, and tropical fruits are raised in the limited area under cultivation. Pearl and shark fisheries are important—about \$300,000 worth of pearls being shipped annually to the United Kingdom. The roads follow the old Jesuit foot trails. A concession was granted in 1911 for a railroad along the northern boundary, the only lines in the territory (2 and 6 miles respectively) at that time being operated in connection with mining properties.

Foreign trade is carried on through the ports of La Paz, Magdalena Bay, Santa Rosalia, and Ensenado. The capital is La Paz. Pop. (1920) 62,831, largely half-breeds.

Lower California was discovered by Cortez in 1533, and settled by the Jesuits in 1642.

**California Poppy.** See ESCH-SCHOLTZIA.

**California, University of**, a coeducational institution of higher learning in Berkeley, Cal. It was organized in 1868, and opened at Oakland in 1869, when the College of California, incorporated in 1855, closed its work and transferred its property to the State for the use of the new University. The University was transferred to its present site in 1873.

The University occupies a commanding site of about 530 acres overlooking the Bay of San Francisco. The campus is being developed on an architectural plan adopted after an international competition in 1898, made possible by the generosity of Mrs. Phœbe A. Hearst. The following buildings have been erected in accordance with this plan: The Greek Theatre (1903, the gift of W. R. Hearst); California Hall (1904, by State appropriation); the Hearst Memorial Mining Building (1907, gift of Mrs. Phœbe A. Hearst); the University Library (1911, by bequest of Charles Franklin Doe); Boalt Memorial Hall of Law (1911, by gift of Mrs. Elizabeth Boalt and the Bench and Bar of California); Agricultural Hall (1921, by State appropriation); Hilgard Hall, completed in 1917; Le Conte Hall for physics (1923); Hesse Hall, engineering (1923); Memorial Stadium (1923); and Haviland Hall (1924).

As at present organized, the

University comprises the following departments; in Berkeley—Colleges of Letters, Social Sciences, Natural Sciences, Commerce, Agriculture, Mechanics, Mining, Civil Engineering, Chemistry, Medicine (first year); Schools of Architecture, Education, Jurisprudence and Librarianship, University Extension Division and Institute of Child Welfare; at Mount Hamilton—Lick Observatory; in San Francisco—California School of Fine Arts, George Williams Hooper Foundation for Medical Research, Hastings College of Law, College of Medicine (second, third, fourth and fifth years), College of Dentistry, and California College of Pharmacy; in Los Angeles—College of Medicine (Los Angeles Department, graduate instruction only) and University of California at Los Angeles, including College of Letters and Science and Teachers College; in Riverside—Citrus Experiment Station and Graduate School of Tropical Agriculture; in Whittier—Southern California Pathological Laboratory; in the Imperial Valley—outlying agricultural station; in La Jolla—Scripps Institution for Biological Research; in Pacific Grove—Herzstein Seaside laboratory; in Santa Monica and Chico—forestry stations; and in Davis—University Farm School. Annual summer sessions of six weeks are conducted, the attendance being several thousand. A department of University Extension was organized in 1902, the agricultural section of which conducts farmers' institutes and operates a demonstration train through the State. The University, through its examiners, is closely in touch with the high schools of the State.

The government of the University is vested in a Board of Regents of twenty-three members, including the governor of the State and the president of the University. The internal management is in the hands of the faculties and the academic senate, with standing committees in charge of the academic, graduate, professional, and editorial work.

The endowment of the Academic College and Lick Observatory consists of the Seminary and Public Building funds; the property derived from the College of California, including the site at Berkeley; the fund derived from the Federal Land Grant of 1862; the State University fund; the Tide Land fund; State appropriations; individual gifts; two Experiment Station funds of \$15,000 a year each; and the Morrill College aid fund of \$50,000 a year. Tuition is charged to resi-

UNIVERSITY OF CALIFORNIA

1. Greek Theatre (seating capacity 7,000); 2. Mining Building (Hearst Memorial, erected in 1907);  
 3. Boalt Memorial Hall of Law (1911); 4. New University Library (1911).

dents of California only in the professional colleges (exclusive of law). For recent statistics see Table under the heading COLLEGE.

**Caligula**, ka-lig'ū-la (12-41 A.D.), Roman emperor, was the son of Germanicus and Agrippina. He was born in Antium, but was brought up in his father's camp in Germany. His real name was GAIVS CÆSAR—'Caligula' being a nickname given him by the soldiers from his wearing, as a child, small *caligæ*, or soldiers' boots. On his father's death he ingratiated himself with Tiberius and on the death of the latter in 37 A.D. (which he is believed to have hastened), he was declared heir to the throne. For the first few months he acted with justice and moderation; but after a severe illness he appeared as the most sanguinary tyrant known to history and unquestionably he was insane. He made his horse a consul; and leading his legions to the coast of Gaul, as if for an invasion of Britain, he bade them pick up the shells as trophies from the ocean, and led them away. He was barbarously cruel, delighting in torture and bloodshed; he also insisted on divine honors being paid to him. At last, in January, 41 A.D., Cassius Chærea, tribune of a prætorian cohort, formed a conspiracy, and murdered him. Fragments of valuable bronzes have been recovered from his famous floating gardens sunk in Lake Nemi. Dramas based on Caligula's life have been written by Crowne (1698), Dumas père, Möller (1906), Vittori (1910), and Glaser (1910).

**Calipers**, a kind of compass with curved legs, used in machine shops for measurements, such as the determination of diameters of shafts, bores and centring. Vernier and micrometer calipers are used for minute measurements. See VERNIER; MICROMETER.

**Caliph**. See CALIF.

**Calippus**, ka-lip'us, or CALIPPUS (c. 330 B.C.), Greek astronomer, who invented the Calippic lunar cycle. See CALENDAR.

**Callsaya**. See CINCHONA.

**Calisthenics**. See GYMNAS-TICS.

**Calixtus**, ka-lik's'tus (CALLIXTUS) I. (d. 222), bishop of Rome and saint, elected 219, and martyred Oct. 14, 222. He is known as the constructor of the celebrated catacombs on the Appian Way at Rome.

**Calixtus II.** (d. 1124), Pope of Rome, was elected 1119, previous to which he was archbishop of Vienne, in France. He was a relative of the Emperor Henry v. When he became Pope he made an arrangement—the Concordat

of Worms, 1122—with Henry, by which the latter abandoned the papal privilege of spiritual investiture by ring and crosier, but retained that by sceptre, as representing the temporal power.

**Calixtus III.**, the name of two Popes. The first was one of the anti-Popes elected in 1168, under the influence of Frederick Barbarossa, in opposition to Alexander III. The second was Alfonso de Borgia, a Spaniard, elected in 1455. He annulled the sentence against Joan of Arc, and appealed to Christendom against the Turkish invasion in 1456. He died in 1458.

**Calixtus** (CALLISEN), GEORGIUS (1586-1656), Protestant theologian, was born in Medelbye, Schleswig. He became professor of theology at Helmstedt, and attacked the Roman Catholic Church; but, later, the Lutherans believed that he was too tolerant of Roman Catholic tenets, and found him guilty of heresy. For his Calvinistic leanings, shown at the conference of Thorn in 1645, he was subjected to a further charge of apostasy. His dispute with the Lutherans, known as the Syncretistic controversy, lasted for many years. His chief work is *Epitome Theologiæ Moralis* (1634). He was styled by Bossuet 'the most able Lutheran of our time.'

**Calking**. See CALKING.

**Call**, in finance 'Call money' means money deposited with a bank, or loaned by a bank, and returnable when called for. A call with reference to stocks or shares has several meanings: (1) An instalment of capital to be paid by subscribers to a new company, or to a new issue of shares. (2) A demand for contribution made upon the shareholders by the liquidator of a company which is being wound up. (3) An option to buy certain stocks or shares at a certain price on a certain date (see STOCK EXCHANGE).

**Calla**, kal'a, a genus of plants of the family Araceæ. *C. palustris*, the only species of the genus, is a marsh plant with trailing stems and heart-shaped leaves. The inflorescence has a white, elliptical spathe, and is attractive and interesting. The water arum, as the calla is sometimes called, is easily grown in a pond or piece of boggy ground. The calla lily, with creamy white or yellow spathes, known as *Richardia*, also an arum, is frequently cultivated.

**Callahan**, JAMES MORTON (1864- ), American educator, was born in Bedford, Ind. He was graduated from Indiana University in 1894, and received a doctorate from Johns Hopkins in 1897. He was acting professor

at Hamilton for one year, and lecturer at Johns Hopkins for four years; he was also director of the Bureau of Historical Research (1900-2); and since 1902 has been professor and head of the department of history and political science and dean (since 1916) of the College of Arts and Sciences at West Virginia University. In 1911 he was a delegate to the National Conservation Congress. He is well known as a writer on diplomacy and international relations, and is the editor of the *West Virginia University Studies in American History*. His published works include *Neutrality of the American Lakes* (1898); *Cuba and International Relations* (1899); *American Relations in the Pacific and the Far East* (1901); *Confederate Diplomacy* (1901); *American Expansion Policy* (1908); *Alaska Purchase* (1908); *Evolution of Seward's Mexican Policy* (1909); *History of West Virginia* (1923); and many monographs and magazine and encyclopædia articles.

**Callao**, käl-yá'ō, chief port of Peru, in Callao province, at the mouth of the Rimac River; 7 miles southwest of Lima, with which it is connected by two railroads and an electric tramway. The average annual temperature is 68° F. The town has an old jail and fortress, now used as a custom house; a hospital, a modern naval school, and a wireless station. The water-supply system, installed in 1904, and the sewerage system, recently completed, have greatly improved sanitary conditions and public health. Industries include the manufacture of sugar, flour, cocaine, liquors, matches, cigarettes, and machinery.

Callao is the starting point of the famous Oroya Railroad (138 miles) and of the line to Cerro de Pasco (221 miles). It has a good harbor, protected by San Lorenzo Island, and equipped with docks and sea walls. The chief exports are copper, silver, hides, guano, salt, coffee, sugar, and wool. The annual trade amounts to more than \$25,000,000. Callao province includes the city, the villages of Bella Vista and La Punta, and several islands. Pop. province (1920) 52,843.

Callao was founded in 1537, and became an important centre of trade with Spain. It was destroyed by an earthquake and tidal wave in 1746.

**Callcott**, kól'kut, SIR AUGUSTUS WALL (1779-1844), English artist, called 'the English Claude,' was born in London. He first became a portrait painter, but finally devoted himself to landscapes. His best pictures, painted between 1812 and 1824, are bright, pleasant, and finished

in execution. Later he was successful in large figure subjects. In 1837 he exhibited *Raffaele and the Fornarina*, and was knighted; and in 1844 he was appointed conservator of the Queen's pictures.

**Calles**, PLUTARCO ELIAS (1877- ), Mexican public official, was born in Guaymas, in the State of Sonora. He taught school for a short time and held various municipal offices. In the revolutionary struggles he fought on the side of Madero and Obregon and became Secretary of Commerce and Labor in Carranza's Cabinet. Later he was made Secretary of State in Obregon's Cabinet. In 1924 he was elected president of Mexico. He is interested in educational and social reforms, and the agrarian rights of the peons.

**Callias**, kal'i-as, a name borne by various members of a noble Athenian family famous for their wealth. The best known was an ambassador from Athens to Artaxerxes, king of Persia, who is said to have concluded (c. 448 B.C.) the so-called Peace of Callias, which assured the liberty of the Greek towns of Asia Minor, and closed the Ægean to the Persians. The existence of a formal treaty has been questioned; but it is regarded as probable that some understanding was reached, and that Callias was the ambassador through whom it was accomplished.

**Calliehthys**, kal-ik'this, a genus of cat-fish or siluroids, including about a dozen species found in the rivers of tropical America. The body is enclosed in four rows of bony plates, and the head is also armored. Like their allies in the same region, these cat-fish are capable of migrating overland from one river to another, and construct nests of leaves for their ova. See CAT-FISH.

**Callimachus**, ka-lim'a-kus (c. 310-240 B.C.), scholar and poet, was born in Cyrene, and lived in Alexandria, where he was in charge of the famous library from about 260 to 240 B.C. Among his pupils were Eratosthenes, Aristophanes of Byzantium, and Apollonius Rhodius. He wrote about eight hundred works, of which only half a dozen hymns, some sixty epigrams, and some fragments of elegies are extant. They are characterized by extreme artificiality and great learning, being full of recondite allusions. They were highly esteemed, however, by the Romans, and had great influence on such poets as Catullus (who imitated his *Coma Berenice*), Propertius, Ovid, and Virgil. His greatest work, unfortunately lost, was a comprehensive history of

Greek literature. In antiquity, *Ælia*, a volume of elegies, and *Hecale*, an epic which had Theæseus for its hero, were especially celebrated.

**Callinus**, ka-li'nus, the earliest extant writer of elegiac poetry in Greece; indeed, the invention of that metre is usually attributed either to him or to Archilochus. He was a native of Ephesus, and lived in the sixth or seventh century B.C. Only a few fragments of his poems survive, among them a war song (twenty-one lines) of great beauty.

**Calliope**, ka-li'o-pē, mother of Orpheus, the first of the Nine Muses. She presided over epic poetry, and is generally represented with a wax tablet and a pencil.

**Callirrhoe**, kal-ir'ō-ē, a famous ancient fountain in Athens, one of the chief sources of the water supply of that city.

**Callisthenes**, ka-lis'thi-nēz, Greek historian and philosopher, was born in Olynthus. His mother was a cousin of Aristotle, whose pupil he was. He accompanied Alexander the Great on his Asiatic expedition; was implicated in the conspiracy of Hermolus to assassinate the king; and was put to death in 328 B.C. His works—none extant—included an account of the expedition, a history of the Trojan War, and a history of Greece in ten books.

**Callisto**, ka-lis'to, an Arcadian nymph, companion of Artemis. She was loved by Jupiter, and Juno, in jealousy, changed her into a she-bear. One account says that Artemis meeting her while hunting, was about to slay her, when Jupiter snatched her away and placed them both in the heavens as the Great and Little Bear. Her son Arcas was the progenitor of the Arcadians. Callisto is merely a type of Artemis Calliste, 'the most beautiful.'

**Callistratus**, ka-lis'tra-tus, a prominent Athenian public man and orator, between 380 and 360 B.C., whose policy was usually friendly to Sparta. In 366 he advised a temporary surrender of Oropus to Thebes. As the Thebans refused to restore the town, he was condemned to death for his evil counsel, but fled into exile. In 356 he returned, without having obtained pardon, and was executed. His oratory was greatly admired by Demosthenes.

**Callorhynchus**, kal-o-rin'kus, a fish genus nearly allied to *Chimæra* (q.v.). The single species (*C. antarcticus*), popularly called 'bottle-nosed chimæra,' inhabits the seas of the South Temperate zone. It has the long

tail bent upward at the extremity.

**Callosities**, ka-los'i-tēz, bare patches of skin in which the epidermis is hardened and thickened, are of frequent occurrence in mammals. They occur especially on surfaces subjected to pressure, and are thus found on the under surface of the feet of most mammals, over the ischial tuberosities of many monkeys, as well as in other locations. They are an especially conspicuous feature in the camel; and in the horse and its allies the callosities on the inner side of the limbs are of considerable systemic importance.

**Callot**, kā-lō', JACQUES (1592-1635), French draughtsman and etcher, was born in Nancy, Lorraine. At the age of twelve he ran away from home, and joined a band of gypsies, whose features he has immortalized in a series of engravings, generally known

Common Heather or Ling  
(*Calluna vulgaris*)

1, Flower; 2, corolla and pistil; 3, stamens; 4, leaf.

as *Les bohémiens*. These pictures exemplify his work, displaying his characteristic humor, verve, and extraordinary wealth of detail. Leaving the gypsies at Florence (where, and at Rome and elsewhere, he rapidly acquired great skill as an etcher), he became famous in Tuscany, Lorraine, the Spanish Netherlands, and France. Of the many engravings he left, the greater part depict, with intense reality and not without a touch of satire, the pomp and social life of his time. His *Misères de la guerre* (25 plates) and *The Nobles* (12 plates) may be specially mentioned.

**Calluna**, a genus of the order Ericaceæ, of which one species, *C. vulgaris*, is the ling or common heather.

**Calmar**. See KALMAR.

**Calmet**, AUGUSTINE (1672-1757), French theologian and historian, born near Commercy. Entering the Benedictine order, he was successively professor of theology in the abbey of Moyeu-Moutier (1696), prior of several monasteries, and in 1728 became abbot of Senones in Lorraine, where he remained to the end of his life. He supervised the publication in Paris of the famous *Commentaire Littéral sur tous les Livres de l'Ancien et du Nouveau Testament* (23 vols. 1707-16). Among his other works are *Dictionary of the Bible* (Fr. 1722; Eng. new ed. by Buckley, 1856), and *Histoire Ecclésiastique et Civile de Lorraine* (4 vols. 1728), his principal book. See *Life*, by Dom E. Fangé (1763).

**Calmucks**. See KALMUCKS.

**Calochortus**. A lilaceous genus of plants found chiefly in the Far West, and especially in California, in all sorts of situations and soils. They are called mariposa lilies, star-tulips, and the like, and are very beautiful, with a cup-shaped perianth of unequal segments, the 3 inner ones being the larger. They have a wide range of color, and may be either delicate or showy in tint. The stems are more or less leafy and branched, and spring from a coated corm. This little corm, especially that of the sego lily (*C. Nuttallii*), forms a tidbit and food for various aborigines, and is called by certain tribes 'sego.' It is prevalent in the valleys of Utah. Not many of the calochorti are hardy enough for general cultivation, but they are greenhouse plants. Among the best for amateurs are the varicolored *C. Nuttallii*; the lilac *C. villosus*, and *C. venusta*, with its many hybrids of many hues. *C. luteus* and *C. clavatus* are yellow-flowered. These are the hardiest, but all calochorti suffer more from alternate thawing and freezing than they do from extreme cold.

**Calomarde**, DON FRANCISCO TADEO (1775-1842), Spanish statesman, born at Villel, Aragon, and after studying law attracted the notice of Ferdinand by his abilities. A zealous absolutist, Calomarde acted as minister of justice (1824-33), framing new penal codes, recalling the Jesuits, closing the universities, and persecuting the Liberals by tyrannical statutes. In favor of Don Carlos, he carried the abolition of the laws regulating the Spanish succession to the exclusion of Isabella; but in 1833, on the assumption of the regency by the queen-mother (Christina), Calo-

marde fled to France, where he resided until his death.

**Calomel**, mercurous chloride, or subchloride of mercury, is found native as 'horn quicksilver,' but is generally manufactured by triturating a mixture of mercuric sulphate, common salt, and metallic mercury, subliming, and washing with boiling water. It is a white, heavy, odorless, and tasteless powder that is almost insoluble in water. It is blackened by ammonia, and sublimes when heated, forming a gas with a density that corresponds to the formula  $HgCl$ , which condenses on a cool surface unaltered. There is a strong opinion, however, that this vapor is a mixture of mercuric chloride and mercury formed by the decomposition  $Hg_2Cl_2 = HgCl_2 + Hg$ , and that calomel has thus really the formula  $Hg_2Cl_2$ . Calomel is used in medicine for very various purposes, and is administered by inunction, as a lotion, or internally in the form of pills. It has the antiseptic qualities characteristic of mercurial preparations. In small internal doses, from one-tenth of a grain to one grain, it is of the highest use in congestive conditions, especially those due to over-eating, over-indulgence in alcohol, want of exercise, etc., by its effect in producing more rapid changes in all tissues of the body. For this purpose it may be taken in small continued doses, in which form also it has been found to check vomiting in children. In doses of from four to eight grains for an adult it acts as a purgative, by stimulation of intestinal glands and irritation of the mucous membrane. In larger doses it is a gastric and intestinal irritant, producing severe vomiting and diarrhoea. Calomel is much used as a specific for syphilis, being administered internally or by inunction over prolonged periods; but if pushed too far excessive salivation sets in, a blue line may be seen along the gums, and in extreme cases the teeth may be loosened and fall out.

**Calonne**, CHARLES ALEXANDRE DE (1734-1802), French statesman, became advocate-general of the chief council of Artois, then *procureur-général* to the Parlement of Douay, intendant of Metz, and afterward of Lille, in which capacity he displayed so much ability that Louis XVI. appointed him (1783) minister of finance. To meet the increasing expenditure of the state, Calonne proposed (1787) to abolish the pecuniary immunities from taxation of the nobles, the magistrates, and the clergy—a measure which met with such violent opposition that he was forced to resign.

**Calophyllum**, a genus of beautiful evergreen, leathery-leaved

tropical trees, order *Guttifera*. The flowers, which are borne in loose racemes, are usually white and fragrant. *C. Calaba* yields a green fruit, and *C. inophyllum* a red one. The seeds of the latter yield an oil (dilo) which is used in the Fiji and Hawaiian Islands as a remedy against rheumatism. The timber also is valuable for building purposes. Other species, too, give excellent timber, and some of the species yield the resin known as tacamahaca.

**Caloric Engine**, or HOT-AIR ENGINE. See AIR ENGINES.

**Calorie** is a unit of quantity of heat. It is usually stated as the amount of heat required to raise 1 gram of water 1° C.; but as this varies slightly with the initial temperature, it is necessary to specify that the rise is from some given point, such as from 15.5° to 16.5° C., or that it is  $\frac{1}{100}$  of the quantity of heat required to raise 1 gram of water from 0° to 100° C. In dealing with larger quantities of heat, the large calorie, or heat required to raise 1 kilogram of water 1° C., is employed; and this is equal to 3.97 B.T.U. (British thermal units), or quantity of heat that will raise 1 lb. of water 1° F. Owing to the uncertainty in the definition of the degree of temperature, and the variation in the specific heat of water, it is better to express quantity of heat in terms of units of work, heat and work being mutually convertible; according to which the small calorie is equal to 426.5 kilogram metres, or 1,400 ft. lbs. in gravitational units, or  $4.184 \times 10^7$  ergs in absolute units.

**Calorimeter** is the name given to the apparatus used to determine the specific heat of substances, or the amounts of heat evolved or absorbed in various physical and chemical changes. Calorimeters take very diverse forms, according to the particular kind of determination to be carried out in them, varying from quite simple vessels, if the specific heat of a metal is to be determined by adding it to water at a different temperature, to highly complex apparatus, if the specific heat of gases is to be measured, or the method of fusion or evaporation is to be the basis of the operation. In all such experiments the great difficulty is to prevent loss of heat during the process, and many precautions, such as silvering and polishing, enclosing in non-conducting air and vacuum jackets, etc., have to be taken, and corrections made to obviate errors that might arise in this way. See SPECIFIC HEAT, LATENT HEAT, and THERMOCHEMISTRY.

**Calotte**, a cap or coif commonly worn over the tonsure by eccle-

siastics in France in the 15th and 16th centuries. The name was also applied to the padded cap which knights wore under their helmet, and, during the period of the reformation, to a close-fitting woman's headdress. The word, when used in architecture, designates a flattened dome.

**Calottists**, a satirical society founded in 1702 by Aymon and Torsac, of Louis XIV.'s bodyguard, and deriving its name from the *calotte*, a small cap worn by priests to conceal their tonsure. Transformed about the middle of the 18th century into a military institution, it was finally suppressed at the revolution. See *Mémoires pour servir à l'Histoire de la Calotte* (1725).

**Calovius**, or **KALAU**, ABRAHAM (1612-86), leader of the strict Lutheran party in Prussia, born at Mohrungen, E. Prussia, and after filling a theological chair (1637) at Königsberg, was appointed (1650) to a similar position at Wittenberg, along with the post of chief superintendent. In 1665 he launched his polemical *Consensus Repetitus Fidei Veræ Lutheranae* against Calixtus, and followed it up with attacks on Socinians, Arminians, and Calvinists. His chief works were *Systema Locorum Theologicorum* (12 vols. 1655-77); *Biblia Illustrata* (1672); *Historia Syncretistica* (1682).

**Caloyers**, Greek monks of the order of St. Basil. Their rules are severe: flesh foods are forbidden, and their bread must be earned by manual labor. Their most famous monastery is on Mt. Athos. Female caloyers, observing rules similarly strict, form a separate community.

**Calpe**, the mountainous headland in the S. of Spain, now known as Gibraltar.

**Calpurnia**. The last wife of Julius Cæsar, who married her in 59 B.C. Her anxiety for Cæsar when the conspiracy was formed against him, and the dream which made her beg Cæsar not to leave his house on the ides of March, have been made famous by Shakespeare.

**Calpurnius Siculus**, a Roman poet of the 1st century A.D. Little or nothing is known of his life. His works consist of seven eclogues (four others being erroneously attributed to him), or poems of rustic life, closely imitating those of Virgil. His style is elegant, but he is lacking in simplicity and naturalness. Editions: Text, in Baehren's *Poeta Latini Minores*, vol. iii. (1879-83); Schenkl (1885); with notes, Keene (1887); Eng. verse trans., Scott (1890).

**Caltagirone**, tn. and episc. see, prov. Catania, Sicily, 42 m. by

rail S.W. of Catania; is a well-built town, crowns a couple of hills (2,015 ft.) linked by a bridge, and is a favorite place of residence for the rural nobility of the island. It is famous for its good schools, as also for its pottery and statuettes. Pop. (1901) 44,527.

**Caltanissetta**. (1.) Province of Italy, in the middle of Sicily. In the N. it rises to an altitude of over 3,000 ft., and is drained by the Salso and other streams. Sulphur, wheat, wine, salt, olives, and other fruits are the principal products. Area, 1,455 sq. m. Pop. (1901) 327,977. (2.) Capital and episc. see of above province, 43 m. by rail N.E. of Girgenti; stands nearly in the middle of the island, on a lofty plateau (1,930 ft.), and has a cathedral, a technical and a mining school, large fairs, sulphur mines, mineral springs, and potteries. Close by is a monastery in the Norman style, built (1153) by King Roger I. Pop. (1901) 43,033.

**Caltha**, a genus of plants belonging to the order Ranunculaceæ, of which the marsh marigold (*C. palustris*) may be taken as representative. It is the 'cowslip,' used for greens, before it flowers in early spring. Its golden flowers are familiar at the edges of ponds, blooming profusely, and nearly concealing the glossy kidney-shaped foliage. *C. leptosepala* bears white flowers, and *C. purpurascens* has purple stems and rich yellow flowers.

**Caltrop** (A.S. *calcatrippe*), a small iron ball with projecting spikes; was much used in mediæval warfare, the ground over which an enemy was expected to charge being thickly strewn with them, with the effect that the advancing horses were at once disabled by the sharp spikes piercing their hoofs. The effect was equally disastrous in the case of barefooted infantry. Caltraps were also used by the New England colonists, who placed them in the grass around their villages, as a precaution against Indian attacks. The word is, moreover, applied to plants that catch or entangle the feet; and 'water caltraps' is a name given to the Potamogeton water-plant, because it entangles swimmers.

**Caluire et Cuire**, tn., dep. Rhône, France, on river Saône, 3 m. N.N.E. of Lyons. It has potteries, nurseries, and essence distilleries. Pop. (1901) 10,926.

**Calumba**. *Calumbæ radix* is the dried root of *Jateorrhiza palmata*, a lofty herbaceous climbing plant, native of E. Africa. The roots or tubers are brown without and yellow within, and have a bitter taste, due to a substance known as calumbin, and in a

lesser degree to berberin, an alkaloid which also occurs in the barberry. Calumba root, in infusion, is used as a stomachic and tonic, the maximum official dose being half a drachm.

**Calumet**. See LAURIUM.

**Calumet**, the tobacco-pipe specially known among the Algonquin Indians as 'the pipe of peace,' owing to its distinctive use at a council of warriors assembled for the purpose of concluding peace between their opposing tribes; though it was, in fact, used on all solemn occasions.

The Calumet or 'Pipe of Peace.'

Custom prescribed that the calumet should be solemnly whiffed by each warrior in turn, and so handed round. Its long stem, formed of wood or reed, was fringed with eagles' quills, the bowl being made of stone. See *McGuire's Report National Museum* (1897, 1899); *Dorsey's Third Report, Bureau of American Ethnology* (1885).

**Calumpit**, pueb., Bulacan prov., Luzon, Philippine Is., 27 m. N.W. of Manila, on the Pampanga R., near its delta and near the Manila Dagupan R. R. The region is very fertile. It was burned in the war of 1899. Pop. (1903) 13,897.

**Calvados**, dep. of Normandy, France, between the estuary of the Seine on the E. and the Cotentin peninsula on the W. Area, 2,132 sq. m. Cap. Caen. Pop. (1901) 410,178.

**Calvaert**, or CALUWAERT, DENIS, also designated DIONISIO FIAMMINGO (1540-1619), Flemish painter of the Bologna school, born at Antwerp, and studied at Rome under Fontana and Sabbatini. At Bologna he founded a school, which numbered among its students Guido Reni, Albani, and Domenichino. Among the best are: *The Martyrdom of St. Agnes*, in the church of St. Agnes at Mantua; *Paradise*, at Bologna; *The Transfiguration*, at Parma.

**Calvary**, the scene of the crucifixion of Jesus Christ, is situated close to Jerusalem. The Hebrew name was Golgotha ('skull'), derived either from its having been the place of execution, where bones, etc., were constantly lying about, or from its resemblance to a skull. There is no indication in Scripture that it was a hill at all, and the name Mount Calvary does not go back beyond the 5th century; it is, however, spoken of as a conspicuous place (Mark 15:40; Luke 23:49). Golgotha is traditionally placed to the north-west of the (ancient) city, the spot having, as it was supposed, been discovered by Constantine; and here was erected a church, on the site of which stands the present Church of the Holy Sepulchre. Many Roman Catholic churches have a representation of the crucifixion (Calvary) approached by a Via Dolorosa. See JERUSALEM.

**Calvé**, EMMA (1866), French operatic singer, whose real name is EMMA DE ROQUER, was born at Madrid; made her début as Marguerite in Gounod's *Faust* (1882). She appeared in London in 1892, at Covent Garden, in *Cavalleria Rusticana*, and in *L'Amico Fritz* as Suzel, a part she had created at Rome. She first appeared at New York in 1893-94, and again in 1895-96, 1896-97, 1899-1900, and on other occasions. Her *Carmen*, and Santuzza in *Cavalleria Rusticana* are two of her most popular rôles in the U. S. Not only is she a remarkably fine singer, with a voice of extraordinary range, but she is also a very capable actress. Among her most noteworthy impersonations are the leading parts in *Carmen*, in Joncière's *Chevalier Jean*, Massenet's *Sapho* and *Navarraise*, De Lara's *Messalina*, and Samara's *Flora Mirabilis*. Other rôles assumed by her are the Countess in *The Marriage of Figaro*, Ophelia in Thomas's *Hamlet*, Leila in *The Pearl Fishers*, and Pamina in *The Magic Flute*. Mme. Calvé's home is an old castle situated in the Cévennes, about 800 feet above the valley of the Tarn, France. She has built on her estate a home for little girls, in ill health or otherwise unfortunate, and placed here under the care of a Catholic sisterhood, to be taught various useful employments.

**Calverley**, CHARLES STUART (1831-84), English poet, born at Martley, Worcestershire, his surname originally being Blyads. In 1862 he published *Verses and Translations*. He wrote delightfully witty verses in parody of classical and modern poets, and excelled in spirited translation. He published *Fly Leaves* (1872) and a memorial volume entitled *Literary Remains* (1885), to which

was appended a biographical sketch by W. J. Sendall.

**Calvert**, tn., Robertson co., Tex., 83 m. N.E. of Austin, on the Houst. and Tex. C. and the Fort Worth branch of the Int. and Gt. N. R. Rs. It is the trade centre of an agricultural region and manufactures cotton and ice. Pop. (1910) 2,579.

**Calvin**, JOHN (1509-64), the reformer, was born at Noyon in Picardy. Destined for the Roman Catholic Church, he entered the college of the Capettes, where he displayed extraordinary precocity. At the age of twelve he became chaplain to the chapel of the Gésine. He next entered (1523) at the college of La Marche, under the regent Cordier (Corderius). It was to him that Calvin dedicated his *Commentary on the First Epistle to the Thessalonians*. Passing through the college of Montaigu, he became (1527) curé of Marteville, and subsequently curé of Pont-l'Évêque, his father's native town, in 1529. Obeying his father's instructions, he gave up the study of theology for that of law, at Orleans, and afterwards at Bourges. At Bourges he also learned Greek from Wolmar, read the Greek Testament, and became a Protestant. He went to Paris, and in support of the 'new religion' he wrote a commentary on Seneca's *De Clementia* (1532); but persecution became too strong, and he had to flee to Basel, where, in 1536, he produced the *Institutes of the Christian Religion*. Calvin is next found in Geneva in 1536. Here the courageous Farel entreated him to stay, and Calvin received a ministerial charge and the chair of professor of divinity in the academy. Accused of Arianism by Caroly, he successfully defended himself before the Synod of Bern, and in less than a year's stay in Geneva he procured the renunciation of Roman Catholicism by the public authorities; but over an unhappy schism as to the use of unleavened bread in the celebration of the eucharist, Calvin had to leave Geneva and take refuge in Strassburg, where he was at once appointed pastor of a church and professor of theology. Here he composed his *Treatise on the Lord's Supper*, and an eloquent reply to Cardinal Sadolet, who endeavored to win back the Genevese to the Catholic Church. In 1540 he attended the Diet of Worms, and in 1541 that of Ratishon, where he was introduced to Melancthon, who ever after spoke of him as 'the theologian' of the day. In 1541 he returned to Geneva at the public request of the inhabitants, and his system of ecclesiastical discipline, called the Consistory, was established

in the city in the same year. He wrote a *Catechism* in Latin and French, and in 1543 he composed a famous liturgy. Next we hear of him engaged in controversy with the decisions of the Council of Trent in a work called *The Amidote*, and in a long correspondence with Luther, Bucer, and other reformers. In 1554 he received a visit from John Knox, which resulted in an intimate friendship till Calvin's death. A slur is cast on the later part of Calvin's life by his treatment of Servetus, a Spanish physician, who was passing (1553) through Geneva, and who is said, at the instigation of Calvin, to have been seized, imprisoned, and consigned by the council to a cruel death. In 1564 Calvin was visited by Beza, and on May 24 of the same year he died. Calvin's views may be summarized thus: (1) particular election; (2) particular redemption; (3) moral inability in a fallen state; (4) irresistible grace; (5) final perseverance. Calvin held the spiritual presence of Christ in the eucharist, and not the doctrine of consubstantiation. His tenets were directly opposed to those of Arminius. That his opinions on predestination and election have been pushed far beyond his own belief by his Calvinist followers may be illustrated by a passage from his will: 'The blood which my sovereign Redeemer has shed for the sins of the human race'—not, as they teach, for the elect only. As a theological writer, Calvin is remarkable for clearness, method, and scientific exactitude; as a reasoner, he is distinguished for logical acuteness. According to Scaliger, he stood alone among theologians. Calvinism has long been losing ground in England, and the Scottish Free Church litigation proves that it has largely lost its hold on the Scottish people. A complete edition of Calvin's *Works* was issued in 59 vols. by Braun, Reuss, and Cunitz in 1863-1900. See Paul Henry's *Life and Times of Calvin* (1835); Beza's *Histoire de la Vie et la Mort de Calvin* (1564); and other *Lives* by Bolsec (1616), Masson (1638), Fischer, Doumergue (1899), John Scott (1833), T. H. Dyer (1850), and Bungener (1863). See also Schaff's *History of the Christian Church*, vol. vii., pp. 257-844 (1892).

**Calvinia**, dist. and vil. in the N.W. province, Cape Colony, stretching to the Orange R.; chiefly inhabited by nomad Boers. Area, 23,800 sq. m. Pop. of dist. 12,255.

**Calvinistic Methodist Church**. See METHODISM.

**Calvi Risorta**, vil., prov. Caserta, Italy, see of a bishop, with

old cathedral. It is the ancient Cales, celebrated for its wines, praised by Horace. Pop. (1901) 3,308.

**Calvo, CARLOS** (1824-1906), Argentine historian, born at Buenos Ayres. In 1860 he undertook a diplomatic mission to London and Paris, in 1885 was appointed Argentine minister at Berlin, and in 1899-1905 held the similar post at Paris. His chief works include *Derecho Internacional Teórico y Práctico de Europa y América* (2 vols. 1863; 6 vols. 1887); *Anales Históricos de la Revolución de América Latina* (5 vols. 1864-75); *Dictionnaire du Droit International* (1885).

**Calycanthus**, a genus of hardy deciduous shrubs mostly natives of North America. *C. floridus* (the Carolina allspice) grows to a height of 6 ft., and is fragrant in all its parts. *C. occidentalis* (the sweet-scented shrub of California) is taller, and equally fragrant; it is sometimes known as *C. macrophyllus*. Both have axillary, or terminal, purple-brown flowers with numerous sepals, narrow and spreading. *C. praecox* (*Chimonanthus fragrans*), is the winter sweet, which bears its fragrant brownish-yellow flowers in very early spring. All the kinds may be increased by layers or suckers or by division.

**Calydon**, a mythical city of Ætolia, the scene of the hunt of the Calydonian Boar, related by Ovid in bk. viii. of *Melamorphoses*. This legend covers also the magic or sacred boar of Gaelic (as of Cymric legend), and the theory has been advanced (*Ossianic Soc. Trans.*, 1860, vol. v. p. 62) that it represents a porcine worship similar to that of Vishnu, in his avatar as a boar. The Teutonic tribes also held the boar as sacred, and Tacitus mentions that among the Æstyi it was the symbol of 'the mother of the gods.' In modern Europe and in China a pig is still the emblem of luck.

**Calymene**, a genus of fossil trilobites which is very common in Silurian rocks of Europe and N. America.

**Calypso**, a daughter of Atlas, who lived in the island of Ogygia. Homer tells that when Odysseus was wrecked on her island she wished to keep him with her, but after seven years the order of the gods and his longing for home prevailed on her to let him go. (See *Odyssey*.) Another version of the story, adopted in Fénelon's *Télémaque* (1669), substitutes for Odysseus his son Telemachus.

**Calyx**, the outer of the four whorls which compose a typical flower, its parts or leaves being known as sepals. When the sepals are joined together, forming a cup, the calyx is gamosepalous; when the sepals are not united, it

is called polysepalous. Usually the sepals are green, but occasionally they are of other colors; they are then called petaloid. When the calyx is adherent to the ovary, it is called superior; when not adherent, it is inferior. When the sepals are joined together, the terminal part of each that is unattached is called its limb, the united parts of all the sepals together forming the tube.

**Cam**, a mechanical device by which the rotary movement of a shaft may be transformed into any required movement of other parts of the machine which engage with the cam. The simplest instance is the eccentric on a steam-engine shaft, which communicates a reciprocating harmonic motion to the slide-valve; but cams having peripheries of any required curve, or combination of curves, may transmit the most complex movements.

**Cam**, riv., Cambridgeshire, England, formerly called the Granta, flows in a N.W. and then N.E. direction. Its total length is 40 m., and it is navigable as far as Cambridge, 15 m. from its union with the Ouse, 3½ m. s. of Ely.

**Cam**, or **CAO**, **DIAGO**, Portuguese navigator, sent by Alfonso V. of Portugal to continue the explorations of the African coast promoted by Prince Henry; in 1484 discovered the Congo. He also explored the W. African coast from the Congo to the 22nd parallel of s. lat.

**Camaguey**, a popular name for Puerto Principe prov., Cuba, sometimes extended to the city. It was an old territorial division comprising about four-fifths of Puerto Principe.

**Camajore** (anc. *Campus Maior*), tn., Tuscany, Italy, 12 m. N.W. of Lucca; has olive groves. Pop. (1901) 18,548.

**Camajuani**, city, Santa Clara prov., Cuba, 20 m. E. of Santa Clara, and 15 m. W. of Caibarien, with which it is connected by rail. Its importance is due to its communications. It has a post office and telegraph station. Pop. (1899) 5,082.

**Camaldolites**, or **CAMALDULENSIANS**, an austere order of monks founded in 1012 by St. Romuald at Camaldoli, among the Etruscan Apennines, about 30 m. east of Florence. The monastery at Camaldoli is much visited as a summer resort. Pope Gregory XVI. (1765-1846) belonged to the order. Its habit is white, and the members are compelled to fast during two Lents in the year, and to abstain perpetually from flesh. They are also bound to observe strict silence in all public places.

**Camalig**, pueb., Albay prov., Luzon, Philippine Is., 5½ m. N.W. by W. of Albay, on the main road.

It is an important centre in the hemp industry. Pop. (1903) 14,153.

**Camana**, seapt., Peru, cap. of the prov. and on the riv. of the same name, situated in a plain, 4 m. from its harbor and 70 m. W.S.W. of Arequipa. Coffee, olives, and sugar are prepared for export. Pop. 6,000.

**Camargo**, tn., Tamaulipas state, Mex., 100 m. E.N.E. of Monterey and a like distance from the Gulf coast, on the San Juan, near its confluence with the Rio Grande. The mission of San Augustin Laredo was situated here. Pop. 6,815.

**Camargue**, LA, isl., France, in the Rhone delta. It has an area of 150 sq. m., of which one-third is marshy; but in the rest cereals and wine are grown, and cattle and sheep are grazed. It is protected by dikes against inundation, and the mistral, which blows here, makes it healthier than it otherwise would be. Seabirds abound.

**Camarilla**, originally the small or audience chamber of a king, but the term has come to mean a royal clique, junto, or cabal of unofficial court intriguers, in contradistinction to the king's regular ministers and advisers.

**Camarina**, tn. on the S. coast of Sicily, founded as a colony from Syracuse in 599 B.C. It was successively destroyed by the Syracusans (552 B.C.), Carthaginians (405 B.C.), Romans (258 B.C.), and Saracens (853 A.D.). Twice it was reconquered by the people of Gela—in 492 B.C. and 461 B.C.

**Camarines**, **AMBOS**, prov., Luzon, Philippine Is., in middle of S.E. peninsula, between Tayabas and Albay, and the Pacific Ocean and the Gulf of Ragay. Area, 3,092 sq. m., and 83 islands 69 sq. m. additional. A chain of mountains, covered with luxuriant vegetation, runs lengthwise and has several notable peaks, among which Isarog (6,450 ft.) is the highest. The province is rich in natural products, including gold. Nueva Caceres is the capital. Pop. (1903), civilized, 233,472; wild, 5,933.

**Camass** or **QUAMASH**. An important food of the Indians of the Northwestern United States. It consists of the bulbs of various species of *Quamasia*, a liliaceous genus, frequently found in vast colonies in damp places in the West.

**Cambacérés**, **JEAN JACQUES RÉGIS DE** (1753-1824), French statesman, was born at Montpellier. He represented the nobles in the Legislative Assembly (1792), was on the Committee of Public Safety in 1793, and was minister of justice under the Directory. In 1799 he was made second consul in France (with Bonaparte and Lebrun), and afterward became

arch-chancellor of the empire and president of the Senate. It was under his direction that the French *Code Civile* was prepared. He was created Duke of Parma in 1808, but on the overthrow of the empire he was exiled till 1818.

**Cambaluc**, kam-bā-look' (*Khan-Baligh*, 'city of the emperor'), the name by which, during the Middle Ages, Pekin became known to Europe, and rendered familiar by Marco Polo's travels.

**Cambay**, kam-bā' (*Khambhat*), port and capital of a small Indian feudatory state of the same name, Bombay Presidency, India; 52 miles south of Ahmedabad. Once a prosperous and important city, it has declined with the silting up of the Gulf of Cambay and the consequent obstruction to its seaward navigation. Its principal industry is the making of agate, cornelian, and onyx ornaments. Many ruins still attest its former magnificence and extent. The population, at one time 200,000, has shrunk to 30,000. The state has an area of 350 square miles and a population of 75,000.

**Cambay, GULF OF**, a large inlet about 80 miles long and 25 broad, between the peninsula of Kathiawar and the mainland of Bombay; formerly a great commercial resort of Arab traders.

**Cam'berwell**, parliamentary borough, Southeastern London. Pop. (1911) 261,357. See LONDON.

**Camberwell Beauty**, a butterfly. See MOURNING CLOAK.

**Cam'bist**, a person skilled in the foreign exchanges, hence a dealer in bills of exchange.

**Cambium**. See BARK.

**Cambo'dia**, kingdom and French protectorate of Indo-China, bordering on the eastern coast of the Gulf of Siam, situated between Siam on the north and northwest and French Cochinchina and Annam on the south and east. Its area is 67,741 miles, having been increased about 7,000 square miles by territorial acquisitions under the Franco-Siamese Treaty of 1907. The coast, about 160 miles long, forms two bays, Kompong-Som and Kampot, on which stands Cambodia's only haven, Kampot. A little off the coast there stretches a string of islands, most of which are inhabited.

The greater part of the surface of Cambodia is included in the alluvial plain formed by the lower course of the Mekong, which traverses the country, dividing near Pnom-Penh into an eastern and a western arm, while a third arm diverges 70 miles

northwest to Tonle-sap or Great Lake, 100 miles long and 5 miles broad.

**Natural Resources.**—Owing to the periodical inundations, the soil of the plains is remarkably fertile. Sweet potatoes and tropical fruits, from the cocoanut and bread-tree to the guava and banana, flourish luxuriantly. Rice, cotton, sugar-cane, coffee of excellent quality, cinnamon, betel, tobacco (remarkably like that of Manila and Sumatra), indigo, sugar-palm, mulberry (on which silkworms may be reared all the year round), and other industrial plants, prosper. The forests—very extensive and little depleted—are rich in building, joinery, cabinet, and dye woods. Caoutchouc and cardamoms especially abound. The elephant, tiger, panther, rhinoceros, buffalo, wild boar, monkey, and honey bear are included in the fauna. Crocodiles and numerous poisonous reptiles also abound. The rivers teem with fish, and many towns are devoted exclusively to drying and salting fish and manufacturing fish oil.

Iron (the only metal worked) occurs in the province of Kompong-Svai. Limestone is very common. Precious stones (emeralds and rubies) are found in the mountains of Pursat, and coal has been discovered (1880).

**Industry and Trade.**—Agriculture and fishing are the principal occupations, but there are some manufacturing interests. Sugar is made from the fan palm all over the country, and silk weaving is carried on as a domestic industry. There are factories near Pnom-Penh for the shelling of cotton seeds, to which have been added oil-works for the treatment of the cotton grains. Trade is chiefly in the hands of foreigners and is carried on through Saigon, in French Indo-China. Exports include rice, fish and fish products, haricots, cardamoms, palm sugar, skins, tobacco, cotton, mattresses and mats, silks, cocoons, gamboge, ivory, tortoise-shell, pepper, bamboos, and lime. Salt, sugar, textiles, and arms are imported. Transportation facilities are meagre.

**Peoples.**—The total population is estimated at 1,500,000, four-fifths of whom are collected in the valley of the Mekong. About three-fourths of the population belong to the Camboja or Khmer race. Chinese and Annamites, each about 11 per cent., are steadily increasing through immigration. The Malays and Chams (Tsiamis), along the valley, and to the east of the Mekong, constitute about 2½ per cent., and there are small groups

of primitive Cambodians—the Penong, Khois, and Tsiam.

The Cambodians approach the Malay and Indian types, are less Mongoloid and more nearly resemble the Caucasian type than their neighbors. They are tall and robust, copper-colored rather than yellow, the skull elongate, the nose, though flat, more prominent than in the Annamite, and the eyes very slightly oblique. The religion is a development of Buddhism, in which the worship of ancestors forms a large part. Christianity has made little progress.

The Cambodian language has much in common with the other monosyllabic languages of Indo-China, especially those of Siam and Annam. It lacks, however, the varieties of tones, or inflections of voice, by which these discriminate between the different significations of the same monosyllable. The letters are borrowed from the Indian Pali, the parent of all the Indo-Chinese alphabets. Besides the current idiom there is a sort of literary language of Pali vocables used in official ceremonies by the bonzes (monks) and mandarins.

**Government.**—Cambodia is nominally ruled by its own king, but a French resident-general directs the king's political actions. At the head of each province is a French resident, under whom is a native governor. The foreign policy, exchequer, and public works are controlled by the French, and the police and tax collections by the natives. There is a tribunal of first instance at Pnom-Penh, to decide cases with Europeans, with a court of appeal at Saigon.

**History.**—As early as the twelfth century B. C. Chinese records mention an independent kingdom called Fou-nan which occupied the same territory as Cambodia, but the Cambodian kingdom seems to have been founded by colonists from India in the early part of the Christian era. It was a flourishing kingdom until the seventeenth century, with a great army and an inexhaustible war treasure. In the seventeenth and eighteenth centuries some of its outlying provinces were annexed by Siam and Annam and its glory steadily declined. In 1864 Siam was compelled to abandon all claims to Cambodia and it placed itself under the protection of France. In 1884 this protectorate was formally recognized by King Norodom. The present King Sisowath came to the throne in 1904.

**Antiquities.**—A most remarkable feature of Cambodia is the splendid ruins of Khmer architecture. The great piles explored

number over fifty, while the smaller isolated structures are counted by the hundreds. The temple of Angkor-Wat occupies a larger area than that of Karnak in Egypt, and just as vast are the monuments of Préa-Khan (near Angkor), of Méléa, and of Pontéay-Chma. Those of Baion, Préa-Khan (province of Kompong-Soai), Ta-Prohm, Ka-Kéo, and Ek-dey constitute likewise immense groups. Among the ruins are also massive stone bridges so solidly constructed as to have almost all resisted the periodical inundations and shock of huge tree-trunks hurled against them. The bridge of Spean-Tenk measures 470 feet in length, and has 34 arches.

**Bibliography.**—Consult Garnier's *Excursions et Reconnaissance* (vols. viii and xiii); Vincent's *The Land of the White Elephant*; Hannah's *Brief History of Eastern Asia*; and Aymer's *Le Cambodge*.

**Cambodia River.** See ME-KONG.

**Cambon,** kân-bôn', JULES MARTIN (1845), French diplomat, was born in Paris. He served in the Franco-Prussian War, reaching the grade of captain, and after the war was appointed (1871) auditor of the provisional committee which succeeded the Council of State. He was made director-general in the civil service of Algeria in 1874, and governor-general of that colony in 1891. From 1897 to 1902 he was French ambassador at Washington, and during that period acted as intermediary between Spain and the United States at the close of the Spanish-American War. He was ambassador to Spain in 1902, and to Germany from 1907 to 1913. During the Great War he served as General Secretary to the Foreign Office, as adviser to the Foreign Office on Franco-American relations and on matters concerning Alsace-Lorraine, and as one of the French delegates at the Peace Conference. He was elected a member of the French Academy in 1918.

**Cambon,** PIERRE PAUL (1843), French administrator and diplomatist, brother to Jules Cambon (q.v.), was born in Paris. He was secretary of the prefectures of Alpes-Maritimes and Bouches-du-Rhône; and prefect of the Aube, the Doubs, and the Nord. He entered the diplomatic service in 1882 as minister to Tunis, became ambassador at the court of Madrid in 1886, and at Constantinople in 1891. He was named ambassador to Great Britain, an office which he still (1919) maintains.

**Camborne,** kam'börn, parliamentary and market town, West Cornwall, England, 3 miles

southwest of Redruth. It has tin, copper, and lead mines. Pop. (1911) 15,829.

**Cambrai,** kân-brā, town, Northern France, department of Nord, on the River Scheldt; 32 miles south of Lille. It has an ancient citadel, a belfry dating from the fifteenth century, a fine nineteenth century cathedral containing a monument to Fénelon, archbishop of Cambrai from 1695 to 1715, and other modern buildings. It is famous for its fine linen textiles, or cambrics, invented and first manufactured here by Baptiste Coutaing in the fifteenth century. Other industries include tanning, brewing, distilling, sugar mills, and manufactures of linen thread, wool, flax, and soap. Pop. (1906) 21,791.

**Camaracum,** the ancient Cambrai, was one of the chief cities of the Nervii. It was fortified by Charlemagne, and was long governed by its own bishops, to whom the emperor Henry I. ceded it. Taken by the Spaniards in 1595, it was delivered to France by the treaty of Nimeguen (1678). The celebrated League of Cambrai against the republic of Venice, which comprised the pope, the emperor, and the kings of France and Spain, was entered into here in 1508 and here was signed the peace between Charles v. and Francis I. in 1529.

In the World War (1914-19) Cambrai was of special strategic importance as the converging point of four railways and numerous highways. It was occupied by the Germans in the early days of the War and was an important distributing station for the German armies. It was the objective of the great British drive begun on Nov. 20, 1917, but remained in the possession of the enemy until the autumn of 1918, when it was taken by the British (Oct. 9, 1918) in the Cambrai-St. Quentin advance (see CAMBRAI, BATTLES OF).

**Cambrai, Battles of. First Battle.**—With the close of the protracted and costly operation of the Third Battle of Ypres (q. v.) on Nov. 6, 1917, the British High Command faced a serious situation. The Germans had brought large forces to the Western front from Russia, more were on their way, and there were many more to come. If the enemy were left in peace, he had it in his power to create a dangerous situation in the spring of 1918. Moreover, Italy, fighting desperately on the Piave, by all the laws of war deserved some relief in the shape of an Allied diversion. The operations at Passchendaele had compelled the Germans to concentrate heavily on the threatened

front and reduce their strength in other sectors. Haig reckoned that if he could strike at once in an unexpected quarter, he might have the benefit of a real surprise and possibly break the rigidity of trench warfare with a marked effect upon the *morale* of the enemy, who would not anticipate a fresh Allied effort at this time.

Having decided on the policy of a surprise attack, Haig found in that sector of the old Siegfried Line which lay in front of Havrincourt Wood, between the Bapaume-Cambrai road and the Scheldt Canal, an area which offered many advantages. The place was very thinly held by the enemy, and, any considerable British advance would endanger a vital part of the enemy's front, and seriously hamper his communications. Cambrai, a main centre, would be brought under the British guns, as would the great lateral railway which ran through it. The heights of Bourlon would also command the Arras-Cambrai road, and take in the rear the German positions in the southern part of the Drocourt-Quéant line and the Sensée valley.

The Cambrai sector from Bullecourt to the Oise was held by Von der Marwitz's second German Army, which at that time had only eleven divisions in line. In the threatened area it had only three divisions and three more in reserve. The British force was Allenby's Third Army, now commanded by Sir Julian Byng, which had not been seriously engaged since the Battle of Arras (q. v.) in the spring. On the six-mile front of the main attack, Byng had six divisions in line, also two divisions detailed for a subsidiary attack on the left, and a division in support in the main area. The mounted forces at his disposal were four cavalry divisions.

The German defences were complicated and strong. First came the forward positions in the nature of outposts at the ridge of La Vacquerie and at the northeastern corner of Havrincourt Wood. Behind lay the Siegfried Line proper, running northwest to Havrincourt from the Scheldt Canal at Banteux—a line with especially wide trenches to prevent the passage of tanks. A mile or more behind that lay the famous Siegfried Reserve Line, tunnelled to a great depth and heavily wired. Between three and four miles to the east ran the final German position covering Cambrai from Bearevoir by Masières to Marquion.

At twenty minutes past six on the morning of Nov. 20, 1917, a single gun broke the silence.

It was the signal, and just north of the Bapaume road to the hamlet of Gonnellieu in the south a long line of tanks crept forward into the fog, their commander, Gen. Hugh Elles, leading them in his 'flagship.' Gas and smoke were released everywhere from the Scarpe to St. Quentin, and in front of the tanks a dense smoke barrage blinded the enemy's guns. The British artillery broke loose and deluged the German rear with shells, while behind the tanks quietly and leisurely moved six divisions of assault. At Epehy on the south, and at Bullecourt on the north, the subsidiary attacks were launched at the same moment.

The enemy was taken utterly unawares. The tanks cut great lanes in his wire, broke up his machine-gun nests, and enfiladed his trenches, while the British infantry followed to complete the work. At once the outposts went, the main Siegfried Line followed soon, and shortly thereafter the fighting was among the tunnels of the Reserve Line. By half-past ten that also had vanished, and the British troops, with cavalry close behind, were advancing to their final objectives in open country. In the meantime the Twenty-ninth Division, which had been in support, pushed through between the Sixth and Twentieth Divisions as a spearhead, taking Marcoing and Neuf Wood, and turning south entered Masnières, but not before the enemy had managed so to weaken the bridge over the canal that the first tank which tried to cross fell through. They had trouble in the north end of the village, with the result that the Germans had the chance to occupy Rumilly and the sector of their final line of defence south of it. This delayed what might have been the final blow to the enemy defence, for had the cavalry been able to cross the canal in force there was little between them and Cambrai.

The day closed with a remarkable record of success. The subsidiary attacks captured the remainder of the Siegfried Line at Bullecourt with 700 prisoners. On the whole front over 5,000 prisoners were brought in. Byng had carried the outposts, the Siegfried Line, and the Siegfried Reserve Line on most of his front, and had broken into the final lines at Masnières. He had won nearly all his objectives; but at three points, and vital points, he had not succeeded. He had not yet got Rumilly and Crèvecœur, and so had not obtained that defensive flank which he needed for his swing to the north. Nor had he won

the crossing of the Scheldt Canal, and breached the final line widely enough to let the cavalry through, for which the destruction of the bridge at Masnières and the check of the Fifty-first Division at Flesquières village were to blame. The last also prevented the attainment of the most important objective of all, the Bourlon Ridge, the garrison of which was re-inforced. The first shock of surprise had passed, and the chance for cavalry was gone.

The attack was continued next day. By 8 A.M. Flesquières had fallen and by 11 A.M. the final German line had been breached to the north of Masnières. The enemy counter-attacked from Rumilly but were beaten off, and at Noyelles part of the Thirty-ninth Division and dismounted regiments of the First and Fifth cavalry divisions were hotly engaged during the day. On the extreme right the attack on Crèvecœur was hung up by machine-gun fire at the canal crossings. On the extreme left, the Thirty-sixth Division, pushing north of the Bapaume road, got into the outskirts of Mœuvres, where they found a stiff resistance. But the vital point was on the left centre, where the Fifty-first and Sixty-second Divisions, assisted by tanks and squadrons of the First cavalry Division, were struggling desperately towards Bourlon. Anneux, Cantaing, and Fontaine-Notre-Dame were taken, but Bourlon Wood itself was a machine-gun nest which barred the infantry advance, though a few tanks penetrated some way into its recesses.

By this time the enemy's reinforcements were hurrying up from Lens and Flanders. The three vital points—Rumilly, Crèvecœur and Bourlon—had not been gained. Haig decided to view the action thus far as a substantive battle and press for a decision. Beginning Nov. 23, the greatest effort for the next few days was made to take the Bourlon Wood and village, and by Nov. 27 both places and Fontaine - Notre - Dame had changed hands six times, although at that time the British held a strong position on the Bourlon Ridge. To the south the Twelfth Division had won ground in the Siegfried Line northwest of Bullecourt. In the week's fighting the British took over 10,500 prisoners and 142 guns, and carried 14,000 yards of the main Siegfried Line and 10,000 yards of the Reserve Line. They held a salient formed like a rough rectangle some 10 miles wide and 6 miles deep, but it was awkwardly placed, as neither the positions to north

nor east which would have made it secure had been won. During the week, also, the enemy by means of fine communications had been hurrying up troops for a counterstroke.

Cambrai had beyond a doubt startled the German High Command, who realized that only by the narrowest margin had they escaped a catastrophe. By Nov. 29 sixteen fresh German divisions had arrived. The British being aware of this, took measures to prepare for the worst by bringing up fresh reserve divisions to replace and support their exhausted troops, and by placing additional machine-guns. Nevertheless, the enemy secured a tactical surprise. Ludendorff planned to strike hard on both flanks and press in the centre. On his right he hoped to win the line Flesquières - Havrincourt, and on his left Ribécourt-Trescault - Beaucamp - Couzeaucourt, and so nip off all the British troops in the front of the salient. Twenty-four divisions, the bulk of them fresh, were used for the attempt. He used also his new tactics, designed on the Eastern front and first practiced at Caporetto.

At 7.30 A.M. on Nov. 30, a storm of gas shells broke out on the 10 miles between Masnières and Vendhuile. There was no steadily advancing barrage to warn of the enemy's approach, but the thick mist enabled his infantry to approach the British trenches while they were still under cover. The result was that the line from Bonavis Ridge to Vendhuile was overwhelmed and at 9 A.M. the enemy were in Gouzeaucourt.

The situation was saved by the Twenty-ninth Division at Masnières, which did not yield ground but beat off attacks, though covered by the enemy on flank and rear. Its heroic resistance defeated the German plan of a frontal assault and gave Byng time to attend to his broken right wing, where the Guards came into action at midday, filling out the gap at Villers Guislain, retaking Gouzeaucourt and completing the linking up of the line at La Vacquerie after hard fighting on St. Quentin Ridge. In the meantime, the greater part of the enemy's force had hurled itself against the front between Mœuvres and the Scheldt Canal after a severe preliminary bombardment followed by a barrage. A little after 9 A.M. the German infantry came on in wave after wave, so that by evening as many as eleven waves had advanced in one area. The fiercest thrust was at the Bourlon Wood, but the assault failed by evening of the same day.

The battle, however, was not over. On Dec. 1 the British Guards advanced, captured the St. Quentin ridge and entered Gonnelleu, while further south, with the help of tanks and the dismounted Ambala brigade of Indian cavalry, they took Gauche Wood but failed to enter Villers Guislain. There was heavy fighting, also, at Bourlon and Marcoing; and at Masnières the Twenty-ninth Division beat off no less than nine attacks. But the Masnières position, with the Bonavis Ridge in the enemy's hands, was precarious and that night the Twenty-ninth Division withdrew to a line west of that village. On Dec. 2 and 3 there was a further withdrawal, until the British occupied a position west of the Scheldt Canal near Marcoing. The new salient was in grave danger, though little happened for the next two days. The enemy strength seemed to be exhausted. It became clear to Haig that he must regain the Bonavis Ridge to make his positions secure, but that meant a new and severe engagement for which he had not the troops. Consequently he gave up the Bourlon position for which his troops had so gallantly fought. The shortening of the line began Dec. 4 and was completed by the morning of the 7th. The new front, which in its northern part corresponded roughly to the old Siegfried Line, ran from the Canal du Nord, along the Welsh Ridge to La Vacquerie. South of that it ran west of Gonnelleu and Villers Guislain, rejoining the old front at Vendhuile. For some days there was local fighting but the battle was over, and by the end of the year the Cambrai front had returned to the normal winter activity.

Viewed in the light of the central strategy of the war, Cambrai effected nothing. It was a brilliant feat of arms, but it had no real bearing upon the fortunes of either combatant.

#### *Last Drive on Cambrai.*—

When the last advance against the German defences which finally broke them up before its hammer blows and thus ended the European War (see EUROPE, GREAT WAR OF) was set in action, the British Third Army under Byng lay before Cambrai; to his left was Horne's First Army before Douai; and on his right before St. Quentin (q. v.) lay Rawlinson's Fourth Army, to which the Second U. S. Corps (Twenty-seventh and Thirtieth Divisions) had been assigned. Opposed to the British in this area were the German Seventeenth Army under Otto von Below, in front of Douai and Cambrai, and the Second Army under Von Carolwitz to St. Quentin. The

strategy of this last assault was that of a general pressure on all parts of the salient of the Western front; the vital elements were the attacks of Pershing and Gouraud in the south and of Haig in the centre. The first made retreat imperative and the second destroyed the machinery of retreat.

The first day of the assault, Sept. 26, 1918, Pershing and Gouraud struck a smashing blow against the German right. The next Haig struck towards Cambrai. The defense here was the Siegfried zone, of which the northern limits formed the southern end of the water-line protecting Douai. North and south of Mœuvres the enemy had the Canal du Nord as an extra defence to cover that gap between the water-line and the Scheldt Canal, which offered an approach to Cambrai. But the strongest part of the zone was opposite Rawlinson's front between St. Quentin and Bantouzele, where the Scheldt Canal formed the outworks of the system. The principal German trenches were on the east bank, but on the west bank lay advanced posts skillfully sited, so as to deny the attack effective artillery positions. The canal gave cover for resting troops and shelter to the garrisons of the outpost line during bombardment. From Vendhuile south to Bellicourt the canal passed through a tunnel 6,000 yards long, which was connected by shafts with the trenches above. North of Vendhuile the canal lay in a deep cutting, the sides of which were honeycombed with dug-outs and the edges studded with armored machine-gun emplacements. From Bellicourt south to Bellenglise the cutting became shallow, till at the latter place the canal was almost on the ground level, while south of Bellenglise it was dry. From there southward the enemy had two heavily wired trench lines, nearly a mile west of the canal, while north of Vendhuile his positions were on the east bank. These were, so to speak, the outpost and battle zones of the system; but it ran back for a distance of from five to seven miles, a belt of country containing many subsidiary lines and numerous fortified villages, and culminated in what was known as the Beaufort-Ponsomme line, a double row of trenches analogous to the front position. East of that there was open country.

Haig had selected the southern section between Vendhuile and Holnon, held by the Fourth Army, as the main area of attack. But there the Siegfried defences were at their strongest,

and a long 'preparation' was necessary. He therefore decided to attack first with the First and Third Armies from Vendhuile north to the water-line in order to puzzle the enemy as to the quarter in which the chief blow would be delivered, and to enable the two armies to get forward so as to simplify Rawlinson's task. On the night of Sept. 26, a heavy bombardment opened between St. Quentin and the Sensée. At 5.30 A.M. on Sept. 27, Byng and Horne advanced on a front of thirteen miles, between Gouzeaucourt and Sauchy-Lestrée. The key of the problem was the *debouchement* on a narrow front in the Mœuvres area, for the Canal du Nord north of that place was too strong to be pressed in the face of the enemy. But if the canal could be crossed there, the northern sector might be turned by an attack fanning out from the bridgehead. This task was entrusted to the Sixty-third Division, and the Fourth, Third, and First Canadians. Just at dawn these divisions stormed the canal and swung forward on Graincourt, Anneux and Bourlon—the storm centre of the First Battle of Cambrai—all of which were taken by evening. On the right the Fifty-seventh and Fifty-second Divisions were east of Anneux and close upon Fontaine-Notre-Dame. Further south the Guards and the Second Division took Ribécourt and Flesquières, while the Fifth and Forty-second Divisions had established a flank between Ribécourt and Beaucamp. In the left centre the First Canadians and the Eleventh Division had taken Sains-lez-Marquion, Haynecourt, and Epinoy, and on the extreme left the Fifty-sixth Division was in part across the canal and moving towards Palluel. That evening the British had taken over 10,000 prisoners and 200 guns; and they were everywhere across the Canal du Nord and close on the Scheldt Canal south of Cambrai.

Next day Fontaine-Notre-Dame, Marcoing, and Gouzeaucourt fell, and at Marcoing the British reached the east bank of the Scheldt Canal, while further north Saily, Palluel and Aubencheul-au-Bac had been entered. Cambrai was now menaced on two sides, and the defences of the gap had been destroyed. The great road-and-rail junction was out of action, and Douai was also threatened by the turning of its water-line on the south. Worse still, the crossing of the Canal du Nord by tanks on the back of tanks, and the passing of the Scheldt Canal at Marcoing, had broken Luden-

dorff's confidence in his outer Siegfried defences. He was now hotly engaged in two vital sectors and having no general reserves, and unwilling to take troops from Rawlinson's front, he could look only to St. Gobain and the Aisne sections or to Von Armin and Von Quast in the north for aid.

On the twenty-ninth New Zealanders cleared Welsh Ridge and took La Vacquerie; the Sixty-second Division took Masnières on their left, crossed the Scheldt Canal east of Cantaing, and reached the southern skirts of Cambrai. Farther north the Canadian Corps took St. Olle and Sancourt, and reached the environs of Cambrai from the northwest. Already both Cambrai and St. Quentin were gravely outflanked. The next day the German resistance stiffened at Cambrai, but the Canadians, advancing slowly, were in the suburbs of Provville and Tilloy.

On Oct. 1, Byng advanced on his right, the Third and New Zealand Divisions took Crèvecoeur and Rumilly. The Canadians were still battling fiercely in the northern and western skirts of Cambrai.

The position on Oct. 7 was as follows: Haig had crossed the Canal du Nord and the Scheldt Canal; he had broken through all the front Siegfried Line and was pressing upon the last defences, in one section being actually beyond them. The time was ripe for a great movement on the broadest possible front which should destroy the whole zone beyond which lay nothing but the natural obstacles of a wooded and well-watered country between the British army and Maubeuge.

The great movement was begun on Oct. 8 by Haig. Byng and Rawlinson attacked on a 17-mile front from south of Cambrai to Sequehart, while Debeney extended the battle four miles further south. The Germans resisted desperately, but no gallantry had power to stay the rush of the Allied infantry and the deadly penetration of their tanks. The whole Siegfried zone disappeared in a cataclysm. Byng's New Zealanders took Lesdain and Esnes; the Third, Second, and Sixty-third Divisions took Searnvillers, Forenville and Nierngies; while on Byng's extreme left the Fifty-seventh Division forced their way forward into the southern part of Cambrai, which the Germans had previously set on fire. By evening Haig and Debeney had advanced between three and four miles, and the Siegfried zone was no more. The enemy was falling back to the

Oise and the Selle, and for a moment his organization had been broken. Every road converging upon Le Cateau was blocked with transports and troops, and the Allied cavalry galloped forward to confuse the retreat.

During the night the Canadian Corps forced their way at last into Cambrai from the north, and joined hands with the Fifty-seventh Division. The next day, Oct. 9, Byng and Rawlinson again advanced and pressed the retreat. Cambrai was occupied and the Canadians pushed three miles east of the town. Bohain was taken, Cauchy was outflanked, and the British advance guards were within two miles of Le Cateau, the old battle field where on Aug. 26, 1914, Smith-Dorrien and the Second Corps had saved the British Army. See EUROPE, GREAT WAR OF.

**Cam'bria**, the Latin name of Wales, derived from the Celtic Cymry, and originally applied to both Wales and the Cymric kingdom of Strathclyde, but now restricted to the principality. See WALES.

**Cambrian System**, the name given to the great series of sedimentary deposits which come next in order of succession to the Archæan System.

In North America the Cambrian or Primordial system comprises an upper series of shales and sandstones (Acadian series), and a lower one of sandstones, etc. (Potsdam series). These strata have been recognized in Newfoundland, Nova Scotia, New Brunswick, and Canada, and in the States of Massachusetts, Vermont, and New York. They appear also in many different places along the Appalachian chain, also round the Great Lakes and in several areas in the far western States, especially in Utah, Nevada, and in the Grand Cañon of the Colorado.

The British Cambrian rocks are best developed in Northern Wales, and are also well represented in Shropshire, etc. They consist largely of coarse red and purple graywackes, sandstones, grits, and conglomerates, and grayish-blue and green slates and slaty shales; and the same general character is maintained by the rocks of this system in other parts of the world. In Ross-shire and adjoining districts in the northwest of Scotland certain dark reddish-brown conglomerates and sandstones are found overlying unconformably the Archæan rocks of that region, and are themselves covered unconformably by Silurian strata. They form the pyramidal-shaped mountains of Sulven, Canisp, and Coulmor. Cambrian strata with a few fossils have also been

recognized in the southeast of Ireland, where they attain a thickness of 14,000 feet at least.

The Cambrian strata are for the most part unfossiliferous—organic remains being met with chiefly in the higher members of the system. Remains of plant life occur sparingly if at all. Animal life, however, is surprisingly well represented, as by sponges (Protospongia), sea-lilies (Dendrocrinus), cystideans (Proto-cystites), and star-fishes (Paleasterina). Worm-burrows and worm-castings often abound, and crustaceans are plentiful—the modern groups of Ostracods (water - fleas) and Phyllo-pods (brine-shrimps, etc.) being represented. The most notable crustaceans, however, are the Trilobites, some of which were very minute and blind (agnostus), while others attained a length of one or two feet. (Paradoxides). The Brachiopods belong almost exclusively to the 'inarticulate' group—the three most characteristic forms being Lingulella, Discina, and Obolella. Four out of the five classes of Molluscs now existing appear in the Cambrian—*viz.*, lamelli-branches, pteropods, gasteropods, and tetrabranchiate cephalopods. The last are represented by straight and curved chambered shells (Orthoceras, Cyrtoceras) which belong to the family of the Nautilidae. The lamelli-branches and gasteropods, which attain their maximum in our own day, appear to have been but sparsely present in the seas of Cambrian times, but some of the gasteropods, such as the snail Pleurotomaria, are types still living. The same, it may be remarked, is the case with some of the brachiopods (Lingulella, Discina), which have persisted to the present day.

Cambrian rocks have been recognized in various other parts of Europe, as in Central and Southern Sweden, where the strata are not nearly so thick as in the British area. In Central Brittany and in the Ardennes they are likewise represented, and they also come to the surface in several provinces of Spain. The most important continental area in Europe, however, is that of Bohemia.

**Cambric**. See LINEN.

**Cambridge**, kām'brij, capital of the English county of the same name, and site of Cambridge University (q. v.), is situated on the river Cam, about 55 miles northeast of London. Besides the University buildings and grounds, features of interest are the Guildhall; Addenbrooke's Hospital; St. Sepulchre's, the oldest of the four round churches in England; Great St. Mary's, the university church, a fine specimen of Per-

pendicular Gothic; St. Benedict's, the oldest building in Cambridge and an excellent example of Saxon architecture; the Perse School, a free grammar school for boys; and Parker's Piece, the playground of Cambridge.

During the Roman occupation Cambridge was known as Grant-bridge. It was burned by the Danes in 870 and again in 1010. In 1068 William the Conqueror erected a Castle for military operations on what is known as Castle Hill, but all traces of it have disappeared. Stourbridge Fair, granted to the town by Queen Elizabeth, was, until the eighteenth century, the most important and flourishing market in England. Pop. (1914) 59,159.

**Cambridge University**, one of the two ancient universities of England, probably dates from the twelfth century, though the year and mode of its establishment are undetermined. One legend runs that it owes its origin to Cantaber, a Spanish prince, brother of Partholin, the king of Ireland, who brought philosophers and astronomers from Athens as early as 300 B.C.; while another gives the credit of its foundation to King Siebert of East Anglia in 635. The generally accredited account is that the Abbot of Croyland, who had been educated at the University of Orleans, brought with him to Cambridge, in 1110, four monks well instructed in philosophical problems, who taught their sciences in a hired barn and in a short time attracted a large following of scholars. The friars and other religious teachers of the time assisted them, and they soon formed themselves into an association or university. The letters patent addressed to the mayor and burgesses of the town by Henry III. in 1231 are the earliest documents which can be regarded as a university charter.

The university as a corporate body consists of the chancellor, the masters, and the scholars. The chancellor, usually a nobleman of high rank, is the chief executive officer. The governing body (called the senate) consists of the chancellor, vice-chancellor, doctors of divinity, law, and medicine, science and letters, doctors of music, bachelors of divinity, and masters of arts, law, surgery, and music. The university sends two representatives to Parliament, elects the chief officers and examiners, and sanctions all degrees. The resident members of the senate annually elect one of the heads of colleges (masters) as vice-chancellor, through whom the chancellor generally acts. They also elect 'the council of the

senate,' a most important body of sixteen persons, which initiates all legislation, nominates the syndicates and persons by whom university business is carried on, and has a veto on every degree.

The colleges are separate corporations independent of each other, and, in most things, of the university. The head of King's College is called the provost, the head of Queen's College the president, the head of every other college the master. Fellows are those who have been co-opted into the governing body of the college. By recent legislation certain fellowships—one or more in every college—have been appropriated to university professors, and the colleges are required to pay a proportion (now more than a tenth) of their net income into the common fund of the university. The university has very little income of its own. Its revenues are derived chiefly from fees for matriculation, examination, and degrees, and from the taxation of the colleges.

Members of the student body are of three classes: the scholars, chosen by examination and having certain privileges; the pensioners, who pay for their board and lodging and constitute the great majority; and the sizars, or poorer students who pay smaller fees and receive their commons gratis. The academic year is divided into three terms. The method of tuition consists of the lectures, classes, weekly papers, and examinations. Special written examinations for honors, called *trijoses* from the three-legged stool or tripod occupied in former times by the one to be examined, are as follows: Mathematics (established 1747); Classical (1822); Moral Science (1851); Natural Science (1851); Law (1858); Theological (1874); Historical (1875); Mediæval and Modern Languages (1886); Mechanical Science (1894); Oriental Languages (1895); Economics (1903).

The University confers the degree of bachelor, in arts, divinity, law, medicine, music and surgery; of master, in arts, law, music, and surgery; of doctor, in divinity, medicine, music, science and letters.

The colleges, seventeen in number, are as follows:

*Peterhouse*, or *St. Peter's*, the oldest college, was founded in 1284 by Hugh de Balsham, sub-prior of Ely. The quadrangle was begun in 1424, and in 1590 Dr. Perse bequeathed his books and money to build a library. Dr. Matthew Wren, in 1628 built the chapel. The Gisborne court was added in 1825. Peterhouse is one of the small colleges. It has 11 fellowships and 23 scholarships.

*Clare College* was founded in 1326 by Dr. Richard Badwe, under the name of University Hall. In 1338 Elizabeth, Countess of Clare, founded her college, and in 1340 obtained possession of University Hall and decreed that it should be known as 'House of Clare.' It consists of a single court, and is perhaps the most elegant building in Cambridge. It has 18 fellowships and 31 scholarships.

*Pembroke College* was founded in 1347 by Marie de St. Paul, widow of Aymer de Valence, Earl of Pembroke. It was the first collegiate house to be built, not adapted from existing buildings. The entrance gate, the chapel (the earliest built for any college), and two sides of the original quadrangle still remain. The hall, combination room, and master's lodge were destroyed, and were rebuilt in 1870-5 by Waterhouse. The second court was built in 1633-59: its chapel was built (1663-5) by Bishop Wren, after a design by his nephew, Sir Christopher Wren; and the new building east of the master's lodge was built (1883) by the younger Scott. Trinity alone outshines Pembroke in the fame of its scholars. It has 13 fellowships and 34 scholarships.

*Gonville and Caius College*, founded in 1348 by Edmund Gonville, rector of Terrington, Norfolk, was removed to its present site in 1352, and re-founded in 1557 by Dr. John Kaye, or Caius, one of the great physicians of the sixteenth century, who, in 1565, built the second or Caius court to the south of Gonville's court, which contained, besides chambers, the hall, library, master's lodge, and chapel. He directed that the south side of the court should be left open for ventilation and light, thus showing himself 300 years in advance of his time. Till 1868, when the first or tree court was rebuilt by Waterhouse, the college was entered from Trinity Street through a small doorway called the Gate of Humility. Caius has always been the great medical college of Cambridge, and its character is partly maintained by the Tancered medical studentships. Dr. Harvey, the discoverer of the circulation of the blood, was educated here. There are 22 fellowships, and 36 scholarships.

*Trinity Hall*, founded in 1350 by William Bateman, bishop of Norwich, for the study of the canon and civil law, has three courts. The library contains a very valuable collection of law books, and has retained its ancient aspect better than any in the University. There are 13 fellowships and 12 scholarships.

*Corpus Christi*, or *Benet College*,

was founded in 1352 by the town guilds of Corpus Christi and the Blessed Virgin Mary on the site previously occupied by Gonville Hall. The old court, built by the guilds, was the first closed quadrangle constructed in Cambridge, and is the oldest collegiate structure still remaining. A gallery connects it with the neighboring church of St. Benedict (Benet's), which for a long time served as the college chapel. The new court was built by Wilkins (1823-7). The glory of the college is the library, which contains the unique collection of manuscripts collected by Archbishop Parker, master from 1544 to 1553, and the Lewis collection of coins,

of wills. Until 1857 students claimed and received the B.A. degree without submitting themselves to the examinations required by the other colleges. Of the buildings intended by the founder, the only one completed was the chapel, which has been described as 'one of the rarest fabrics in Christendom.' It is one of the finest and most complete Perpendicular buildings in the country, and is particularly noteworthy for the magnificent glass in the twenty-six windows, the lofty fan vault of stone, and the rood or organ screen which separates the choir and antechapel. There are 46 fellowships and 48 scholarships.

was built in 1891. There are 14 fellowships and 18 scholarships.

St. Catherine's College was founded in 1473 by Robert Wode-larke, third provost of King's College. Nothing remains of the original buildings. Dr. Eachard, master from 1675 to 1697, began to rebuild the present main court, while the chapel, consecrated in 1704, was extensively restored in 1896. The new master's lodge was built in 1875. There are 9 fellowships and 26 scholarships.

Jesus College was founded in 1497 by John Alcock, bishop of Ely, its plan following the arrangement of the Benedictine nunnery of St. Radegund, on the site of which it stands. The

Trinity College, Cambridge.

gems, vases, and plate. There are 12 fellowships and 31 scholarships.

King's College was founded by King Henry VI. in 1441, but, when in 1443 he enlarged the scope of his foundation, it was connected with Eton. The first stone of the chapel was laid in 1446, but the high altar was not put in place until 1545. The fellows' building, by Gibbs, was erected in 1724; the hall, library, provost's lodge, and screen, by Wilkins, in 1824; Scott's building in 1870; and Bodley's building in 1893. The provost had within the precinct 'all manner of spiritual and temporal jurisdiction,' including the probate

Queen's College, founded in 1448 by Andrew Duket under the patronage of Margaret of Anjou, queen of Henry VI., and refounded in 1465 under that of Elizabeth Woodville, queen of Edward IV., was built of red brick, after the plan of the manor-house, Haddon Hall. The gallery over the cloister, a singularly beautiful specimen of British architecture of the 16th century, connects the president's lodge with the western range, and contains many valuable pictures. Other interesting features are the sun dial on the clock tower, said to have been made by Sir Isaac Newton, and an ancient wooden bridge across the river. The new chapel

chapel, restored in 1846, is cruciform with a central tower and windows of stained glass by Burne-Jones and Morris (1873-7). There are 16 fellowships and 32 scholarships.

Christ's College, originally founded in 1439 by William Byng-ham, under the name of 'God's House,' was enlarged and practically refounded (1505) by Lady Margaret Beaufort, mother of Henry VII. The first court was probably completed by the foundress before her death in 1509, while the hall was rebuilt in 1876 by the younger Scott. In the second court stands the fellows' building (1640-2), partly built by Inigo Jones, and called by Evelyn

'a very noble erection . . . of exact architecture.' Beyond this building is another, similar in style, erected (1888-9) by Stevenson. The college offers 15 fellowships and 30 scholarships.

*St. John's College*, the second foundation of the Lady Margaret, who in her will (1510) suppressed the hospital of St. John the Evangelist (founded in 1135), is entered through the most beautiful of all the Cambridge gateway towers. The first court, built in 1510-14, contains the new chapel, constructed by Sir G. G. Scott (1864-9), and the hall (lengthened in 1865), which has good original panel-work and a valuable collection of college portraits. The second court is a most beautiful piece of Elizabethan brickwork, built (1595-1620) by Ralph Simons. On the right is the gallery, now used as a combination room—the finest specimen of its class left in England—and through which the library is reached, an interesting example of Jacobean Gothic, built (1623-8) by John Williams, bishop of Lincoln. The third court was built in 1669-73. The gateway on the west and a covered bridge of one arch called the Bridge of Sighs lead to the fourth court, built by Rickman and Hutchinson (1826-30). The 'Backs,' so called—walks extending along the river to Queen's Grove—are thickly shaded with ancient trees. There are 56 fellowships and 60 scholarships.

*Magdalene College* (pron. *Maudlin*), was founded in 1542 by Thomas, Lord Audley, to replace Buckingham College, the site of which had been granted by Henry VI. (1428) to the English Benedictines. The entrance gateway (1585) opens into the single quadrangle containing the chapel (restored in 1850), the hall (built in 1519-21 by the third Duke of Buckingham), and the foundation library. Beyond the hall is the Pepysian library, a valuable example of 17th-century architecture, containing the manuscript of Pepys' famous *Diary*. A new range of buildings by Webb was finished in 1909. There are 7 fellowships.

*Trinity College* was founded in 1546 by Henry VIII., by the union of King's Hall (1337), Michaelhouse (1324), Fyswick's Hostel, and some minor hostels. The chapel, begun by Queen Mary and finished by Queen Elizabeth, contains statues of Newton, Bacon, Barrow, Macaulay, and Whewell, and the graves of Bentley and Porson. The fountain, queen's gate, and hall were built by Neville (1593-1604). Through the screens is Neville's or the Cloister Court, the western side of which is the library, designed by Sir Christopher Wren, and

containing busts by Roubiliac, Thorwaldsen's statue of Byron, exquisite carvings by Gibbons, manuscripts of several of Milton's poems, a large collection of coins, and many rare books and manuscripts. Besides this court there are New Court, Bishop's Hostel, the Great Court, and Whewell's Courts. There are 63 fellowships and 80 scholarships.

*Emmanuel College*, founded in 1584 by Sir Walter Mildmay, occupies the site and buildings of the house of the Dominican friars. It is composed of two quadrangles. The chapel and cloister (1666-77), with the master's gallery above, were designed by Sir Christopher Wren. The 'brick building' dates from 1633, and 'the hostel' from 1885-94. There are 16 fellowships and 36 scholarships.

*Sidney-Sussex College* was founded in 1588 by a bequest of the Lady Frances Sidney Sussex, on the site of the house of the Franciscan friars, and incorporated by charter of Queen Elizabeth in 1594. It has three courts of three sides each. The present chapel is all that remains of the old Franciscan buildings. The hall contains the best extant portrait of Oliver Cromwell, who entered at Sidney-Sussex College. There are 11 fellowships and 36 scholarships.

*Downing College*, founded by the will of Sir George Downing (1717), did not receive its charter till 1800, owing to the litigation following the death of the founder (1749). The buildings, forming an irregular quadrangle, were designed by Wilkins in 1807. There are 6 fellowships and 6 scholarships.

Mention should be made of Selwyn College (1882), a public hostel for members of the Church of England, and Fitzwilliam Hall, the headquarters of the non-collegiate students. Ridley Hall (1879-82), the Clergy Training School, St. Edmund's House (for candidates for the Roman priesthood), Westminster College (1899, for Presbyterian students of theology), and the two colleges for women, at Girton (1869) and Newnham (1875), have no formal connection with the university.

The Fitzwilliam Museum, a sumptuous building, contains a large collection of paintings, illuminated manuscripts, engravings, vases, coins, and gems. The new museums of science, with lecture rooms, laboratories, and workshops, cover a very large area and are centrally located on and near the site of the old botanical garden.

Consult C. Dickens's *Dictionary of the University of Cambridge*; *The Architectural History of the University of Cambridge*, by Wil-

lis and Clark; J. Bass Mullinger's *History of the University of Cambridge*; Atkinson's *Cambridge Described and Illustrated*; Humphry's *Cambridge: The Town, University and Colleges*; *Student's Handbook to the University and Colleges of Cambridge* (1919).

**Cambridge**, city, Maryland, the county seat of Dorchester county, is situated on the Choptank River, on the Pennsylvania Railroad, and on steamboat lines to Baltimore; 57 miles southeast of Baltimore. It is in a fertile agricultural region and has a good trade in farm produce, fruit, livestock, fish, and crabs. It manufactures underwear and lumber and has flour mills and oyster and tomato canneries. Pop. (1910) 6,407; (1920) 7,467.

**Cambridge**, city, Massachusetts, one of the county seats of Middlesex county, is situated on the Charles River, which separates it from Boston, and on the Boston and Maine and Boston and Albany Railroads. Electric lines join it with a large number of surrounding towns, and several bridges across the Charles River connect it with Boston. The city covers an area  $4\frac{1}{2}$  miles long by 1 to 2 miles wide. Harvard Square at the southwestern corner of Harvard University grounds is a converging point for all the interurban railways and chief thoroughfares. Cambridge has many beautiful residences and broad streets shaded by magnificent old trees. It is the seat of Harvard University (q. v.) with its many beautiful buildings, of the Episcopal Theological School, Radcliffe College, Massachusetts Institute of Technology, removed there from Boston in 1916, and Andover Theological Seminary. Other important buildings are the Public Library, First Parish Church (Unitarian), Shepard Congregational Church, Christ Church (Episcopal), Cambridge Hospital, Home for Aged People, the Y. M. C. A., Y. W. C. A., Margaret Fuller House, the Craigie house, which was Washington's headquarters and later occupied by Longfellow, and Elmwood, the home of James Russell Lowell. The Washington Elm, under which Washington took command of the Continental army in 1775, still stands near the common. There is a fine park system including the Charles River Embankment and Fresh Pond. The Botanical Gardens, covering an extensive area and filled with a great variety of native trees and shrubs, and Harvard Observatory are about a mile from the city. Mount Auburn, west of the city, is the burial place of many famous New England men and women.

Cambridge, although primarily a city of homes and an educational centre, nevertheless has a thriving and ever expanding industrial section. Three important printing establishments, the Riverside Press, the University Press, and the Athenæum, are located here. There are also foundries and machine shops, meat-packing plants, as well as factories for making confectionery, musical instruments, structural iron work, pianos, organs, boots and shoes, rubber goods, automobiles, furniture, and soap. The Census of Manufactures for 1919 gives the number of establishments as 339, with an invested capital of over \$98,742,000, and a value of manufactured products of over \$186,603,000.

The site of Cambridge was at first selected (1630) for the headquarters of the Massachusetts Bay Colony, but it was found to be less advantageous for commerce and defence than the peninsula of Boston. It was permanently settled under the name of Newtowne in 1631, and in 1638 the present name was adopted. Stephen Daye, the first printer in the country, here issued his *Almanack for New England* in 1639. The American army during the siege of Boston was quartered in the town, as were also, later, the prisoners taken at Burgoyne's surrender. In 1846 Cambridge was incorporated as a city. In the Civil War the first volunteer company was organized here. The city comprises Old Cambridge, North Cambridge, East Cambridge, Cambridgeport, and a part of Mt. Auburn. Pop. (1910) 104,839; (1920) 109,694. Consult Eliot's *History of Cambridge, Massachusetts* (1913).

**Cambridge**, city, Ohio, county seat of Guernsey county, on the Baltimore and Ohio and the Pennsylvania Railroads; 76 miles east of Columbus. It is situated in a coal and iron region, and natural gas occurs in the vicinity. It has a public library, children's home, and a courthouse. The leading industrial establishments are glass-works, rolling mills, and manufactures of pottery and foundry products. Pop. (1910) 11,327; (1920) 13,104.

**Cambridge**, GEORGE WILLIAM FREDERIC CHARLES, SECOND DUKE OF (1819-1904), son of Adolphus Frederick (1774-1850), first Duke of Cambridge, and second cousin of Queen Victoria, was born in Hanover. He led a division of Guards and Highlanders at the battle of the Alma (Sept. 20, 1854), and saw service also at Inkerman, Balaklava, and Sevastopol. He became general commanding-in-chief in 1856, and was made field-marshal at the majority of the Prince of

Wales (Nov. 9, 1862). In 1887 he became commander-in-chief, which rank he held until his retirement in 1895.

**Cambridge Platonists**, the name given to a number of distinguished philosophers of the English church in the seventeenth century, sometimes known to their contemporaries as 'Latitude Men.' They drew their inspiration mainly from the study of the Platonic philosophy and sought to reconcile reason and religion. Among their number were Ralph Cudworth and Henry More (qq. v.) See also LATITUDINARIANS.

**Cambridgeshire**, an inland county of England, lying north of Hertfordshire and Essex, south of Lincolnshire, east of Huntingdonshire, and west of Suffolk and Norfolk. It is oblong in shape, about 50 miles long and 30 miles wide, and contains approximately 860 square miles. The northern part is level throughout, while the southern part attains a height of 300 feet near Cambridge and of 100 feet toward the southeast. The chief rivers are the Great Ouse, the Cam, the Lark, and the Nene. The soil is fertile, and agriculture is the most important industry, small fruits, especially strawberries, being largely cultivated. Basket making gives employment to a large number of persons, while brick making, paper making, leather work, printing, and cement making are also carried on. Pop. (1911) 198,074; (1921) 129,594.

**Cambuslang**, kam'bus-lang, parish and town in Northwestern Lanarkshire, Scotland, on the Clyde River; a residential suburb of Glasgow. It has extensive steel works, and brick making and turkey-red dyeing are important industries. Population of the parish (1921), 26,130.

**Cambusnethan**, kam-bus-nē'than, parish and village, Mid-Lanarkshire, Scotland; 1¼ miles southwest of Wishaw, with which it is incorporated. It has coal mines and iron works. Pop. (1921) 32,730.

**Cambyses**, kam-bī'sēz (?-522 B. C.), king of the Medes and Persians, was the son of Cyrus the Great. He succeeded his father on the Persian throne, reigning from 529 to 521 B. C. His great achievement was the conquest of Egypt in 525, during which he treated the Egyptians and their religion with great severity, slaying the bull Apis, their god, with his own hands. Following this he made an unsuccessful attempt to conquer Ethiopia. He was a cruel and tyrannical ruler, instigating the murder of his own brother as well as bringing death to many other leading men. A revolt led by Gaumata, a Magian priest impersonating Cambyses' murdered

brother Smerdis, recalled him from an expedition against Carthage, but he perished, either by accident or by suicide, at Ectabana on the return. His excesses are sometimes attributed to insanity.

**Cam'den**, city, Arkansas, county seat of Ouachita county, on the Ouachita River, a terminus for steamers from New Orleans, and on the Missouri Pacific, the Chicago, Rock Island, and Pacific, and the St. Louis and Southwestern Railroads; 90 miles southwest of Little Rock. It is a trade centre for live-stock and agricultural products and manufactures cotton, cotton-seed oil, wagons, and lumber. Pop. (1910) 3,995; (1920) 3,238.

**Camden**, village, Knox county, Maine, on Penobscot Bay; 8 miles north of Rockland and 15 miles south of Belfast. Electric roads connect it with Rockland and Thomaston, and various steamship lines with Boston, Bangor, and Castine. It is well known as a summer resort. Its industries include the manufacture of paper makers' felts, medicinal plasters, engines and boats, shirts, and ship machinery; there are also ship building plants, woollen mills, foundry and machine shops, and lime quarries. Camden was founded in 1769 by James Richards and was incorporated in 1791. It was named for Lord Camden, Lord High Chancellor of England. Pop. (1910) 3,015; (1920) 3,403.

**Camden**, city, New Jersey, county seat of Camden county, is situated on the left bank of the Delaware River and on the Atlantic City, the West Jersey and Sea Shore, and the Pennsylvania Railroads; opposite Philadelphia, with which it is connected by several ferries. The city has an excellent water supply, well-paved streets, and a municipally owned asphalt plant which turns out the material for street rebuilding. Among the important buildings are the Courthouse, City Hall, Elk's Club, Moose Club, Red Men Hall, Masonic Temple, Carnegie Library, Cooper Library, West Jersey Homeopathic Hospital, Cooper Hospital, Municipal Hospital, Chamber of Commerce Building, Y. M. C. A., Y. W. C. A., Y. M. H. A., and Y. W. H. A. Buildings, Knights of Columbus Building, Catholic Lyceum, Camden Club, Bellevue Private Hospital, Republican and Democratic Clubs, Camden Home for Friendless Children, Salvation Army, Society for Prevention of Cruelty to Children, and the New Jersey Conference Deaconess' Home.

The industries are widely diversified and include ship-building, making of canned soup, brick works, foundries, machine shops, woollen mills, chemical works,

candy factories, talking-machine works, cigar factories, boot and shoe factories, paint and varnish works, licorice works, and leather factories. According to the Census of Manufactures for 1919, establishments number 336, with an invested capital of \$256,492,000, and a product value of \$323,226,000.

In 1773 Jacob Cooper, a merchant of Philadelphia, laid out a town plot of forty acres, calling it Camden in honor of Charles Pratt, the first Earl of Camden. In 1828 it was incorporated as a city and in 1850 a new charter was obtained, which was revised in 1871, at the addition of new territory. Pop. (1910) 94,538; (1920) 116,309. Consult Cooper's *Historical Sketch of Camden*.

**Camden**, town, Oneida county, New York, on the Rome, Watertown and Ogdensburg, and the Lehigh Valley Railroads; 30 miles northwest of Utica. It has abundant water power and manufactures of furniture, knit goods, sleighs, wagons, paper, and packing boxes. Dairying is carried on; corn-canning is an important industry; and maple sugar and syrup of good quality are produced. Pop. (1910) 3,426; (1920) 3,054.

**Camden**, city, South Carolina, county seat of Kershaw county, is situated on the Wateree River, and on the Seaboard Air Line, the Southern, and the Atlantic Coast Line Railroads; 28 miles northeast of Columbia. It has a fine bracing climate and is a popular winter resort. Its industries include brick yards, lumber works, and cotton and yarn mills. The town was founded in 1758 by Joseph Kershaw, an Irish Quaker. On August 16, 1780, General Gates was defeated here by the British General Cornwallis at the battle of Camden (q. v.). Pop. (1910) 3,569; (1920) 3,930.

**Camden**, BATTLE OF, a battle fought at Sanders Creek, near Camden, S. C., on Aug. 16, 1780, between a British force of about 2,200 under Lord Cornwallis and a superior American force, consisting mostly of untried militia, under Gen. Horatio Gates, who was decisively defeated. Early in the engagement a large part of the American militia fled precipitately, most of the fighting on the American side being done by the regulars under Baron de Kalb, who was mortally wounded. The conduct of General Gates was investigated by a court of inquiry, and in December he was superseded by General Greene. The English casualties numbered about 325, while the Americans lost, in killed, wounded, and captured, about 2,000 men. The battle of Hobkirk's Hill, in which General Greene was defeated by the Brit-

ish, April 25, 1781, is often spoken of as the second battle of Camden. Consult Carrington's *Battles of the American Revolution*.

**Camden**, CHARLES PRATT, FIRST EARL OF (1714-94) lord chancellor of England, was born in London. Admitted to the bar in 1738, he gained recognition for his successful defence of a bookseller charged with libel on the House of Commons. He became attorney-general in 1757, and in 1761 was appointed chief-justice of common pleas, in which capacity he championed John Wilkes (q. v.) by pronouncing illegal the issue of general warrants by the government. He was created baron (1765), and as lord chancellor (1766) he continuously opposed the government in its American policy and its treatment of Wilkes. His judicial career ended in 1770. On account of his liberal policy during the American Revolution his name became very popular in the United States, where it is borne by various counties, towns, and villages. President of Council in the second Rockingham administration, he ably defended the policy of Pitt. He was created earl in 1786.

**Camden**, WILLIAM (1551-1623), English antiquary and historian, was born in London. He became prebendary of Salisbury Cathedral (1589-1623), headmaster of Westminster (1593), Clarendieux king-at-arms (1597-1623), and was commissioned by James I. to translate into Latin the account of the trial of the Gunpowder Plot conspirators. He founded his professorship of history at Oxford in 1622. His most celebrated work, *Britannia*, a survey of the British Isles, first appeared in 1586, and was translated from Latin into English by Philemon Holland in 1610. Some of the theories advanced in the work are no longer tenable, but it is still of much value to scholars. Other works are a compilation of a list of the epitaphs in Westminster Abbey (1600), a collection of old English historians (1603), the *Remains concerning Britain* (1605), and the *Annales of Queen Elizabeth's reign*, the first part of which appeared in 1615. Consult *Life* by T. Smith and Wood's *Athenæ Oxonienses*.

**Camden Town**, a district in the northeast of London built in 1796 by Lord Chancellor Camden. It is in the vicinity of Hampstead. See LONDON.

**Camel**, a large ruminant of the genus *Camelus*, and constituting, with the llama (q. v.) of South America, the family *Camelidae*. The camel has for centuries been subservient to man and is unknown in a wild state, although in some localities half-wild herds roam about—the offspring of ani-

mals which undoubtedly escaped from captivity. There are two distinct species of camel, the *Camelus dromedarius*, commonly known as the dromedary, and the *Camelus bactrianus*, or Bactrian camel.

*C. dromedarius*, the dromedary or true Arabian camel, is characterized by a single hump, which forms a regular pyramid and constitutes about one-fourth of the length of the body. The dromedary occurs in both Africa and Asia and has been successfully introduced into Australia, where it has proved valuable in exploration. Attempts to introduce it into the United States, in 1856, were unsuccessful.

*C. bactrianus*, peculiar to Central Asia, differs from the Arabian species in having two humps; it is also a shorter and stockier animal with longer and more abundant hair, and is better fitted for the rigorous climate of the Tibetan Plateau.

Animals of both species are large and ungainly, with long necks and fatty humps on the back and long, shaggy hair, reddish-brown in color, covering some parts of the body only. The feet are broad, two-toed, and provided with callous pads, similar to those which protect the chest and joints and upon which the animals rest in a kneeling position. The upper lip is hairy and deeply cleft; and the stomach is composed of three compartments, two of which are provided with a number of cells containing only fluid and which can be closed by muscular action.

The food of the camel is purely vegetable, consisting of grass, and the branches and leaves of trees. The animals crave salt and drink the most brackish water with relish. Because of the fat reserve in the hump and the peculiar formation of the stomach, camels can exist for long periods with little food and water, and are, therefore, especially valuable in desert transportation. They are also valued for their milk and flesh; the hair is woven into ropes and fabrics; and the bones, which are remarkably solid, are often used to replace ivory.

Camels are in general stolid, stupid beasts; they are obstinate and impatient, and exhibit no fondness for their masters. Both species are of a particularly vicious temperament, the kick or bite of an enraged camel being especially feared. Many breeds have been produced, especially in Arabia; the strong, slow varieties are used in farmwork and for carrying heavy loads, while the slender animals, which are swift and of easy gait, are employed for riding. Camel corps of European troops have been constantly organized when operating

in Egypt and the Sudan since about 1880. The Egyptian camel corps is a permanent branch of the Egyptian army. The men are chiefly Sudanese, Arabs, and

dant. The attractive flowers are rather stiff and waxen. Propagation is usually by cuttings or layers, in the former case the ripe young shoots being cut off at a

kept in a cool house during winter. In spring they should be placed in a warmer house, and in the following autumn moved into pots.

Bactrian Camel

fellahin. Consult Leonard's *The Camel*; Count Gleichen's *With the Camel Corps up the Nile*; and for the 'wild' camel, Sven Hedin's *Through Asia and Central Asia and Tibet*.

**Camel**, an apparatus used for raising a ship over shoal water. It consists of large hollow vessels which are attached to the sides of the vessel when full. When the ship reaches the shoal the vessels are pumped dry and the resulting buoyancy raises the ship enough to decrease its draft.

**Camellia**, *ka-mel'i-a*, a genus of Asiatic evergreen trees and shrubs belonging to the order Ternstroemiaceæ and closely allied to the Tea family (see TEA). The best known species of camellia are the common *C. japonica* (the parent of most of our garden forms), *C. reticulata* and *C. Sasanqua*. The first named grows to a height of 30 feet, and bears reddish flowers about 4 inches in diameter. The others have pink and white flowers. All are greenhouse plants, especially suited to cool houses or winter gardens, where moisture is abun-

joint in August, planted in a mixture of loam, sand, and peat, and

Camellia japonica

**Camelopardalis**, *kam-el-õ-pâr'da-lis*, a northern constellation added by Jakob Bartsch, Kepler's son-in-law and assistant, in 1624. It occupies the interval between Ursa Major and Cassiopeia, but includes no conspicuous stars.

**Camelot**, *kam'e-lot*, in Arthurian romance the seat of King Arthur and the knights of the Round Table. It has been identified by Geoffrey of Monmouth with Caerleon, Monmouthshire, and by others with Winchester of Queen's Camel, Somersetshire, and Camelford, Cornwall. Shakespeare alludes to it in *King Lear*, and Tennyson in *The Lady of Shalott* and the *Idylls of the King*.

**Camel's Hair**, the long hair of the camel, which is shorn every summer, is woven by the Arabs into clothing, tent-covers, and ropes. It is chiefly used in America and Europe for making the brushes used by painters, for dress materials and rugs. The linen haik of the Arabs is usually attached to the cap by a rope of camel's hair.

**Camel's Thorn** (*Alhagi camelorum*), a spiny shrub, native of West Asia, bearing papilionaceous flowers in summer, followed by legumes in August.

**Camenæ**, ka-mē'nē, in Roman mythology, prophetic nymphs, worshipped in the old Italian religion, and often identified with the Greek muses. A temple at the foot of the Capitoline Hill in Rome was erected for their use.

**Cameo**, a gem cut or engraved in relief. The art of cameo-cutting consists in carving out a figure in the upper of two differently colored layers of stone so that it stands out in relief on a darker ground. The phrase has been loosely applied to all sorts of lapidary work. The materials used are: (1) translucent rock crystals—e.g. amethyst (purple), emerald smaragdus (vivid green), carbuncle, anthrax (rose), jacinth (orange-red), chrysolite (golden), beryl (sea-green); (2) semi-translucent crystals—as various agates, the onyx, chalcedony, or cloudy quartz and its varieties, such as the orange-red sardius, and, *par excellence*, the sardonyx; (3) opaque crystals—various jaspers, lapislazuli (sapphire), turquoise, and chrysoptase; (4) certain metallic oxides and bituminous substances—e.g. hæmatite, malachite, and amber; (5) animal secretions—as coral and the inner layers of certain molluscan shells; lastly, and largely for purposes of imitation of the antique cameos, vitreous pastes. The cutting and polishing of agates is an important industry at Oberstein in Oldenburg and it is said that the Egyptian scarabæus is doubtless the origin of the cameo. The art was largely practised by many of the older races before the classical period, and reached its climax c. A.D. 150. Genuine antique cameos signed by the artist are extremely rare. The British Museum and the museums at Florence and Naples have a few so signed; and the authentic signature of Dioscorides may be seen on a few intaglios, among which is the portrait of Cicero. Names of possessors were, in the antique and early Christian epochs, graven on the gem itself; later, on the metal mounting only. Consult A. H. Smith's *Catalogue of Engraved Gems in the British Museum*; and C. W. King's *Antique Gems and Rings*.

**Camera**. See CINEMATOGRAPH; PHOTOGRAPHY.

**Camera Lucida**, kam'e-ra lū'si-da, the name given to two different instruments: (1) that of Dr. Hooke, for the purpose of casting the image of any object on the wall of a lighted room; (2) an ingenious contrivance of Dr. Wollaston for making outline sketches of any distant object.

The best form is essentially a prism (vertical cross-section ABCD) such that AB makes  $22\frac{1}{2}^\circ$  with the horizon, and BC makes the same angle with the vertical. A horizontal ray from the object M is twice totally reflected (see REFLECTION and REFRACTION) at H and K so as to emerge vertically from K to E. The eye at E refers the ray HK along the line EKN,

Camera Lucida

and therefore the image of M is seen at N. But the eye at E sees also past the corner of the prism C, along the line EN', and thus on a paper placed at NN' the operator can trace the image of the object at M. The amateur microscopist can achieve equally satisfactory results by fixing a small plate of transparent and polished glass to the eye piece of his microscope, so that it will make an angle of  $45^\circ$  with the axis of the tube, using for this purpose a small ball of adhesive wax.

**Camera Obscura**, ob-skū'ra (Lat. 'dark chamber'), so called by Battista della Porta in 1558, because the form described was really a dark room lighted only by a hole in the window shutter allowing the rays from without to pass through a convex lens. At the focal distance a sheet of white

Camera Obscura

Tracing on ground glass the view reflected from mirror B; A, convex lens.

paper, especially if curved to suit the focal distance, will very faithfully show the figures of the objects opposite the lens, with their proper colors and motions. A convenient form is obtained by placing the convex lens at the top of a dark tent of movable box, and letting the rays fall vertically upon it by means of a plane mirror above it inclined at  $45^\circ$ .

The height of this camera, or the distance of the table from the lens, should equal the focal length. Battista della Porta does not appear to have been the inventor of the camera obscura, since it is referred to by Leonardo da Vinci and even in the 13th century it was known to Friar Bacon.

**Camerarius**, kā-mā-rā'rē-ōos, JOACHIM (1500-74), German humanist and classical scholar, was born in Bamberg, and in deference to the family's hereditary office of episcopal *Kämmerer* (chamberlain) he changed his proper name of Liebhard into Camerarius. He was educated at the University of Leipsic and for a time taught Greek and Latin in Nuremberg. He took a conspicuous part in the Diet of Augsburg (1535), established the study of the classics at Tübingen University (1535) and effected important reforms at Leipzig University (1541). His works include a biography of Melancthon (1566), excellent editions and translations of Greek and Latin writers, and contributions to Greek and Latin grammar and antiquities. He was a friend of Erasmus and Melancthon. His son JOACHIM (1534-98) was a distinguished physician and botanist.

**Camerarius**, RUDOLF JAKOB (1665-1721), German physician and botanist, laid the foundation of the sexual theory of plants in his *Epistola de sexu Plantarum* (1694).

**Camerino**, kā-mā-rē'nō, city, Italy, in the province of Mace-rata, on a spur of the Apennines; 69 miles southwest of Ancona. It is the seat of a 'free' university, founded in 1727, and the chief industry is silkworm rearing. Pop. 12,000.

**Camerlengo**, kam-er-len'gō (It. 'chamberlain'), the cardinal in charge of the financial and judicial interests of the Holy See. During an interregnum he presides over the apostolic chamber, and administers the functions of government till the election of a new pontiff. The cardinals also have a camerlengo who administers the revenue of the Sacred College.

**Cameron**, city, Missouri, in Clinton County, on the Chicago, Rock Island, and Pacific, and the Chicago, Burlington, and Quincy Railroads; 33 miles east of St. Joseph. It has agricultural interests and manufactures wagons. Pop. (1910) 2,980; (1920) 3,248.

**Cam'eron**, city, Texas, county seat of Milam County, on the Gulf, Colorado, and Santa Fé and the Southern Pacific Railroads; 64 miles northeast of Austin. It is a shipping point for agricultural produce and has manufactures of ice and cotton. Pop. (1910) 3,263; (1920) 4,298.

**Cameron, SIR CHARLES ALEXANDER** (1830), agricultural chemist, was professor of hygiene at the Royal College of Surgeons, Ireland (1867), of which he was president in 1885. He was appointed public analyst for Dublin in 1862. Besides a history of his college, he has published *Chemistry of Agriculture* (1857), *Lectures on Public Health* (1868), *Manual of Hygiene* (1874), *Elementary Chemistry and Geology* (1896, 1898), etc.

**Cameron, SIR DUNCAN ALEXANDER** (1808-88), British general, joined the Black Watch (1825), fought in the Crimean War at the Alma (1854), at Balaklava, and at Sebastopol (1855); and became commander of the forces in New Zealand, where he defeated the Maoris (1863). He became general (1874).

**Cameron, JAMES DONALD** (1833), American politician, the son of Simon Cameron, born at Middletown, Pa. He graduated at Princeton in 1852, engaged successfully in business, was president of a bank at Middletown, and from 1866 to 1874 was president of the Northern Central Railroad Company. In many respects he was the political heir of his father and was long influential as a Republican, both in state and in national politics. He was Secretary of War in the Cabinet of Pres. Grant (1876-7), was a member of the U. S. Senate (1877-97) as the successor of his father who resigned to make a place for him, and in 1880 was chairman of the Republican National Committee. He is generally known as "Don" Cameron.

**Cameron, JOHN** (?1579-1625) Scottish scholar and theologian, born in Glasgow. In 1622 he became principal of Glasgow University; but the odium excited by his advocacy of the divine right of kings compelled his resignation (1623), and ultimately he became professor of divinity in the University of Montauban (1624). His death, next year, was due to an assault made on him by opponents of his doctrine of passive obedience. He was the author of *Santangelus* (1616), *Theses de Gratia et Libero Arbitrio* (1618), *Theses XLII. Theol. de Necessitate Satisfactionis Christi pro Peccatis* (1620), etc. See *Memoir* by Cappel (1642).

**Cameron, RICHARD** (c. 1648-80), Covenanting leader, was born at Falkland in Fife. Converted from Episcopacy by the field preachers, he became an ultra-Presbyterian. After two years' residence in Holland he returned in 1680, and took part in the Sanguhar Declaration, for which a price of 5,000 marks was set on his head. He continued to preach whenever opportunity offered, until his party was surprised by a body of

dragoons at Aird's Moss in Ayrshire, and Cameron and his brother were among the slain. See Howie's *Scots Worthies* (1876); *Richard Cameron*, by Professor Herkless, 'Famous Scots Series' (1896).

**Cameron, SIMON** (1799-1889), American political leader, born at Maytown (now Donegal), Pa. He received little education, served an apprenticeship to a newspaper publisher at Northumberland, Pa., and as editor in turn of the Doylestown (Pa.) *Democrat* and the Harrisburg *Intelligencer* he first showed his remarkable aptitude for politics, eventually gaining almost complete ascendancy over the Democratic Party in Pa., and becoming a power, also, in national politics. He was also notably successful in business and accumulated a large fortune. From 1845 to 1849 he was a Democratic member of the U. S. Senate. Subsequently, however, he became one of the foremost leaders of the 'People's Party' in Pa., which soon developed into the Republican Party, and, as a Republican, he was again a member of the U. S. Senate (1857-61). When war threatened between the North and South he joined Seward in favoring a policy of conciliation. In 1860 he was a prominent candidate for the Republican presidential nomination, and in 1861, though he was strenuously opposed by many prominent Republicans, especially by Gov. Curtin and A. K. McClure of Pennsylvania, he was appointed Secretary of War in Pres. Lincoln's Cabinet. His administration of the War Department caused general dissatisfaction. Though the charges of peculation brought against him personally are now thought to have been unjust, it is certain that he awarded contracts to his political followers and friends, some of whom grossly defrauded the government, and in Jan., 1862, he was removed by Pres. Lincoln, who, however, commended him for 'ability, patriotism, and fidelity to public trust.' Soon afterward he was formally censured (April 30) by the House of Representatives. He was U. S. minister to Russia in 1862, and was once more a member of the U. S. Senate (1867-77), resigning to create a vacancy for his son, J. D. Cameron (q.v.). Cameron was undoubtedly one of the shrewdest, most adroit, and most astute of politicians in the history of the U. S.

**Cameron, VERNEY LOVETT** (1844-94), African traveller, born at Weymouth, Dorsetshire. He took part in the Abyssinian campaign, and in suppressing the slave trade in E. Africa. At the head of an expedition to carry aid to Livingstone, Cameron left Zanzibar in 1873, but at

Uyanyembe heard the news of Livingstone's death. He then determined the position of the southern portion of Lake Tanganyika. Having defined Nyangwe to be on the main stream of the Congo, he struck south, and then west, and discovered the sources of the Zambezi. He was (1875) the first traveller to cross the breadth of Africa. In 1878 he explored the route for a railway from Beirut to Bushire, and in 1882 the Gold Coast. He was killed when hunting at Leighton-Buzzard, in Bedfordshire. His works include *Across Africa* (1877, 2nd ed. 1885), and *Our Future Highway to India* (1880).

**Cameronians**, a sect of Scottish Presbyterians, originating in the latter part of the 17th century, deriving their name from their chief leader, Richard Cameron (d. 1680), who, with his colleagues, John Semple, Alexander Peden, and John Welwood, definitely separated themselves from the great body of Presbyterians in Scotland, on the question of the spiritual independence of the church. They repudiated the authority of Charles II., took up arms against him, and were defeated in battle at Aird's Moss, July, 1680. Cameron was slain. The defeat and the relentless persecution by the Scottish government which followed, had only the effect of intensifying their zeal and of increasing their numbers; and they continued to hold their conventicles among the moors (whence their name of 'hill-folk' or 'hill-men'). With high spiritual feeling they combined the fiercest fanaticism, and many of them were so ignorant as to ascribe supernatural and prophetic power to Peden, Cameron, and Semple. Their fierce polemical and controversial spirit is seen from the fact that, on one point or another, they were soon subdivided into petty sects, such as the Hamiltonians, the Harleyites, the Howdenites, the MacMillanites, and the Russelites: the founder of this last sect was James Russel, one of Archbishop Sharp's assassins.

The Cameronians are still represented by a few congregations bearing that name. They prefer themselves to be called 'Reformed Presbyterians,' and as such have a few representatives in the United States. See PRESBYTERIANS and Shield's *Faithful Contendings Displayed* (1780); *Testimony of the Reformed Presbyterian Church* (1842); and Walker's *Lives of Peden, Semple, Welwood, Cameron, Cargill, and Smith*, republished (1901) as *Six Saints of the Covenant*, and edited by Hay Fleming.

**Cameron.** See KAMERUN.

**Camiguin**, isl., Misamis prov.,

Philippine Islands, lying  $6\frac{1}{2}$  m. N. of Sipaca Pt., Mindanao. Area, 113 sq. m. It is of volcanic origin and still shows activity, is mountainous, the highest peak being 5,383 ft., and has several towns and a port at Catarman. The crops are tobacco, cacao, and rice, and wax is an important product. In comparison with its relatively small size Camiguin is one of the best agricultural areas of the islands. Pop. (1903) all civilized, 30,754.

**Camiling**, SAN MIGUEL DE, pueb., Tarlac prov., Luzon, Philippine Is., 25 m. s.s.e. of Lingayen, on river of same name. It produces timber, rice, maize, cotton, and sugar-cane. Pop. (1903) 25,243.

**Camillus**, MARCUS FURIUS, one of the early heroes of Rome, perhaps the first who is a character of history rather than of legend. He was censor in 403 B.C., military tribune with consular powers six times, and dictator five times. In 396 he defeated the people of Falerii and Fidene, and captured Veii. In 391 he was banished on the ground of having unfairly distributed the booty of Veii. He rebuilt Rome, and so was called a second Romulus. In later campaigns he won victories over the Volscians and Etruscans, and finally, in 367 B.C., when eighty years of age, routed an invading band of Gauls. Camillus was a patrician, and a rigid upholder of the rights of his order against the commons.

**Camisards**, the Protestants of the Cévennes who rose in arms after the revocation of the Edict of Nantes (1685). They obtained their name from the white shirt (*camise*) which they adopted as a uniform. The ruthless cruelties of the ministers and troops (*dragonnades*) of Louis XIV. produced at first many converts to Roman Catholicism, while others fled from their native land; but a stern and fanatical minority, consisting for the most part of those who were too poor to escape, held out in the mountains, and at last (1702) slew the Abbé du Chayla, for fifteen years their merciless persecutor. Then, under the daring leadership of Roland and Jean Cavalier, the latter a youth of eighteen, the rising took shape. Prophets arose and the usual abnormal phenomena of religious excitement among an ignorant people appeared. A series of successes led to the appearance of Montrevel, a marshal of France, at the head of 60,000 men and it became necessary to split the Camisard force, which never exceeded 3,000, into roving bands. During 1703 the royal army devastated the country, destroying over four hundred villages, while the Camisards on their part burned churches, mur-

dered priests, and plundered generally. In the following spring the Camisards gained the battle of Cannes, but in April a body of 1,000 was only saved from annihilation by the military genius of Cavalier. The latter now found himself opposed by the famous Marshal Villars, who adopted conciliatory tactics; and a meeting between the two leaders resulted in the acceptance by Cavalier of certain concessions. Nothing less than the restoration of the edict, however, would satisfy the fanatics of the party; and Cavalier and some of the more moderate Camisards having left the country, hostilities were resumed, ending in the slaughter or expatriation of the remnant. Some of the wanderers found their way to Spain, where Cavalier had taken service with the British, and distinguished themselves at the battle of Almanza (1707). After this engagement, where so many of his co-religionists perished, Cavalier went to Britain, and was governor successively of Jersey and the Isle of Wight. See *Revolt of the Protestants of the Cévennes*, by Mrs. Bray (1870), T. Schott's *Kirche der Wüste* (1893), and H. M. Baird's *Huguenots and the Revocation of the Edict of Nantes* (1895).

**Camlet**, a rich fabric which during the middle ages was made from camel's hair, but now is generally made from the hair of the Angora goat, mixed with silk, wool, or cotton.

**Camoens**, or CAMOES, LUIZ DE (1524-80), the greatest of Portuguese poets, was born at Lisbon in 1524. When only sixteen he had already written his *Amphitriões*. At the age of eighteen he fell in love with a lady of the court, Donna Caterina de Ataide; but her father forbade their union. Camoens remained true to her till her death, at a late period in his own life. In his *Rimas* he passionately celebrated his love. Banished from Lisbon for a time, he joined as a volunteer the expedition which John III. sent out against the Moors of Ceuta, and distinguished himself in several engagements. In a naval encounter in the Strait of Gibraltar he lost the sight of his right eye. Having wounded one of the king's equerries, he was thrown into prison and was only released on the understanding that he would volunteer for service in India. He arrived at Goa in 1553. At this time he fought under the king of Cochín against the king of Pimenta and again took part in an expedition against the Arabian corsairs in the Red Sea. But his outspoken condemnation of certain Portuguese officials caused his banishment to Macao in 1556. A new viceroy

having permitted him to return to Goa, which he reached in 1560, his troubles began again; for his enemies having accused him of malversation in office, he was cast into prison. After some years he obtained his liberation, and proceeded to the distant and barbarous settlement of Sofala. Finally, after an absence of nearly seventeen years, Camoens arrived at Lisbon, in abject poverty, in 1569. His celebrated work, *Os Lusíadas* (i.e. the Lusíads or Lusitanians, standing for the Portuguese), was published in 1572. The poem proved an immediate success; but its unhappy author died in the public hospital on June 10, 1580. In addition to his masterpiece, Camoens wrote a number of songs and eclogues, three dramas, and no fewer than 352 sonnets. An edition of his works appeared at Lisbon, in four volumes, in 1779-80, and a further edition, in five volumes, in 1782-3. The *Lusíads* have been translated into English by Sir R. Fanshawe (1655), Mickle (1771-5; new ed. 1877), Musgrave (1826), Quillinan, four books only (1853), Sir L. Mitchell (1854), Aubertin (1878), and Sir R. Burton (1881). A fine edition was published at Paris in 1817. A portion of the sonnets was translated by Aubertin in 1881, and a complete version of them by Sir R. Burton in 1885. See also *Life of Camoens in German*, by W. Storck (1890); *Poems of Camoens*, with remarks on his life and writings, by Lord Strangford (1805); and *Camoens, his Life and his Lusíadas: a Commentary*, by Sir R. Burton (1882).

**Camomile**. The camomile, or chamomile (*Anthemis nobilis*), is much cultivated in Europe as a medicinal herb. It has prostrate stems and downy, doubly-pinnate leaves, and in July and August bears solitary daisy-like heads of flowers, with central convex yellow discs and white recurved rays. The flower-heads point downward before they expand. The whole of the plant has an aromatic fragrance, whence it derives its name of chamomile (*chamamelon*). As *anthemis* the plant was known to the Greeks, and its dried flower-heads were early used in medicine, Dioscorides extolling its virtues in the treatment of intermittent fevers. The flowers should be picked in fine weather, as soon as they are fully open, and dried in the shade, care being taken to turn them frequently. An infusion of the flowers acts as a mild tonic, as a stomachic, and as a diaphoretic and diuretic. If given warm and in full doses, it acts as an emetic.

**Camorra**, a secret society in S. Italy, which took its rise during the times of Bourbon misgovern-

ment in the former kingdom of Naples. While mainly composed of the poorer criminal classes, banded together to evade and defy the law, it also included many associates from the upper classes, who carried on their lawless schemes with its aid. Its energies were chiefly directed to extortion, often on a large scale, and to smuggling; but at the same time it carried on brigandage, and lent itself to more serious crimes. The members were bound together by a stern and exacting discipline, and as a rule faithfully observed the oath of secrecy under which they worked. The last Bourbon Minister of the Interior, Liborio Romano, was in league with the Camorra, and used it for his own ends. The rebellion of 1860 was carried through largely with the help of the Camorra.

After the union of the kingdom of the Two Sicilies (Naples) with Sardinia, the governor of Naples, Lamarmora, effectually curbed its worst excesses. But the organization still survived, though toward the end of the nineteenth century it assumed the aspect of a political party, and secured possession of the municipal government of Naples. Finally, its corrupt methods aroused the interference of the Italian government (1899-1901); and an Honest Government League was formed which defeated the Camorra candidates at the polls.

The Society retained considerable power, however. In June, 1906, a double murder, committed under circumstances of unusual cruelty by four delegated members of the Society, removed two of its agents who were suspected of ambition or treachery, and resulted in the arrest of forty men. The difficulty of getting evidence within the sphere of the Society's influence caused the removal of the court to Viterbo, where the trial was opened in March, 1911. One of the Camorrist, Abbatemaggio, turned state's evidence, and told a detailed story of the Camorrist methods and crimes. The other prisoners, including Enrico Albano, or Erricone, the reputed head of the Society, denied all knowledge of these crimes; and even of the Camorra's existence. About 650 witnesses on each side were called. After a trial lasting until July, 1912, 30 of the accused men were found guilty, of whom 8 were sentenced to prison for thirty years, and 18 received sentences varying from five to nine years.

Consult Monnier's *La Camorra*; Umiltà's *Camorra et Mafia*; Alongi's *La Camorra*; Serao's *The Head of the Camorra*.

**Camouflage**, cam-ōō-flāzh' (literally, 'faking'), a term adopted

from the French theatrical vocabulary (in which it signifies the process of 'making up') to describe the new military art of so concealing or disguising an object that the enemy cannot recognize it. The practice of camouflage is not entirely new, as is evidenced by the screening of trench furrows with leaves and sod in earlier wars. As a military art, however, it has received recognition only since the outbreak of the present world conflict, and the introduction of the aeroplane for observation purposes.

The simplest forms of camouflage are those which employ natural means of protection, as screens of leaves and boughs, or stacks of hay; but these are at best of limited application. To conceal long lines of supply trains, far-reaching trench systems, and vast encampments of men, and to meet the other requirements of modern warfare, artificial means must be resorted to. The earliest attempts consisted chiefly in the painting of guns, tractors, and ammunition wagons in realistic imitation of the foliage and rock forms by which they were to be surrounded. The results thus produced are only partially satisfactory, particularly as the painted objects must often be moved into surroundings of wholly different character; while at long distances the strokes of paint become blended, and reveal the outlines of the object itself.

To remedy these defects a plan has been adopted based on the protective coloration observed in birds and animals. High lights are darkened; under surfaces are lightened with colors in general harmony with the surroundings; outlines are broken by irregular streaks and blotches of color; wheels and other prominent projections draped with painted cloth; and the whole screened with reed or leaf nettings.

The concealment of roads, a later development, has become of vital importance for the transportation of supplies and troops. The usual method is by the use of road screens consisting of leaves on wire netting, of burlap, or of other material stretched along the road to form a continuous wall on either side, or arranged in a series of wings extending outward from the edges of the road. A network of cloth is strung overhead as a further protection.

Another phase of camouflage is the introduction into the landscape of objects intended merely to distract the enemy. 'Fake' trenches are dug in such a way that they appear to be part of the real trench system; dummy guns are interspersed with real ones; and sheds, barracks, and

headquarters are simulated by clever scene painting in order to draw the fire of the enemy's guns.

Camouflage is also extensively used on ships at sea as a protection against the submarine (q. v.) The hulls of vessels are painted to blend with sky and ocean, rendering them practically invisible at a short distance, or in such a way as to give an erroneous impression of character, size, or speed.

The art of camouflage as practiced in the present war originated with the French, and was speedily taken up by the other nations. In the United States an American Association for Camouflage was organized by a number of artists early in 1917, and a Camouflage Division was later organized as a branch of the Engineer Corps. For an excellent illustration of camouflage, see the article on TANK, MILITARY.

**Camp, Military.**—**ROMAN.**—The Roman camp of the Polybian period surrounded the *prætorium*, or consul's tent, the whole camp lying within an exact square whose sides measured 2,017 Roman feet. The main street was 100 feet wide. There were four entrances, one at or near the middle of each side. The *intervallum* between the tents and the ramparts was 200 feet wide. The rampart which enclosed the camp all round was made of earth thrown up from the moat which lay outermost, and was surmounted by a palisade. About two-thirds of the camp afforded accommodation for two legions (9,000 men) and 9,600 allies. The camp at the time of Hyginus—about 250 years subsequently—was an oblong of about 2,400 by 1,440 feet, the *intervallum* was reduced to 60 feet, and there were other modifications.

**MODERN CAMPS.**—The camp used in active service in the field is composed either of tents or of huts, or it may be merely a bivouac where shelter from the weather is extemporized out of branches, straw, or any handy material. In the U. S. Army the tents used are pyramidal, common, and wall tents for ordinary camps. In addition to this, each man carries one-half of a shelter tent, which when set up affords excellent protection to two men. Huts are used only when an army is occupying a defensive position for a long time, during a siege, when resting in winter quarters in a hostile country, waiting for seasonable weather, etc.

During the temporary occupation of any territory by a large body of troops (as was the case with U. S. troops in parts of Cuba and the Philippine Islands), camps are established with more

or less permanent buildings of wood or thatch for shelter of troops.

Camps are of various kinds, depending upon the length of occupancy, the military situation, the character of communication with the base, and the facilities afforded by the country. In time of peace and when not in the presence of the enemy, camp grounds which are to be occupied for some length of time are selected with great care; but in the presence of the enemy every consideration must give way to military necessity. The troops must find such shelter as the enemy will allow them, often being reduced to the necessity of lying out in the open without shelter of any kind.

It is a military axiom that to maintain the efficiency of any command the troops must have adequate shelter. A good camp ground should fulfill the following conditions:

1. The site should be convenient to an abundant supply of pure water.

2. Good roads should lead to the camp, and interior communication throughout the camp should be easy. A camp near a main road is undesirable on account of dust and noise. If the camp is a large one, good railway communications and ample siding facilities should be convenient.

3. Wood, grass, forage, and supplies should be at hand or easily obtainable.

4. The ground should accommodate the command without crowding and without compelling the troops of one unit to pass through the camp of another, either when going to drill or to reach the main road.

5. The site should be sufficiently high and rolling to drain off storm water readily, and, if the season be hot, to catch the breeze. In cold weather it should preferably have a southern exposure with woods to the north to break the cold winds. In warm weather, an eastern exposure, with the site moderately shaded by trees, is desirable.

6. The site should be dry. For this reason porous soil, covered with stout turf and underlain by a sandy or gravelly subsoil is best. A site on clay soil, or where the ground water approaches the surface, is damp, cold, and unhealthful. Alluvial soils, marshy ground, and ground near the base of hills, or near thick woods or dense vegetation, are undesirable as camp sites on account of dampness. Ravines and depressions are likely to be unduly warm and to have insufficient or undesirable air currents.

7. Proximity to marshes or stagnant water is undesirable on account of the dampness, mosquitos, and the diseases which the latter transmit. The high banks of lakes or large streams often make desirable camp sites.

8. Dry beds of streams should be avoided, as they are subject to sudden freshets.

9. The occupation of old camp sites is dangerous, since these are often permeated by elements of disease which persist for considerable periods. Camp sites must be changed promptly when there is evidence of soil pollution or when epidemic disease threat-

The best site in the vicinity of the place selected for a halt is taken, but the distance between suitable halting places frequently places many limitations on the choice of camp sites.

The form of a camp, especially of a one night camp for troops on the march, should be such as to facilitate prompt encampment of the troops and their prompt departure when camp is broken. The form also will depend upon the proximity of the enemy and the amount and character of ground available. When near the enemy, camps should of necessity be constructed to facilitate se-

ens, but the need for frequent changes on this account may be a reflection on the sanitary administration of the camp. A change of camp site is often desirable in order to secure a change of surroundings and to abandon areas which have become dusty and cut up.

It is very seldom that all of these conditions will be fulfilled, but as far as the military situation warrants, as many as possible should be met. For example, two hostile armies might be in contact either beside or even in the midst of a swamp but not all the force of either side would be withdrawn to a better or more healthful camp site. On the march in time of peace in the United States troops often have to accept such camp sites as are available.

curity at night and deployment for action.

When marches are made in time of peace arrangements for the halts and camps are made some time in advance. But this is not possible in time of war in a hostile country. If the column is large and not in close touch with the enemy, the commander of the troops sends one or more staff officers up with the advance guard to select sites near the place where a halt is ordered and to guide organizations to their sites. Places for obtaining cooking and drinking water, for watering animals, for bathing and washing clothes are designated. The troops sleep in their shelter tents and in such few wall or pyramidal tents as can be carried on wagons.

In a permanent or semi-permanent camp, more attention is given to shelter and sanitation and to the comfort of the troops. The troops are sheltered in pyramidal tents, and various conveniences are added, the number of such usually varying with the length of occupancy. If occupancy is to be for a considerable period tent floors, frame kitchens and mess halls, bathing and toilet facilities may be added, and even water and sewer systems may be installed. Finally in extreme cases the tents may be replaced by huts or barrack buildings constructed of lumber or other material which may be obtained locally. In the latter case the camp becomes a cantonment (See CANTONMENT.)

If a camp is to be occupied a long time, say a year or more, it is a measure of economy to construct buildings instead of putting the troops in tents, aside from the greater comfort afforded the troops. Tentage is expensive, and a tent does not last long, especially if subjected to high wind.

In the United States, manoeuvre and training camps at ports of embarkation are usually intended for long or comparatively long occupancy, and every convenience is given the troops, even to the construction of cantonments. As examples of these we have the present training camps for the National Guard and National Army, the former tent camps and the latter cantonments; and the various State militia permanent camps. In addition to the conditions which other camps should fulfill, a training or manoeuvre camp should be situated conveniently near ample ground suitable for training of troops or for manoeuvring troops. The sites for these camps are usually selected by boards of officers; one or two members of the board are medical officers and special attention is given to sanitary and health conditions.

In the United States both camps and cantonments are called camps to distinguish them from the permanent posts, which are called forts (q. v.) and are established by act of Congress. The camps and cantonments are established by War Department order, on government ground if available or on leased or requisitioned ground if government-owned land is not available. See CANTONMENT; SANITATION; MILITARY.

**Camp, WALTER** (1859), American writer, was born in New Haven, Conn. He was graduated from Yale in 1880; has since taken an active interest in the athletic undertakings of that university; and is a member of Yale

University Council. He has written extensively on sporting subjects for periodicals; edited the Library for Young People; and has published: *Book of College Sports; Yale, Her Campus, Classroom, and Athletics; Book of Football; Auction Bridge up to Date; American Football.*

**Campagna, Roman**, *cām-pān'yā*, (*Campagna di Roma*), the undulating, marshy plain, of volcanic formation, which stretches for 90 miles along the coast of the Tyrrhenian Sea from Civitavecchia south to Terracina, and for 40 miles on the east to the Alban and Sabine Hills. It is divided into vast estates leased to tenants or companies of capitalist farmers. Though the soil is fertile, a relatively small part is cultivated (chiefly cereals, wine, and fruits). Horses and buffaloes (used for draught purposes) are reared, in addition to cattle, sheep, and goats. The prevalence of malaria left the Campagna a desolate waste, almost the only inhabitants being the shepherds and farm laborers. In recent years, however, drainage, the regulation and embankment of the Tiber and other rivers, the reclamation of the riverine tracts, the screening of windows and doors, and the planting of eucalyptus trees have greatly diminished the extent and violence of the disease.

The prevalence of malaria on the Campagna in ancient Roman times is attested by frequent allusions in the works of Roman authors. An extensive system of sanitation, however, begun shortly before the establishment of the empire and maintained under imperial direction, encouraged the settlement of the region. The Campagna to-day is covered with the ruins of villages and of the fourteen aqueducts that brought spring water from the mountains. The plain was devastated by barbarian invaders—Goths, Vandals, and Longobards—and subsequently by Normans and Saracens. The civil broils of Rome in the late Middle Ages also contributed to its ruin. See **AGRO ROMANO**. Consult Achby's *Roman Campagna*; Lanciani's *Wanderings in the Roman Campagna* (1909).

**Campaign, Military.** See ARMY IN THE FIELD.

**Campaign, Political.** See ELECTIONS.

**Campan, JEANNE LOUISE HENRIETTE** (1752–1822), French educational writer, was born in Paris. At fifteen she was appointed reader to the daughters of Louis xv., and became the first lady of the bedchamber to Marie Antoinette. After the Reign of Terror she opened a school at St.

Germain, where she taught Hor-tense, the mother of Napoleon III. In 1807 Napoleon I. appointed her superintendent of the imperial school at Ecouen, which was suppressed, however, by Louis xviii. Her best known works are: *Mémoires de la Vie Privée de Marie Antoinette* (1823); *Journal Anecdotique* (1824); *Correspondance Inédite avec la Reine Hortense* (1835).

**Campañña**, *kām-pān'yā*, town, Argentina, on the River Parana; 40 miles northwest of Buenos Ayres. Industries include petroleum refining and paper making. Pop. 8,000.

**Campanari**, *kām'pa-nā'rē*, GIUSEPPE (1858), Italian operatic singer, was born in Venice. He was a 'cellist at La Scala, Milan, when he was engaged by the Boston Symphony Orchestra in 1884. He later sang with the Emma Yuch, Hinrich, and Maurice Grau Opera Companies, and for many years has been a leading singer of the Metropolitan Opera Company.

**Campanario**, *kām-pā-nā'rē-ō*, town, Badajoz province, Spain; 70 miles east of Badajoz city. It has manufactures of soap and woollen and hemp goods. Pop. 7,700.

**Campanella**, *kām-pā-nel'lā*, TOMMASO (1568–1639), Italian philosopher, was born in Stilo, Calabria, and entered the Dominican order at the age of fifteen. He became the leader of a political conspiracy to expel the Spaniards from Naples, for which he was imprisoned for twenty-seven years, tried five times, and tortured seven, accused of heresy, and declared the author of a book which had been published thirty years before he was born. In 1626 Pope Urban VIII. had him brought to the prison of the Inquisition at Rome, and three years afterward gave him his liberty and a yearly pension. Campanella went to Paris, where he was graciously received by Louis XIII. and Richelieu, and for the remainder of his life he devoted himself to philosophy. The contemporary of Bacon, like that philosopher he was an opponent of the *à priori* conceptions of the Aristotelian school, and endeavored to ground philosophy on experiment and the observation of nature. He also made an attempt to classify the sciences, and to form a philosophy of history and politics, following out the principle of the indefinite progress of mankind as leading to a universal communion of nations and the extinction of evil.

His chief works were: *De Sensu Rerum* (1620); *De Monarchia Hispanica Discursus* (1640; Eng. trans. 1654); *Philosophia Rationalis* (1638); *Philosophia Universalis seu Metaphysica* (1637);

*Died May 31, 1927*

*Civitas Solis* (1643; new Eng. trans. 1885), which describes an ideal communistic organization of society on the model of Plato's *Republic*. A new complete edition of his works was published by A. d'Ancona; his sonnets were translated into English verse by J. A. Symonds. Consult Amabile's *Fra Tommaso Campanella* (3 vols.)

**Campanero.** See BELL BIRD.

**Campanha**, kām-pān'yā, city, Minas Geraes, Brazil, 150 miles northwest of Rio de Janeiro. There are hot springs in the neighborhood. Mining is the chief industry. The city has schools, a hospital, and a theatre. The settlement dates from the eighteenth century. Pop. 8,000.

**Campania**, a province of ancient Italy, coinciding practically with the modern provinces of Avellino, Benevento, Caserta, Naples, and Salerno, with an area of 6,289 square miles, and a population of 3,300,000. The Neapolitan Apennines fill the greater part of the region. The Salernian plain, drained by the Sele, is in great part malarious. The Campania, drained by the Voltorno, is very fertile, and has always been densely peopled. The products of prime importance are wheat, maize, wine (celebrated in antiquity—e.g., Falernian), fruits, hemp, silk, and sulphur.

The oldest part of the Campania region known to history is that around Cumæ, a Greek settlement (*Kyme*). The notable cities of the distant past were Naples, Buxentum, Elea (or Velia), Posidonia (afterward Paestum), Salernum, Puteoli, Caieta, Capua, Volturnum, Nola, Beneventum, Herculaneum, Pompeii, and Stabiae (the three last buried under the ashes of Vesuvius, 79 A.D.). The chief seat of commerce in Southern Italy in the eleventh century was Amalfi. The vicinity of Cumæ is rich in classic reminiscences, chiefly owing to its attractions (Baiae, etc.), its associations with celebrated men (Cicero, Augustus, Nero, and Hadrian), and its mythological sanctity (Lake Avernus and the Sibyl's Cave). The Oscans, Etruscans, Samnites, and Romans were successively predominant in this region. In modern times it has shared the destinies of the kingdom of Naples (q. v.).

**Campanile**, kām-pā-nē'lā (Italian, 'belfry' or 'steeple'), literally the name of any bell tower, is popularly applied to the tall, graceful, and usually rectangular structures that form a striking adjunct to many churches and palaces of Italy. Among the most famous Italian campaniles are the Leaning Tower of Pisa (q. v.), the Campanile of Giotto in Florence (q. v.), and that of

St. Mark's, Venice. There is also the fine campanile of La Giralda in Seville (q. v.), Spain.

**Campanile of Florence.**—Its erection was begun in 1334, with the object of surpassing in height and in richness of workmanship any of the remains of antiquity. In form it is a paralleloiped, and is of the same dimensions from bottom to top. Though it is very lofty (275 feet) it consists of only four stories, of which the tallest are the uppermost and undermost. The style is Italian Gothic, and the walls are entirely veneered with marble. The original design of Giotto was that a spire of 90 feet in height should have surmounted the present structure, and on the summit may be seen the four great piers from which it was intended that it should have risen.

One of the most remarkable campaniles is the so-called *Leaning Tower of Pisa*, circular in form, and decorated with columns and arcades to the summit of its eight stories. Its construction was begun in 1170, and it was to have been carried up vertically; but the work was interrupted, and when resumed in 1298 it was seen that the part already built had taken a certain slant. To preserve the existing structure the line of inclination was followed, but the horizontal level of the stories was retained by increasing the height of the lower arches. At the opening of the nineteenth century its inclination was 8.6 per cent. of its height; to-day it has reached 9.2 per cent.

**Campanile of St. Mark's.**—Perhaps the noblest of the Italian campaniles is that of St. Mark's in Venice, founded in 888, added to in 948 and 1148, and completed to the platform in 1170. The *loggia* was added in 1349. Founded upon a rectangular base of Istrian stone, its brick walls taper gently to a height of 200 feet in a series of eight stories pierced with windows. Above the platform rises an open *loggia* of marble 50 feet high, being the actual belfry, wherein hang five great bells of bronze. This is surmounted by a copper figure of an angel 16 feet high, the total height of the campanile being thus 325 feet.

On July 14, 1902, this Campanile suddenly collapsed, and from 1903 to 1911 it was rebuilt as nearly like the old one as possible, the principal modifications being enlarged and strengthened foundations and a powerful hidden framework of iron. The Sansovino *loggia* and the terracotta Madonna and Child—the latter broken into nearly two thousand pieces—were pieced together and restored to their places, and four of the bells were

recast at the expense of Pope Pius x.

**Campanini**, kām-pā-nē'nē, CLEOFONTE (1860), Italian operatic conductor and director, brother of Italo Campanini (q. v.) was born in Parma, and studied at the Royal Conservatory there. In 1883 he was engaged as assistant conductor at the Metropolitan Opera House, New York; and was later conductor at Naples, Venice, Rome, London, and Milan. In 1906, on the opening of the new Manhattan Opera House in New York, Campanini was made conductor and artist director; in 1910 he became general musical director, and in 1913 general manager, of the Chicago and Philadelphia Opera Companies. Among his notable productions are *Salome*, *Natoma*, *Thais*, *Louise*, *Pelléas et Mélisande*, *Samson and Delilah*.

**Campanini**, ITALO (1846–96) Italian singer, was born in Parma. He served in the army under Garibaldi, and studied and sang in Parma in various companies until 1869. He then studied for two years under Francesco Lamperti, and made his *début* in *Faust* at La Scala in Milan (1871). He appeared at London in 1872 and at New York in 1873, achieving notable success. He made several tours of the United States, and after 1883 lived chiefly in New York. His voice was a true tenor of great power and sweetness, and his repertory comprised about 100 operas and oratorios.

**Campanology**, the art of bell ringing. See BELL.

**Campanula**, or BELL FLOWER, a genus including about 300 species and numerous varieties. They are confined to the Northern Hemisphere, and find most favorable conditions in England; in America they are less hardy. Most of the campanulas are herbaceous perennial plants; a few are annuals or biennials; while some species, perennial when wild, became biennial when cultivated. The color of the flowers ranges between white and blue, though occasionally a suggestion of pink is seen. In size they vary from the tiny *C. Raineri*, about two inches in height, to the Chimney Campanula (*C. pyramidalis*), often three feet or more.

The annual species may be raised from seed, sown under glass in early spring or in the open border at the end of April. Of the annuals may be named *C. macrostyla*, a purple flowering species about eighteen inches high. Of the biennial kinds, the most important is the *Canterbury Bell* (*C. medium*).

The biennials may be raised from seeds, sown as the annuals. If sown under glass in the month of March, they usually flower the same year; if sown in

FAMOUS CAMPANILES.

1. Florence Cathedral: Campanile by Giotto. 2. Bologna: Torre Asinelli (twelfth century).
3. Pisa: the Leaning Tower. 4. Milan: San Gottardo, by Francesco de Pecorari. 5. Venice: St. Mark's (rebuilt 1903-1911).

April or May, they usually do not flower until the following year. They also may be raised from seeds, may be propagated by division, or in some cases by cuttings.

The following are the most beautiful kinds: *C. pyramidalis*, which bears spikes of blue flowers in July and August, the spikes often three or four feet in height; the Peach-Leaved Campanula (*C. persicifolia*), about two feet high, with white and blue varieties; *C. punctata*, white, spotted with red; *C. carpatica*, with blue and white varieties, a dwarf; and *C. rapunculoides*, a tall bluebell, whose leaves are used for salad. The slender and graceful Harebell, 'the blue bell of Scotland,' is *C. rotundifolia*.

**Campan'ula'ria**, a common genus of Hydroids, and type of a family, Campanulariæ. The delicate stem bearing the colony of polyps may be simple or branched; the nutritive individuals are surrounded by transparent, bell-shaped sheaths, within which they may be retracted. The mouthless, tentacle-less, reproductive individuals bud off sexual ones, which do not, however, go free as they so often do in allied genera.

**Campbell**, kam'el or kam'bel, family of. See ARGYLL.

**Campbell**, ALEXANDER (1788-1866), principal founder of the religious denomination known as the Disciples of Christ, was a native of Antrim, Ireland, and was educated at Glasgow University. He emigrated to the United States in 1809, and in 1811 received a license to preach from the Christian Association, a religious organization founded by his father Thomas Campbell at Washington, Pa. In 1812 he formed a connection with the Baptists, and labored as an itinerant preacher principally in Pennsylvania, Virginia, and Ohio. In 1826 he published a translation of the New Testament in which the words 'baptism' and 'baptist' gave place to 'immersion' and 'immerser.' By his discussions, and by the *Christian and Baptist* and the *Millennial Harbinger*, Campbell gradually formed a large party, who about 1827 organized the Protestant sect known as Christians or Disciples of Christ (see CHRIST, DISCIPLES OF). In 1841 he founded Bethany College in West Virginia, and was its president for twenty-five years. The most important of Campbell's works, besides his translation of the New Testament, are: *The Christian Messenger and Reformer*; *The Christian System*; *Christian Baptism*. Consult Richardson's *Memoirs of A. Campbell*; Grafton's *Alexander Campbell*.

**Campbell**, BARTLEY (1843-88), American dramatist, was

born in Allegheny City, Pa. After an unsuccessful start in a law office, he became a reporter for the *Pittsburgh Leader*. In 1868 he founded the *Pittsburgh Evening Mail*. His first play, *Through Fire* (1871), was a great success, and was followed by *Peril*, *The Big Bonanza*, *Matrimony*, *The White Slave*, *Siberia*, *Paquita*, *My Partner*, which achieved immense popularity in New York, and others. In 1886 he became insane, and was confined to an asylum.

**Campbell**, SIR COLIN, LORD CLYDE (1792-1863), British general, the son of a carpenter in Glasgow. He served with Sir Hugh Gough's army in North China (1841), and was conspicuous in the second Sikh War (1849-52). He commanded a brigade in the Crimea, and was mainly instrumental in winning the Battle of the Alma. On the outbreak of the Indian Mutiny (1857) he was made commander-in-chief, and after clearing Lower Bengal, fought his way step by step to Lucknow; then by a masterly campaign in the following spring (1858) completed the capture of Lucknow and the pacification of Northern India. After organizing the successful campaign in Central India under Sir Hugh Rose, he was promoted to the rank of general, created field marshal, and raised to the peerage.

**Campbell**, DOUGLAS (1839-93), American lawyer and writer, was born in Cherry Valley, N. Y. He was graduated from Union College in 1860; served on the Federal side in the Civil War as a major of colored troops; then studied law in the Harvard Law School, and was admitted to the bar in 1866. He wrote largely on American history. His book, *The Puritan in Holland, England, and America*, first published in 1892, laid down the proposition that the United States obtained her political institutions from the Dutch. Other works by the same author are: *Historical Fallacies Regarding Colonial New York* (1879); *The Origin of American Institutions as Illustrated in the History of the Written Ballot* (1891).

**Campbell**, GEORGE (1719-96), Scottish divine, born in Aberdeen. Becoming (1759) principal of Marischal College, Aberdeen, three years later he published his *Dissertation on Miracles*, controverting Hume's famous argument. In 1771 he became professor of divinity in Marischal College and minister of Greyfriars'. He wrote *Philosophy of Rhetoric* (1776), and *A New Translation of the Gospels* (1789).

**Campbell**, JOHN, BARON (1779-1861), British jurist and author, was born at Cupar, county of Fife, Scotland. He was called to

the bar in 1806, for a time also serving on the staff of the *Morning Chronicle*. In 1841 he was created Lord Chancellor of Ireland, with a peerage, but resigned shortly afterward, on the fall of the Melbourne ministry. He then devoted himself to literature, writing first a work on *Shakespeare's Legal Acquirements*, in order to prove that Shakespeare spent his youth in an attorney's office. In 1846-7 he published his *Lives of the Lord Chancellors*, which was followed in 1849 by the *Lives of the Chief Justices*. In the Whig Cabinet of 1846 Campbell was Chancellor of the Duchy of Lancaster; was appointed Lord Chief Justice in 1850; and became Lord Chancellor of England in 1859. As Chief Justice he presided over the trial of Dr. Newman for libel (1855), and as Lord Chancellor he delivered judgment in the *cause célèbre* of the Emperor of Austria vs. Kossuth. Consult the *Life* by his daughter, the Hon. Mrs. Hardcastle.

**Campbell**, JOHN ARCHIBALD (1811-89), American jurist, was born in Washington, Ga., and was graduated from the University of Georgia (1826). He was admitted to the bar in 1829, practised in Alabama, and was a member of the State legislature. In 1857 he was made an Associate Justice of the U. S. Supreme Court; became assistant Secretary of War of the Confederate States (1861); and was one of the commissioners to the Fort Monroe Peace Conference (1865). He published *Reminiscences of the Civil War* (1887).

**Campbell**, JOHN FRANCIS, of Islay (1822-85), was born in Islay, and died at Cannes. He was a keen and diligent collector of Highland oral tradition, and his *Popular Tales of the West Highlands* (4 vols., 1860-2), together with his *Leabhair na Fèine* ('Book of the Fians'), published in 1872, is the best collection of genuine Gaelic tales and ballads. One result of his research was to show that Macpherson's *Ossian* (q. v.) was mostly Macpherson's own creation. He also wrote several records of his travels—*Circular Notes* (1876), *Frost and Fire*, partly scientific (1865), and *A Short American Tramp in the Fall of 1864* (1865).

**Campbell**, JOHN M'LEOD (1800-72), Scottish divine, was born at Kilninver, Argyllshire. Being deprived of his living by the General Assembly on account of his teaching on the personal assurance of salvation and on the universality of the atonement, he worked in the Highlands as an evangelist for two years, thereafter ministering in Glasgow. In 1856 he published a work called *The Nature of the Atonement*,

which placed him in the front rank of living theologians. In 1862 he published his *Thoughts on Revelation*. Consult his *Reminiscences and Reflections*.

**Campbell, MRS. PATRICK** (1867), English actress, born at Kensington, London. After making dramatic tours (1888-91), she attracted special attention by her impersonation of Helen in an amateur performance of *The Hunchback* at Colchester. So favorable was the reception she met in London when playing (1890) in *A Buried Talent*, that in June, 1891, she ventured to take the Shaftesbury Theatre in order to make trial of *Rosalind*. At the Adelphi she created four parts, including *Astrea in The Trumpet Call*, and *Tress Purvis in The Lights of Home*. Next, at the St. James' Theatre, she achieved a brilliant success in the title rôle of *The Second Mrs. Tanqueray*. Other parts in which she has played include those of Kate Cloud in *John a' Dreams*, Agnes in *The Notorious Mrs. Ebbsmith*, Juliet (1895), Lady Teazle, Lady Macbeth (1898), Ophelia, and Magda (1900). She has appeared regularly in America in her most successful plays, including *Hedda Gabler* (1907), *The Thunderbolt* (1908), *Lady Patricia* (1911), *Bella Donna* (1911), and *Pygmalion* (1914). In 1914 she married George Cornwallis West.

**Campbell, REGINALD JOHN** (1867), Congregational minister, was educated at Christ Church, Oxford, and became (1895) minister of Union Street Church, Brighton. After the death of Dr. Parker (1903) he was made pastor of the City Temple, London. He actively opposed the Education Act of 1902, urging all whom he addressed to join in the Passive Resistance movement. Shortly after he inaugurated the 'New Theology' movement, which finally separated him from orthodox Nonconformity. In 1909 he became joint minister of the Weigh House Chapel, London. In the fall of 1911 he visited the United States, and aroused resentment at Philadelphia by his remark that the unsuccessful business man was the honest man. He is the author of *The New Theology* (1907); *Christianity and the Social Order* (1908).

**Campbell, THOMAS** (1777-1844), British poet, was born in Glasgow. He became a tutor in Mull in 1795, and two years later went to Edinburgh, where he found temporary employment in the Register House. Being brought into contact with the literary society of the Scottish capital, he applied himself to *The Pleasures of Hope*, which was published in April, 1799, and met with immediate success. The winter

of 1800-1 was spent at Altona, near Hamburg, where he met the hero of his *Exile of Erin*. He returned to England in 1801, sailing past the Danish batteries, the sight of which suggested his famous *Battle of the Baltic*. After one or two visits to London, he settled at Sydenham in 1804. For some time after this he was engaged in anonymous writing and compilation, until his *Gertrude of Wyoming* appeared in 1809.

Returning to hack work, Campbell produced *The Annals of Great Britain*, and lectured on 'Poetry' at the Surrey Institute in 1812. In 1820 he became editor of *The New Monthly Magazine*. His *Theodric* appeared in 1824, only to be met with universal censure. In 1834 he made a trip to Algiers, an account of which may be read in his *Letters from the South* (1837). His last considerable poem, *The Pilgrim of Glencoe*, appeared in 1842, but was not a success. He retired to Boulogne, France, where he died in 1844. He was buried in the Poets' Corner of Westminster Abbey.

Campbell survives almost entirely by his war songs, notably by *Hohenlinden*, *The Battle of the Baltic*, and *Ye Mariners of England*. Some of his shorter pieces, such as *Lord Ullin's Daughter* and *O'Connor's Child*, reproduce faithfully the style of the new romantic poets, and his *Lochiel's Warning* is still popular in certain circles. Consult William Beattie's *Life and Letters*; also the monograph by J. Cuthbert Hadden in 'Famous Scots Series.'

**Campbell, WILLIAM** (1745-81), American soldier, born in Augusta county, Va. In 1767 he removed to the Holston Valley settlement, where he became an officer of militia and took an active part in Indian warfare. During the American Revolution he served for a short time under Patrick Henry. As lieutenant-colonel he led the Virginia militia, and is generally regarded as the directing officer of the heterogeneous American force which won the battle of King's Mountain (q.v.); and he subsequently took a conspicuous part in the Battles of Guilford Court House and Hobkirk's Hill, where he was wounded.

**Campbell, WILLIAM WALLACE** (1862), American astronomer, was born in Hancock county, O., and was graduated from the University of Michigan (1886). He was professor of mathematics at the University of Colorado (1886-8), and instructor in astronomy at the University of Michigan (1888-91), when he was appointed to the head of Lick Observatory. In this capacity he has done valuable work on the orbits of comets, their spectra, stars and

nebulae, the motions of stars, and solar eclipses. In 1897-8 he had charge of the eclipse expedition to India, and in 1900 superintended the similar expedition to Georgia. He is a member of the National Academy of Sciences and of other learned societies. He has published: *The Elements of Practical Astronomy* (1899); *The Return of Halley's Comet* (1909); *Stellar Motions* (1913).

**Campbell, WILLIAM WILFRED** (1861), Canadian poet, was born in Berlin, Ontario, and was educated at the University of Toronto. He studied for the Church of England, but in 1891 entered the civil service at Ottawa, and devoted himself to literature. He is bibliographer of the Dominion Archives and Records Office, and has written a large amount of verse and several poetical dramas. Among his works are: *Lake Lyrics* (1889); *The Dread Voyage Poems* (1893); *Mordred and Hildebrand* (1895); *Sagas of Vaster Britain* (1906); *Canada* (1907); *A Beautiful Rebel* (1909); *The Scotsman in Canada* (1911); *Oxford Book of Canadian Verse* (1914).

**Campbell-Bannerman, SIR HENRY** (1836-1908), British statesman, familiarly known as 'C.-B.' He was Parliamentary representative for the Stirling Burghs from 1868 until his death. His official career began as financial secretary to the War Office (1870-4) in Gladstone's government, and was crowned in February, 1899, by his unanimous election to the leadership of the Liberal Party in the House of Commons on the retirement of Sir William Harcourt. He was again financial secretary to the War Office from 1880 to 1882, when he was transferred to the Admiralty as secretary (1882-4). During the last year of Gladstone's administration (1884-5) he was Chief Secretary for Ireland. On the formation of the Home Rule government (February-July, 1886) he was made Secretary of State for War. In 1892, when Gladstone was again Prime Minister, he resumed his place at the War Office; there he remained, under the subsequent Premiership of the Earl of Rosebery, until the ministry was defeated (1895). In 1897 he was a member of the Jameson Raid Committee, and he strongly disapproved of the war against the Transvaal.

On the resignation of A. J. Balfour's government in December, 1905, Sir H. Campbell-Bannerman was commissioned by the King to form a Liberal Cabinet. His administration brought the question of the status of the House of Lords prominently to the front, and in 1907 he made a memorable declaration that the powers of the Second Chamber

ought to be 'so restricted by law that . . . the final decision of the Commons shall prevail.'

**Campbellford**, town, Northumberland county, Ontario, Canada, on the Trent River and the Grand Trunk Railway; 30 miles east of Peterborough. The river affords excellent water power, and there are manufactures of paper, leather, woollen goods, and flour. Pop. (1901) 2,485; (1911) 3,051.

**Campbell Island**, an uninhabited, mountainous, peaty, wooded island, nearly 100 square miles in area, the most southerly land of New Zealand, about 145 miles southeast of Auckland Islands. It was discovered in 1810 by Captain Hazelburgh.

**Campbellton**, seaport, Restigouche county, New Brunswick, Canada, on Chaleurs Bay and the Restigouche River and the Intercolonial Railway; 13 miles southwest of Dalhousie. The town is in the midst of an excellent fishing and hunting territory, and sportsmen from the United States and Canada make it their outfitting point. Fisheries and lumbering offer the chief occupations. In 1910 the place suffered severely from fire. Pop. (1901) 2,652; (1911) 3,817.

**Campbeltown**, seaport and borough, Kintyre parish, Argyllshire, Scotland; 83 miles southwest of Glasgow. It possesses a splendid harbor, sheltered by Davaar Island (with a lighthouse). The place is a fishing station. Its industries comprise woollen and net factories, shipbuilding, and the distillation of whiskey. Pop. town (1911) 7,626.

**Camp du Marechal**, commune, Algeria; 45 miles east of Algiers. Pop. 8,300 (Europeans, 200).

**Camp e**, kām'pe, JOACHIM HEINRICH (1746-1818), German educationist, was tutor to Wilhelm and Alexander von Humboldt; became director of the Philanthropin at Dessau (1776-7); and in 1783 conducted a small private school of his own; after which Duke Karl Wilhelm Ferdinand invited him to reform education in Brunswick. In 1779 appeared his *Robinson* (based on Defoe's work), which attained immense popularity (Eng. trans.), and *The Discovery of America* in 1781; and between 1785 and 1791 he issued, in sixteen volumes, his *Allgemeine Revision des Gesammten Erziehungswesens*, a journal to which the best educational authorities contributed, and which did much to popularize and render practicable Rousseau's ideas on education. He then endeavored to purify the German language in his *Wörterbuch der . . . unserer Sprache aufgedrungenen fremden Ausdrücke* (1801). His *Wörterbuch der Deutschen Sprache* (1807-11) contains a large store of

words; but its value is otherwise slight, as the general historical knowledge of the language was at the time still imperfect. Consult *Leyser's Life* in German.

**Campeador**, EL. See CID CAMPEADOR.

**Campeche**, kam-pē'chi, or CAMPEACHY, state of Mexico, occupies the western part of the peninsula of Yucatan. The climate is tropical, and much of the country is covered with forests of valuable woods. The agricultural products are henequen, tobacco, and cotton; rice, beans, and peanuts are also grown. Tropical fruits of all kinds grow luxuriantly, and some indigo is produced. The industries of the country are fishing, agriculture, and stock raising, the gathering of dyewoods, and manufactures of hammocks, mats, and cordage. Logwood (Campeche wood), cotton, indigo, and wax are exported. Area, 18,086 square miles. Pop. (1910) 85,795.

**Campeche**, or CAMPEACHY (*San Francisco de Campeche*), town and seaport, capital of Campeche state, Mexico, is situated on the bay of the same name; 90 miles by rail southwest of Mérida. It has a citadel, university, naval academy, and shipbuilding docks. The harbor is safe, but shallow. The chief exports are logwood, hemp, cordage, wax, hides, cocoa, and salt. Cigars and palm-leaf hats are the principal manufactures. Pop. (1910) 16,864.

**Campeche Wood**. See LOGWOOD.

**Campeggio**, kām-ped'jō, LORENZO, CARDINAL (1474-1539), bishop of Feltri, was sent by Leo X. on a mission to the Emperor Maximilian, being created a cardinal in his absence (1517). Next year he visited England as papal legate to incite Henry VIII. against the Turks. In 1524 he obtained the bishopric of Salisbury and the archbishopric of Bologna, and he presided the same year at the Ratisbon diet. In 1528 he was despatched to England to hear the divorce suit of Henry VIII. against Catherine of Aragon.

**Camper**, kām'per, PIETER (1722-89), Dutch naturalist and anatomist, was born in Leyden. He was appointed successively professor of medicine and surgery at Franeker (1750), Amsterdam (1755), and Groningen (1763). He made many important discoveries in natural history, among them the auditory organs in fish (1761), the structure of the bones of birds and their relation to respiration, and the anatomical differences between man and the orang-outang. He also studied fossils, and he was the formulator of the 'facial angle' system of measurement in craniology.

**Camperdown**, village, Netherlands. See KAMPERDUIM.

**Camperdown**, western suburb of Sydney, New South Wales, Australia, containing the Sydney University and several large colleges and schools, also the Prince Alfred Hospital. Pop. 8,000.

**Camperdown**, THE BATTLE OF. On Oct. 11, 1797, the British Admiral Adam Duncan bore down upon the Dutch, under De Winter, broke through the Dutch line, and engaged closely from leeward. The action was bloody and determined on both sides, and resulted in a decisive victory for the British, who captured seven ships of the line (including both flagships), two 50's, and two frigates.

**Camp Fire Club of America**, an association of American sportsmen and nature lovers, having for its objects the promotion of local and national measures for game protection and forest preservation, the establishment and maintenance of standards of sportsmanship, the promotion of good fellowship among men of a common interest in the out-of-doors, and the recognition of signal achievements in the purposes for which the club is organized. Founded in 1897 as an informal association of campers and big game hunters, it was reorganized on a more formal basis in 1903, with William T. Hornaday as the first president.

The club has played an important part in rescuing the fur seals from slaughter; in the establishment of Glacier National Park, Montana, and Goat Mountain Park, British Columbia; in the promotion of Federal laws for the protection of migratory birds, and the prohibition of the importation for millinery purposes of wild birds' plumage; and in other State and national movements for conservation. The headquarters are in New York City, and the official organ is *Field and Stream*. President, George D. Pratt; secretary, Arthur F. Rice.

**Camp Fire Girls of America**, an organization of girls and young women between the ages of twelve and twenty years and upward, which aims to add the power of organization and the charm of romance to health, work, and play, particularly through the use of certain ceremonies, costumes, and symbols evolved from American Indian lore. Particular emphasis is placed upon out-of-door life, and an essential feature of the plan is a season spent in the open air, under camp influences. The order was established in March, 1912.

The members are organized into Camp Fires of not less than six and not more than twenty

members, each under the direction of a Guardian of the Fire, who receives her appointment from the National Board of Directors. Any girl of twelve years or over is eligible for membership, and may be received on probation by expressing her determination to follow the Law of the Camp Fire—to seek beauty, give service, pursue knowledge, be trustworthy, hold on to health, glorify work, and be happy. Full membership is of three ranks—Wood Gatherers, Fire Makers, and Torch Bearers—to be progressively attained by meeting specified requirements and by winning a certain number of elective honors chosen from the divisions of health craft, home craft, nature lore, camp craft, hand craft, business, and patriotism. Honors are symbolized by distinctively colored beads, which are awarded the members in recognition of attainment.

The symbol of the general organization is fire, for around it the first homes were built; the symbol of membership is the standing pine. The watchword is *Wohelo*, made up from the first two letters of the words Work, Health, and Love. In addition, each Camp Fire and each Camp Fire girl has a special name and symbol. Ceremonial meetings, or council fires, at which the ceremonial costume is worn and a prescribed ritual followed, are held once a month or oftener.

The Camp Fire Girls of America is a self-supporting and self-governing organization. Each girl pays 50 cents annual dues. She is urged to earn this money herself. The administration rests in the hands of a board of directors elected annually by the corporation, or board of electors, which includes the guardians of all camp fires and a number of additional members especially elected. On Oct. 31, 1916, there were 6,113 Camp Fires in good standing, with a total membership of 79,669 girls and 6,113 guardians. Headquarters, 461 Fourth Ave., New York City. President, Luther H. Gulick.

**Camphausen**, kâmp'hou-zen, OTTO VON (1812-96), Prussian statesman, born at Hünshoven, near Aix-la-Chapelle. He was elected to the second chamber (1849), where he joined the Moderate Liberal Party. As Minister of Finance from 1869 to 1878 he succeeded in transforming a large annually recurring deficit into a surplus, and, with the aid of the French war indemnity, considerably reduced the national debt, these services earning for him the appointment of vice-president of the ministry (1873-8). His strong adherence to free trade principles resulted in continual conflict with

Bismarck, and finally caused his retirement.

**Camphausen**, WILHELM (1818-85), German historical and battle painter, was born at Düsseldorf, and became a representative of the local school of art. His works are accurate, but monotonous in theme, and comprise: *Cromwell's Guard Watching the Approaching Enemy* (1846); *Puritans with a Convoy of Prisoners*; *Charles II. Escaping After the Battle of Worcester* (1849); *Charles I. at the Battle of Naseby* (1852); *Morning Watch of the Puritans* (1852). He afterward executed a great number of paintings of Frederick the Great's wars, the Schleswig-Holstein campaign of 1864, the Austro-Prussian War of 1866, and the Franco-German War of 1870. Of the last series may be mentioned the two colossal canvases, *Wilhelm I. on a Battlefield, Accompanied by Roon, Bismarck, and Moltke* (1872), now in the Cologne Gallery, and *Wilhelm I. with Moltke* (1873). Other well-known compositions of his brush are: *The Meeting of Bismarck and Napoleon III.*; *The Entry of the Victorious Army into Berlin*.

**Camphene**, kam'fēn (C<sub>10</sub>H<sub>16</sub>), a solid hydrocarbon, crystallizing in white prisms, and prepared by heating pinine hydrochloride or artificial camphor with sodium stearate. It smells like turpentine and camphor, and exists in a dextro and lævo modification.

**Camphine**, kam'fin, or -fēn, the trade name of a purified spirit of turpentine, formerly used for burning in lamps, and generally prepared by distilling good turpentine with quicklime.

**Camphor**, kam'fer, a volatile, semi-transparent, crystalline substance, with a characteristic penetrating odor and an aromatic, cooling taste, obtained from various species of laurel, notably the Camphor Laurel (*Laurus* or *Cinnamomum camphora*). It dissolves slightly in water (1-1,000), and readily in ether or alcohol; melts at 175° c.; boils at 204° c.; and burns with a bright flame and much smoke. Its specific gravity is slightly less than that of water. Chemically it is a ketonic derivative of paracymene, and is represented by the formula C<sub>10</sub>H<sub>16</sub>O.

The camphor tree is a handsome, dense topped tree growing to a height of forty to sixty feet. It is a native of Southeastern Asia—notably China, Japan, and Formosa—whence its cultivation has been introduced into Ceylon, Malaya, and Italy. In the United States it has been grown as an ornamental tree in the Southern and Southwestern States, and is cultivated on a commercial scale in Florida.

The bulk of the camphor of commerce comes from Japan and

Formosa, where, according to the traditional method, the wood is cut into chips and distilled with water; the vapor of the camphor rises from the steam, and is conducted to a receptacle, where it is allowed to cool and condense; and the oil of camphor is allowed to drain off. In the refining process the impure camphor is mixed with a small proportion of quicklime, is reheated, and allowed to sublime and resolidify. Recent investigations having proved that the leaves of the camphor tree yield more camphor and oil of camphor than the wood, and that their proper harvesting does no injury to the tree, methods of distillation have been modified accordingly.

Other natural varieties of camphor are Peppermint Camphor, or Menthol (q. v.); Thyme Camphor, or Thymol (q. v.); Borneol (C<sub>10</sub>H<sub>18</sub>O), occurring as coarse crystals in the wood of *Dryobalanops camphora*; and Blumea or Ngai Camphor, distilled from the leaves of *Blumea balsamifera*, little known outside of China.

**Artificial or Synthetic Camphor** is prepared by a number of processes based upon the conversion of pinene, a hydrocarbon existing in the volatile oil of turpentine. By most of these, pinene hydrochloride is converted into borneol or isoborneol (C<sub>10</sub>H<sub>17</sub>OH), and the product oxidized into commercial camphor.

Camphor has been used for many years as an insecticide and in medicine. Applied externally it is a counter-irritant, a local anæsthetic, and an antiseptic. Internally it is a nerve stimulant and a fever specific. In more recent times it has been extensively employed in the manufacture of celluloid (q. v.) and of high explosives. Imports into the United States in 1915 amounted to 3,729,207 lbs. of the crude and 1,170,666 lbs. of the refined product, valued at \$1,003,261 and \$417,861, respectively.

**Camphuysen**, kâmp'hoi-zen, DIRK RAFAELSZ (1586-1627), Dutch poet, born at Gorinchem, was a teacher and pastor (1616), but was deprived (1619) of his living because of his Arminian views. He wrote *Stichtelijke Rijmen* (1625), and numerous other editions, mostly religious poems in a simple style characterized by some natural force. There is a *Life* in Dutch by Kindermann.

**Campi**, kâmp'pē, a family of artists of Cremona in Italy. (1.) GALEAZZO CAMPI (1475-1536), painter, was the father of three more famous sons. (2.) GIULIO CAMPI (1500-72), painter, influenced chiefly by the style of Giulio Romano, has left fine specimens of his art at Cremona and Milan. (3.) AN-

TONIO CAMPI (1536-91), architect, painter, and historian, not only added to the valued paintings of Cremona and Milan, but composed a *Chronicle* (1585) of Cremona adorned with plates of his own engraving.

(4.) VINCENZO CAMPI (1532-91) devoted himself to portraiture and still life.

(5.) BERNARDINO CAMPI (1522-90) may have been related to Galeazzo and Vincenzo. His works show study of his master Giulio Romano, and of Titian, Correggio, and Raphael. His great work in the cupola of San Sigismondo represents the assembly of Old and New Testament saints. In the Louvre is his *Mater Dolorosa*.

**Campi Bisenzio**, kām'pē bē-zent'sē-ō, town, Tuscany, Italy, in the province of Florence; 7 miles northwest of Florence. It has tile and iron works. Pop. (commune) 14,000.

**Campidano**, kām-pē-dā'nō, the fertile plain in Sardinia which stretches across the island from the Gulf of Cagliari, in the south, to the Gulf of Oristano, in the west, and produces especially wine, fruits, and cereals. It is hot, dry, and in parts malarious.

**Campiglia Marittima**, kām-pēel'ya mar-rit'te-ma, commune, Italy, in the province of Pisa; 35 miles southeast of Leghorn. Lead, iron, and copper are mined. Pop. 8,000.

**Campillos**, kām-pēel'yos, commune, Spain, in the province of Malaga; 35 miles northwest of Malaga. It manufactures cloth and leather. Pop. (1920), 5,938.

**Campinas**, kām-pē'nāsh, city, Brazil, in the state of Sao Paulo; 55 miles northwest of Sao Paulo city. It has one of the finest churches in Brazil—the Church of the Conception, a hospital, a theatre, three libraries, and a hippodrome. There are large coffee and sugar plantations in the surrounding district, and machinery, agricultural implements, hats, and cotton goods are manufactured. Pop. 15,000.

**Camping**, a form of recreation which generally implies living more or less simply out of doors, with a tent of some kind for shelter.

The camp site should be near wood and water, to supply fuel and drink. The tent should be pitched on well drained rising ground, partly shaded if possible but near the open. Dense woods or thickets are undesirable, and dead timber is a breeding place of dampness. Tents vary greatly in style, size, and material, according to the climate, the number in the party, and transportation facilities. For a permanent camp the wall-tent, which is quickly put up, is considered by

many the most practical form of shelter. Another popular tent is the 'Dan Beard' tent, which is practically a wall-tent with one side sheared off about 2 feet beyond the ridge, the place of the side being taken by a veranda flap which can be closed down or guyed out horizontally, permitting an open camp fire in front. Other excellent tents are the miner's tent, with or without walls, pyramidal in shape and adaptable for open country; the

so as to form a support for the bottom of the utensils, and having a small trench underneath, in which are placed kindling and small logs. A wind guard or radiator formed of logs placed at the back improves this fireplace. If stones or turf are available, what is known as a Matiso stove is excellent. This is made by building a pier of stones about 3 feet high, and leaving a hollow in the centre for a fireplace, with a bottom of turf.

#### A Motor Camping Tent

'Baker' or shelter tent, a good light-weight tent, fairly spacious and comfortable; and the Forester tent, the lightest and warmest of all tents, easy to construct and easy to pitch, requiring 8 pegs, 3 poles, a ridge-pole, and a pair of shears.

The next important consideration is the camp fire, both for purposes of warmth and for cooking. There are various types of fires, adapted to various kinds of camps: the back-log fire, virtually a log hearth which burns all night; the Indian fire, a circle of logs with the fire in the centre, easily made and easily replenished; the teepee fire, similar to the Indian fire but of fewer and larger logs; and the snow fire, built to burn on a snow bank and yet not be extinguished by the melting snow beneath. For cooking, the simplest device is the log range made by two logs set on the ground near together

The camp bed is of several varieties. A canvas sack, filled with hay and stretched between two poles resting on logs in which notches have been cut to hold them firmly, makes a comfortable bed when blankets are placed below and above the sleeper. Another good camp bed, called the 'browse bed,' is made by filling a canvas bag with pine boughs, dead leaves, or any kind of young browse. Sleeping bags of various kinds, stretcher beds, air mattresses, and Indian stick beds, made of kinnikinnic, on which is laid a sleeping bag, blanket, or deer skin, are other popular arrangements.

Equipment for a camping trip varies with the time of year, the location of the camp, the size of the camping party, and other matters, but in general it should include, beside the tents, beds and blankets, a cook-kit, of which there are several on the

market, a medicine kit, warm, light, and durable clothing, a clock, a lantern or flashlight, if possible a hay-box cooker, matches, soap, an axe, and such canned food as will be necessary to supplement what is likely to be obtained by hunting and fishing. Milk and eggs are often obtainable within a reasonable distance.

**Motor Camping.**—A popular form of camping, coincident with the growing use of the motor car, is motor or auto camping. Outfitting for a motor camping

which is towed behind the car, bearing tents, beds, provisions, and utensils, and leaving the car itself free from clutter.

Many towns and cities throughout the Western United States and some in the East maintain camping grounds for motor tourists. In Southern California there are more than fifty such grounds; and Vancouver, Banff, and other Canadian cities offer similar facilities. Often the section is in a city park and in all cases the campers find numerous accommodations, as electric lights,

door living. These agencies may be generally divided into three classes: (1) private individuals and organizations conducting camps for profit; (2) private organizations conducting camps without profit; and (3) public associations providing opportunities for camping. The private camps are of three general types, boys', girls', and adults'. The first organized camp for boys was founded in 1881. For twenty years the progress of this movement was slow, but the last two decades have seen a rapid

#### *Water Sports at a Girls' Camp*

trip, as for any other camping trip, varies with the size of the car and the number in the party. The fundamental considerations are the comfort of the passengers, compactness of equipment, its protection against rain and dust, its security in attachment, and the best running conditions for the car. Many of the outfits used in motor camping are combination beds and tents. In some cases these are set up apart from the car, in others they are attached to it; some can be used in either way. Generally the tent part is merely a shelter for the bed and has little or no room for living space. Auto campers who desire a maximum of comfort use a trailer, weighing between 500 and 800 pounds,

stoves, water, toilet facilities, and sometimes even chairs and tables. In most cases the accommodations are free, but the length of stay is sometimes limited. The National Parks and Forests welcome the motor camper and offer many aids for his comfort; in many States the same courtesies are extended in the wild open spaces under State control.

**Organized Camping.**—The last twenty-five years, with its increase in wealth, shorter working hours, extension of National Park and Forest areas, and greater attention to the benefits to be derived from fresh air and exercise, have witnessed a great development in agencies devoted to the promotion, for brief periods at least, of out-of-

growth, and there are now some 300 private camps for boys in the United States. The first private camp for girls is credited to Dr. and Mrs. Gulick, who in 1888 established a camp in Maine for their own daughters, from time to time admitting other girls on a paying basis. The growth of girls' camps has been extremely rapid, and they now number approximately 260. The private camp for adults is still in its infancy. There are some 65 or 70 now in operation, purely commercial ventures, many of them really decentralized hotels.

The majority of organized camps in the United States are conducted by private organizations for civic, social, recreational, or educational purposes

the fees being usually only enough to cover the actual cost of operation. Chief among the organizations establishing such camps are the Y. M. C. A., Y. W. C. A., Boy Scouts of America, Camp Fire Girls, Girl Scouts, Federation of Boys' Clubs, Federation of Girls' Clubs, Woodcraft League of America, and the American Legion. Many large city churches conduct summer camps for their children and poorer parishioners, as do many social agencies, newspapers, magazines, and commercial clubs.

The public agencies providing opportunities for camping include municipal, county, State, and the National governments. During the past decade a number of municipalities have established organized camps. They usually enroll both boys and girls, as well as mothers and small children, and are generally under the control of municipal recreation departments. Municipalities have also shown much interest in establishing tourist camps for motoring parties and there are more than 2,000 of these in the United States (see above). County governments have not as yet become an appreciable factor in the camping question, and the State governments are concerned chiefly through their park and forestry departments, promoting camping by the building of roads, construction of trail shelters, providing police and sanitary protection, and developing certain areas for motor camping. The National Government aids in the promotion of camping in like manner, working through the Bureau of Forestry, the National Park Service, and the War Department.

In practically all organized camps a more or less definite programme of work and play is carried out, varying with the type and location of the camp. In general it includes horseback riding, swimming, hiking, games, religious exercises, and educational work as exemplified in a study of woodcraft, dramatic entertainments, pageants, basket making, bead and leather work, nature study, and other activities. Good leaders, or counsellors as they are called, are of prime importance in an organized camp.

Consult Miller's *Camp Craft* (1915); Gibson's *Camping Out for All* (1919); Jessup's *The Motor Camping Book* (1921); Brummer's *Autocamping* (1923); Brooks' *A Handbook of the Outdoors* (1925); Wack's *The Camping Ideal* (1925).

**Campion**, kām'pī-un, the common name of plants belonging to the genera *Lychnis* and *Silene* (qq. v.).

**Campion**, EDMUND (1540-81), English Jesuit, was born in London. During a visit to Dublin he advocated the cause of Irish education in a pamphlet called a *History of Ireland* (1569). After studying in the English College at Douai, he openly recanted (1572) Protestantism, and was chosen by the Society of Jesus for the mission to England (1580), during which he preached with such effect that wavering Catholics drew to him in crowds. At the same time he wrote the *Decem Rationes* (1581), against the Protestants. Betrayed to the government, he was thrice put to the torture, and was hanged at Tyburn. He was beatified in 1886. Consult Simpson's *Life*.

**Campion**, THOMAS (c. 1567-1620), English poet and composer of music. He seems to have become a member of Gray's Inn, but turned from law, and practised as a physician. About 1593 he was known as a poet, both in Latin and in English. Between 1601 and 1617 he published a series of exquisite song books, writing both words and music. He also wrote on the theories of poetry and counterpoint, and worked with Inigo Jones in the production of court masques. His works include: *Epigrams* (Latin, 1595, 1619); *A Book of Airs* (with Philip Rosseter, 1601); *Songs of Mourning* (1613); *Two Books of Airs* (c. 1613); *Third and Fourth Books of Airs* (c. 1617); *Observations in the Art of English Poesy* (1602). His *Collected Works* were edited by Bullen in 1889, by P. Vivian in 1908.

**Campi Raudii**, kām'pī rô'di-i, the Raudian Plains, in the north of Italy, near Verzellæ. In 101 B.C. a great victory was won there by Marius and Catulus over the invading Cimbri and Teutones.

**Camp'li**, commune, Italy, in the province of Abruzzi; 6 miles northeast of Teramo. Tanning and cattle raising are industries. Pop. 10,000.

**Camp Meetings**, religious gatherings, of several days duration, held out of doors in temporary encampments. In earlier times they were often marked by emotional preaching and much religious excitement. They were originated by the Methodist Church in Kentucky in 1799, for the benefit of people living in sparsely settled districts. About the same time Hugh Bourne, an English Wesleyan, began a series of open-air meetings in North Staffordshire, England; and following a visit of Lorenzo Dow, an eccentric American, these became (about 1807) typical camp meetings. The English Wesleyan Conference disappeared, and for this and other

reasons Bourne and his followers founded the Primitive Methodists (see METHODISM). In America Presbyterians and Baptists at first took part in the camp meetings, but they soon became distinctively Methodist.

In recent years the meeting grounds have become fixed, and have developed into exceedingly valuable properties (as at Ocean Grove, N. J., Round Lake, N. Y., and many other places), taking on the character of summer resorts; while the rude preaching and disorders of the early time have disappeared, and various educational features have been added. Consult Swallow's *Camp Meetings*; James' *Varieties of Religious Experience*.

**Campoamor y Campoosorio**, kām-pō-ä-mör ē kām-po-o-sō'rē-ō, RAMON (1817-1901), Spanish man of letters and legislator, was born in Navia, Asturias. He was one of the most popular poets in Spain, and claimed to be the creator of two new genres of poetry, the *dolora* and the *pequeño poema*. The *doloras*, his first collection of which appeared in 1856 (18th ed. 1890), illustrate or enforce some moral or philosophical idea; while the *pequeño poema* is a novel or novelette in verse, turning upon a social or psychological theme. Collections of *pequeños poemas* appeared from 1879 on, among the most celebrated being *La niña y el nido*, *El tren express*, *Los grandes problemas*. Other works include *Nuevos poemas* (1892); *El idealismo* (1883), an exposition of philosophical principles; *El drama universal* (1873 and 1891), a lengthy poem; the dramas *Dies Ira* (1873) and *Glorias humanas* (1885); and the comedies, *Cuerdos y locos* and *El honor*. The author's best productions, however, are his lyrical works (e.g., *Obras poéticas*, 1900), some of his shorter sentimental poems being notable for their highly polished diction and subtle thought. Campoamor was an eloquent speaker in the Cortes, in which he sat for several years. Consult Boris de Tannenberg's *La poésie Castellane contemporaine*.

**Campobasso**, kām-pō-bäs'sō (formerly MOLISE), province of Italy, stretching from the South Apennines to the Adriatic; area 1,692 square miles. Sheep and cattle grazing is the chief industry in the mountainous parts. The coastlands and lower valleys yield wheat, corn, wine, olives, and hemp. Cutlery, paper, hats, and silk are manufactured. Pop. (1921) 340,909.

**Campobasso**, town, capital of the province of Campobasso, Italy; 52 miles north of Benevento by railroad. It lies in the heart of the Neapolitan Apennines.

nines, has several fine churches, and manufactures cutlery. Pop. (1921) 18,330.

**Campobello**, kam-pō-bel'ō, island in the Bay of Fundy, New Brunswick, Canada, at the entrance to Passamaquoddy Bay. It is about eight miles long and three miles wide, and has a picturesque rocky coast. It is a popular summer resort. Pop. (1921) 1,250.

**Campobello di Licata**, town, Girgenti province, Sicily; 17 miles north of Licata by railroad. It is situated in a fertile district near large sulphur mines. Pop. 12,000.

**Campobello di Mazza**, town, Sicily, in the province of Trapani; 32 miles southeast of Trapani. It has famous quarries, which yielded the material for the temples of Selinus, constructed in the fifth century B.C. Pop. 9,000.

**Campodea**, kam-pō'di-a, a small insect—widely distributed over the world—which has acquired considerable importance from the fact that it has been supposed to be the nearest living representative of the ancestral insect. See THYSANURA.

**Campo de Criptano**, kam'pō dā krip-tā'na, town, Spain, in the province of Ciudad Real; 80 miles southeast of Madrid. Pop. (1920) 12,772.

**Campo Formio**, kām'pō for-mē-ō, village, Venetia, Italy; 6 miles southwest of Udine. Here, on Oct. 17, 1797, peace was signed between Austria and Napoleon at the end of his first Italian war.

**Campomanes**, kām-pō-mā'nās, PEDRO RODRIGUEZ, COUNT OF (1723-1802), Spanish statesman and writer, was born in Asturias. He held successively the offices of president of the Cortes, director of the Royal Academy of History, and minister of state, but retired from public life on the accession of Charles IV. He wrote the first Spanish work of any value on political economy, and to his efforts are due several of the most important economic measures in Spain, such as the creation of a national bank, the opening of Spanish ports to foreign trade, the free importation of raw materials, and the foundation of agricultural and industrial societies.

**Campos**, kām'pōōsh, a Brazilian word for *savannas*, or stretches of land intermediate between forest and grass land, in climates transitional between the temperate and the tropical. The *llanos* (q. v.) are similar to the campos.

**Campos**, city, state of Rio de Janeiro, Brazil, on the Parahyba River, connected by rail (37 miles) with the port of Sao Joao do Barra, at its mouth; 150 miles northeast of Rio de Janeiro. After the capital, it is the largest and healthiest city of the state.

It is an important railroad centre, and has an active export trade in sugar, coffee, and rice. Pop. 50,000.

**Campos**, ARSENIO MARTINEZ DE (1831-1900), Spanish general and statesman, was born in Segovia. He distinguished himself in the Morocco campaign of 1859-60; served in Cuba from 1869 to 1872; and commanded against the Carlists (1870 and 1873). Returning to Madrid, he, with General Jovellar, succeeded in placing Alfonso XII. on the throne (1874), after which he finally defeated the Carlists at Peña de Plata (1876), thus ending the civil war. Appointed commander-in-chief of the army in Cuba (1877), he was uniformly victorious. Thereafter he was successively minister of war (1879 and 1881-3), president of the Senate (1885), minister of war (1887), captain-general of Madrid (1888). Returning to Cuba in 1895 to quell disturbances rekindled by the refusal to grant reforms, he was unsuccessful, and was replaced by General Weyler. On his return he became governor of Madrid and president of the Senate, and during the minority of Alfonso XIII. was the trusted adviser of the queen-regent.

**Campo Santo** ('holy field'), kām'pō sán'tō, the Italian and Spanish name for a cemetery or burying ground, especially for one enclosed by an arcade. The walls of the famous Campo Santo of Pisa are covered with frescoes by early painters; that of Genoa has some fine sculpture.

**Campos-Salles**, kām'pōōsh sāl'lesh, MANOEL FERRAZ DE (1840-1913), Brazilian statesman, was born in the state of Sao Paulo. Upon leaving college, in 1864, he entered the profession of journalism, and later became active in politics. During the Brazilian Empire he was a member of Parliament, where he was known as the 'Gambetta of Brazil.' He was successively Minister of Justice under the Republic, and governor of the state of Sao Paulo, and in 1898 became President of Brazil, serving until 1902.

**Campu-Lung**, kām-pōō-lōōng', or KIMPOLUNG, town, Roumania, capital of the province of Muscel, near the Carpathians; 80 miles northwest of Bucharest. It has Roman remains, and was the first capital of Walachia, in the fourteenth century. Pop. 13,500.

**Campus**, a Latin term signifying 'a field,' subsequently limited to a large vacant space near a town, where games, shows, and assemblies could be held. In the United States, the term is used for a college green.

**Camtoos**. See GAMTOOS.

**Camuccini**, kā-mōōt-chē'nē, VINCENZO (1775-1844), Italian painter, was born in Rome. The

school of which he became the head was founded on the theatrical antique style of the French painter David. His *Incredulity of Thomas* was copied in mosaic for St. Peter's.

**Camulodunum**, the old Roman name of COLCHESTER (q. v.).

**Camus**, kā-mū', ARMAND GASTON (1740-1804), French revolutionist, was born in Paris. At the Revolution he was elected a deputy to the States-General and to the National Convention, and was one of the accusers of Louis XVI. He was also appointed keeper of the archives, and preserved the records from destruction. When sent in 1793 to arrest Dumouriez he was seized and given up to the Austrians, but after thirty months' imprisonment was liberated by exchange. In 1796 he was president of the Council of Five Hundred.

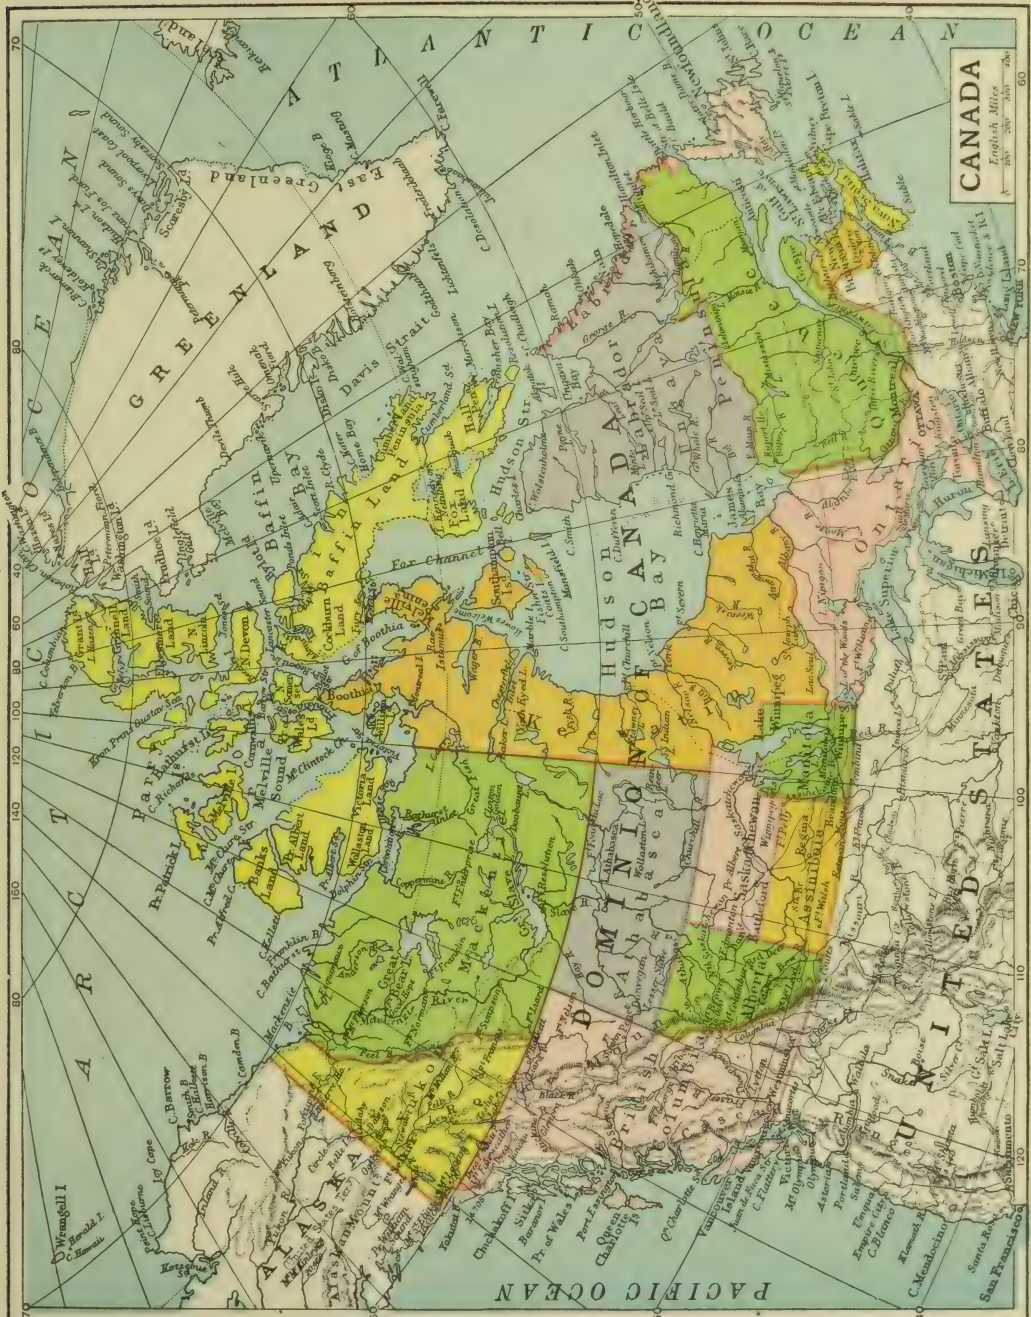

**Cam'wood**, a wood from which an important red dye is obtained. The tree (*Baphia nitida*) is a native of Angola, West Africa, and is leguminous.

**Cana** OF GALILEE, kā'nā, the scene of Christ's first recorded miracle, and the birthplace of Nathanael, was situated near Capernaum, west of the Sea of Galilee. Two modern villages claim to represent the site. The one, now Kefer Kenna, is 4½ miles northwest of Nazareth; the other, Kana el Jelil, is 9 miles north of Nazareth.

**Canaan**, kā'nān ('low land'), the name originally applied to the low coast land of Palestine on the Mediterranean, inhabited by the Canaanites (strictly so called), as opposed to the mountain land (cf. Num. xiii). In this original sense the name is still applied in Isa. xxiii. 11 to the Phœnician, and in Zeph. ii. 5 to the Philistine coast land. At a later period, the name Canaan became extended to the whole country. See PALESTINE.

**Canaanites**, according to Gen. x. 15 f., the descendants of Canaan, the son of Ham and grandson of Noah, who inhabited Palestine previous to the Israelite invasion. In the Old Testament, the name is frequently used to include all the heathen between the Jordan and the Mediterranean. In the time of the Patriarchs they were already civilized, and living in towns; and by the time of Joshua their country was studded with walled cities, each under a king. Their religion was a licentious worship of Baal and Ashtoreth, as the productive powers of nature. Their subjugation was effected only by degrees. In some passages of the Old Testament Canaanites stands for the Phœnicians. See PALESTINE; PHœNICIANS; HITTITES.

CANADA  
English Names

**Canada, DOMINION OF,** comprises the whole of the northern half of the North American Continent, with the exception of Alaska, which belongs to the United States, and Newfoundland with its dependency Labrador, the boundaries of which were extended by the award of the Judicial Committee of the British Privy Council, on Mar. 1, 1927, at the expense of Canada. From east to west Canada is divided into the following provinces: Nova Scotia, Prince Edward Island, New Brunswick, Quebec, Ontario, Manitoba, Saskatchewan, Alberta, and British Columbia. The remainder is included in the two territorial districts of Yukon and the Northwest Territories. The provinces and districts thus comprised in the Dominion of Canada cover an area of 3,684,723 square miles, of which 142,674 is water. This is somewhat greater than that of the United States (including Alaska but not the insular possessions) and a little less than that of Europe.

**Topography.**—So far as physical features are concerned, the Canadian half of the continent may be divided into four regions: (1) In the east, and including the larger part of the Maritime Provinces, the hills and lowlands are a continuation of the Appalachian Highlands. (2) Westward, and covering an immense portion of the country, is the Laurentian region, including the provinces of Quebec and Ontario and the eastern part of Manitoba, as well as the land north of these provinces. (3) Next comes the great unwooded plain of Western Manitoba, Southern Saskatchewan, and Southern Alberta, extending to the base of the Rocky Mountains. (4) British Columbia forms the fourth and last division, a veritable 'sea of mountains,' running parallel to the coast and enclosing many fertile valleys.

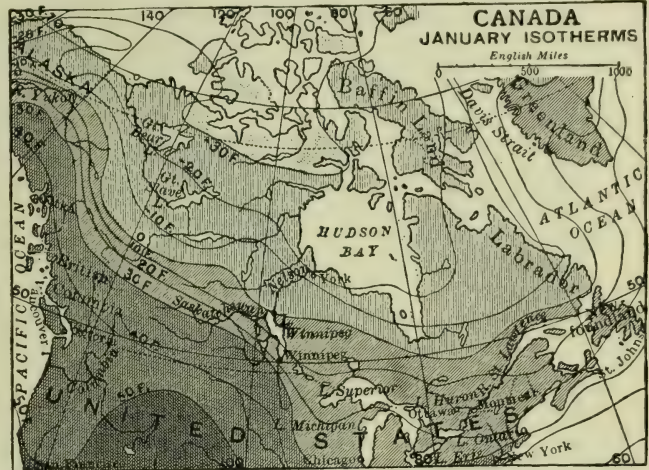

(1) In the Appalachian region the ranges of hills run from northwest to southeast, and are of later formation than the Laurentian hills. That portion bordering on the Bay of Fundy is fertile, especially the parts reclaimed from the sea by dikes. Most of the uncultivated land, particularly in New Brunswick, is heavily wooded. The coast line is much indented, offering numerous secure harbors to the trading and fishing population.

(2) The Laurentian region, from a geological point of view, is the nucleus and backbone of the continent. This great extent of territory nowhere attains any great height, although it presents some bold ranges of hills along the sea coast. South of the plateau region is a great lowland area, embracing the valley of

the St. Lawrence River and the peninsular portion of Ontario. On account of its temperate climate and fertile soil, the St. Lawrence valley region is well suited to agricultural and horticultural pursuits. The northern and sterile portion of the Laurentian region is covered with a dense forest, except in the extreme north, in what is known as the

through which at the present time the Red River flows. It is very fertile. In the west of Manitoba the second prairie steppe begins, where the land is of a rather more undulating character than that to the east. Still farther west, a second steppe intervenes, followed in its turn by a third.

(4) The Cordilleran region, in

'Great Barrens.' The great central plain, from a breadth of 800 miles at the international boundary, gradually contracts toward the north as a result of a western extension of the Laurentian region. Here we have the granary of the Dominion. In the extreme north it again increases in width, and along the banks of the rivers is heavily wooded. The general slope is from the southwest toward the east and north.

(3) A large part of Manitoba is the bed of a former lake,

British Columbia, attains a breadth of 400 miles, and is traversed from north to south by four ranges of mountains, including the partially submerged island range. Between the Gold and Coast Mountains is an elevated plateau region, in which is included the celebrated Okanagan Valley.

The highest peaks in Canada are Mount Logan (19,539 feet), and Mount Lucania (17,147 feet), in the Yukon District, and Mount Fairweather (15,292 feet), in British Columbia. The dif-

ferent ranges diminish in height as they approach the ocean.

Canada is drained by four river systems: (1) The Atlantic, including the St. John River in New Brunswick and the St. Lawrence River, with its tributaries—the St. Maurice, the St. Charles, the Saguenay, the Ottawa, and the Richelieu. The St. Lawrence River and the Great Lakes form a vast navigable waterway, extending from the Gulf of St. Lawrence into the heart of the continent. (2) The Hudson Bay system includes the Nelson, Albany, and Churchill Rivers, as well as the Saskatchewan, which, rising in the foothills of the Rockies, eventually discharges its waters into Hudson Bay through the Nelson. (3) The Athabasca and Peace Rivers flow into Lake Athabasca, which discharges its surplus waters into the Great Slave Lake, under the name of the Slave River. The Mackenzie River flows from the Great Slave Lake into the Arctic Ocean. These, with other rivers, are included in the Arctic system. (4) The Pacific system includes the Fraser, Thompson, and Columbia Rivers, all flowing into the Pacific Ocean.

**Climate and Soil.**—Along the Pacific Coast the Japanese current greatly modifies the extremes one would naturally look for in a continental province north of the forty-ninth parallel of north latitude. At Vancouver the mean temperature of the coldest month is 35.6° F., of the hottest 63.3° F., and in the winter the temperature seldom falls below 22° F. East of the Rocky Mountains we find such extremes of temperature as are generally to be expected in the same latitudes of the North Temperate zone.

In the northwest the chief disadvantage of the Canadian climate for wheat growing lies in the fact that there is an occasional early frost before harvest; but this risk is greatly minimized by the cultivation of the hardier varieties, which produce hard wheats (in particular Marquis wheat) unrivalled in the world for their excellent quality and high value. The summers, following the cold but invigorating winters, are bright and warm, and under the influence of the long, sunny days the wheat rapidly reaches maturity. In winter the cold of the districts adjacent to the mountains is mitigated frequently by the warm 'chinook' winds, which, especially in Alberta, soon clear the ground of snow and revive the pasture grasses.

In the east the presence of the Great Lakes and the adjacent ocean exercises a modifying influence upon the climate, while the

winter's snow protects the ground from severe frosts. The presence of a cold Arctic current along the Atlantic Coast retards the advance of spring in the Maritime Provinces, where, however, there is a marked absence of those extremes both of heat and cold which are at times experienced farther west. The figures in the accompanying table give the mean annual temperature and average annual precipitation for representative centres throughout the Dominion.

*Normal Mean Daily Temperature and Annual Precipitation*

Place	Temperature, Fahr.	Precipitation, Inches
Halifax . . .	44.3°	56
Charlottetown . . .	41.8	39
St. John . . .	41.6	48
Montreal . . .	42.4	41
Toronto . . .	44.4	33
Ottawa . . .	41.8	33
Winnipeg . . .	35.2	20
Regina . . .	32.5	19
Edmonton . . .	36.8	18
Vancouver . . .	49.1	59

A large part of the Maritime Provinces has a climate and soil well adapted to raising all kinds of cereal, horticultural, and root crops. In Nova Scotia the most fertile parts are the Annapolis and Cornwallis valleys and the counties of Cumberland, Colchester, and Antigonish. In New Brunswick the valleys of the St. John and the Kennebecasis are the gardens of the province; while by far the larger part of Prince Edward Island is extremely fertile. In Quebec, the Eastern Townships and the valley of the St. Lawrence contain the best and most fertile land in the province. The peninsular part of Ontario is the most desirable portion of that province, from an agricultural and horticultural point of view. Peaches and grapes are grown there in large quantities. Farther west, in the Prairie Provinces, the virgin land is of unexcelled fertility; and this is true, to a less extent, as far north as the wooded portions of these provinces; while the Peace River country, in Northwestern Alberta, is particularly suitable for mixed farming. In British Columbia, the valleys in the interior and a large part of the sea coast are the choicest portions.

**Geology.**—Geologically, Canada may be divided into six great provinces. Of these, the most extensive is the great Laurentian Plateau. Its southern extremity includes a large part of Northern and Western Ontario, and even penetrates into the United States. On the east it

follows the north bank of the St. Lawrence River in a northeasterly direction. Its western boundary runs toward the northwest until it is lost in the Northwest Territories. This great plateau is occupied by rocks of pre-Cambrian age, and belongs to the oldest of the world's systems of strata. To a certain extent this primeval area is enclosed and penetrated by granitic rocks. The Laurentian Plateau, particularly the northern part, is as yet largely unknown and unexplored; but since much of the southern portion has been discovered to be rich in valuable metals and minerals, it is highly probable that the more inaccessible parts may yet yield a rich return to the miner.

Surrounding the Laurentian Plateau are three geological provinces. In the extreme north lies the Arctic Archipelago, unknown and perhaps unknowable in its formidable armor of ice and snow. In the east is the St. Lawrence valley area, extending to and through the peninsular part of Ontario. In the west is the Interior Continental Plain, in many respects resembling the St. Lawrence valley. Both of these geological provinces are underlain by sedimentary strata, deposited by the seas which encircled the Laurentian Plateau, or by the rivers and lakes which followed upon the oceanic period.

The Eastern or Appalachian area includes the Maritime Provinces and that part of Quebec which lies south of the St. Lawrence, while the Cordilleran area covers the province of British Columbia and part of the Yukon District. They have many characteristics in common, but the Cordilleran presents all the Appalachian peculiarities on a far grander and more imposing scale. Geologically, they are both of pre-Cambrian origin, and are marked by the presence of sedimentary strata and volcanic intrusions. Both areas are rich in the valuable minerals and metals.

**Flora and Fauna.**—The flora of Eastern Canada, embracing the Maritime Provinces, Quebec, and Ontario, is very much alike; but in certain respects the flora of Nova Scotia differs somewhat from that of the other provinces. In Nova Scotia a few varieties are found which are also common to Newfoundland, but do not exist farther west. On the other hand, Nova Scotia is lacking in a number of species which exist in New Brunswick, Quebec, and Ontario.

The southern flora is found to a certain extent as far north as the city of Quebec, but does not become distinctive until the latitude of Montreal is reached. Northern and Western Ontario,

SCENE IN THE ROCKY MOUNTAINS OF CANADA  
The Beautiful Valley of the Bow (from the Banff Hotel).

on the other hand, belong rather to the northern type. The typical eastern flora continues for some distance into Manitoba, particularly in the river valleys and near the lakes, but is soon overwhelmed and obliterated by the prairie types, which in turn extend to the foothills of the Rockies. Farther north we reach the arctic regions of saxifrages, lichens, and mosses. In the prairies are found innumerable varieties of grasses, vetches, and wild peas. The flora of Western Alberta and British Columbia varies considerably, the variation depending upon altitude and the dryness or moisture, warmth or coldness of the climate. In Western British Columbia shrubs and wild flowers of all kinds flourish and bloom in profusion.

Moose and caribou are found in all the provinces save Prince Edward Island. Bears and wolves are found in much smaller numbers, and less widely scattered, though in constantly diminishing force they still lurk upon the outskirts of civilization. The prairie wolf or coyote, on the other hand, is confined to the Prairie Provinces. The musk-oxen are confined to the 'Great Barrens' northwest of Hudson Bay. In British Columbia the puma or cougar still roams. In all the provinces the fox, lynx, beaver, otter, marten, mink, skunk, and rabbit are found in varying numbers.

The Canada jay, grosbeak, wax-wing, and snow bunting remain during the winter; while in the southern latitudes the crow, blue-jay, chickadee, and other varieties are also winter birds. In summer numerous varieties of song birds are found everywhere. So also are geese, ducks, teal, partridges, and woodcocks, and in the prairies the so-called prairie chicken. In some parts the ducks remain all winter, as do the partridges, woodcocks, and prairie chickens. The sea birds include most of the common varieties, as well as a few peculiar to the country.

**Forestry.**—The forests of Canada contain pine, spruce, cedar, Douglas fir, and hemlock, elm, maple, beech, birch, butternut, hickory, basswood, and other less common varieties of trees. They are distributed very generally throughout the country, with the exception of the central prairie region, 32.5 per cent. of the total land area (or 1,151,454 square miles) being covered with forests, of which 311,234 square miles may be considered as containing saw-timber of merchantable size, while 554,641 square miles carry young growth which if protected from fire and other damage will eventually produce

merchantable timber. The remaining 285,574 square miles are considered as inaccessible or unprofitable to operate under present conditions. The Pacific Coast as far north as Alaska is covered with an immense forest, the wooded area of British Columbia being estimated in 1926 at 91,432,100 acres, bearing 75,630 million cubic feet of merchantable conifers and 375 million cubic feet of broad-leaved varieties, besides much young growth. Large parts of the older provinces have been cleared for cultivation, but there still remain areas whose potential value is enormous, and these the Dominion and Provincial Governments are making praiseworthy attempts to protect. (See CONSERVATION MOVEMENT, *Canada*.)

The general policy of both the Dominion and the Provincial Governments has been to dispose of timber by means of licences to cut rather than to sell timber land outright. Of the 1,151,454 square miles of timber land, the area which is privately owned is 110,065 square miles, or only 9.6 per cent. of the total. Of the remaining 1,041,389 square miles owned by the State, 76,045 square miles is in forest reserves, 152,341 square miles is being cut under licences yielding revenue in stumpage bonuses, annual ground rents and royalties, while the remaining 882,048 square miles is unalienated.

In spite of the work of the Forestry Departments of the Federal and Provincial Governments, however, much remains to be done in surveying and tabulating the forest resources of the Dominion, in providing forest reserves, in preventing and stopping forest fires, and in replanting with suitable trees those areas which have been denuded and are unfit for cultivation, as well as providing trees for those sterile portions where trees have not grown naturally. In the Prairie Provinces, where the forests are under the control of the Dominion Government, these duties are now being undertaken by responsible officials, and in the older provinces a good beginning has been made. In Nova Scotia an attempt to classify and tabulate the merchantable timber and entire forested area has been attended with considerable success. Data on the forest resources of Saskatchewan have been collected, while a similar investigation is in progress in Ontario. Less comprehensive annual reports are issued by the Forest Service, Department of the Interior, Ottawa, and by the provincial departments administering timber lands in Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia.

The Dominion Government has established forest reserves in British Columbia (where the railway belt and a portion of the northeastern forest is under Federal control), Alberta, Saskatchewan, and Manitoba. These reserves cover an area of 34,171 square miles, are more or less protected by forest rangers, and are not open to settlement. By far the largest is the Rocky Mountain Reserve of 13,786 square miles, situated in Western Alberta. In British Columbia there are 14 reserves, in Saskatchewan 15, in Alberta 4, and in Manitoba 6. Portions of two of them have been set aside as a refuge for those indigenous wild animals which are neither dangerous nor harmful. Dominion parks in Alberta, Saskatchewan and British Columbia, with an aggregate area of 11,670 square miles, may also be considered as forest reserves. Besides these, the Provincial Governments of British Columbia, Ontario, and Quebec have set aside as forest reserves an aggregate area of 31,655 square miles, together with 11,928 square miles of provincial parks, making a grand total of 89,424 square miles reserved for timber production. (In this connection see also the sections on *Forestry* in the articles on the different provinces.)

There is no doubt that most of the forest fires, which in the five years 1922-26 destroyed an average of 1,392,000 acres per annum, are started by careless hunters or campers or by locomotives. Recent legislation makes the railways responsible for fires caused by locomotives. As a result of legislation initiated and urged by the Conservation Commission, the fire losses due to locomotives have been reduced to a minimum.

The necessity for forestation and reforestation has been urged upon both Dominion and Provincial Governments; but little has been accomplished, except in the Prairie Provinces, Ontario and Quebec, where the farmers are gratuitously provided with trees, the understanding being that they shall plant and care for them. The Dominion Government distributed some 7,500,000 young trees in the Prairie Provinces in 1927, and the Ontario Government distributed some 7,000,000 trees in that province. The capacity of the Quebec forest nursery has been raised to 10,000,000 trees.

Education in forestry and allied subjects and opportunities for research are offered by four Canadian universities and by other agencies. The University of Toronto, the University of New Brunswick at Fredericton, and the University of British

Columbia at Vancouver, provide four-year courses leading to a professional degree. The School of Forestry and Surveying in connection with Laval University at Quebec provides in the French language a combined course of four years' duration, leading to diplomas in both sciences. The Government of Quebec has established a school in paper making at Three Rivers in the heart of the paper industry; several agricultural colleges provide short courses in farm forestry, and a school for forest rangers has been established at Berthierville by the Quebec Forest Service.

The lumbering industry in Canada is a most important one. In 1926 the value of the lumber products, including the total value of the products of woods operations, together with the net value of production in saw mills and pulp mills, was \$312,844,584. Among the natural industries it ranks second, coming next after agriculture. Canada is also an extensive producer of pulp wood, but lacks the valuable woods, save in British Columbia. The output of pulp wood in 1927 was valued at \$70,284,895. Of the 114 pulp and paper mills operating in 1927, 50 are in Quebec, 44 in Ontario, and the rest in British Columbia, Nova Scotia, and New Brunswick. The pulp finds a ready market in the United States, but the Dominion and all the Provinces prohibit the exportation of pulp wood obtained from crown lands. The capital of the pulp and paper industry in 1927 was \$579,853,552, and the products had a gross value of \$219,329,753. The production of newsprint paper in 1927 was 2,082,830 tons, rising to 2,382,011 tons (provisional estimate) in 1928. Canada is the largest producer of newsprint paper in the world.

**Fisheries.**—Canadian fisheries, which are carried on over an area of 200,000 square miles in the Atlantic, 20,000 square miles in the Pacific, and 140,000 square miles of inland waters, are under the control of the Dominion Government, although each province has proprietary rights within its own jurisdiction. The ascertained value of the catch of sea fish for the calendar year 1927 was \$41,921,126, and of inland fish \$7,575,912—a total of \$49,497,038, as compared with \$56,360,633 in 1926. The fishing equipment was valued at \$56,306,461, and the industry gave employment to 50,338 persons in sea fisheries, 13,077 in inland fisheries, and 16,697 in fish-canning and curing establishments—a total of 80,112. British Columbia and Nova Scotia are the leading fishing provinces.

The salmon, cod, lobster, and halibut fisheries are the most important, so far as value of catch is concerned. The industry is encouraged by the granting of liberal bounties by the Dominion Government. The interest on \$4,420,882, the Canadian share of the fishery award granted in 1877 under the terms of the Treaty of Washington, is annually distributed among the deep-sea fishermen of the Atlantic Coast. Fishery inspectors have been appointed in the different provinces, and government boats patrol the fishing grounds for the purpose of enforcing the fishing regulations promulgated by the Government, and preventing poaching on the part of foreigners. (See FISHERIES.)

In order to increase the fish of all varieties, the Dominion Government has also established 32 fish hatcheries on the Atlantic Coast in the Prairie Provinces, and on the Pacific Coast, releasing in 1927 more than 295,000,000 fish eggs and fry in Canadian waters. Eight other hatcheries in Ontario, which distributed 454,500,000 fish eggs in 1926, were transferred to the Ontario Government in 1927. The Dominion Government has also equipped biological stations on the Atlantic, the Great Lakes, and the Pacific, where the habits of fish are studied and their treatment is considered.

A treaty was signed by Great Britain and the United States in 1908 for the purpose of providing uniform and effective regulations for the protection, preservation, and propagation of food fishes in waters contiguous to the international boundary between the United States and Canada. An International Fisheries Commission, composed of an American and a Canadian, was appointed in accordance with a provision of this treaty, for the purpose of preparing regulations in connection therewith.

The fishery clauses of the treaty of 1818 between Great Britain and the United States were referred to The Hague Tribunal for its decision with reference to the respective rights of the United States, Canada, and Newfoundland. In September, 1910, the decision of the tribunal was announced, and was received with satisfaction by all the interested parties. Previous to Dec. 31, 1923, United States fishing vessels were allowed, on payment of a fee of \$1.50 per registered ton, to purchase provisions and outfits in Canadian ports, to transship catches and to ship crews, but these privileges have been discontinued, and United States fishing vessels are now limited to the provisions of the Treaty of 1818, under which they

may call at Canadian ports only for shelter, wood, water or to make repairs.

The halibut fishery on the Pacific side is engaged in only from Canadian and United States ports, but owing to the fact that it is largely carried on beyond territorial waters, neither country alone can control it, but it is in the interests of both countries that the fishery should be permanently maintained in a flourishing condition. The question of dealing with the matter was referred to the Canadian-American Fisheries Conference appointed in 1918, and in 1922 Canada proposed that the halibut question should be considered by itself. This was agreed to, and resulted in the treaty signed March 2, 1923, 'For the Protection of the Pacific Halibut', which provides a close season for halibut fishing from Nov. 16 in each year to Feb. 15 following, both dates inclusive. This treaty was ratified on Oct. 21, 1924, and became effective Nov. 1, 1924.

**Minerals.**—All of the six geological provinces of Canada, with the exception of the Arctic region, contribute to the mineral production of the Dominion. The Appalachian region, comprising the Maritime Provinces and that part of the province of Quebec which lies south of the St. Lawrence, was responsible in 1928 for about 18 per cent. in value of the total production. In this area coal is by far the most important non-metallic mineral, and at present the larger part of it is mined in Cape Breton Island and the northwestern portion of the peninsula of Nova Scotia. Next comes asbestos, found in the Eastern Townships of Quebec. Gypsum occurs in many places in the Maritime Provinces, and gold and copper are produced.

The St. Lawrence region, lying west and southwest of the Appalachian, is not rich in minerals, being largely an area of sedimentary deposits. In that portion of it commonly known as the peninsular part of Ontario, petroleum and natural gas are present in large quantities. Gypsum also is mined to some extent. From this region is produced about 2½ per cent. of the mineral output of Canada as measured by value.

The southern part of the Laurentian region was credited in 1928 with 40 per cent., in value, of Canadian mineral products. Gold came first, the richest gold mines being in the Porcupine district of Northern Ontario and the near-by Rouyn district of Quebec. The Hollinger mine, in particular, is credited with having been the most productive individual gold mine in the world. Silver came next, the richest

mines being situated in the famous Cobalt district of Northern Ontario. West of Cobalt and north of Lake Superior is another well known silver-producing area. Large and productive nickel mines, which produced nickel valued at \$22,318,907 in 1928, are found near Sudbury. This is also a famous copper-producing district. Iron ore is found in that part of Ontario which lies north of Lake Superior, but is of too low grade to be profitably refined under present conditions.

The interior Prairie region closely resembles the St. Lawrence region both in its geological formation and the minerals it contains. This is subject, however, to one important exception, for the Prairie region contains large deposits of coal and lignite, whereas the St. Lawrence region lacks both. In the Prairie, as in the St. Lawrence region, petroleum, natural gas, and gypsum are present in large quantities. This region produces  $2\frac{1}{2}$  per cent. in value of the minerals of the Dominion.

The Cordilleran region, embracing Western Alberta and all of British Columbia, supplies about 36 per cent., in value, of Canada's minerals. Coal is the most important of these. Its output in 1928 was about 10,140,000 tons as compared with 6,741,000 tons in Nova Scotia. Besides, its value is proportionately greater, as the price is higher in the west than in the east. The richest gold and copper areas are situated at and near Rossland. The ore is a combination of gold and copper. The silver-lead ores are found in the southeastern part of British Columbia.

During the last twenty years the mineral output of Canadian mines has increased three times in value, but as yet only the fringe of the Dominion has been thoroughly investigated, so far as its mineral possibilities are concerned, and it is probable that there are valuable mineral resources still undiscovered. Among the latest discoveries are those of gold and copper in the Rouyn district in Northern Quebec, of gold in the Red Lake district of Ontario and of copper in the Flin Flon area on the border between Manitoba and Saskatchewan.

The total value of all minerals produced in Canada during the year 1928 is provisionally stated as \$273,446,864, an increase of \$101,000,000 over 1921 and the largest value on record. The following table lists the most important minerals produced in 1928 with their valuation.

The mining industry in Canada represents a capital investment of more than \$700,000,000

Mineral Production, 1928

Mineral	Value
Coal . . . . .	\$62,681,136
Silver . . . . .	12,753,806
Nickel . . . . .	22,318,907
Copper . . . . .	28,488,118
Gold . . . . .	39,091,472
Asbestos . . . . .	11,238,360
Lead . . . . .	15,474,003
Zinc . . . . .	10,250,589

actually spent on the properties or used as working capital by the operating companies. Approximately 85,000 persons were employed in 1927.

(See CONSERVATION MOVEMENT, Canada.)

**Agriculture.**—Agriculture is the leading industry in Canada, not only in the Prairie Provinces of the middle west, but also in the older provinces of the east; while the value of the agricultural products is greater than of any other industry, excepting the net product of manufactured commodities. In a general way the agricultural belt extends across the continent north of the American border, a belt 2,500 miles long and several hundred miles wide, but not all of this vast area is suitable for cultivation. In Western Ontario, for instance, is an immense area of land north of Lakes Superior and Huron which will probably always be forested country. A large part of Quebec north of the St. Lawrence will perhaps never be cultivated, and the same is true of large areas in the Maritime Provinces, with the exception of Prince Edward Island. In British Columbia, too, the fertile land is confined to the valleys. The land of agricultural value in Canada, under existing conditions, has been estimated in the final report of the Dominions Royal Commission at 689,062 square miles, an area subject to increase as new early-maturing and frost-resisting varieties of grains and other field crops are evolved.

In the Prairie Provinces land is still to be obtained free in quarter sections of 160 acres each; but the holder must perform certain services entailing actual occupation and cultivation for part of each year. In these provinces the public lands are still (1929) under the ownership and control of the Dominion Government, though negotiations are going on for their transfer to the provinces. In the older provinces there are many vacant farms which can be obtained for nominal sums, while the Crown lands are also disposed of upon easy terms to actual settlers. The government of New Brunswick has undertaken the purchase of

vacant farm lands which it is selling to immigrants. In the Prairie Provinces the Canadian Pacific Railway owns several millions of acres of land which are for sale to settlers. Portions of this land have been brought under partial cultivation by the company, and buildings erected. These are sold to settlers as 'ready-made' farms, and payments are accepted on the instalment plan. The company has also constructed extensive irrigation works in those districts where the rainfall is insufficient. The Hudson's Bay Company has considerable areas of land for sale in this part of Canada. (See the sections on *Conservation and Irrigation* in this article.)

Though an increasing tendency toward mixed farming is observable in Manitoba, the farmers of the Prairie Provinces still devote most of their attention to the growth of wheat. In the Eastern Provinces the farmers have adopted mixed farming, and wheat is becoming a crop of comparatively little importance. In general, however, the average eastern farmer uses no system of rotation of crops, or the system adopted by him does not answer the purpose; while in the west wheat growing has been aptly described as 'wheat mining.'

Horticulture is successfully practiced in many parts of the Dominion. In the Maritime Provinces the greatest progress and most successful results have been obtained in the fertile Annapolis valley in Nova Scotia, in parts of Prince Edward Island, and in the St. John valley in New Brunswick. In Quebec, portions of the Eastern Townships and the Island of Montreal grow the largest amount of fruit; but the peninsular part of Ontario is the real fruit centre of the Dominion. There apples, pears, plums, peaches, grapes, and berries are grown to perfection. In British Columbia several of the fertile valleys of that province have established a world wide reputation for the size and color of their apples. The commercial value of the fruit-growing industry in Canada was estimated at \$17,605,995 in 1927, while the grand total value of fruits produced would approximate \$25,000,000.

**Dairy Farming** is carried on in all parts of the Dominion, and Canadian cheese, made to a large extent in coöperative factories, has attained an excellent reputation in the English market. The best known cheeses are produced in the Eastern townships of Quebec and in Ontario. Formerly butter also was exported to Great Britain, but this trade has ceased, owing partly to the increased demand at home, and partly to the

excellent prices obtained for milk and cream. The value of the total production of milk and its products is estimated for 1927 at \$253,736,605, as compared with \$288,836,093 in 1920. The 1927 figures include creamery butter \$65,709,986, dairy or home-made butter \$30,435,121, factory cheese \$25,522,148, home-made cheese \$70,654, miscellaneous dairy factory products \$18,879,335 and milk consumed fresh \$113,119,361. Both the Dominion and the Provincial Governments, which under the Canadian constitution have joint jurisdiction in agricultural matters, encourage the development of agriculture and its allied industries by the publication of information, gifts of seeds to farmers, the maintenance of experimental stations where research work is carried on, and the publication of the information thus obtained.

In 1928 there were twenty-seven experimental farms in Canada, scattered from the Atlantic to the Pacific, maintained by the Dominion Government. In addition, experimental work was carried on in nine different places in the more northerly parts of the Prairie Provinces. These sub-stations are largely for the purpose of determining the varieties of crops that may be successfully grown in high latitudes. Several of the provinces also maintain agricultural schools or colleges with experimental farms attached, the most notable being the Nova Scotia College of Agriculture, Macdonald College at Ste. Anne de Bellevue, Quebec, and the Ontario Agricultural College at Guelph. (See AGRICULTURAL EDUCATION.)

in 1927. The yields and values of the most important varieties are given in the accompanying table.

**Conservation.**—The Canadian Conservation Commission, composed in part of certain Federal and Provincial ministers whose interests were closely connected with the natural resources of the country, and in part of professional and business men to whom the conservation of the wealth of the country was a matter of importance, financial or otherwise, was established in 1909 by the Dominion Government. It was discontinued in 1921 since as a result of its investigations and advice various governmental organizations, such as the Department of Public Health, the Forestry Branch, the Water Powers Branch, the Lands Branch, and the Natural Resources Intelligence Branch of the Department of the Interior, were organized to carry out its recommendations. The annual and special reports of the Commission, however, remain as a most valuable library of information on the many subjects with which they deal.

**Irrigation** in Canada is as yet confined to small areas in the southern parts of Saskatchewan and Alberta, in which provinces the work is under the supervision of the Dominion Government. In 1919 it was decided between the Dominion and the Alberta governments that the former would continue to make surveys and exercise supervision, but would not assume responsibility for actual irrigation developments. The Alberta and Saskatchewan governments in 1920

headquarters in Calgary, Alberta, and nearly all of their work is in the southern part of the Province of Alberta, where irrigation is more necessary than in the adjoining Province of Saskatchewan. The Canadian Pacific Railway Company has been drawing its supply mainly from the Bow River, and at the present time has water sufficient to supply the needs of 2,000,000 acres of irrigable land, while the irrigable area is 727,000 acres, reached by 4,162 miles of canals. Its irrigation enterprise in the Lethbridge district supplies 108,000 acres from St. Mary's river. The Alberta Railway and Irrigation Company has been granted supplies from the Belly, Milk, and St. Mary Rivers. The Southern Alberta Land Company obtains water from the Bow and South Saskatchewan Rivers for 530,000 acres; and its subsidiary company, the Alberta Land Company, has been granted the supply of a small amount from the Bow River.

**Stock Raising.**—The distinctive ranching country of Canada is in Southern Alberta and South-western Saskatchewan, where 6,247,700 acres of land were under grazing leases in 1928. The Peace River district and certain parts of Manitoba also have ranching areas. The ranches, however, have largely been displaced by farms, and the raising of live stock has taken its proper place as part of the general farming system. Thus the type of live stock farming varies greatly in the different districts of Canada. Dairy farming is typical of Eastern Canada since this region is tributary to the populous Canadian and American centres demanding milk and cream and convenient to the overseas markets for cheese and butter. The demands of the American Middle West for cattle and of the Pacific Coast for hogs have influenced the kind of live stock production in the West.

The live stock industry of Canada is characterized by periods of depression and prosperity due to changing markets. It is profoundly influenced by the height and variation of United States tariffs and their changing effectiveness with price changes. It also encounters climatic difficulties, centred around the cold winter and short pasturage season. Other farm enterprises, particularly in the agricultural west, have greater comparative advantages, but live stock raising has shown evident, though intermittent growth. In recent years there has been a great improvement in the class of stock kept on Canadian farms, as is shown by the statistics of pure bred stock collected at the census.

Chief Canadian Crops in 1928

	Bushels	Value at point of production
Wheat . . . . .	533,572,000	\$426,013,000

\*Tons.

In 1928 the estimated total area under field crops was 59,351,811 acres. While the yields of wheat and barley were the largest on record, and the yield of oats was the largest since 1923, the hay and clover crop was smaller than in 1927. Owing to lower prices, the total value of the field crops at point of production was only \$1,099,781,000 as compared with \$1,172,643,600

passed Irrigation District Acts which made it easy for settlers in an area to organize and proceed with the necessary developments. Dry seasons have increased public interest in irrigation, but the declining prices of agricultural products and the high rates of interest have been a stumbling-block. The irrigation officials, who are appointed by the Dominion Government, have their

The Dominion Government is now directing the attention of farmers in various parts of Canada to the increased demand for mutton and wool. The Maritime Provinces and parts of British Columbia are well adapted to sheep raising. Good land for

Swine . . .	3,904,895	4,497,367

the purpose can be obtained at a nominal sum, and there is no doubt that for the average farmer a small flock of sheep is a desirable investment. In the Prairie Provinces the cold winter, the expense of fencing, and the loss from prairie wolves must be considered by the prospective sheep breeder. The numbers of the different varieties of live stock in Canada in 1921 and 1928 are shown herewith.

**Shipping.**—In the days of wooden sailing vessels, Canada held an important position among the maritime nations of the world. The highest point was attained in 1878, when there were 1,333,015 tons of shipping on her registry books. Since that time there has been a decrease, the tonnage of new vessels per annum falling as low as 16,146 in 1896. At the present time, the amount of tonnage owned is relatively so small, compared with former years, that Canada has been reduced from fourth to ninth place. But her maritime population still preserves the seafaring instinct, and efforts are now being made to encourage the building of steel steamers. There are shipyards at Collingwood, Port Arthur, and other places, where steel vessels are built for lake traffic, while successful experiments have been made along the same lines in Nova Scotia and British Columbia. The Dominion Government maintains a shipyard in Sorel, where scows, dredges, and small steamers are constructed. The vessels built and registered in Canada in the fiscal years ended 1926 and 1927 had a tonnage of 39,840 and 32,801 tons respectively.

On Dec. 31, 1927, the total number of vessels on the registry books of the Dominion was 8,454, of 1,956,268 gross and 1,368,000 net tons. The new vessels built and registered during the year numbered 398, of 32,237 gross and 21,943 net tons. The number of vessels having Canadian

registration included 5,096 steamers, with a gross tonnage of 1,428,024. The number of men and boys employed on Canadian vessels in 1927 was 42,410. Nova Scotia formerly had the largest registered tonnage of any Canadian province, but at present, Quebec, Ontario, and British Columbia take precedence in the order named.

The tonnage of seagoing vessels other than coasting vessels which arrived during the fiscal year 1927-28 was 24,240,847; the tonnage of those which departed was 23,973,787. Vessels employed in inland waters between Canada and the United States had an arrival tonnage of 16,745,632, and a departure tonnage of 18,843,531. Vessels employed in the coasting trade showed an arrival tonnage of 45,381,586 and a departure tonnage of 44,146,030.

**Canals.**—The canals of the Dominion of Canada, which played an important part in the early settlement of Ontario and still have an important place in the transportation system of the country, are owned and operated by the Dominion Government. According to their geographical position, they naturally comprise six main systems:

(1) The first and most important is that which has been constructed primarily for the purpose of affording a navigable water route between Lake Superior and Montreal, at the head of ocean navigation. This series of canals has a total length of 74 miles, and comprises from west to east the following, in the order named: The Sault Ste. Marie, between Lake Superior and Lake Huron (dimension of lock, 900 x 60 feet; depth of water at lowest known water level, 20½ feet); the Welland Canal, between Lakes Erie and Ontario (a new Welland canal 25 miles long, with 7 lift locks, each 800 feet long by 80 feet wide, and having a lift of 46½ feet and a depth of 30 feet on the sills, now under construction), and the Murray, Galops, Rapide Plat, Farran's Point, Cornwall, Soulages, and Lachine Canals. The total lockage is 551 feet, and the number of locks through which a vessel passes from Port Arthur or Fort William, at the head of Lake Superior, to Montreal is 48. The Soulages is now used instead of the Beauharnois Canal, the latter having been abandoned as a means of navigation. The enlargement of the canals between Lake Erie and Montreal has resulted in the erection of locks of the minimum dimensions of 270 x 45 feet, with a minimum depth of water on the sills of 14 feet. On the Sault Ste. Marie Canal the total movement of freight in

1928 was 2,007,137 tons, an increase of 536,586 tons as compared with the preceding year. On the St. Lawrence River canals the tonnage was 8,411,542, an increase of 498,590 tons. The quantity of wheat which passed down the St. Lawrence River canals in 1928 was 3,833,778 tons, as compared with 3,573,341 tons for the preceding year.

(2) The second system comprises the Grenville, Carillon, and Ste. Anne's canals, having a combined length of 7 miles; and affording, in conjunction with the Ottawa River, a means of water transportation between the city of Ottawa and the St. Lawrence River. The minimum lockage dimensions are 200 x 45 feet, with a depth of 9 feet on the sills.

(3) The third system comprises the Chambly and St. Ours' canals, which make it possible for boats to pass from Sorel, at the mouth of the Richelieu River, to Lake Champlain. These canals have a combined length of 13 miles, locks with minimum dimensions of 118 x 22½ feet, and a depth of water on the sills of 7 feet.

(4) The fourth series of canals is included in what is known as the Rideau Navigation System, which connects the Ottawa River at the city of Ottawa with the eastern end of Lake Ontario at Kingston, a distance of 126 miles, a large part of which is a river waterway. The minimum lock dimensions are 134 x 33 feet; depth of water on the sills, 5 feet; total lockage, 457 feet, rise and fall. The Perth branch of this system connects Beveridge's Bay, on Lake Rideau, and the town of Perth.

(5) The fifth system (the Trent Canal) is not yet completed. It is composed of a chain of rivers and lakes extending from Trenton, at the mouth of the Trent River, on the Bay of Quinté, Lake Ontario, to Lake Huron, a distance of about 236 miles, of which about 20 miles will be canals. The navigable portion of this system extends from Trenton to Washago, a distance of about 200 miles. It is noted for the hydraulic lift-lock at Peterborough, which is capable of lifting an 800-ton vessel a vertical distance of 65 feet.

(6) St. Peter's Canal, forming the sixth system, connects St. Peter's Bay, on the south side of Cape Breton Island, Nova Scotia, with the Bras d'Or Lake. It is nearly half a mile long, with lockage dimensions of 300 x 48 feet, and a depth of water on the sills of 18 feet.

Portions of the St. Lawrence River below Montreal may be considered a submerged canal. By means of an extensive and

SCENE IN THE ROCKY MOUNTAINS IN CANADA  
The Three Sisters, Canmore, Alberta.

costly system of dredging, a minimum depth of 30 feet has been obtained. The dredged channel has a minimum width of 450 feet, extending to 700 feet at points of curvature. It is well lighted and buoyed.

The total capital expenditure for canals by the Canadian Government up to March 31, 1928, has been \$203,420,904, of which \$90,301,957 had been expended upon the New Welland Ship Canal. The total revenue for the fiscal year 1927-28 from rentals, wharfage, dues, fines, etc., was \$1,355,677. No tolls are extracted on any of the canals. The traffic passing through all the canals during the season of 1928 amounted to 18,720,441 tons, an increase of 1,232,130 over the tonnage for the preceding year and nearly double the tonnage of 1921.

*Georgian Bay System.*—The construction of a new canal system for the purpose of providing a shorter water route between the Great Lakes and Montreal was some years ago strongly urged, but is no longer regarded as practical, in view of the greater interest in the St. Lawrence and the approaching completion of the Welland Ship Canal.

A counter proposition, a part of which is in actual process of completion, is to provide a 25 or 30-foot channel from Lake Erie to Montreal, and the work of constructing the new Welland Ship Canal is now in its later stages, \$90,301,957 having been spent on the new Welland up to March, 1928. The locks on the new canal will be 800 feet long and 80 feet wide, and will provide 30 feet of water over the mitre sills. It is expected that the work will be complete in 1930, opening Lake Ontario to the grain carriers of the Upper Lakes. A \$4,000,000 grain elevator and other works are under construction at Prescott, at the head of the St. Lawrence rapids in anticipation of the opening of the canal.

The larger part of the work, however, will be the deepening of the St. Lawrence canals, which may be eventually undertaken in connection with the development of hydro-electric power at the St. Lawrence rapids. A report submitted in 1921 to the International Joint Commission by an eminent American and an eminent Canadian engineer is to the effect that a 25-foot channel can be provided from Lake Ontario to Montreal for \$252,728,200, or a 30-foot channel for an additional \$17,986,180, besides developing for the use of the two nations the 1,464,000 estimated horse power available at the Long Sault Rapids.

It would appear, therefore, in

view of the enormous wealth and resources of the regions bordering upon the Great Lakes in the United States and Canada that, if an equitable division of the cost and of the advantages can be arranged between the two countries, the construction of the 30-foot channel through the Great Lakes will mean much more to the economic development of the North American continent than could the Georgian Bay Canal, of which comparatively little is now heard. The new Beauharnois canal, construction of which was begun in the summer of 1929, will provide a canal 800 feet at the top, 600 feet at the bottom, and 27 feet of minimum depth from Lake St. Francis to Lake St. Peter in the all-Canadian section of the St. Lawrence River, incidentally developing some 500,000 additional horse power. The enterprise will involve an estimated cost of \$16,000,000 to the Beauharnois Light, Heat and Power Co. for the canal and of \$21,600,000 to the Government for navigation facilities.

*Railways.*—When the Maritime Provinces entered the Confederation, it was agreed that a railway should be built to connect them with Quebec, a promise which was redeemed by the completion in 1876 of the Intercolonial Railway, which is owned and operated by the Dominion Government. Later, the Canadian Pacific Railway Company was incorporated for the purpose of affording a connection between British Columbia and the Eastern provinces. At the present time, the Intercolonial, Transcontinental, Canadian Northern, National Grand Trunk, Grand Trunk Pacific and Prince Edward Island Railways are owned and operated by the Dominion Government, under the general name of the Canadian National Railways. The Canadian National Railways Board was operating on Dec. 31, 1928, 22,468.49 miles of lines, including 3,104.36 miles of the Eastern lines in the Maritime Provinces and Eastern Quebec. For these lines separate records are maintained. Ontario and New Brunswick also maintain railways under provincial government management.

In December, 1927, there were 40,572 miles of railway in operation in Canada, which has the largest per capita mileage of any country in the world. This is an increase of 219 miles as compared with the preceding year. Including the Government railways the total capital was \$3,637,837,497, about three-eighths stocks and five-eighths bonds, an increase over the preceding year of \$76,888,565. The cost of the

Government lines was \$502,370,886 to March 31, 1928.

*Canadian Pacific System.*—The Canadian Pacific Railway Company, the first to be constructed of the three great Canadian railway systems which now connect the Atlantic with the Pacific Ocean, owns and operates more than one-third of the railway mileage of Canada. Among the many improvements planned and completed by this company in the comparatively prosperous years from 1912 to 1917 were the double tracking of its line between Fort William and Hargrave, west of Brandon, between Broadview and Swift Current, and between Montreal and Perth, to be extended to Toronto. The company, during its more prosperous period, also built a double-track bridge across the St. Lawrence near Montreal to replace the old bridge, and placed two new boats on its Vancouver-Japan-China service. The company also owns a large fleet of steamers by means of which communication is maintained between Montreal and Europe, and between Vancouver and the Orient, and has several ships engaged in the coasting trade on the Pacific, as well as on the Great Lakes during the navigation season.

The operating revenues of the Canadian Pacific railway in 1928 were \$230,406,354 and the operating expenses \$173,871,973, leaving an operating income of \$51,694,452.

*National Transcontinental Railway.*—In 1903 the Dominion Government entered into a contract with the Grand Trunk Railway Company for the construction of a railway from Prince Rupert, on the Pacific Coast, to Moncton, in New Brunswick. The portion from Prince Rupert to Winnipeg was to be built and operated by the Grand Trunk Railway Company, and was to be known as the Grand Trunk Pacific Railway. The part from Winnipeg to Moncton was to be constructed by the Government and leased to the Grand Trunk Pacific Railway for operation. This eastern portion—the National Transcontinental Railway—has been completed from Winnipeg to Moncton, a distance of 2,007 miles. The cost of construction — \$156,701,210 — was greatly in excess of the amount anticipated by the Government or by the Grand Trunk Pacific Railway, which had agreed to operate it and pay a rental of 3 per cent. on cost. In addition, the Grand Trunk Pacific Railway became financially embarrassed and was quite unable to assume the responsibility of providing the necessary rolling stock and meeting the anticipated operat-

ing deficits. A government commission, appointed for the purpose of investigating the manner in which the railway had been constructed, reported adversely, and as a result the Grand Trunk Railway Company declined to be bound by its contract, and the Government was compelled to operate the line. The great railway bridge over the St. Lawrence near Quebec City was successfully completed in 1917. The National Transcontinental has been of considerable value as a colonization road in Northern Ontario and Quebec, and is now being operated as a part of the Canadian National Railways.

The *Grand Trunk Pacific Railway* was controlled by the Grand Trunk Railway, which held nearly all the common stock and, together with the Dominion Government, guaranteed the bonds of the Grand Trunk Pacific. It has been fully completed and is being operated between Winnipeg and Prince Rupert. The gross receipts were quite insufficient to meet operating expenses and fixed charges, nor was the parent company, the Grand Trunk Railway, able to meet the recurring deficits, with the result that the Dominion Government was called upon more than once to make good the deficiencies. In 1916, after the Dominion Government had made loans to the Grand Trunk Pacific and the Canadian Northern Railway Company, a royal commission was appointed to investigate the general problem of transportation, the status of each of the three transcontinental systems and the reorganization of any of these systems or their acquisition by the Government. This commission, composed of Alfred Holland Smith of New York, Sir Henry Drayton of Ottawa, and William M. Acworth of London, England, presented a majority report signed by the two latter, recommending that in view of the existing situation the public should take control of the Grand Trunk Pacific, the Grand Trunk proper, and the Canadian Northern, these to be consolidated and administered on purely business principles by a Board of Trustees, such compensation as seemed proper to be decided by arbitration and given to the shareholders of the Grand Trunk and the Canadian Northern. This report, generally known as the Drayton-Acworth report, has become the basis of the subsequent railway policy of the Canadian Government. The Grand Trunk Pacific was taken over by the Government under receivership on Mar. 10, 1919, and has been operated as a part of the Canadian National Railways since October, 1920.

The *Grand Trunk Railway* is the oldest of all the great Canadian railway systems. It was chartered in 1852, and was financed by English capital. As its name implies, it was intended to furnish a trunk line to connect the British-American provinces in existence at the date of its incorporation. In this it was supplanted by the Intercolonial Railway, so far as the Maritime Provinces were concerned. Its main line runs between Portland (Maine), Montreal, and Chicago, with numerous branches in Ontario. As a result of its unfortunate entanglement with the Grand Trunk Pacific and of the financial difficulties consequent upon its war-time operation, the Grand Trunk Railway was taken over by the Canadian Government, the question of the amount to be paid for it having been referred to the Imperial Privy Council in consequence of the disagreement of the three arbitrators. This final decision was against the dissatisfied shareholders of the Grand Trunk, who, however, received a guarantee of interest payments on their guaranteed and debenture stocks to a total amount of \$216,207,142. The Grand Trunk is now included in the Canadian National system.

The *Canadian Northern Railway*, Canada's third transcontinental line, completed its system from ocean to ocean, and operated trains between Quebec and Montreal in the East, and Winnipeg, Edmonton, and Vancouver in the West. In addition it controlled two railways in Nova Scotia. For some years it often appealed successfully to the Dominion Government for help and as in the case of the Grand Trunk Pacific, both the Dominion and Provincial Governments became heavily involved by guarantees of interest on the bonds of the railway. Finally a commission appointed by the Government to inquire into the railway situation in Canada and advise what remedy should be adopted, recommended in its majority report that the Canadian Northern, the Grand Trunk, the Grand Trunk Pacific, and the Government Railways should all be transferred to a Board of Trustees appointed by the Government, but freed from political influence. The third member of the commission, the president of the New York Central, advised that government ownership and operation should not be adopted, but that a readjustment of existing lines should be tried. The Government eventually adopted the majority suggestion, and passed an act bringing the Canadian Northern Railway under public ownership and operation.

This was accomplished by the acquisition of the remaining 600,000 shares of common stock of the company, as the Government already owned the remaining 400,000 shares. The Canadian Northern was subsequently incorporated with the Canadian National system.

*Hudson Bay Route.*—The Canadian Government some years ago undertook to build a railway from Le Pas Mission (on the Canadian National Railway) to Port Nelson on Hudson Bay. During the war and for some years afterwards the project was suspended, but construction was resumed in 1926, with Fort Churchill instead of Port Nelson as the terminus. The tracks have now been laid to Fort Churchill.

See also RAILROADS, *Canada*.  
*Postal, Telegraph, and Telephone Service.*—During the fiscal year ending March 31, 1928, the Canadian postal revenue was \$30,529,155 and the expenditure \$32,379,196. This expenditure does not include the cost of post office buildings, as these are constructed by the Department of Public Works. On Mar. 31, 1928, there were 12,478 post offices in the country compared with 12,440 in 1920, the comparatively small increase in the number during recent years being due to the extension of rural mail delivery. The number of money orders issued in Canada in the fiscal year ended March 31, 1928, was 17,505,563, having a value of \$200,773,403. Twocent letter postage, which had been abandoned during the war, again became effective for Canada, the United States, Newfoundland and other countries of North America on July 1, 1926, and for Great Britain and the British Empire on Dec. 25, 1928. Air mail services are being instituted, and a parcel post service and a rural mail delivery have been established. In connection with the post office, a post office savings bank is operated, with deposits which at the end of February, 1929, aggregated \$25,080,704.

At the end of 1927 there were six telegraph companies doing business in Canada, in addition to the service maintained by the Dominion Government on the north shore of the St. Lawrence and extending into Labrador, also in the outlying points of the Maritime Provinces and British Columbia. There were also six transoceanic cables having a terminus in Canada. The telegraph companies reported for 1927 a revenue of \$12,990,549, operating expenses of \$10,600,412, wire mileage of 323,539 and pole line mileage of 52,731 miles. The number of mes-

sages sent was 15,564,067, the number of cablegrams 6,664,771, including transatlantic cablegrams relayed between Canso, N. S., and the United States. The Marconi Company, in conjunction with the Government, has established land stations from the Atlantic Coast to Ontario. A wireless service to the United Kingdom is also maintained by the Marconi Company. The most important telegraph companies are the Canadian National Telegraph Company (formerly the Great Northwestern), the Canadian Pacific, and the Western Union.

In 1927 there were 2,462 telephone companies or organizations in Canada, but many of these are only local in their field of operations. They include provincial government, municipal, stock, coöperative, partnership, and private organizations. By far the most important is the

industrial situation, particularly in the pulp and paper industry. In the past it has been a drawback to the industrial provinces of Ontario and Quebec that most of their manufacturing was dependent upon the use of United States coal. The utilization of the 'white coal' of the great rivers of Canada is taking away this disadvantage. The turbine installation in Canada has increased from 235,946 h.p. in 1901 to 5,349,232 in 1928. Of the latter figure, 2,387,118 h.p. are developed in Quebec and 1,903,705 in Ontario. It is officially estimated that only one-eighth of the available water power is as yet in use, and in electrical energy generated per head of population Canada ranks second only to Norway.

**Manufactures.**—Manufacturing in Canada is increasing at a rapid rate. The growth and prosperity of the agricultural popula-

Establishments . . . . .	19,218

Products . . . . .	\$1,165,975,639

As a result of the conviction that a period of ten years—during which no records are collected—is unduly long, the Department of Trade and Commerce in 1905 instituted the custom of compiling a series of figures midway between the regular census years. This is called the Postal Census and was taken in 1905 and 1915 for all establishments having an output of \$2,500 or over, irrespective of the number of persons employed, except in the case of flour and grist mills, butter and cheese factories, fish preserving factories, saw-mills, brick and tile yards, lime kilns

Bell Telephone Company. The Prairie Provinces of Manitoba, Saskatchewan, and Alberta have bought up the plant of the Bell Company within these provinces, and are actively engaged in constructing trunk lines and aiding the rural communities to connect with them. Many cities and municipalities have also established systems of their own. (See MANITOBA; SASKATCHEWAN; ALBERTA.) The capital of all the telephone organizations in 1927 was \$192,442,495; gross earnings, \$56,907,338; operating expenses, \$48,561,916; net earnings, \$8,345,422. The wire mileage was 3,591,035; number of telephones, 1,259,987; and number of employees, 23,437, receiving salaries or wages to the amount of \$26,254,605. There was a telephone instrument for every 7.6 persons in the country.

**Water Powers.**—One of the most important undertakings in the recent history of Canada is the remarkable development of its water powers, which is proceeding rapidly and affecting the

tion, especially in the West, have created an extensive market for the products of the factories. The capital and energy of Eastern Canada, particularly Ontario, are largely devoted to meeting this increasing demand for manufactured goods. Added to this is the fact that the home producer enjoys a large measure of protection from British and foreign competition by means of the tariff. The hemp and copper industries are also encouraged by liberal bounties. (See TARIFFS.)

In 1900 the principal statistics of manufactures, as shown by the census of 1901, were as follows:

Establishments . . . . .	14,650
Capital . . . . .	\$446,916,487
Salaries employees . . . . .	30,691
Salaries . . . . .	\$23,676,146
Wage earners . . . . .	308,482
Wages . . . . .	\$89,573,204
Raw and partly manufactured materials . . . . .	\$266,527,858
Products . . . . .	\$481,053,375

The following table gives the corresponding statistics for 1910, as shown by the census of 1911:

and electric light plants, where all plants were included.

An annual census of industry was established in 1917, when all establishments reporting to the Bureau of Statistics were included, the result being a large increase in the number of establishments, from 21,306 in 1915 to 34,392 in 1917, 35,797 in 1918 and 38,344 in 1919. However, on account of the smallness of the establishments on the custom and repair group, this whole group was dropped from the annual census after 1921, while the construction industries are also not included in the total. The gross production of Canadian manufacturing industries, with these exceptions, has increased in the last few years from \$2,482,209,130 in 1922 to \$3,425,498,540 in 1927, or by over \$943,000,000.

The manufactures for 1927, classified by industries, are given in the accompanying table.

**Domestic Commerce.**—No general attempt is normally made to value or tabulate the goods and commodities passing from

one province to another, though this was done in the case of rationed commodities such as coal during the war, and in this case has been continued.

In the east, the Maritime Provinces have comparatively little in common with the neighboring provinces of Quebec and Ontario. Their trade is rather with Great Britain, the West Indies, and New England. At the same

On the other hand, the goods obtained from Ontario and Quebec consist of beef, flour, and feed products; and among manufactured commodities the most important are household utensils and furnishings, ready-made clothes, boots, shoes, rubbers, and agricultural implements.

Quebec and Ontario constitute the second geographical unit, separated from the Prairie Prov-

cattle. Manufactured products include agricultural implements in large quantities, household goods, clothes, and wearing apparel. From the west, Ontario and Quebec take large quantities of wheat, oats, and barley, and a few manufactured goods, such as flour, meats and canned fish, produced in Manitoba and British Columbia.

The Prairie Provinces and

time a common protective tariff and specially low railway rates have done much to promote interprovincial trade. Coal is shipped in large quantities to Quebec. Fish also are being sent to Quebec and Ontario in much larger quantities than was formerly the case. Apples are sent in small quantities to the west, while the trade in certain manufactured goods is increasing. These consist of steel products, woollen goods, cars, foundry products, and confectionery.

inches by the infertile country north of Lake Superior. These provinces are the chief manufacturing centre of Canada, producing in 1927 80 per cent. of the country's manufactures, and selling these products largely throughout the Dominion, as well as abroad. Ontario's trade with the middle west is larger than Quebec's. From Ontario, and to a less extent from Quebec, the west receives timber, beef and other animal products, some flour, and a good deal of feed for

British Columbia constitute the third and fourth geographical units. British Columbia supplies the middle west with large amounts of timber and coal, fish (particularly canned fish), and an increasing amount of fruit, especially apples. From the Prairie Provinces, British Columbia receives the staple agricultural products to a limited extent, and also some cattle from the ranches of Southern Alberta.

*External Trade.*—The external trade of Canada has increased

enormously during the last fifteen years. To aid in marketing the products of the Dominion, the Government has subsidized lines of mail steamers running to Great Britain, Europe, the West Indies, Mexico, Australia, France and South Africa, and has even, like Australia, gone into the shipping business itself, building and operating in 1927 a fleet of some 46 freight steamers to Newfoundland, Cuba, the West Indies, South America and British ports, as well as an Australian service. The external trade for the fiscal year ending March 31, 1929, amounted to the grand total of \$2,654,452,166.

A new classification of imports and exports according to chief component materials was adopted in 1919, the classes being as follows: (1) vegetable products (except chemicals, fibres, and wood); (2) animals and their products (except chemicals and fibres); (3) fibres, textiles, and textile products; (4) wood, wood products, and paper; (5) iron and its products; (6) non-ferrous metals and their products; (7) non-metallic minerals and their products (except chemicals); (8) chemicals and allied products; (9) all other commodities. In 1929, the exports of commodities belonging to the first class reached a value of \$646,500,000; fourth class \$288,600,000; second class \$158,750,000 and sixth class

ports of class 5 goods amounted to \$346,600,000; of class 1 to \$233,000,000; of class 3 to \$206,000,000; and of class 7 to \$167,000,000, no other class showing

year ended March 31, 1919, when they constituted only 8 per cent. of the total imports, as compared with 81½ per cent. from the United States.

The percentage value of imports from Great Britain reached its highest point, 59.2, in 1871-2. Then followed a decline until 1898-9, when the percentage was only 24.7. The percentage value of American imports had risen in the meantime from 32.1 in 1871-2 to 60.3 in 1900-1.

In the years since the war, imports from the United States, broadly speaking, approximate two-thirds of the total. Preliminary figures of total exports in the fiscal year ended Mar. 31, 1929, are given as \$1,388,773,075 as against imports for consumption of \$1,265,679,091. The so-called 'favorable' balance of trade for the year is therefore \$123,093,984.

**Tariff.**—The existing customs regulations in Canada provide for three different rates of duties, the preferential tariff, the intermediate tariff, and the general tariff. In addition, a special 'dumping' duty and a surtax may be imposed.

The preferential tariff applies to goods produced or manufactured in the United Kingdom, British India, and most of the British colonies when imported direct from any British country. This tariff went into operation on Aug. 1, 1898, the duties on British goods being 25 per cent. less than those on foreign goods. On July 1, 1900, the preference was increased to 33½ per cent. A modification of this tariff in 1904 raised the duty on most of the woollen and worsted goods of British origin to 30 per cent., as against 35 per cent. on those of foreign origin, a preference of only 14⅓ per cent. In 1922 the duties on cotton and woollen fabrics, and clothing, flannels, knitted goods, rubber clothing and boots and shoes were reduced by 2½ per cent. ad valorem, and on collars and cuffs by 5 per cent. ad valorem under the preferential tariff, the general tariff remaining unchanged. In 1923 a further discount of 10 per cent. of the preferential duty was given where commodities dutiable at more than 15 per cent. were directly imported into a sea or river port of Canada.

The intermediate tariff may be applied by Order-in-Council to the products of any British or foreign country. The duties there set forth are slightly lower than those of the general tariff. The intermediate tariff applied in 1928 to the products of France, her colonies and protectorates, Belgium, Italy and the Netherlands (under special treaties), also Argentina, Colombia, Cuba,

\$112,650,000. Exports in each of the other classes amounted to less than \$100,000,000. Im-

ports as great as \$100,000,000. Of the total value of exports, \$500,000,000 went to the United States as against imports of \$868,000,000, and \$430,000,000 to the United Kingdom as against imports of \$194,000,000. Of \$1,228,000,000, the total value of domestic produce exported in 1928, \$580,000,000 represented raw materials, \$189,000,000 partly manufactured goods and \$459,000,000 fully or chiefly manufactured goods.

In 1875 exports to Great Britain began to exceed those to the United States. In 1882 conditions were reversed, but in the years following Great Britain again came to the front as Canada's market until 1889. After the latter date, however, the United States steadily fell behind in the race until the Great War, which seriously reduced British purchasing power. In 1928-29 the United States took about 37 per cent. of Canada's total exports as compared with about 31½ per cent. going to the United Kingdom. On the other hand, the United Kingdom supplied only 15½ per cent. of Canada's imports, while the United States supplied no less than 68½ per cent. Canada's imports from the United Kingdom reached their lowest point in the fiscal

Denmark, Finland, Japan, Norway, Spain, Sweden, Switzerland and Venezuela (under reciprocal most-favored-nation legislation). Further, arrangements entered into in that year and becoming effective by the end of the year granted most-favored-nation treatment to Czechoslovakia, Estonia, Hungary, Latvia, Lithuania, Portugal, Roumania and the Serb-Croat-Slovene kingdom.

The general tariff applies to the imports from all countries not entitled to the preferential or intermediate tariff. It is decidedly protective in its nature, but numerous deductions have been made since 1921, mainly in the duties on instruments of production and on textiles and articles of clothing.

The special or 'dumping' duty is an additional tax which may be levied upon goods sold to a Canadian importer at a price lower than the market price in the country whence they are exported to Canada. This tax may not exceed 15 per cent. ad valorem.

Finally, goods exported to Canada from any country which treats Canadian imports less favorably than the imports from other countries may be subject to a surtax, not exceeding 20 per cent. ad valorem, over and above the general tariff.

*Japan.*—In 1906 a convention was signed and ratified by Great Britain and Japan, admitting Canada to the advantages of the conventions signed by the two contracting parties in 1894 and 1895. Canada is, therefore, entitled to the lower duties of the special Japanese tariff contained in the treaty. Since 1894, agreements have been concluded between Japan and France, and Japan and Germany, providing for lower duties on some articles not specified in the treaty of 1894, to the benefits of which Great Britain and Canada are entitled as well. Under the Japanese Treaty Act of 1913, Canada and Japan extend to each other's products most-favored-nation treatment.

*France.*—An agreement was concluded with France in 1907 by which certain specified products are admitted by either country at lower rates than those imposed by the ordinary tariffs. The Canadian articles enumerated are for the most part agricultural, mining, or fishing products in the raw state. The French commodities entitled to the lower treaty rates include wines, spirits, and other less important articles, generally in the nature of luxuries. The French Treaty was denounced in 1920, but in 1921 a French Trade Agreement was signed, Canada granting to France, subject to the usual reser-

vation in favor of other portions of the Empire, most-favored-nation treatment. Certain Canadian articles were removed from the operation of the French minimum tariff, while certain others were granted its privileges. Belgium, Italy and the Netherlands have also been granted the lower duties of the intermediate tariff on many goods shipped directly from the country of origin or from a British port to a Canadian port.

*United States.*—An agreement for the free exchange of most natural products and a few manufactured commodities at reduced rates was rejected by Canada as a result of the defeat of the Liberal Government on this issue in the election of 1911. Canadian producers benefitted somewhat from the reductions in the American tariff under President Wilson, but consumers probably lost by the increased prices of certain raw products, which passed more freely across the border to the United States. During the war, in consequence of a provision of the American tariff and of the action of the Canadian Government in abolishing the duty on American wheat and flour, by order in council under the War Measures Act, wheat and flour and other less important commodities passed free of duty in both directions. This ended with the advent to power of the Republicans and the enactment of tariff measures, which seriously injured the Canadian farmer.

*British West Indies.*—The products of the British West Indies are complementary to rather than competitive with those of Canada. This feature was recognized in the West Indian Trade Agreement of 1913 under which Canada and the British West Indies gave specially favorable treatment to each other's products. In 1920 a trade conference between the Governments was held at Ottawa, and as a result an arrangement was effected under which Canadian customs duties on products of the British West Indies shall not be more than 50 per cent. of similar duties imposed on products of foreign countries, Canadian goods receiving an equivalent preference in the West Indies. A subsidized steamer service between St. John or Halifax and West Indian ports was also arranged. A further agreement between Canada and the British West Indies was signed on July 6, 1925, under which duties levied on dutiable goods other than tobacco and liquors from any of the colonies are not to exceed 50 per cent. of the general tariff. Separate steamship services have also

been arranged for between Canada and the Eastern and Western groups of the West Indies and neighboring colonies.

See also the article **TARIFF**.

*Finance.*—On Mar. 31, 1928, the gross debt of Canada was \$2,677,137,243, with active assets amounting to \$380,287,010, leaving a net debt of \$2,296,850,233, a decrease of \$50,984,137 during the year. The total receipts under the division consolidated fund for the fiscal year ending March 31, 1928, amounted to \$422,717,983, besides \$6,924,594 of special revenue, an increase of \$29,189,097 over the preceding year in spite of considerable reductions in taxation. The expenditure under the same head was \$336,167,961. In addition, there were special expenditures of \$3,361,322, capital expenditures of \$20,635,648 (mainly on the Welland Ship Canal and the Hudson Bay Railway) and other expenditures (mainly the charging off of old obligations due to the government) amounting to \$18,493,509, bringing the grand total expenditure to \$378,658,440. On Oct. 15, 1928, the national debt was reduced by the paying off out of surplus revenue of \$53,000,000 of 5 per cent. bonds falling due on that date. On August 1, 1929, \$60,000,000 of 5½ per cent. bonds then due were paid off out of surplus revenue.

*Direct Taxes.*—In 1915 the Dominion Government, in anticipation of impending deficits and in addition to the increase in indirect taxes, decided to resort to the use of direct taxes which previously had been informally understood to be reserved to the provinces. Under the Special War Revenue Act of 1915, direct taxes of one per cent. were imposed on the average note circulation of the banks, on the gross incomes of trust and loan companies, and on the net premiums of insurance companies other than life, marine, and fraternal insurance companies. Taxes were also levied on telegrams, railway and steamship tickets, checks, bills of exchange, money orders, letters, post cards, patent medicines, and wines.

In 1916 the Business Profits War Tax Act was passed, and to a certain extent was made retroactive. It was applicable to all persons, firms, and incorporated companies engaged in business, but exceptions were made in favor of insurance companies and persons engaged in agriculture. Moreover, individuals and incorporated companies whose capital was less than \$50,000 were exempt unless engaged in manufacturing war supplies. In the case of incorporated companies the tax was placed at 25 per cent.

on profits in excess of 7 per cent. of the capital, while individuals were taxed 25 per cent. on their excess of profits over and above 10 per cent. on their capital. In 1917 this act was amended, in 1918 its operation was extended to businesses with a capitalization of from \$25,000 to \$50,000, and in 1919 the tax on such businesses was fixed at 25 per cent. of profits in excess of 10 per cent. on capital. In 1920 the tax was modified and in 1921, the period of large profits being over, the tax was discontinued.

In 1917 an income tax was introduced and adopted with general approval. This tax was, generally speaking, based upon the Federal income tax of the United States and the income tax of the United Kingdom. When the income tax was passed it was officially announced that the business profits war tax would be repealed, but in view of public opposition it was retained until the end of 1920.

A sales tax was established in 1920, the rate being raised in 1921 to 1½ per cent. on transactions between manufacturers and wholesalers or jobbers and also between these and retailers or consumers, and to 3 per cent. on sales made directly by the manufacturer to the retailer or consumer. These rates were further increased by 50 per cent. in 1922, and raised in 1923 to a general rate of 6 per cent. Returning prosperity has brought about a gradual reduction to a rate of 2 per cent. in 1929.

In the last few years, the growing prosperity of Canada has made it possible to reduce or abolish many of the taxes imposed during the war. Income tax is now collected only from single persons with incomes of \$1,500 or over and married persons with incomes of \$3,000 or over, while the normal rate has been reduced to 2 per cent. and \$500 exemption is allowed for each dependent child, so that a married man with 2 children pays only \$20 on an income of \$5,000. The tax on receipts has been abolished and the tax on checks has been reduced to a flat 2 cents on checks for \$10 or over. Two cent postage has also been restored. (See SALES TAX.)

**Loans.**—In order to meet the deficit of over \$104,000,000 for the fiscal year 1914-15 the Government issued \$26,000,000 in Dominion notes in excess of the amount allowed by law and unprotected by gold, a transaction which was legalized by Act of Parliament in 1915. In addition, \$60,000,000 was borrowed from the British Government, \$15,000,000 in treasury bills and \$6,500,000 in Dominion stock were sold in London, and \$5,000,-

000 was borrowed from the Bank of Montreal.

In the fiscal period 1915-16 about \$182,000,000 was needed to meet the deficit, to retire the treasury bills, and to pay the Bank of Montreal. For these purposes \$25,000,000 of 1920-25 debenture stock were sold in London, treasury bills to the value of \$45,000,000 were sold in New York, and \$100,000,000 was borrowed in Canada.

The deficit for 1916-17 amounted to \$157,000,000. A loan of \$75,000,000 was floated in New York, and in September, 1916, \$100,000,000 was borrowed in Canada. During the calendar year 1917 two more loans were floated in Canada—one in March for \$150,000,000, while a second in November was allotted for \$400,000,000; but this gross sum includes a certain amount subscribed not in cash, but in holdings in former loans.

Further, \$100,000,000 of 5 per cent. 2-year notes were floated in New York. The fifth domestic war loan, floated in November, 1918, was applied for by over 1,000,000 subscribers and totalled \$660,000,000, while the sixth loan for demobilization and re-establishment expenses, issued in November, 1919, realized \$678,000,000. The raising of a loan of \$350,000,000 to pay off maturing war debt was authorized by Parliament in 1922. As a result of the unlooked-for success of the various domestic loans during the war, the Canadian Government was able to advance large sums to the British government. The same policy was also adopted by the Canadian banks. On the other hand, the British government paid all expenses for the maintenance of Canadian troops abroad, and debited Canada with a charge of \$1.50 per soldier per day.

**Banks and Currency.**—There are 10 banks in Canada, with branches scattered over the country from the Atlantic to the Pacific. On Dec. 31, 1928, the number of branch banks in Canada was 3,966. Canadian banks also have branches in England, Newfoundland, the West Indies, and the United States. These foreign branches numbered at the above date 187. This branch system, adapted from the method followed by the Scotch banks, offers signal advantages in insuring security to depositors, and in establishing uniform rates of exchange and interest in a large and sparsely settled country.

All banks are chartered by the Dominion Government, and no new bank is incorporated unless its capital stock is at least \$500,000, half of which must be paid up before it is allowed to begin business. The finances of the

banks are based on gold and Dominion notes redeemable in gold. They are not compelled by law to maintain a minimum reserve, but 40 per cent. of such reserve as they find it expedient to provide must be in Dominion notes. The Government is bound to hold as security for the notes not in excess of \$76,000,000 which it issues, \$16,000,000 of railway securities guaranteed by the Dominion. For the protection of all notes issued in excess of \$76,000,000 an equal amount in specie would normally be maintained, but during the war the Dominion was authorized to issue to the banks Dominion notes uncovered by specie against the deposit of approved securities in time of war or panic. This was made a normal feature of the banking system in 1923.

The chartered banks are allowed to issue notes to the amount of their unimpaired, paid-up capital, and they may in addition, during the harvest period, when the crops are being moved (from the first of September to the last of February), issue notes equal in value to 15 per cent. of their combined paid-up capital and reserve—such issue in excess of their paid-up capital being subject to a tax of 5 per cent. By an amendment to the banking act, passed in 1913, banks may also issue notes equal to the amount of a reserve deposited in the central gold reserves. These reserves must be in the form of gold or Dominion notes. The notes so issued are in addition to the issue based on paid-up capital, and are not subject to the 5 per cent. tax imposed upon the issue based on capital and rest during the harvest period. However, since 1915 all banks have paid a tax of 1 per cent. per annum on their average notes in circulation.

The minimum value of a bank note is \$5. Bank notes may also be issued in multiples of five. One, two and four dollar notes are issued by the Government alone. Bank notes form a first lien on the assets of the bank issuing them, which must maintain facilities for redeeming them in the principal cities of the Dominion, and in addition must maintain with the Government an amount of gold equal to 5 per cent. of their average monthly note circulation, from which 'bank note circulation redemption fund' all notes of failed banks are redeemed on presentation.

Monthly statements must also be furnished to the Government. In the event of the failure of a bank, its notes bear interest at 5 per cent. until they can be redeemed; the 5-per-cent. deposit made by it, and, if necessary, by

other banks, may be drawn upon for the immediate redemption of notes, and each shareholder is liable for a sum equal to the par value of the shares held by him, in addition to any amounts not paid upon such shares. Finally, the other banks may also be called upon to make good the losses to note holders, but not to depositors of failed banks.

On March 31, 1928, there were in circulation Dominion notes to the amount of \$221,894,063, nine-tenths of which amount was large notes in the hands of the banks. The aggregate of bank notes in circulation, these forming the bulk of the currency in the pockets of the people, was \$188,726,256. The paid-up capital of the 10 banks at the same date amounted to \$132,421,228, the assets to \$3,494,089,109, and the total liabilities to the public to \$3,188,914,875.

Shortly after the outbreak of the war the Dominion Government announced that there had been an over-issue of Dominion notes to the value of \$26,000,000. This over-issue still remains in circulation legalized by an Act of 1915. Moreover, the Government has adopted as a normal feature of the system the practice of issuing notes to the banks upon the deposit of approved securities, after the model of the U. S. Federal Reserve Act.

On April 30, 1929 there was an available gold reserve in the hands of the Dominion Government of \$58,771,399 against Dominion notes to the amount of \$105,151,681, exclusive of \$84,000,000 outstanding against approved securities and \$16,000,000 issued under authority of the Dominion Notes Act of 1915. The excess Dominion notes have in the main been advanced to the banks upon the deposit by them of approved securities with the Minister of Finance, just as Federal Reserve notes are advanced to banks in the United States. Dominion notes have been redeemable in gold since July 1, 1926. Bank notes are not legal tender, but are accepted as freely as Dominion notes. The Canadian dollar, which was as low as 82 American cents in 1920, has thus recovered its par value, which is the same as that of the United States dollar.

**Area and Population.**—The area of Canada in 1928 was 3,684,723 square miles, of which 3,542,049 square miles is land and 142,674 square miles is water. This area was reduced by 112,400 square miles (106,970 square miles of land and 5,430 square miles of water) as a consequence of the award of the Judicial Committee of the British Privy Council in the boundary dispute

between Canada and Newfoundland.

In 1921 the population was 8,788,483, compared with 7,206,643 in 1911—an increase of 1,581,840, or 21.95 per cent. The rural population in 1921 was 4,439,505, compared with 3,925,679 in 1911—an increase of 513,826, or 13 per cent. In 1921 the urban population was 4,348,978, compared with 3,280,964 in 1911—an increase of 1,068,014, or 32 per cent.

The largest absolute increase in total population was in Ontario, followed by Quebec, Saskatchewan, Alberta, Manitoba, and British Columbia in the order named, all of these increases being over 100,000 in the decade. In the Maritime Provinces (Nova Scotia, New Brunswick and Prince Edward Island) the increases were comparatively slight, the last named showing

the manufacturing centres of the Dominion.

In Canada the details of the census of 1921 show that, as in the United States, the westward movement of population continues. At the first census of the Dominion, taken in 1871, only 3.4 per cent. of the population resided west of Ontario. In 1881 the percentage was 3.5; in 1891, 7.3; in 1901, 12; in 1911, 24.1; and in 1921, 28.3. On the other hand, the three Maritime Provinces, which in 1871 contained 20.3 per cent. of the population of the Dominion, had in 1881, 19.8 per cent. in 1891, 18.2 per cent.; in 1901, 16.7 per cent.; in 1911, 13 per cent.; and in 1921 only 11.4 per cent. of the country's population. Their people migrated in large numbers to the fertile farms of the prairies or to the industrial cities of Ontario and Quebec, as well as to Boston

*Area and Population of Canada (1921)*

Provinces	Area (sq. m.)	Pop. 1921	Increase per cent. 1921 over 1911
Alberta . . . . .	255,285	588,454	57.22
British Columbia . . . . .	355,855	524,582	33.66
Manitoba . . . . .	251,832	610,118	32.23
New Brunswick . . . . .	27,985	387,876	10.25
Nova Scotia . . . . .	21,427	523,837	6.40
Ontario . . . . .	407,262	2,933,662	16.08
Prince Edward Island . . . . .	2,184	88,615	-5.46
Quebec . . . . .	706,834	2,361,199	17.72
Saskatchewan . . . . .	251,700	757,510	53.80
Yukon . . . . .	207,076	4,157	-51.16
Northwest Territories . . . . .	1,242,223	7,988	22.76
Royal Canadian Navy . . . . .	.....	485	.....
Totals . . . . .	3,729,663	8,788,483	21.95

an actual decrease as did also the Yukon. The largest percentages of increase were in Alberta and Saskatchewan (over 50 per cent.), followed by British Columbia, Manitoba, Northwest Territories, Quebec, Ontario, New Brunswick and Nova Scotia, in the order named. On the other hand, Prince Edward Island, an almost purely agricultural community, and the Yukon Territory, mainly a mining camp, lost 5 per cent. and 51 per cent. respectively of their population.

All of the western provinces, including British Columbia, showed large increases, both in rural and urban population, all having greater absolute increases in rural than in urban population, and all but Saskatchewan and Alberta greater relative increases. Of the eastern provinces, Ontario and New Brunswick showed some absolute increase in rural population, while Nova Scotia, Quebec, and Prince Edward Island experienced a decline. In each of these provinces, urban population showed a greater absolute increase than rural, more especially in Ontario and Quebec,

and New York. Ontario and Quebec, which before 1867 constituted the old Province of Canada, still contribute the largest element to Canadian population, though their percentage has gradually declined from 76.24 in 1871 to 60.25 in 1921.

The areas and population of the various provinces and districts are shown in the accompanying table.

The population of the principal cities and towns in 1921 was as follows: Montreal, 618,506; Toronto, 521,893; Winnipeg, 179,087; Vancouver, 117,217; Hamilton, 114,151; Ottawa, the capital, 107,843; Quebec City, 95,193; Calgary, 63,305; London, 60,959; Edmonton, 58,821; Halifax, 58,372; St. John, 47,166; Victoria, 38,727; Windsor, Ontario, 38,591; Regina, 34,432.

At the quinquennial census of the Prairie Provinces (Manitoba, Saskatchewan and Alberta) in 1926, the populations of these provinces were recorded as follows:—Manitoba, 639,056; Saskatchewan, 820,738, Alberta, 607,584, being a total of 2,067,378, as compared with 1,956,082

in 1921. The rate of growth was thus 5.69 per cent. in the five years, which included the period of the great agricultural depression of 1921-24, which severely affected these grain-growing provinces.

The populations of the chief cities in the Prairie Provinces in 1926 were Winnipeg, 191,998, Calgary, 65,513, Edmonton, 65,163, Regina, 37,329, Saskatoon, 31,234.

**Immigration.**—Largely as a result of the opening up of virgin wheat land in the provinces of Manitoba, Saskatchewan, and Alberta, there has been a marked influx of population into Western Canada since the beginning of the century. The great fertility and productivity of this new country have attracted many farmers and farm laborers from the American West and the United Kingdom. There were also before the war many arrivals from Eastern Europe, largely attracted by the demand for railway 'navvies' and miners. However, the English-speaking element largely outnumbered those of other nationalities, and the educational authorities are actively at work in 'Canadianizing' the children of the continental Europeans.

Any person who is the sole head of a family, or a male over eighteen years of age, may 'home-stead' a quarter section (160 acres) of Crown lands in the provinces of Manitoba, Saskatchewan, and Alberta, or in the Territories. The Canadian Pacific Railway also has land for sale, and is offering 'ready-made' farms for sale or lease.

The numbers of immigrants who have arrived within recent years are shown in the accompanying table.

Canadian Immigration, 1915-1920

Year*	From United Kingdom	From United States	From All Countries
1915	43,276	59,779	144,789
1916	8,664	36,937	45,537
1917	8,282	61,339	75,374
1918	3,178	71,314	79,074
1919	9,914	40,715	57,702
1920	59,603	49,656	117,336
1921	74,262	48,059	148,477
1922	39,020	29,345	89,999
1923	34,508	22,007	72,887
1924	72,919	20,521	148,560
1925	53,178	15,818	111,362
1926	37,030	18,778	96,064
1927	49,784	21,025	143,991
1928	50,782	25,007	151,597
1929	58,880	30,560	167,722

\*Ending March 31.

Any immigrant may be deported within five years after arrival, if he has, during that period, become a public charge or an in-

mate of a prison, hospital, or charitable institution.

All British subjects from the United Kingdom or from the British Dominions are eligible to enter Canada, provided they are sound mentally and physically and in a position to maintain themselves until employment can be found. Special encouragement to agricultural workers and their families and to domestic workers is extended in the form of low ocean rates of £2 from port to port, with free passage for children under 17, together with low railway rates. British children over 14 and under 17 are also brought to Canada under the auspices of certain juvenile societies and are given supervision in their new homes by officials of the Government.

Citizens of Northern European countries, including Scandinavia, Germany, Switzerland, Holland, Belgium and France, are eligible for entry into Canada if sound mentally and physically and in a position to maintain themselves until employment can be found. The same applies to immigrants from the United States, but in all such cases no financial assistance is given. Immigrants from the Central and Southern European countries are only accepted if they are agricultural workers, domestic servants or closely related to residents already legally admitted to Canada; exceptions may be made where the Minister of Immigration is satisfied that their labor or service is required in Canada.

Chinese immigrants, since the passage of the Chinese Immigration Act of 1923, have been admitted to Canada only in rare cases. Immigration from Japan is regulated by the 'gentleman's agreement' between the Canadian and Japanese Governments, under which the Japanese Government grants only a small number of passports for Canada and the Canadian Government admits only those Japanese to whom passports have been granted and who are otherwise acceptable. Japanese to the number of 445 migrated to Canada in the fiscal year ended March 31, 1929. Immigration from the East Indies is also restricted and only 52 such immigrants were received in this latest fiscal year.

**Language.**—English is spoken or understood almost everywhere, except in the rural parts of Quebec, where French alone is understood by many of the *habitants*. French is also spoken in parts of Eastern Ontario, where the French-Canadians have settled, and in a few small communities in the West. The English-speaking people of most of the Eastern townships in Quebec are being supplanted by French-

speaking Canadians. French and English are official languages both in the Dominion Parliament and in the Quebec legislature. In the latter French is commonly used to the exclusion of English, but in the Dominion Parliament even the French-Canadians generally prefer to speak English.

In the towns and cities of Quebec it is highly desirable for professional and business men to know both languages; and this is required in the case of civic employees and corporation officials who come into close contact with the public. There has recently been a marked movement in Quebec to preserve and perpetuate the language of old France, a movement which owes its origin to the Nationalists and to the Roman Catholic church.

**Religion.**—There being no state church in Canada, priority among the denominations is determined by numbers only. The Roman Catholic church has a privileged position in Quebec, with the legal right to collect tithes from all her members.

The Church of England has 4 archbishops and 21 bishops, with about 1,618 clergy and 785 licensed lay readers; the Roman Catholics, 11 archbishops, 37 bishops, and over 7,000 clergy; the United Church of Canada, formed in 1925 by a union of the Methodists, Congregationalists and a majority of the Presbyterians, 4,700 ministers, including 600 foreign missionaries; the 'continuing' Presbyterians, 654 ministers; and the Baptists, 735. Religious statistics obtained from the census of 1921 show the number of persons belonging to the larger denominations as follows:

Roman Catholics . . . . .	3,389,636
Presbyterians . . . . .	1,409,407
Anglicans . . . . .	1,407,994
Methodists . . . . .	1,159,458
Baptists . . . . .	421,731
Lutherans . . . . .	286,458
Greek Church . . . . .	169,832
Jews . . . . .	125,197
Mennonites . . . . .	58,797
Congregationalists . . . . .	30,730

The proportion of each of the larger denominations to the total population in 1911 and 1921 was as follows:

	1911	1921
Roman Catholics . . . . .	39.31%	38.57%
Presbyterians . . . . .	15.48	16.04
Anglicans . . . . .	14.99	16.02
Methodists . . . . .	14.47	13.19
Baptists . . . . .	5.31	4.80
Lutherans . . . . .	3.19	3.26
Greek Church . . . . .	1.23	1.93
Jews . . . . .	1.04	1.42
Mennonites . . . . .	0.62	0.67
Congregationalists . . . . .	0.47	0.35

**Education.**—Canada's free educational system is in the hands of the provinces, except in so far as the British North America Act secures the permanence of

the denominational schools which existed at the time of Confederation. In 1905 the Federal Government passed acts concerning education in the new provinces of Alberta and Saskatchewan. In Ontario, Quebec, Alberta, Saskatchewan, and the Northwest Territories there are separate schools for Roman Catholics; in the other provinces, the schools are nominally non-sectarian; but as a result of a compromise, the Roman Catholics really have separate schools in the larger towns and cities. Teachers are trained in the main at provincial normal schools. In 1926-27 the expenditure amounted to over \$125,876,375. On the average, one-seventh is contributed by the Provincial Government, and the remainder by the inhabitants of the school districts.

With the exception of Quebec all the provinces have laws of compulsory education, but under differing conditions. As a rule, the provincial laws provide for uniformity in the training of teachers, the use of textbooks and the grading of pupils. Secondary schools or departments, and colleges or universities for higher education exist in all the provinces, and the three classes of teaching institutions are more or less coordinated to allow of natural transition from the lower to the higher. Arrangements for the superannuation of teachers are applied in most of the provinces.

There are 23 institutions which grant degrees, of which perhaps ten are universities in the true sense of the word. (See Table of Canadian Universities under the heading COLLEGE.)

In 1901, of the total population of the age of five years and over, 129,584 could read but not write. In 1911 there were only 32,863 and in 1921 58,254 who could read but not write. In 1901 there were 680,122 who could neither read nor write; in 1911 the corresponding number was 663,453 and in 1921, 715,167. In 1901 the percentage of those who could neither read nor write was 14.38; in 1911 it was 10.50 and in 1921, 9.25.

In the more significant comparison for those 10 years of age and over, the proportion unable to read and write was 5.10 per cent. in 1921, or 4.49 per cent. if Indians are excluded. In Ontario, the percentage above 10 years of age unable to read or write was 2.96 in 1921, rising to 7.09 per cent. in Manitoba and 7.21 per cent. in New Brunswick. There has been increasing activity in, and expenditure upon, education during recent years, and progress has been marked, more particularly in technical and vocational education, where

the Dominion Government has extended financial assistance to the extent of \$10,000,000, divided among the provinces in the ten years 1919 to 1929. Statistics for the latest year available (1926 or 1927), compiled by the Dominion Bureau of Statistics, place the number of teachers in elementary and secondary schools under public control at 66,004; with 1,944,771 pupils enrolled, and an average attendance of 1,576,728. The total number enrolled in all educational institutions, so far as known, was 2,291,763.

(See EDUCATION IN CANADA and the articles on the separate provinces.)

**Army.**—The Canadian militia, which is administered by the Dominion Government, is under the control of a defence council, presided over by the Minister of National Defence. Certain of the 11 militia districts into which Canada is divided are grouped under commands, each command being under the control of a senior officer, with power to deal with all subjects not involving a question of policy. Service in the militia may be made compulsory for all men between the ages of 18 and 60. Service in the active militia is for 3 years, with 8 to 16 days' annual training. The Permanent Active Militia in 1928 consisted of 3,684 officers and men and the Non-Permanent Active Militia of 124,879 officers and men.

In order that a sufficient number of officers may be available in case of necessity, Officers' Training Corps have been established at many of the Canadian universities and colleges. The Minister of Militia has made arrangements with the Educational Departments of several provinces to furnish military instruction to the boys.

The fortifications at Halifax and Esquimalt are now maintained by the Canadian Government. Military instruction is given by the Royal Military College in Kingston, and by McGill and other universities through their Officers' Training Corps.

On Aug. 1, 1914, the Canadian Government offered the British Government an expeditionary force in case Great Britain should become involved in the war. The offer was accepted, and in the autumn of 1914 a Canadian army of 33,000 men left Quebec for England. This force was increased to 63,000 men during the same year, to 150,000 by July, 1915, and to 250,000 by October, 1915; but during 1916 recruiting fell off. Early in the same year the Premier announced that Canada's contribution of men should be 500,000, and this promise was interpreted as a

pledge made on behalf of the government and the people whom they represented. By March, 1917, the Canadian troops which had actually left Canada numbered 326,000 men, of whom 130,000 were in France. In addition, some 40,000 reservists had also left Canada, and were serving in the Allied armies. In June, 1917, there were 136,000 Canadian troops in France, about 900 in the West Indies and Near Eastern countries, and 108,736 in England—not counting those in hospitals and convalescent homes; while 17,353 were still in Canada. The total number of Canadians who were actually sent overseas up to the date of the Armistice was 418,052, while the total number of enlistments was 595,441.

**Navy.**—An act entitled 'An Act Respecting the Naval Service of Canada' was passed by the Canadian Parliament in 1910. This Act provided for the creation of a naval force to consist ultimately of 11 ships, at an estimated annual expenditure of \$3,000,000 and a total estimated expenditure of \$11,000,000. Its provisions were based upon the Militia Act, with the exception that under no circumstances should naval service be compulsory.

Two training ships, the *Niobe* and the *Rainbow*, were purchased from the British Government. The *Niobe*, a protected cruiser, was stationed on the Atlantic Coast; the *Rainbow* on the Pacific Coast. Nothing further was done in addition to the purchase of the *Niobe* and the *Rainbow*, which were used as training ships for naval cadets. A bill providing for the expenditure of \$35,000,000 for the purpose of providing three battleships to be added to the British fleet was passed by the House of Commons in the session of 1912-13. The Senate amended the bill by requiring a referendum to the people before it should go into effect, and this amendment was rejected by the House of Commons. Shortly after the outbreak of the war two submarines, which were constructed in the United States for the Chilean Government and had been rejected by them, were purchased by the Dominion Government and stationed on the British Columbia Coast.

The *Niobe*, the *Rainbow*, and the two submarines were 'scrapped' after the war, the Government accepting in place of them a gift of ships from the British Government including the *Aurora*, a fast light cruiser built in 1914, two destroyers built in 1916, and two submarines built in 1918.

The Canadian navy had in

1928 a strength of 94 officers and 616 men, manning the two new destroyers and five minesweepers which are in commission. Officers are periodically exchanged with the British navy. Naval training establishments and naval dockyards are maintained at Halifax and Esquimalt. In addition to this permanent service, a naval reserve of 70 officers and 430 men and a naval volunteer reserve of 70 officers and 930 men receive a limited amount of training annually.

**Air Force.**—The Canadian Air Force, under the Chief of the General Staff, administers and controls all military air operations. Its functions are to provide adequate training facilities for Government air service, to provide a nucleus air force in event of war and to build up a reserve of pilots and mechanics. The permanent Air Force had at the end of 1928 a strength of 87 officers and 581 other ranks. Its principal station was at Camp Borden, Ontario, and there were also units at Vancouver and Ottawa.

**Government.**—The Constitution of Canada is of a federal character, all powers not specifically granted to the provinces being exercised by the Dominion Government. Briefly, it is the British Constitution federalized.

The executive authority of the Federal Parliament is vested in the King, and is carried on in his name by a Governor-General and Executive Council or Cabinet, consisting of the outstanding members of the political party having a majority of the House of Commons, and bound to give place to others as soon as they cease to command the support of a majority of the House of Commons. The Governor-General, who is appointed by the King, has the right to disallow or reserve bills passed by Parliament—a power which has only once in the 55 years since Confederation been exercised, and then in a purely technical matter.

The legislative authority is exercised by a Parliament of two houses, the Senate and the House of Commons. The members of the Senate are appointed by the Governor-General-in-Council and hold office for life. There are at present (1929) 96 Senators. The Senate has relatively little power or influence, and does not initiate, amend, or refuse its consent to money bills. The House of Commons is composed of 245 members, chosen by what is practically adult suffrage. The Government has the power to disallow any act passed by a provincial legislature, though this again has rarely been exercised. There is no recent instance of the

disallowance of provincial legislation. The Federal Parliament is quinquennial, unless sooner dissolved, and sits at Ottawa (q.v.), the capital.

Each of the nine provinces of Canada has a separate legislature, with a Lieutenant-Governor appointed by the Governor-General-in-Council and holding office for five years. The Lieutenant-Governor, like the Governor-General, is advised by a Ministry or Cabinet composed of the leading men of the party having the support of the majority of the legislature. All the provinces except Quebec have but one house, called the Legislative Assembly, whose members are chosen by popular suffrage. The upper house in Quebec, called the Legislative Council, is composed of members appointed for life by the Lieutenant-Governor-in-Council—that is, by the government of the day. The provinces legislate on matters which relate solely to local affairs. Provincial legislatures are generally quadrennial, unless sooner dissolved, but the British Columbia legislature has been quinquennial since 1913.

The Northwest Territories (q.v.) are governed by a Commissioner and Council of four members, appointed by the Governor-General-in-Council. The Yukon (q.v.) territory is governed by a Commission appointed by the Governor-General-in-Council, and an Executive Council of 10 members elected by the people.

The Judiciary includes a Supreme Court in Ottawa, having appellate, civil, and criminal jurisdiction over the whole Dominion; an Exchequer Court; a Superior Court in each province; and County Courts—the members of all these courts being appointed for life by the Governor-General-in-Council. In certain cases there is an appeal from Canadian Courts to the Judicial Committee of the Privy Council, sitting in London.

**Recent Legislation.**—In 1923 important legislation included the decennial revision of the Bank Act (the charters of the chartered banks of Canada lapse every 10 years to provide an opportunity for revisions required in the public interest). More complete returns were henceforth required from the banks, and detailed provisions were made for a shareholders' audit of their affairs. Trade agreements with France and Italy were approved, and the Chinese Immigration Act prohibited Chinese immigration to Canada.

At the 1924 session the laws included acts providing for the superannuation of civil servants on a contributory basis, for the

redistribution of the seats in the House of Commons in accordance with the results of the census of 1921, for the perpetuation and extension of the powers of the honorary advisory council for scientific and industrial research. A trade agreement with Belgium was also approved.

In 1925, as the result of the report of a grain inquiry commission, the Canada Grain Act was radically revised in the interests of the producers; large authority was placed in the hands of the Board of Grain Commissioners and their inspectors. Also, as the consequence of a decision of the British Privy Council declaring that the well known Industrial Disputes Investigation Act of Canada infringed the constitutional rights of the provinces, that Act was amended to provide that it should be resorted to only where the provinces had passed legislation to make it operative in their province.

The legislation of 1926, as the result of the indecisive election of 1925 and the consequent difficulty of administration, was not heavy. It included notable reductions in the rates of the income tax, the sales tax, and in the duties on automobiles, together with a trade agreement with the West Indies.

In 1927 the Farm Loan Act established a system of long term mortgage credit at low interest to farm borrowers, where the province would also provide part of the fund required. A Federal District Commission was set up for the beautifying of the capital, with wider powers than those exercised by the older Ottawa Improvement Commission. A system of old age pensions was also provided where provinces would manage the system and bear half the cost of the pension. To assist the depressed Maritime Provinces, reductions in railway rates were provided at the cost of the nation, in order to stimulate interprovincial trade.

In 1928 trade treaties or conventions providing for reciprocal most-favored-nation treatment were approved with Czechoslovakia, Spain, Estonia, Hungary, Latvia, Lithuania, Portugal, Roumania and the Serbo-Croat-Slovene State.

Provincial legislatures have within recent years passed much valuable legislation on such subjects as workmen's compensation, minimum wages, and mothers' pensions, while they are paying much attention to public health and particularly to venereal disease and the drug habit. As a result of the temperance sentiment aroused during the war the legal prohibition

of alcoholic liquors existed for some time in nearly all the provinces; but the dying down of this feeling and the fiscal necessities of the provincial governments have brought it about that in 1929 all of the provinces except Nova Scotia and Prince Edward Island have inaugurated systems of government control of the sale of liquor, securing the profits of the traffic for the public treasury (see PROHIBITION).

**History.**—In 1534 Jacques Cartier landed on the Gaspé coast of Quebec, of which he took possession in the name of Francis I., king of France. However, nothing was done toward the permanent occupation and settlement of Quebec till 1608, when Samuel de Champlain, who had visited the country in 1603 and in 1604, founded the city. In the meantime (1604–5), French settlements were made in what are now the Maritime Provinces, but known to the French as Acadia (q.v.), where De Monts established a permanent agricultural population at Port Royal (now Annapolis Royal). France claimed, as a result of this settlement, exclusive control of the whole region from Acadia west to Lake Superior, and down the Mississippi to the Gulf of Mexico.

The control of this region was contested by England, who claimed part of it through right of prior discovery. In 1670 a charter was granted by Charles II. to Prince Rupert to found the Hudson's Bay Company, with exclusive rights of trading in the Hudson Bay basin. A long struggle was carried on between England and France for the control of the North American Continent, which ended in the cession of Acadia, Newfoundland and the Hudson Bay Territory by the Treaty of Utrecht in 1713, and the cession of Canada by the Treaty of Paris in 1763. Of all its Canadian territory, France retains only the islands of St. Pierre and Miquelon, off the coast of Newfoundland. The French shore rights, which were for long a cause of friction, in the end were renounced by France under the Anglo-French convention of 1904.

During the War of American Independence Canada was invaded by the Americans, and the end of the war saw a great influx of loyalists from the United States, and the formation of the province of New Brunswick (previously part of Nova Scotia). The treaty of peace in 1783 took away from Canada territory now included in Minnesota, Michigan, Ohio, Indiana, Illinois, and Wisconsin.

By the Treaty of Paris (1763) the French in Quebec received

the guarantee of the free exercise of their religion. This guarantee was continued by the Quebec Act of 1774, and in addition the old French civil law was declared binding, while the criminal law was superseded by that of England. During the period from 1763 to 1791 Canada was ruled by the despotic *régime* established at Quebec—satisfactory neither to the French, nor to the increasing English population in the present province of Ontario. The attempt on the part of the Americans to take advantage of this discontent and to enlist the French, who had never experienced any but despotic government even before the conquest of Canada, against English authority failed. At the close of the American Revolution, many Loyalists settled in Ontario. They had been accustomed to a democratic form of government in their old homes, and naturally protested strongly against the absolutism in power at Quebec. As a result, Upper Canada, which was English in population and sentiment, was separated from Lower Canada in 1791, and an elected assembly was granted to each.

In Lower Canada discontent arose at an attempt to establish a system of free schools, and in other matters a spirit of antagonism developed between the French and English elements of the population. For a time the War of 1812 (q.v.) united both sides in loyalty to the Crown; but on the conclusion of peace, in 1814, matters began rapidly to reach a crisis. Open strife arose between the non-responsible executive council and the popular assembly, the French-Canadian leaders claiming the rights of Englishmen to control their government, and a new source of trouble between Upper and Lower Canada came to the front—a dispute as to the share which each should have of the import duties on commodities brought through the common *entrepôt*, Montreal.

Discontent resulted in rebellion in both provinces (1837–8)—a rebellion which was primarily a protest against an irresponsible executive. Lord Durham, sent over by England with authority to crush the insurrection, reported in favor of responsible government, which was granted in 1841, when the two provinces were again united. The English element in the united province as a rule divided on party lines, while the French presented a combined and solid front to the common enemy, and were thus enabled to hold the balance of power. Deadlock followed deadlock. The union of the various colonies under a federal form of

government was proposed as the solution of a difficult problem, and in 1867 Canada, Nova Scotia, and New Brunswick united to form the Dominion of Canada.

During the period 1841–67 the commercial preferences enjoyed in the English market were removed; the Crown lands and civil list transferred to the colony; and the British cabinet system, with the practice of the House of Commons in the exercise of government, gradually introduced. Self-government was granted Prince Edward Island (1850–1), Newfoundland (1856), and British Columbia (1863).

The essential features of Canadian history since 1867 have been the consolidation of the constituent elements of the Confederation, and its expansion to include those provinces and territories not under its control in 1867. Newfoundland declared for union through its legislature, but the people in the election of 1869 refused their consent. During the next year the Northwest Territories were included. This provoked the resentment of the French half-breeds and Indians in the Red River Settlement. They rebelled at this time, and again in 1885, but the rebellions were easily crushed. (See MANITOBA.) While the first rebellion was being suppressed (1870), the province of Manitoba was organized and admitted into the Confederation. In 1871 British Columbia was admitted upon condition that a railway should be built to connect her with the Eastern provinces. The project was delayed for years, and one government was defeated as a result of the methods adopted in its promotion, but the promise was eventually fulfilled by the completion of the Canadian Pacific Railway in 1885. In 1873 the little island province of Prince Edward Island threw in its lot with the Dominion, but the ancient colony of Newfoundland still holds aloof.

In 1877, by the Halifax Fisheries Award, the United States agreed to pay \$4,420,882 for the use of Canadian fisheries from 1870 (Treaty of Washington) to 1883. In the latter year, notice of its intention to terminate the agreement was given by the United States, and conditions reverted to the provisions of the Treaty of 1818. Considerable friction resulted in connection with the interpretation of the sections of that treaty and the power of the colonies to impose regulations upon American fishermen. After fruitless negotiations the question was settled by the award of The Hague Court (1910) on the points in dispute. (See ATLANTIC FISHERIES ARBITRATION.)

In 1893 the Bering Sea Dispute (q.v.) was settled, and in 1903 the disputed question relative to the boundary between Alaska and Canada was decided by the commission appointed for that purpose. (See ALASKA BOUNDARY DISPUTE.)

In 1887 the first Imperial Conference was held. At this and subsequent meetings matters of importance to the United Kingdom and her colonies were discussed. In 1905 Alberta and Saskatchewan (qq.v.) were separated from the Northwest Territories, and admitted as provinces. In 1908 the tercentenary of the foundation of Quebec was celebrated with great pomp, and a permanent memorial erected to General Wolfe. The Insurance and Currency Acts passed in 1910 were important events in internal legislative history.

Toward the end of 1910 an agreement was concluded between the American and Canadian Governments for the exchange of certain national products free of duty. The existing duties on a few manufactured commodities were also to be reduced. Early in 1911 this agreement was submitted to Parliament for approval, and was strongly opposed by the Conservative Opposition. On May 19, Parliament was adjourned to enable the Premier and some of his colleagues to attend the Imperial Conference in London. Following the adjournment, the agreement was ratified by Congress at a special session. Parliament resumed business on July 18, but the opposition to the measure was so great that the House was dissolved, and a general election called for September. A bitter struggle followed. Reciprocity was practically the sole issue before the people, although social and religious difficulties and jealousies were freely discussed by the more intolerant partisans. In the province of Quebec, too, the question was complicated by the Nationalists, who eventually united with the Conservatives in opposing the existing government. In general the Liberals urged upon the people the material advantages of reciprocity with the United States; the Conservatives, however, denied these, and denounced the agreement as dangerous to the political independence of Canada and a movement away from imperial federation. In the election the Liberal government was defeated, only 82 Liberals being returned out of a total membership of 221. Sir Robert Borden (q.v.) became Premier, and Sir Wilfrid Laurier (q.v.) assumed the position of leader of the opposition.

When war was declared be-

tween Great Britain and Germany, Conservatives and Liberals united in a declaration of loyalty to the Empire, while Sir Wilfrid Laurier pledged the support of his party to an active participation in the Government's efforts to aid the mother country and her allies. Early in 1917 Sir Robert Borden went to England for the purpose of discussing with the British Government important matters connected directly and indirectly with the war. Shortly after his return to Canada he announced that conscription would be adopted by his government, and put into force as soon as possible; and he invited Sir Wilfrid Laurier to join him in a Union Government committed to the policy of conscription, upon which policy an election should be held immediately. Sir Wilfrid refused the invitation unless and until the people should have declared their acceptance of the principle of conscription in a referendum based upon that principle alone, and uncomplicated by other issues. Sir Robert denied the necessity or desirability of a referendum, and invited other members of the Opposition to join him in the formation of a Union Government. Again he was unsuccessful, and thereupon decided to press his conscription bill through both Houses, which was accomplished in the face of intense opposition.

During 1918 the Union Government vigorously carried on its policy of bending all the resources of the country to the prosecution of the war, in this being enthusiastically supported by the great majority of the population. Among other measures taken was the registration in June of the whole population over sixteen years of age for war service in whatever line of work they would be most useful to the common cause, 5,246,703 persons being registered. The end of the war in November made it unnecessary to proceed with this scheme, and the Government and public at home turned their attention to the problems of demobilization and the return to peace-time conditions, while abroad the Government claimed for Canada, which had spent some \$2,000,000,000 and sacrificed some 60,000 lives in the struggle, a voice in the terms of peace. This claim was conceded to Canada and the other Dominions (Australia, New Zealand and South Africa), as well as to India, so far as the Empire was concerned, and the claim was made good at the Peace Conference in Paris (q.v.), the Dominions securing effective representation, taking no inconsiderable part in the Conference, and finally signing the Treaty of

Versailles. As a natural result they became in their own right members of the resulting League of Nations (q.v.), with their own representatives on its Council and Assembly, and at the first meeting of the latter at the end of 1920, Sir Geo. E. Foster, then Canadian Minister of Trade and Commerce, acted as a vice-president of the League. Thus, without any violent break with the past, Canada has secured through the League of Nations a voice in international affairs at least as powerful as Argentina or Brazil. Senator Dandurand, the representative of Canada, acted as President of the League of Nations Assembly in 1925. In September, 1927, Canada was elected to one of the nine non-permanent seats on the Council of the League and was represented on that Council in 1928 by her Prime Minister, Hon. W. L. Mackenzie King.

Internally, in 1919, Canada passed through a period of grave industrial unrest, due partly to demobilization and the consequent congestion of the labor market, partly to the still advancing commodity prices, and partly to the agitation of those who wished to overturn 'capitalism.' This unrest culminated in the Winnipeg strike, which cut that cosmopolitan community off from the rest of the world for several weeks, but finally collapsed on the display of force by the Government, several of the leaders being sentenced to terms of imprisonment. Industrial unrest throughout the country was, however, mitigated by the great business activity based upon advancing prices, and when prices began to fall about the middle of 1920, the community at large had had some time to adapt itself to normal conditions of peace-time. Particularly notable throughout 1919 and 1920 was the spending of nearly half a billion dollars in re-establishing the returned soldiers by war service gratuities, by vocational training, by loans to those desiring to go upon the land and by the provision of special governmental life insurance for these too often impaired lives (see RECONSTRUCTION).

The year 1921 was in Canada, as throughout the world, a period of grave depression, more especially in agriculture and in the mining of metals. The decline in the world price of wheat affected Canadian farmers disastrously and aroused their wrath against the existing Government, now led by Arthur Meighen, Sir Robert Borden having retired from the Premiership, about the middle of 1920, exhausted by the long strain of the war and reconstruction peri-

od. Many people, too, had been alienated from the Government because of its alleged arbitrary conduct during the war period, and the Liberals who had joined the Union Government in 1917 had mostly left its ranks. Taxation, too, was high and not too equitably distributed. Though Mr. Meighen might possibly have carried on for another session to complete the legal term of five years, he decided upon an appeal to the country. The election held on December 6 resulted as follows: Liberals elected, 118 (a bare majority); Progressives, 65; Conservatives, 50; Labor, 2. Total 235.

As the natural result of the election, Mr. W. L. Mackenzie King, the Liberal leader, was called upon to form a Ministry. After abortive negotiations with the Progressives for a coalition Government, he met Parliament, and in the first session, aided by a benevolent neutrality on the part of the Progressives, succeeded in maintaining his ground. To appease the latter, the Government re-established the Wheat Board for the marketing of grain and to some extent modified the customs tariff. Overtures along the lines of the 1911 reciprocity agreement were made to Washington, but up to the present these have been without effect.

The period between 1922 and 1925 was marked by comparatively few events of importance. Canada gained increasing recognition for her status in the world in 1922 by being represented at the International Economic Conference at Genoa and nearer home at the conference in Washington on the perpetuation of the Rush-Bagot treaty of 1818 keeping warships off the Great Lakes. In 1924 she staged a remarkable exhibition of her products at the British Empire Exhibition at Wembley, near London. A great strike in the coal mines of Nova Scotia in 1925 seriously affected the prosperity of that province. In the same year the United Church of Canada was formed by the merger of the Methodist, Congregational and the majority of the Presbyterian Churches of Canada.

The general election of 1925 was indecisive in its results, no one party having a clear majority of the seats in the House of Commons, though the Conservatives were the strongest single party. As the Progressives and Labor members were generally more friendly to the Liberal Government than to the Conservative Opposition, the Liberals held on to power and their decision was ratified by the majority of the House when Parliament opened. During the session,

however, certain scandals in the customs administration were revealed, and the situation of the Government became more precarious. Finally, the Prime Minister advised the Governor-General to dissolve the House, but the Governor-General took the ground that the Conservatives should first have a chance to see whether they could carry on the administration. Mr. King thereupon resigned and the Conservative leader, Mr. Arthur Meighen, undertook to form an administration. However, his Government was defeated in the House almost immediately afterwards, and he asked the Governor-General for a dissolution of Parliament which was granted. This alleged partiality of the Governor-General to the Conservatives was an issue in the ensuing election of Sept. 14, 1926, and was probably largely responsible for the return of the Liberals to power. Almost immediately after taking office for the second time, Mr. King, together with his chief French-Canadian lieutenant, Mr. Lapointe, sailed for England to attend the Imperial Conference of October-November, 1926, which must rank as an important event in determining the status of Canada. At that Conference, the Committee on Interimperial Relations presented an epoch-making report on this subject, which was generally accepted as settling the outstanding issues. The relative positions of Great Britain and the Dominions are thus defined:—*'They are autonomous Communities within the British Empire, in no way subordinate one to another in any phase of their domestic or external affairs, though united by a common allegiance to the Crown, and freely associated as members of the British Commonwealth of Nations.'* It was also recommended that the Governor-General of a Dominion should be regarded as the personal representative of the Crown rather than as an official of the Government at London. Thus it became necessary for the Governments of Great Britain and Canada to be diplomatically represented in each other's capitals, and accordingly the British Government sent out Sir William Clark as its first High Commissioner to Canada, while Mr. Peter Larkin became High Commissioner of Canada in London. Further, Canada's right to have her own representatives at foreign capitals was recognized, and in February, 1927, Hon. C. Vincent Massey took up his duties as Canadian Minister in Washington, while the United States reciprocated by appointing Hon. William Phillips as its Minister in Ottawa. Subsequently an

exchange of Ministers was arranged with France, and somewhat later with Japan, Hon. Philippe Roy becoming the first Minister of Canada in France, while Hon. H. M. Marler was designated as the first Canadian Minister to Japan.

In 1927, Canada celebrated the sixtieth anniversary of Confederation. The notes of the carillon which had been installed in the Victory Tower of the new Parliament Buildings, together with the addresses delivered on Parliament Hill, were transmitted by radio throughout the Dominion. The Prince of Wales and Prince George, together with Rt. Hon. Stanley Baldwin, the Prime Minister of Great Britain, visited Canada during the summer, and were enthusiastically received, among the ceremonies in which they took part being the opening of the International Peace Bridge, connecting Fort Erie, Ontario, with Buffalo, N. Y.

**Canada Balsam**, a kind of turpentine obtained from the balsam fir (*Abies* or *Pinus balsamea*), a native of Canada and the northern parts of the United States (see FIR). It exists in vesicles between the bark and the wood, and is obtained by making incisions. It is a transparent, al-

most colorless liquid, having an agreeable odor and acrid taste, and solidifying occurs upon exposure to the air. Its component parts are essential oil, 24 parts; resin, soluble in boiling alcohol, 60; and resin, soluble only in ether, 16. Canada balsam is valued in the arts for a variety of purposes—as an ingredient in varnishes, in mounting objects for the microscope, and in photography. By opticians it is used as a cement, particularly for connecting the parts of achromatic lenses so that moisture and dust may be excluded; the value for such purposes is enhanced by perfect transparency and by great refractive power.

**Canada Company**, a company organized in 1825 by John Galt (q.v.), the Scottish novelist, who became its Canadian superintendent. Lands were purchased in the western peninsula of Ontario, the town of Guelph was laid out, large tracts of land were cleared, and hundreds of the best class of English and Scottish settlers were established. The company did not, however, make an immediate profit; its stock fell; Galt quarrelled with the lieutenant-governor and was superseded, but the company played a large part in the opening up and settlement of Ontario.

**Canada, Literature of.** See ENGLISH LITERATURE, *Canadian*.

**Canada, United Church of**, formed by the union of the Congregational Churches of Canada, the Methodist Church, the Presbyterian Church in Canada, and the Local Union Churches in Western Canada, themselves each the product of a series of unions. It was the culmination of a definite historical movement which arose (1) from the spiritual desire for the reunion of Christendom, (2) from the practical needs of a rapidly growing country whose population was scattered. The movement towards inter-denominational union began in 1885 and took definite shape in 1902, when the Methodist proposal for organic union of the Presbyterians, Methodists, and Congregationalists was taken up by each. A joint committee examined the questions involved and drew up a basis of union, which was eventually approved by the membership and the supreme bodies of the three churches. The doctrinal statement is a summary of their common faith: the polity is presbyterian, there being a General Council, territorial conferences, presbyteries, congregational sessions and boards. Only in the Presbyterian church was there serious opposition to the scheme, but after presbyteries and membership had twice given substantial majorities in

favor, the General Assembly of 1916 resolved to consummate union. During the war controversy was dropped and by unanimous agreement Local Union Churches were formed in the West. In 1921 the necessary legislation was prepared, approved by the courts of the three negotiating churches and subsequently passed by the Provincial Legislatures and the Dominion Parliament. With the loss of a little over 30 per cent. of the membership and assets of the Presbyterian church, the union was consummated on June 10th, 1925. The United Church has since been admitted as a member of world wide Presbyterianism, Methodism and Congregationalism.

The work of amalgamation and expansion proceeded expeditiously. Twenty-six Boards and Committees became six. Five hundred and sixty congregations have already been merged into half their original number. Overlapping has been nearly eliminated, many Home Mission fields have become self-supporting and new territory has been occupied in new fields. Approximately 3,000 ordained ministers are in active work in Canada, where the church maintains 26 hospitals, 13 residential secondary schools, 3 Arts Colleges and 8 Theological Colleges. Foreign missionaries carry on work in Trinidad, Japan, Korea, Central India, Angola, West and North China. On Dec. 31st, 1928, the total number in full membership was 647,154; total under pastoral oversight, 1,486,384; total membership of Sunday schools, 634,432; total value of all local church property (exclusive of colleges, etc.), \$88,375,729. The total raised for all purposes during 1928 was \$16,713,663.

**Canadian Northern Railway.** See CANADA: *Railways*.

**Canadian Pacific Railway.** See CANADA: *Railways*.

**Canadian Pondweed**, a dark green perennial plant (*Anacharis alinastrum*), of the natural order

*Canadian Pondweed*

Hydrochardeæ, with long, slender, branched stems, and small, sessile, linear-oblong leaves. It grows submerged in rivers and ponds, so thickly as sometimes to impede navigation. The cir-

cultation of cell protoplasm is well seen in its leaves under the microscope. The stem is brittle, and every piece broken off is capable of forming a new plant. It is a favorite plant for aquaria.

**Canadian River**, a tributary of the Arkansas River in the United States, rises in the north-eastern part of New Mexico, and flows south and east for about 900 miles across the Panhandle of Texas and Oklahoma. It is of comparatively small volume, and is much influenced by the wet and dry seasons. About 35 miles west of its confluence with the Arkansas it is joined by the North Fork or Rio Mitría, its chief tributary (length, 600 miles), which follows a parallel course.

**Canadum**, a metal of the platinum group, discovered in 1911 by A. G. French in the Kootenay ores of Canada.

**Canajoharie**, kán-a-jō-har'í, village, New York, in Montgomery County, on the Mohawk River, the Barge Canal, and the West Shore and New York Central Railroads; 45 miles north-west of Albany. Its principal industries are agriculture and dairying. It has manufactures of paper and cotton bags, canned beef, bacon, chewing gum, and candies. Pop. (1910) 2,273; (1920) 2,415.

**Canal**, an artificial channel filled with water. Though the name generally denotes a channel used for navigation, it is also applied to channels made for drainage and irrigation.

**Canal Dover**, now known as DOVER, town, Ohio, in Tuscarawas County, on the Tuscarawas River, the Ohio Canal, and the Baltimore and Ohio, and Pennsylvania Railroads; 52 miles northwest of Wheeling, W. Va. It has iron and steel works, and manufactures of roofing, tin, carriages, leather, and flour. Pop. (1910) 6,621; (1920) 8,101.

**Canal, Drainage**, an artificial watercourse formed to supplement rivers, where, owing to a deficiency of fall and the low level of the adjacent lands, they are inadequate for the discharge of the surplus rainfall in wet seasons, and the lands are exposed to floods. Many instances of such canals are found in Holland, and in the Fen districts of Lincolnshire and Norfolk, England. By embanking each side with the material excavated in forming the canal, and especially by placing these longitudinal embankments a little distance back from the edges of the cut, an enlarged channel is economically provided for the flood discharge, as soon as the water rises above the ordinary surface level, without exposing the land to inundation. See DRAINAGE.

**Canalejas y Mendes**, ká-ná-

lā'hás ē mán'dás, José (1850-1912), Spanish statesman, was born in Ferrol. He was educated at the University of Madrid and began public life with his election to the Cortes (1875), after which he served as sub-secretary to the presidency of the short-lived republic. He was again elected to the Cortes in 1880, and acted as Minister of Public Works and of Justice in several Liberal Cabinets from 1882 to 1890. In 1897 he visited the United States and Cuba, to investigate conditions that were causing strained relations between Spain and the United States; and his assurances of reforms in Cuba helped to mitigate anti-Spanish sentiment in the United States. In 1898, dissatisfied with the conduct of the Spanish-American War, he broke with the Liberal Party, and helped to form the Radical Party, of which he was made leader. He became Minister of Agriculture (1902), President of the Cortes (1906), and Premier of Spain (1910). He was assassinated on Nov. 12, 1912, by an anarchist. Canalejas was assiduous in the work of social reform, and a recognized authority on all branches of social and industrial legislation. His talent as an orator procured him many triumphs.

**Canaletto**, ká-ná-lét'tó, ANTONIO (1697-1768), properly ANTONIO CANALÉ, the great architectural painter of Venice in the eighteenth century, was born in Venice. In 1764 he visited London, and painted several picturesque English views. He possessed the power of reproducing what he saw with an accuracy almost photographic. He was a master of perspective, his touch being firm and certain; while his best work is distinguished by broad simplicity of effect, clearness of tone, and occasional brilliancy of sunlight, his usual tone is chastened and subdued. Examples of his work are found throughout Europe and in Great Britain.

**Canaletto**, BERNARDO BELLOTTO, called CANALETTO THE YOUNGER (1724-80), Italian painter and engraver, was born in Venice. After studying under his uncle, Antonio Canaletto (q.v.), whom all his life he imitated both in tone and treatment, he visited Rome, Verona, Brescia, Milan, Dresden, and England, where he painted an interior of King's College Chapel, Cambridge. His pictures are chiefly remarkable for correctness of perspective and subtle effects of light and shade. Many of them are in the Dresden Gallery.

**Canal, Grand**. See GRAND CANAL.

**Canal, Irrigation**, a canal whose object is to lead the waters

of a river, flowing through a dry country, on to lands at a distance from the river bank, and so increase their fertility. Considerable tracts of the Lower Nile valley and the rice crops of India are largely dependent upon the supply of water conveyed by irrigation canals; and important irrigation works have been carried out in Italy and Spain, as also in California, Colorado and other arid regions. These canals are made with a regular fall or slope. By increasing the fall, the size of the channel may be proportionately reduced for a given discharge; but it is inexpedient to augment the fall, even if practicable, beyond the limit at which the increased velocity of flow thereby induced begins to scour the bed of the channel—as occurred on the Ganges Canal, necessitating works for checking the flow.

Sluices and weirs for regulating the supply are constructed at the intakes of these canals, and arrangements are provided for the admission of the water into the branch canals and trenches which serve to distribute the water over the area to be irrigated. The formulas for determining the flow, and consequently the requisite section of a drainage or irrigation canal with a given available fall, form a branch of hydro-mechanics. See IRRIGATION.

**Canal, Navigation**, a level still-water channel solely constructed as a waterway. These canals may be classified under two divisions: (1) ordinary inland navigation canals, admitting smaller craft, known as *Barge Canals*; and (2) *Ship Canals*, providing a means of less expensive transportation between ocean and ocean, or between the ocean and some inland centre.

**Construction**.—In building canals the following two main points must be determined on: the cross section of the canal; the longitudinal profile. Upon the best determination of those two points depend, in a still higher degree than in railroad work, the cost, capacity, and time for finishing the canal.

The channel is generally formed with a flat bottom and sloping sides, which in some situations have a stonework 'pitching.' The breadth at the bottom should be more than twice that of the largest boats or barges which are to navigate the canal; the depth should be at least 1½ feet greater than the draught of the loaded boats. The embankments are from 2 to 3 feet above the level of the water, and from 4 to 6 feet in width; each embankment should have a vertical puddle wall in its centre from 2 to 3 feet thick. Where the soil is not retentive, the bottom and sides

of the canal should be puddled with clay, tempered and well mixed with sand and gravel. This prevents the percolation of water and the burrowing of animals. The angle of slope depends entirely on the nature of the ground. In soft ground the angle is flat; in rock, the sides are made almost vertical. Through towns vertical side walls are constructed to save space and provide quays. In tunnels and deep cuttings the width is usually made only just sufficient for a single barge; and passing places are formed at intervals. A towing path along one side of the canal, raised about 2 feet above the water level, affords facilities for haulage.

Canals generally consist of a number of different sections or reaches, each on one level, but differing from each other in height. By means of locks, inclines, or lifts, boats are transferred from one level to another.

The *Lock*, placed at the termination of the lower level, is a water-tight enclosure of masonry of sufficient dimensions to contain the largest barges or vessels that navigate the canal. Each end is closed by heavy swinging gates, which open in the middle against the direction of the current. As the double gates are somewhat wider than the lock, they meet before they form a straight line, and are forced firmly together by the pressure of the water against them. *Sluices*, which are controlled from above, are inserted in the gates near the bottom, and when opened allow the passage of water, though the gates remain shut.

When a boat, in ascending a canal, arrives at a lock, the upper gates are first closed, then the lower ones opened to allow the boat to enter, and when it has entered are closed behind it. Water is allowed to flow through the sluices in the upper gates, and sometimes also a side culvert discharges from the upper level into the lock. As the lock fills the water level rises to that of the upper reach; whereupon the upper gates can be opened, so that the boat can pass out of the lock on the higher level. The lift of a single lock ranges from 2 to 12 feet, and is commonly 8 or 9 feet.

*Incline*.—Occasionally, where water is scarce, and the lift large, vessels are conveyed on an incline from one reach to the next, in a special carriage running on rails laid on the incline, and controlled by a cable. The vessel is either lifted on a cradle out of the water, or it is floated into a wrought-iron caisson or trough, containing water, with lifting gates at each end, and supported on a frame so constructed that

the caisson is conveyed in a horizontal position up or down the incline. Primitive inclines were employed on the ancient canals of China, the boats being hauled up by a capstan, and made to slide down the paved track.

Caissons were first adopted for inclines on the Chard Canal, in Somersetshire, England, and, on a larger scale, on the Monkland Canal, near Glasgow, Scotland.

*Lift*.—The lift or elevator (inclined or vertical) is also employed on some canals. The inclined elevator consists of two counterbalancing troughs or caissons, each holding enough water to float a boat. Two lines of rails are employed, one caisson running on each line of rails; and the caissons are so connected by ropes or chains running on guide pulleys that when one ascends, the other descends. The vertical elevator, instead of a series of regular locks, may in many cases be useful, as in a few minutes it lifts the barge to the same height it would take hours to reach by means of regular locks.

According to the system employed—*viz.*, regular hydraulic piston, or hydraulic balance—the water consumed for every lift will vary only a trifle, as the main part of the water in the caissons remains the same when travelling up and down. The last point is in many cases of the greatest importance where the water supply is limited, or where water has to be pumped up to the summit of the canal to keep water on the right level.

Hydraulic canal lifts have been in use for some years, the first having been opened in 1875, at Anderton, England. Another similar lift has been erected at Les Fontinettes, near St. Omer, on the Neufossé Canal, with a lift of 43 feet, in substitution for a flight of five locks which had become inadequate for the large barge traffic from Boulogne, Calais, and Dunkirk to Paris. In the United States the five locks at Lockport, N. Y., on the Erie Canal were replaced by an elevator in 1895. One of the highest hydraulic lift locks in the world is located on the Trent Canal, at Peterborough, Ontario.

There is no difficulty in the supply of water to canals in low-lying districts, such as Holland and parts of Belgium; and even in most parts of river valleys streams are generally available for introducing a supply at various points. When, however, a canal rises to the higher portions of a river basin, and crosses the ridge separating two adjacent basins, in a reach called the summit level of the canal—a common course for inland canals—it is sometimes difficult to secure an

adequate supply, especially for the summit level; so that occasionally an artificial reservoir has to be formed, at a high level, by constructing a dam across the valley of a mountain stream.

*Historical*.—The great advantage of the canal was recognized in ancient times, and remains and accounts of old canals in Egypt, Babylonia, Persia, India, China, Greece, Italy, and other countries are numerous. The Grand Canal (q.v.) of China is world famous.

Among important canals of the Old World are the famous *Suez Canal*, connecting the Mediterranean and Red Seas; the *North Sea and Baltic Canal*, known as the Kaiser Wilhelm or Kiel Canal, which begins at the dockyard in Kiel, on the Baltic, and enters the Elbe near Brunsbüttel, 15 miles above the North Sea; and the *Teltow Canal*, beginning near Potsdam and ending in Berlin. The *Amsterdam Ship Canal*, improving the access to Amsterdam, extends westward to the North Sea, reducing the distance to about 17 miles, instead of the 50 miles by the old North Sea Canal, thus enabling much larger vessels than formerly to enter the port. The *Corinth Canal*, cutting through the Isthmus of Corinth, saves two days in the voyage from the Adriatic to the *Ægean Sea*. The *Kronstadt or Pontileff Canal*, 18½ miles long, connects Kronstadt with Leningrad. (See articles on SUEZ CANAL; KAISER WILHELM CANAL; CORINTH, ISTHMUS OF.)

Probably the earliest known canals in England were the Foss Dyke still navigable, and Caer Dyke, in Lincolnshire, 11 and 40 miles long, constructed by the Romans, and improved in the twelfth century; but the opening of the Aire and Calder Navigation, toward the close of the seventeenth century, was the first important step in inland navigation.

The largest canals of Great Britain are the Gloucester and Berkeley Canal, with a depth of 15 feet, enabling vessels of 600 tons to go from Sharpness to Gloucester, 17 miles; the Aire and Calder Navigation, 9 feet deep, on which steam towage with a train of barges has been successfully carried out; the Caledonian Canal, with a depth of 17 feet, which crosses Scotland and affords a passage for vessels of 300 tons; the Crinan Canal, 12 feet deep, across the peninsula of Kintyre, providing a short cut for vessels of 160 tons; and the Forth and Clyde Canal, with a depth of 10 feet. The formation of a ship canal between the Forth and Clyde has frequently been suggested, and in 1909 and later the project was actively discussed in

## CANADA IN THE GREAT WAR

### *Effects of the War in General.*—

The year 1914 opened inauspiciously for Canada. The land boom in the West, and in the East too, had collapsed. Many people held more land than they could pay for, or even pay the taxes on. Many farmers had more land than they could cultivate, or ever intended to cultivate; others had settled in areas not well adapted for cultivation; interest rates were high, and it was difficult to obtain credit—difficult for individuals, corporations and municipalities. In the East, production was curtailed, the banks were restricting their loans, many people were out of work and could not obtain employment, and corporations were anticipating the passing of their dividends.

For a time, most of these evils were accentuated by the outbreak of the Great War (see EUROPE, GREAT WAR OF). Numerous industries suspended or curtailed operations, and no one could say what the day or the year would bring forth. Then the outlook began to clear. In the West, the acreage of field crops was less than in any year since 1910, and could not be increased after the outbreak of the war. The wheat crop was only 161,280,000 bushels, but the average quality was better than for previous years; while the highest price (\$1.22 a bushel) for a decade was reported at the close of the year. The value of all field crops was \$638,580,300, as compared with \$552,771,500 in 1913.

In 1915 the flood of war orders began to pour in on the Eastern manufacturers, while the opportunity for enlistment proved a boon for men who were out of work. This was particularly true during the closing months of 1914, and for the West, where the first contingent was largely recruited. It has been estimated that \$600,000,000 of war orders have been placed in Canada, and the profits obtained have been enormous. The cost of manufacturing an eighteen-pound shrapnel shell amounted to \$1.91 for one concern, while the price received was \$4.15. On the other hand, there have been instances of loss of capital and custom as a result of attempts to embark upon a new and untried line of production. For this and other reasons it was perhaps necessary

to offer the stimulus of excessive gain in the early stages of the new enterprise.

Profits are not so excessive now (March, 1916), but it is safe to conclude that in many cases they amount to 100 per cent. New capital was obtained, plants were enlarged, and many manufacturers of other commodities turned their attention to the production of munitions. Of course, this sort of prosperity will last only as long as the war lasts, and the day of reckoning must come—the day when Canada must think of the interest charge on her increasing indebtedness, and the day when industry must once more be adjusted to meet the normal demands of peace.

Particular attention was directed, both in the East and the West, to the encouragement of agriculture and the preparation of new land for cultivation. The result has been the largest harvest in the history of the country. The yield of the most important field crops is shown in the following table:

	1914.	1915.
	Bushels.	Bushels.
Wheat.....	161,280,000	336,258,000
Oats.....	313,078,000	481,035,500
Barley.....	36,201,000	50,868,000
Buckwheat.....	8,626,000	8,101,000
Flax.....	7,175,200	12,604,700
Corn.....	13,924,000	14,594,000
	Tons.	Tons.
Hay, clover	10,259,000	10,953,000

The amount of wheat available for export is estimated at 228,132,200 bushels. Prices have been excellent, although there has been considerable fluctuation.

	British.	American.	Foreign.	Total.
Year ending March 31, 1913..	150,542	139,009	112,881	402,432
Year ending March 31, 1914..	142,622	107,530	134,726	384,878
Year ending March 31, 1915..	43,276	59,779	41,734	144,789

During 1915 there was practically no lack of employment for those who sought work. At the same time, there was considerable suffering in some of the cities, and many railway employees were dismissed during the first part of the year as a result of the diminution in railway earnings. This unfortunate state of affairs has been remedied to a great extent by a marked increase in railway

receipts, resulting from the movement of the large wheat crop of the West. For the most part, the relations between capital and labor have been surprisingly harmonious, and there has been a marked absence of friction between employers and employed. This is the more remarkable when the huge profits of many of the manufacturing concerns are considered; but then Canadian labor is not well organized, and not very active in obtaining its rights; in this respect showing a marked contrast to English labor under similar conditions. During 1914 the membership of the Canadian trade unions actually diminished—from 175,799 for the previous year to 166,163; though this is explained, in part, by enlistments.

The construction of new buildings has been adversely affected, particularly during 1915. The value of the building permits issued during the eleven months ending November, 1915, was only \$30,419,393, as compared with \$97,236,334 for the same period of the preceding year.

The Dominion Government obtained Parliamentary sanction to provide for the 'postponement of all or any debts, liabilities, and obligations however arising,' but fortunately made no use of the power. On the other hand, the governments of Manitoba, Saskatchewan, and Alberta provided for partial moratoria, principally applicable to land payments.

Immigration has diminished perceptibly as a result of the war. This is shown by the following immigration figures for the fiscal years preceding the war and for the fiscal year 1914-15:

Most Canadians anticipate a great increase in immigration at the close of the war; but there seems considerable doubt whether their prophecies will be realized when we consider the depletion of the labor forces of Europe and the great demand for labor which peace will bring. In addition, Canada is now a very expensive country to live in; taxes are exceedingly heavy, and will be

much heavier when she begins to pay the interest on her prospective war debt. Furthermore, the burden of a protective tariff has been increased by the addition of new duties.

These and other causes have been instrumental in producing a further rise in prices. The index numbers, compiled by the Department of Labor, are obtained from the wholesale prices of 272 commodities, and, like the American index numbers, are compared with the prices for the base period 1890-1899 inclusive—the average for that period being 100. These index numbers are as follows: 1911, 127.4; 1912, 134.4; 1913, 135.5; 1914, 136.1.

They are not yet available for the complete year 1915, but are known for eleven months; they are as follows, and speak for themselves: January, 138.6; February, 143.8; March, 145.9; April, 147.0; May, 147.6; June, 147.3; July, 147.1; August, 147.6; September, 147.2; October, 148.8; November, 157.8.

**Public Finance.**—During the fiscal year ending March 31, 1914, the total consolidated fund receipts of the Dominion Government amounted to \$163,174,395; the disbursements for the same period were \$186,241,048; leaving a nominal deficit of \$23,066,653. It is only fair to add that a considerable portion of the expenditure (\$37,180,176 in all) is chargeable to capital, apparently for the reason that it will ultimately be wholly or partially productive. When the special war session of Parliament was summoned in August, 1914, the Government was confronted by increasing expenditures, largely for war purposes, and by a diminishing revenue, due to the falling off in imports.

Before the war the anticipated revenue for the fiscal year 1914-15 had been estimated at \$145,000,000, with an expenditure of \$175,000,000, the balance to be made good in the usual fashion by borrowing in London. In anticipation of a further decrease in revenue and increase in expenditure, the import and excise duties on a variety of commodities were increased, the principal articles affected being coffee, sugar, spirits, malt liquors, and tobacco. In all cases where both import and excise taxes were increased upon the same commodity, the Government, true to its protective policy, imposed import duties considerably in excess of the excise. It was anticipated that these new duties would yield a revenue of \$15,000,000 for a full year.

In January, 1915, the regular session of Parliament was held, and the budget speech was delivered on Feb. 11. For the fiscal year ending March 31 the Minister of Finance anticipated that the receipts would be \$130,000,-

000; consolidated fund expenditure, \$140,000,000; capital and other expenditure, \$50,000,000; war expenditure, \$50,000,000; resulting in a deficit of \$110,000,000 to be met by loans—a deplorable presentation of the country's finances, and a state of affairs calling for a radical increase in taxation. As a matter of fact, the revenue for the fiscal year 1914-15 was \$133,073,482; expenditure on consolidated fund, \$135,523,207; capital expenditure, \$41,447,320; total expenditure, including war expenditure, \$248,098,526.

In order to meet the still larger deficit anticipated for the succeeding fiscal year, the Minister of Finance proposed, as the principal revenue measure, an increase in the customs duties upon nearly all commodities imported into Canada. The increase adopted was  $7\frac{1}{2}$  per cent. *ad valorem* to the general and intermediate tariffs, and 5 per cent. to the British preferential tariff; and it was imposed also on most goods which had formerly been admitted free of duty. The most important commodities to which the increase does not apply are wheat, flour, anthracite coal, tea, fish from Newfoundland, fishermen's supplies, and certain agricultural implements. Finally, the manufacturers were favored by a provision that a drawback of 99 per cent. should be returned on all duties paid upon imported materials used in articles further manufactured in Canada and exported therefrom.

In addition, the following direct taxes were imposed: (1)  $\frac{1}{4}$  of 1 per cent. on bank notes; (2) 1 per cent. on gross incomes of loan and trust companies; (3) 1 per cent. on premiums of insurance companies other than life, fraternal, benefit, and marine; (4) 1 cent each on telegraph and cable despatches; (5) on railway and steamship tickets, 5 cents for a ticket costing more than \$1 and not more than \$5, and 5 cents for each \$5 in value; (6) 10 cents on railway berth tickets, and 5 cents on railway chair car tickets; (7) on tickets carrying passengers outside Canada, Newfoundland, the United States, or the British West Indies, \$1 for a ticket costing over \$10, \$3 for a ticket costing more than \$40, and \$5 for a ticket costing more than \$65; (8) 2 cent stamp tax on checks, bills of exchange, bank receipts, express money orders, post office money orders, and 1 cent on postal notes; (9) 1 cent additional on each letter or post card posted in Canada; (10) 1 cent stamp tax for each 25 cents in value of proprietary and patent medicines and perfumery; (11) 3 cents a pint and 5 cents a quart on non-sparkling wines in bottles or packages; (12) 13 cents a half pint and 25 cents a pint on sparkling wines.

The Minister of Finance considered that the old taxes would produce a revenue of \$120,000,000, which would be increased to \$150,000,000 or \$155,000,000 with the new taxes. The anticipated expenditures on consolidated fund are \$140,000,000; capital and other special expenditures, \$40,000,000; war, \$100,000,000; investments authorized by statute, \$4,000,000; outstanding treasury bills, \$15,000,000; giving a total expenditure of about \$300,000,000. In the budget speech delivered on Feb. 15, 1916, the Minister stated that the revenue for 1915-16 would be \$170,000,000; consolidated fund expenditure, \$125,000,000; capital expenditure, \$46,000,000; and war expenditure, \$100,000,000.

The proposal for an income tax was dismissed with the comment that two provinces and many municipalities already made use of income taxes, and that in any case the gross yield would not exceed \$2,000,000. This latter statement is, of course, absurd, and the first statement, though true, is no reason why the Dominion Government should not do likewise. It seems probable that the Government must eventually come to an income tax, in any real attempt to meet ordinary expenditure, to say nothing of the vast sums necessary for arming, equipping, and maintaining an army of 500,000 men. The increase in import duties serves only to restrict imports and protect the home manufacturer, while the direct taxes are but a makeshift. A Dominion income tax, however, will provoke strenuous opposition from the classes and the manufacturers.

On Feb. 15, 1916, the Minister of Finance announced an increase in the duties on apples and oil, presumably for protective purposes. He also announced a tax of 25 per cent. on the amount by which the net profits, since Aug. 4, 1914, have exceeded, in the case of corporations, 7 per cent. of the paid-up capital, and in the case of persons and partnerships, 10 per cent. of the paid-up capital. This tax is not applicable to any business with a capital of less than \$50,000, unless it is engaged in the production of war materials; nor does it apply to life insurance companies, farming, or stock raising. Foreign companies operating in Canada receive special treatment, being taxed in proportion to the capital in use in the Dominion.

In order to bridge the enormous and growing gap between an increasing expenditure and a diminishing revenue, the Dominion Government during the fiscal year 1914-15 resorted to extensive borrowing. We must include in this category the over-issue of Dominion notes to the value of

\$26,000,000. This transaction is in the nature of a forced loan on which no interest is paid, and carries along with it all the undesirable peculiarities which may accompany an emission of irredeemable paper money. In addition, \$60,000,000 was borrowed from the English Government, being that part of the English domestic loan allocated to Canada; \$5,000,000 was borrowed from the Bank of Montreal; treasury bills were floated to the value of \$15,000,000; and \$6,500,000 worth of 1940-60 stock was sold.

With the virtual closing of the London loan market the Dominion Government was compelled during 1915 to turn to the New York and domestic markets. In July, \$45,000,000 worth of one and two year Dominion notes were sold in New York. These notes will be due on Aug. 1, 1916 and 1917. In November a domestic war loan of \$50,000,000 was announced, and within a few days it was subscribed and doubly subscribed, the Government ultimately deciding to increase it to \$100,000,000. This is the first time that a loan of this description has been negotiated in Canada, and the ready and prompt response from the people shows how their wealth has increased. It is not improbable that the Government will decide to repeat the experiment before the war is over.

The net debt of the Dominion Government on March 31, 1914, was \$335,996,850, and on the same date in 1915 it was \$449,376,083. On Dec. 31, 1915, it was \$515,144,019—an increase of \$179,147,169 since March, 1914. Of this increase in net indebtedness, the war has probably not been responsible for more than \$150,000,000, the rest being due to the difference between consolidated revenue and the ordinary expenses of the government.

**Trade.**—For some years before the war, Canadians had been borrowing freely in the London market for government, municipal, and corporation purposes. The credits so obtained had for the most part been used in buying supplies in the United States, with the result that Canada's imports were greatly in excess of her exports, as the loans floated in any one year were greater than the interest on loans previously floated. Of course, this meant a so-called unfavorable balance of trade, an expression in itself unfortunate if the credits so obtained are used for desirable and productive purposes, and are economically spent. The effect of this borrowing is shown in the great and increasing preponderance of imports over exports in the years immediately preceding the outbreak of hostilities. The figures for imports and exports

of merchandise for the twelve months ending Aug. 31 were as follows:

	Imports.	Exports.
1910.....	\$409,475,853	\$304,941,801
1911.....	474,321,785	293,772,274
1912.....	584,309,568	338,460,185
1913.....	686,492,266	395,879,372
1914.....	549,626,474	468,537,872

One result of the war was an immediate and well-nigh complete stoppage in the London source of supply, with the result that imports diminished very rapidly, and the revenue derived from duties on imports suffered in proportion. For the year ending Aug. 31, 1915, the value of imports was \$415,813,055. On the other hand, exports increased in value as a result of the demand abroad for products of all kinds, including munitions of war. In addition, the prices obtained in England and Continental countries were higher than had prevailed before the war. The value of the exports for the twelve months ending Aug. 31, 1915, was \$504,810,452. Later figures show that the value of the exports has increased very materially over the figures last quoted. It cannot be otherwise when we remember that Canada has just marketed the largest wheat crop in her history, and that the production and exportation of war supplies of all kinds are steadily increasing. For the nine months ending Dec. 31, 1914 and 1915, the values of the exports and imports of domestic merchandise were as follows: exports—1914, \$306,823,039; 1915, \$511,534,042; imports—1914, \$348,746,920; 1915, \$343,923,323. For December alone they were: exports—1914, \$37,193,609; 1915, \$92,171,402; imports—1914, \$30,392,913; 1915, \$45,690,721.

There is little doubt that for some years preceding the war, the Dominion Government, the provincial governments, and many of the industrial and transportation corporations had been borrowing in London far too freely, and that the credits so obtained had often been spent injudiciously. The war effectively put an end to this. Since then the great and growing preponderance of exports over imports is enabling the country to pay the interest on loans previously floated; and as this is the normal state of affairs for a new and growing country, the war, in this respect, has proved a desirable though harsh corrective to national extravagance.

**Banking Changes.**—As a result of the close connection between the Dominion Government and the chartered banks, as well as the fact that a large part of the circulating medium is composed

of Dominion notes, no account of the effect of the war upon the banks is complete without some reference to the changes which have resulted in the provisions governing the issue of Dominion notes. At the outbreak of the war the value of the Dominion notes in circulation was \$112,793,833. The larger part of this issue (\$90,588,065) was held by the banks, and was used by them in liquidating obligations due each other; the rest were in possession of the public. Against the total issue the Government was bound to maintain a gold reserve according to the following conditions: 25 per cent. in gold of the first \$30,000,000, and dollar for dollar in gold against the issue in excess of \$30,000,000. This necessitated a gold reserve of \$90,293,833. As a matter of fact, the gold reserve on July 31, 1914, was \$91,735,584.

When Austria declared war on Serbia the stock exchanges in Montreal, Toronto, and other Canadian cities were immediately closed, and a financial crisis seemed imminent. On Aug. 3, a proclamation was made by order-in-council that Dominion notes should no longer be redeemable in gold. Sir Thomas White, the Minister of Finance, explained that this was necessary in order to protect the gold reserve of the Dominion Government. He also announced that Dominion notes would be advanced to the banks upon the deposit by them of approved securities with the Government. Previously these notes had been obtainable only upon the deposit of gold. The notes advanced against securities were repayable not later than May 15, with interest at 5 per cent. Advantage was taken of this privilege by a few of the banks, and on Jan. 31, 1915, it was announced that the amount then outstanding was \$7,900,000 out of a total of \$14,400,000; but there is some doubt concerning the reliability of these figures.

Parliament assembled on Aug. 18, and shortly afterward the Minister of Finance introduced a bill providing that the partially covered issue of Dominion notes should be increased from \$30,000,000 to \$50,000,000. This bill passed both Houses of Parliament with little or no adverse criticism, and received the royal assent on Aug. 22. It was clearly understood at the time that this was not solely or peculiarly a war provision, and that it would be continued after the conclusion of hostilities.

On March 26, 1915, Sir Thomas White made a further announcement to the effect that there had been an over-issue of Dominion notes to the value of \$26,000,000. This was caused by the issue of \$10,000,000 to the

Canadian Northern Railway, \$6,000,000 to the Grand Trunk Pacific Railway, and \$10,000,000 for general Government purposes. The reason given was the impossibility of raising a loan in the London market. In the case of the advance to the railways it was argued that since the interest on their bonds was guaranteed to a large extent by the Government, and since they, too, could borrow no more in the world's market, it was necessary for the Govern-

ment to adopt the alternative of a forced loan of the nature described. Again the Liberal Opposition remained silent, perhaps remembering that in 1907 they had adopted the like unfortunate expedient for the purpose of helping the banks to move the crops from the West. On Dec. 31, 1915, the value of the Dominion notes in circulation and held by the banks was \$172,010,114; the gold reserve held against them on the same date was of the value of \$108,020,156, the excess issue being \$26,489,958 worth of notes.

At the outbreak of the war the banks were authorized by order-in-council to pay in their own notes. This does not mean that bank notes were made legal tender between individuals, but only from the banks to their customers. When Parliament met in August this order was regularized, and at the same time the banks were empowered to emit an excess issue of notes not in excess of 15 per cent. of a sum equal to the unimpaired paid-up capital and rest fund of each bank, such excess issue to be subject to a tax of 5 per cent. As the banks had before been granted this privilege during the six months from Sept. 1 to Feb. 28, the result was an extension of the power to cover the whole of the year. In addition, the banks had been permitted in 1913 to issue notes dollar for dollar against gold or Dominion notes deposited in the central gold reserve; and as this issue is not subject to the 5-per-cent. tax, the banks have availed themselves freely of the privilege. The result of these various enactments is that in Canada to-day, as in Continental Europe, there is absolute suspension of specie payments. But as the average Canadian never uses gold in exchange, he is not disturbed by his inability to obtain gold, although the trader is hampered in no longer being able to use Dominion notes as gold certificates in the American trade.

Upon the whole, the banks stood the strain very well; and they could hardly have fared ill, considering their favorable treatment by the Government, and the fact that they have made and are making full use of the power to refuse gold to their creditors. In addition, they found their New York call loans a very efficient help when the storm burst. The following figures will convey some idea of the standing of the banks before and during the war:

	Dec. 31, 1913.	Dec. 31, 1914.	Oct. 30, 1915.
Notes in circulation.....	\$108,646,425	\$105,969,755	\$122,782,233
Total liabilities.....	1,308,756,866	1,314,646,254	1,413,362,832
Dominion notes held.....	104,778,358	138,040,382	136,223,275
Gold and other coin.....	45,423,463	62,566,684	61,724,773
Total assets.....	1,551,263,432	1,555,556,815	1,657,256,962

**Army and Navy.**—On Aug. 1, 1914, when war seemed unavoidable, the Canadian Government offered the English Government an expeditionary force in case England should become involved. Since the militia can be placed on active service abroad only for the defence of Canada, it was decided that volunteers should be asked for. On Aug. 6 the offer was accepted, and the troops were to be sent over as soon as possible. The English reservists were sent home for service, the *Rainbow* and the *Niobe* were placed at the disposal of the Admiralty, and the Naval Volunteer Force was called out for active service. Steps had already been taken in 1913 and early in 1914 to provide for the organization of the different government departments on a war footing, and this was now done. Two submarines, which had been partially constructed and afterward assembled in Seattle for the Chilean Government, were purchased by the Dominion Government, at the request of the government of British Columbia, were removed to Esquimaux, and turned over to the Admiralty. Multitudinous orders-in-council were passed, dealing with enemy ships in Canadian waters, trading with the enemy, German and Austrian subjects in Canada, the establishment of prize courts, etc.

At the same time the Department of Militia was engaged in the more onerous and important work of recruiting and training the men of the first contingent. Following upon the preliminary work of enlistment, the volunteers were eventually assembled in a great training camp at Val Cartier, near the city of Quebec, where several weeks were spent. Toward the end of September they left for England, sailing from Quebec in a great fleet of 32 transports, which was met at Gaspé by a convoy of 10 men-of-war and escorted by them across the Atlantic to Plymouth. The winter

camp in England was on Salisbury Plain, and there the men of the first contingent were prepared for the life in the trenches of Belgium and France.

With the departure of the first contingent, and even before, the business of recruiting gained in impetus. During the winter months the volunteers receive their provisional training in various camps in or near the cities and towns, since Val Cartier is not habitable during the cold weather. Some battalions, indeed, do not receive any training there, but go forward directly to England. It is now customary also to send the men over a battalion or two at a time, the transport or transports being met on the other side by cruisers or torpedo-boat destroyers.

The announcement was made in Parliament on April 10, 1915, that up to that time the total overseas forces, either abroad or organized at home, numbered 89,353. Of this number, 35,320 were in the first contingent which had crossed the ocean in a body; 22,272 were in the second contingent; 27,079 were in the reserves; 3,500 had been recruited but not mobilized; and 1,082 were doing garrison duty in Bermuda and St. Lucia. In addition, the active militia and permanent force numbered 12,207, making a total of 101,560. Since April and up to the end of 1915, 80,250 men have been sent to England. Of the total number, about 50,000 have been or are at the front. It should be remembered that Canada is meeting all the expenses of her forces both at home and abroad. At the present session of Parliament the Premier announced the Government's authorization for the establishment of a Canadian army of 500,000, including those who have already gone forward to England and the Continent. As it costs the Government about \$1,000 a year for each soldier, this means a tremendous undertaking for seven or eight million people. But there is no hesitation, no stopping to count the cost.

The demands upon the generosity of the people are constant and pressing. They have voluntarily taken upon themselves the charge of adding to the comforts of the dependents of those at the front, so that no one shall know what want means while father, husband, or son is doing his duty. When the Patriotic Fund began to show signs of depletion it was decided that a further appeal should be made to the people. This was done in January, 1916. City after city, town after town, and village after village exceeded its quota, and more than \$15,000,000 was raised in a few days.

## The Canadian Political Situation and General Elections—1926

In the early summer of 1925 it became evident to observers throughout Canada that the Liberal government of W. L. Mackenzie King, which had taken office at the end of 1921, after the decisive defeat of the Conservative administration of Arthur Meighen, was contemplating an appeal to the electors. Throughout the four years since 1921 the Liberals, though with only a bare majority (they numbered 118 in a house of 235), had received a general support, especially in tariff questions, from the 65 Progressives and 2 Labor members, as against the remaining 50 Conservatives of the official opposition, the high-tariff party of Canada. Few as were these Conservatives, they were encouraged by the feeling that the prevailing stagnation in industry and the consequent unemployment would strengthen their hands in the coming conflict, and in June 1925 they nailed their colors to the mast by introducing a resolution calling for higher protection to all Canadian industries. Though defeated in the House of Commons by an enormous majority of 174 votes to 37, they determined to carry the issue before the electors as soon as the opportunity was afforded.

The Conservatives had not long to wait, for Premier King, who might have postponed the election until 1926, decided to take the chances of an election in the autumn rather than wait until the full legal term of Parliament expired. On Sept. 5, 1925, he announced his decision at a speech in his own constituency, fixing the date of the election for Oct. 29, and laying stress on the economy of his administration, the tariff reductions which had benefited consumers and producers, the increase in the British preference, the reductions in the income tax, and the need for Senate reform. The Conservatives, on their side, drew attention to the depression, the closing of factories, and the exodus of workmen to the United States; the leaders of both the old parties carrying the campaign from the Atlantic to the Pacific. The result of the election was in large measure to justify the confidence of the Conservatives, for they more than doubled their numbers,

securing 116 seats in a house of 245—10 members had been added as a result of the redistribution after the census of 1921—while the Liberals numbered only 101 and the Progressives 25. There were also 2 Labor members and one Independent. While no party had a clear majority, the Conservatives were the strongest single aggregation, and the Liberal prime minister and eight of his colleagues in the cabinet had been defeated in their own constituencies.

As a result of the election a difficult constitutional question now presented itself. What was the will of the people and who should hold the executive power? Hitherto, under the two-party system, every Canadian government had had a clear majority of supporters in the House of Commons, presumably representing a majority of the voters. Now no party had a majority. While the Conservatives, as the strongest single party, claimed the right of forming a government, the Liberals, already in possession and relying upon the continuance of the general support which the Progressives had given them in the previous Parliament, held on to the reins of power, claiming that it was for Parliament to decide whether or not they should give place to their opponents. In this the Governor-General acquiesced, on condition that only routine matters should be dealt with by the government until the will of Parliament had been expressed.

Parliament met as early as possible (Jan. 7, 1926), and a long and bitter debate ended in a vote of confidence in the Liberal administration, the Progressives being strongly opposed to the high tariff tendencies of the Conservatives. Next, the prime minister found a safe seat in Saskatchewan, and proceeded to carry on the government. The solidity of the Conservative Opposition, however, as compared with the heterogeneous and shifting character of the government's support on the many matters coming up for decision, made it exceedingly difficult to carry on the business of the country. For some time close co-operation between the government and Robert Forke, the leader of the Progressives, facilitated the despatch of public

business and secured for the government a narrow majority, but toward spring internal dissensions arose among the Progressives themselves, several of whom, especially among the Alberta members, became extremely critical of the government and of Mr. Forke's leadership of the Progressives. Meanwhile the government, perhaps with another election in view, was conciliating Progressive support and that of the ordinary voters by drastic cuts in the income tax and in the customs duties on automobiles, as well as by a reduction of letter postage from 3 cents to 2 cents.

The plans of the Liberal government were now, however, to be disturbed by an issue arising out of the maladministration of the Customs Department. Early in the session, specific charges of maladministration and graft had been made on the floor of the House by Hon. H. H. Stevens, a Conservative member from British Columbia and a former Minister of Trade and Commerce. These charges, in accordance with the usual practice, were referred to a committee of the House for investigation and report, the committee consisting of four Liberals, four Conservatives, and one Progressive. In spite of its composition, its report, presented on June 18, was unanimous. It declared that the evidence showed that for a long time 'the Department of Customs and Excise had been slowly degenerating, and that the process was greatly accelerated in the last few years.' In particular Hon. Jacques Bureau, when Minister of Customs, from 1921 to 1925, 'failed to appreciate and properly discharge the responsibilities of his office, and as a result there was a lack of efficient, continuous, and vigorous control of subordinates by the headquarters staff at Ottawa.'

Such an indictment, concurred in by representatives supporting the government, led several Progressives to vote against the government on various points connected with the investigation, thereby placing it in a minority. When an amendment moved by Mr. Woodsworth, a Labor member, proposing an extension of the investigation to all parts of the country, but

forbearing to censure the government, had been accepted by the government but defeated in the House, Mr. King, realizing that he no longer had the support of a majority and feeling that Mr. Meighen was also unable to command the support of a majority, advised the Governor-General to dissolve Parliament and have another appeal to the electors. The governor-general, Lord Byng of Vimy, felt, however, that he could not lightly grant the dissolution of a newly-elected House of Commons, presumably representing the public opinion of the country. Thereupon Mr. King announced the resignation of his government on June 28, 1926. His position was that as the Governor-General had rejected his advice, and as the Governor-General could constitutionally act only upon the advice of his prime minister, it was now incumbent upon the Governor-General to find a new advisor who would accept the responsibility for the refusal of the dissolution.

On Mr. King's resignation, Mr. Meighen was on June 28 invited to form a government, and was sworn in the next day. With the acceptance of a salaried office under the crown he automatically vacated his seat in the Commons until he could be re-elected, and for the few remaining days of the session he had to act through Sir Henry Drayton, Minister of Finance in his previous government, who became leader of the House of Commons.

Some at least of the Progressives had given Mr. Meighen assurances of temporary co-operation for the sake of putting through unfinished business and voting the supplies without which the public service could not be carried on, but the difficulty was to do these complicated things in a constitutional manner when all parties were tired of a six months' session of Parliament. Under the constitution inherited by Canada from the United Kingdom, every one of Mr. Meighen's supporters who was appointed as a minister of the crown necessarily vacated his seat\* and thus reduced the number of the government's much-needed supporters until such time as he should be re-elected—a process which would require at least two months. The obvious course would have

\* This is an old provision to prevent the crown granting salaried positions to members of parliament, and thus inducing them to do its will rather than that of the people. The lack of such a rule in the eighteenth century made it possible for George III. and Lord North to secure a majority for their American policy and thereby contributed to the American Revolution.

been to accept the delay as a necessary evil, to adjourn Parliament for two or three months, appoint and re-elect the ministers, and call a short autumn sitting to finish the business and vote the supplies. However, anxious to hurry matters up, the premier adopted the rather novel expedient of appointing not ministers but unsalaried 'acting ministers' from members of Parliament who had already been sworn in as privy councillors and were thus eligible for ministerial positions. The fact that these 'acting ministers' were unsalaried, it was thought, avoided the necessity for the vacating of their seats.

The Liberals protested strongly against the unconstitutionality of the arrangement, and denied the right of the temporary ministry to issue orders in council—the recognized means of executive action. The disposition of the customs enquiry was almost lost sight of in the new issue of the alleged usurpation of power and the right of the 'acting ministers' to carry on public business and ask Parliament for supplies. This contention was expressed in a motion made by Mr. Robb, former minister of finance in the King Government, to the effect that the members of what was called the 'shadow cabinet' should resign their seats, if they held office legally, while if they did not hold office legally they had no right to control the business of government, and ask Parliament to vote supplies. The carrying of this motion by a vote of 96 to 95 on July 1 (one member of the majority stated afterwards that he had inadvertently voted when paired), made it impossible for the new government to continue to transact business with the existing Parliament. Mr. Meighen acted quickly; on July 2 Parliament was dissolved, and another general election became a necessity. Before this, however, on June 29, Parliament had carried by a vote of 119 to 109 an amendment of Mr. Stevens, to the effect that the failure of the Liberal administration, who were cognizant of the situation in the customs department, to remedy that situation was 'wholly indefensible.'

The new prime minister, relieved of the burden of parliamentary business, announced his cabinet on July 13, and proceeded to prepare for the election, which, in the opening speech of his campaign on July 22, he announced for September 14. In this period of nearly 2 months, both he and Mr. King toured the country from ocean to ocean. The Conservatives, having come

so near winning in the previous year, considered that the customs revelations would constitute the finishing stroke, though they also stressed their time-honored policy of higher protection. The Liberals, and perhaps even more the Progressives and Labor members, emphasized the constitutional issues, while the Liberals took credit for the country's return to prosperity and the reductions of taxation by the Robb budget.

The result of the elections of Sept. 14 was in favor of the Liberals, who elected 118 members as compared with 91 Conservatives. There were also 11 Liberal-Progressives, 8 'unhyphenated' Progressives, 11 Progressives of the United Farmers of Alberta group, 3 Labor members, 2 Independents, and one seat still doubtful as between a Liberal and a Progressive on Sept. 24. The 11 Liberal-Progressives ran on a joint ticket, giving the Liberals 129 pledged supporters in a house of 245, but the straight Progressives, the Laborites and the Independents are also expected to give the Liberal Government a general support. The course of the Alberta group is on many questions rather uncertain, though they are certainly opposed to higher tariffs.

On Sept. 25 the Meighen government tendered its resignation and Mr. King took the oath of office. His Cabinet is as follows:

Prime Minister and Minister of External Affairs—W. L. Mackenzie King.

Minister of Finance—J. A. Robb.

Minister of Justice—Ernest Lapointe.

Minister of Railways—C. A. Dunning.

Minister of Interior—Charles Stewart.

Minister of Public Works—J. C. Elliott.

Minister of Agriculture—W. R. Motherwell.

Minister of Trade and Commerce—James Malcolm.

Minister of Customs and Excises—W. D. Euler.

Minister of Health—Dr. J. H. King.

Minister of Immigration—Robert Forke.

Postmaster General—P. J. Veniot.

Minister of Marine and Fisheries—P. J. Cardin.

Solicitor General—Lucien Cannon.

Secretary of State—Fernand Rinfret.

Minister of Labor—Peter Heenan.

Minister Without Portfolio—Senator R. Dandurand.

**Review of the History of Canadian Development in the Last Sixty Years**

National Wealth, 1867—\$1,500,000,000  
 National Wealth, 1921—\$22,200,000,000

The far-flung population of the Dominion of Canada celebrated on July 1, 1927, the sixtieth anniversary of the Confederation of their scattered provinces. The fiftieth, occurring in the middle of the Great War, had passed almost unnoticed, but amends were made by the splendor of the 1927 celebration and the enthusiasm of the people. Tested by the fires of war, her equal national status recognized by the League of Nations, the Mother Country and the other nations of the British Commonwealth, Canada finds herself in 1927, the great post-war depression over, on the threshold of what promises to be a period of wonderful development, surpassing all the achievements of her past. It is with what has been accomplished since Confederation that this article proposes to deal.

**Growth of Area and Population.**—The four original provinces of Ontario, Quebec, New Brunswick and Nova Scotia, had at Confederation a total area of 350,188 square miles and a land area of 338,224 square miles. But in the act which united these provinces (the British North America Act), there was provision for the inclusion of the other British colonies of the northern half of North America, and by the acquisition of the Hudson Bay Territory in 1870, the entry of British Columbia in 1871 and Prince Edward Island in 1873, the Dominion was increased ten-fold, to its present area of 3,684,723 square miles, of which 3,547,230 is land area, Canada thus ranks among the largest territorial units of the world.

Yet mere extent of area is of little value without population and development. The vast increase of the area of the Dominion added only about 200,000 (half of them in Prince Edward Island) to its original population as enumerated in 1871, raising the total from 3,485,761 to 3,689,761. From this original figure the population had increased to 8,788,483 at the census of 1921 and is estimated at 9,519,520 in 1927. While the

increase in the Maritime Provinces on the Atlantic Coast has been comparatively small, the population of the great central provinces of Quebec and Ontario has doubled (Ontario, 1,620,851 in 1871, 3,187,000 in 1927; Quebec 1,191,516 in 1871, 2,604,000 in 1927). In Western Canada, however, the expansion has been phenomenal. Between 1871 and 1927 Manitoba has increased from 25,228 to 647,000 and British Columbia from 36,247 to 575,000. Again, Alberta and Saskatchewan, which had no existence in 1871, had respectively 617,000 and 836,000 people in 1927. These two provinces, created from the North West Territories in 1905, complete the line of Canadian provinces from ocean to ocean. Western Canada, which in 1871 was composed of the isolated Red River Settlement, ordinarily accessible only through the United States, and the even more isolated settlements on Vancouver Island and the nearby mainland of British Columbia, with perhaps 25,000 white people in all, has today about 2,700,000 of the most energetic and progressive people in the world, who rank among the world's largest producers and exporters of food-stuffs. Further, the Pacific Province of British Columbia is extraordinarily rich in minerals, fish and forest products.

The growth of total population, as in other countries of the white man's world, has naturally been accompanied by an even greater growth of urban population. At its first census in 1871, the new Dominion contained only one city of over 100,000—Montreal, with 115,000 people. In 1921 Montreal had 618,000 people and Toronto, which had only 59,000 in 1871, had 522,000. Far more remarkable is the growth of Winnipeg and Vancouver, the former having only 241 people in 1871 and 192,000 in 1926, the latter having no existence as late as 1885 and 117,217 people in 1921. Calgary and Edmonton, with only 4,000 people each as late as 1901, had each 65,000 people in 1926. Much slower, yet still rapid, has

been the growth of Hamilton and Ottawa, with 26,000 and 24,000 respectively in 1871, and 114,000 and 107,000 in 1921. Quebec, which increased only from 59,699 in 1871 to 95,193 in 1921, has declined in relative rank from second to seventh place. The total urban population in 1921 was almost equal to the rural.

**Agricultural Development.**—On the whole, agriculture is still the chief occupation of the Canadian people, whose occupied and improved lands between 1871 and 1921 have increased from 36,000,000 to 141,000,000 acres and from 17,000,000 to 71,000,000 acres respectively. But while the older agriculture was for home consumption the more modern is for world consumption. While in the first decade after Confederation, Canada's production of wheat did not equal her home consumption, in the six crop years ended July 31, 1926, Canada's exports of wheat and wheat flour expressed as wheat were 1,496,000,000 bushels, as compared with 1,372,000,000 bushels exported from the United States; Canada is thus the world's largest exporter of wheat, the white man's staple food. Oats, hay, and clover rank next to wheat among Canada's leading field crops, the total value of which increased from \$111,000,000 in 1871 to \$1,121,000,000 in 1926. Stock-raising has also become an important branch of the farming industry, while the total value of dairy products has increased from \$15,000,000 in 1874 to \$238,000,000 in 1926. The aggregate total value of the products of Canadian farms in 1926 was \$1,668,000,000, while the total capital invested in agriculture in the same year was \$7,817,000,000. The total value of the Canadian agricultural products (including animals and their products) exported in 1926 was \$797,000,000, as compared with only \$48,500,000 of Canadian products of all descriptions exported in 1868, the first year of the Dominion.

**Forestry.**—At Confederation, Canada was a 'lumber-lot' even

more than a granary, and the annual value of the lumber industry, as ascertained at the census of 1871, was \$31,000,000—a figure which compares with \$134,000,000 in 1925. But the intervening period has been marked by the greater elaboration of the product, and the pulp and paper industry of Canada, which produced commodities to the value of \$1,000,000 in 1871, achieved a production valued at \$193,000,000 in 1925. In 1926 the Canadian production of newsprint paper was 1,882,000 tons, making the Dominion definitely the leading producer of newsprint in the world.

**Mining.**—Until long after Confederation, Canada's contribution to the mineral production of the world was insignificant. Gold and coal are the only minerals with a recorded production in 1871, 105,000 oz. and 1,063,000 tons respectively. The first year for which complete statistics of mineral production exist is 1886, when the total value of the minerals produced was only \$10,000,000—a figure which has risen to over \$241,000,000 in 1926, when Canada produced the following percentages of the world production of the following minerals: nickel 90, asbestos 85, cobalt 55, gold 9, silver 8, copper 4. In coal Canada is estimated to possess one-sixth of the world's total reserves, mainly in Alberta. Rapidly as the production of the mines has expanded, new discoveries of paying ores are continually being reported, especially in the Canadian Shield formation which covers an enormous area in Eastern Canada. British Columbia is also immensely rich in metallic ores and coal.

**Fisheries.**—The fisheries of Canada are one of its most slowly growing industries, yet an annual production of \$6,600,000 in 1870 has risen to \$48,000,000 in 1925, largely owing to the addition of the fisheries of the Pacific to those of the Atlantic coast; British Columbia contributed \$22,400,000 to the 1925 total, largely through her salmon and halibut fisheries, while cod and lobsters are the most valuable products of the East.

**Water Powers.**—Canada, with half of the fresh water in the world within or on her borders, possesses enormous resources in water power, owing to the waterfalls, which in earlier days greatly impeded navigation and prevented settlement. While water-mills ground the grain of the pioneer settlers, it was not until about 1900 that any great use was made of 'white coal.' At that time the total developed water-power was only 170,000 H.P., in 1910 it was 975,000 H.P.

and in 1926 4,556,000 H.P., this latter figure representing only 11 per cent. of the water power already known to exist. The use of comparatively cheap electricity is becoming more and more universal for both domestic and commercial purposes in the chief manufacturing areas of Canada.

**Manufactures.**—Up to Confederation the manufactures of Canada were on a small scale, largely of the domestic type and designed for local use rather than for export. At the census of 1871 the statistics collected for all manufacturing industries showed 41,259 establishments with an invested capital of \$78,000,000, 188,000 employees and a gross production of \$221,000,000. By 1890 gross production had increased to \$470,000,000 and by 1905, under a new system which excluded from consideration all factories with fewer than 5 employees, to \$706,000,000. In 1910 the gross production of manufactured goods was \$1,166,000,000, and by 1920 manufactured products (exclusive of custom clothing, dyeing and laundry work, boot, jewelry, automobile and bicycle repairing, blacksmithing and custom work by foundries), reached a total value of \$3,772,000,000. This was at peak prices, but the census of 1925, taken on the same basis, showed an invested capital of \$3,808,000,000, 544,000 employees and a gross production of \$2,948,000,000 in the manufacturing industries of Canada, while 1926 production will be well above the \$3,000,000,000 mark.

To some extent the great development of Canadian manufacturing industries in the past generation has been due to the protective tariff, but certainly the existence of abundant raw material and cheap power and a competent, intelligent and well-disposed labor force have been larger factors in the result. In recent years there have been frequent amalgamations among the manufacturing industries, some of which are now on a very large scale. While most of the manufacturing industries still use Canadian raw material, some, like the rubber industry, the cotton industry, and the sugar industry, import their raw material, producing finished goods to the value of \$78,000,000, \$73,000,000 and \$68,000,000 respectively in 1925. Canada is now reckoned by the League of Nations as one of the eight important industrial countries of the world, and has a permanent seat on the governing body of the International Labor Office.

**Construction.**—Construction in Canada has long since passed the

day of small things when the pioneer built his own shack and invited the neighbors to his 'barn-raising.' Besides the building up of great cities and of highways of transportation such as the great railways, the good roads, and the new Welland canal (q.v.), large sums are being spent upon the development of hydro-electric power for industrial purposes. Construction contracts awarded in Canada in 1926 were valued at \$373,000,000.

**Trade.**—The aggregate external trade of the Dominion in 1868, the first year of Confederation, was \$119,792,000 and in the sixtieth year (ended March, 1927) \$2,298,000,000—an almost twenty-fold increase. Exports of Canadian produce increased from \$48,500,000 in 1868 to \$1,252,150,000 in 1927, or 26 times, while imports increased from \$67,090,000 to \$1,031,000,000 or only about 15 times. Up to the Great War there was usually an excess of imports, especially during the period of rapid development from 1900 to 1913. During the war and since there has usually been an excess of exports over imports, this excess amounting to \$401,000,000 in 1926 and (allowance being made for re-exports) to \$236,000,000 in 1927. When Canada's trade in the calendar year 1926 is compared with the trade of other nations, it is seen that the 'remote dependency' of 1867 ranks fifth among the nations of the world in trade in 1927—immediately after the four great industrial countries, the United States, the United Kingdom, Germany and France. Nor is Canadian trade merely in raw materials; the Dominion exports such manufactured goods as flour, newsprint, automobiles, agricultural implements throughout the world, justifying her claim to be 'the second manufacturing country in the British Empire.' Indeed, she now exports a larger value of manufactured commodities than she imports.

**Transportation.**—Nothing is more remarkable in the history of Canada than the development of her system of transportation and communication which has brought British North America together physically as Confederation united it politically. Most notable are the great railways which stretch across the Continent, with 40,352 miles of line in 1925 as compared with 2,278 miles in 1867, while their gross earnings have increased from \$19,500,000 in 1875 to \$455,000,000 in 1925. Electric railways, again, have increased their gross earnings from \$5,750,000 in 1901 to almost \$50,000,000 in 1925, or about nine-fold in 25

Canada in 1867

Canada in 1927

years. These increases have occurred in spite of the introduction of automobiles, which numbered 836,000 in 1926 as compared with 2,130 in 1907. Ocean-going shipping entered and cleared has increased from 13,000,000 tons in 1868 to 75,000,000 in 1926, and coastal shipping from 10,300,000 tons in 1876 to 82,900,000 tons in 1926. The aeroplane is used in transporting passengers to remote points and in surveying the northern wildernesses.

Not less remarkable is the development of means of communication. The postal revenue of the Dominion has risen from \$525,000 in 1868 to \$30,330,000 in 1926. While the use of the telegraphs has also greatly increased, telephones in use are 1,144,000 in 1925 as compared with 302,000 in 1911. Finally, private receiving radio stations numbered 135,000 in 1926, as compared with 33,000 in 1924.

**Public Finance.**—The national revenue of Canada in 1868, a time when the functions of government were about at their minimum, was about \$13,700,000, and at this low figure covered the expenditure. The revenue receipts in the sixtieth year of the Dominion were \$383,000,000—or about 28 times greater. Expenditures have also greatly increased, but except for the war expenses, have not been out of proportion to the receipts. The net debt of the Dominion, which was \$75,000,000 at Confederation, rose to \$336,000,000 in 1914, but the difference was mainly represented by public works. The war and its aftermath increased it to \$2,453,000,000 in 1923, but in June 1927 it had been reduced to \$2,306,000,000, with a more than proportionate reduction in the interest charge.

**Banking and Insurance.**—The banking system of Canada, developed along similar lines to that of Scotland, consists of a comparatively small number of separate institutions, each with a considerable number of branches. Such branches numbered altogether 123 in 1868 and 3,770 in 1926, besides 195 branches in other countries. Meanwhile the combined assets of the chartered banks of Canada have risen from \$78,000,000 in 1867 to \$2,864,000,000 in 1926. The amount of life insurance in force in companies licensed by the Dominion Government has increased from \$36,000,000 in 1869 to \$4,610,000,000 in 1926, and the amount of fire insurance in force in Dominion companies from \$188,000,000 in 1867 to \$8,045,000,000 in 1926.

**Education.**—The first census of the Dominion in 1871 showed 20 per cent. of the adult population as unable to read or write; by the census of 1921 the proportion, inclusive of Indians, had been reduced to 5.1 per cent. Among the population of 10 to 14 years of age the proportion unable to read and write was only 2 per cent. in spite of the sparsity of settlement in certain areas. Secondary education is good and in several provinces entirely free of charge, and six of the nine provinces maintain provincial universities with very low fees. In 1925 there were 23 universities and 85 colleges in Canada, with about 32,000 students in regular courses. The total public expenditure of the Canadian people on education in that year was \$133,000,000 or about 3 per cent. of the aggregate national income. Research work of a high character is done in the universities of Toronto and McGill, a notable achievement being the discovery of insulin by Dr. Banting.

**Spiritual and Moral Progress.**—This type of progress is not easily measured, yet it is worthy of notice that in 1921 less than one-half of one per cent. of the population classified themselves as atheists, agnostics, pagans or 'no religion.' One thing which has strengthened the religious forces of Canada since Confederation is the union of the various Methodist and Presbyterian bodies into strong united churches, together with the subsequent amalgamation of Methodists, Congregationalists and Presbyterians in 1925 as the United Church of Canada, although a considerable number of the latter remain aloof as the Continuing Presbyterian Church. Generally speaking, the low figures of criminality may be said to indicate the generally law-abiding and orderly character of the population. Convictions for criminal offences in 1925 numbered 27,111 or 289 per 100,000 of the estimated population; only 18 of these convictions were on the charge of murder. As in the United States, immigrants of certain nationalities contribute to the criminal class out of all proportion to their numbers.

In all these years Canada has maintained the friendliest relations with her neighbor across the border. Notable evidences of this pleasant relationship were shown in 1926 by the appointment of a Canadian minister to the United States and a United States minister to Canada; and in 1927 by the opening, in August, of the International Peace Bridge between Canada and the United States, at Buffalo, N. Y. The dedication of the bridge on Aug. 7, 1927, was attended by H.R.H. the Prince of Wales, Premier Baldwin, U. S. Secretary of State Kellogg, Vice-President Dawes, and other distinguished people.

view of the extensive naval base which is being constructed at Rosyth.

CANADA.—In Canada the connection between the St. Lawrence and the Great Lakes of North America has been completed by canals between Lake Ontario and Montreal, and by the Welland Canal for avoiding the falls and rapids of Niagara. The size of these canals has been increased repeatedly since 1825. The Welland Canal is being deepened to 25 feet, and widened to a breadth varying from 150 to 200 feet at the bottom, at an estimated cost of \$45,000,000. With the completion of the work now under

first real lock canal planned was that from the Schuylkill River, near Reading, Pa., to Middletown, on the Susquehanna, in 1762. Work was begun in 1791, and 4 miles opened in 1794. The project was finished in 1827, under the name of the Union Canal.

During the Revolutionary War all canal projects were stopped; but after its close, work was energetically taken up again. Washington was the father of the scheme of a great interstate system of canals; and he was the first to develop and stimulate general interest in plans for connecting the Great Lakes with the Atlantic Ocean. Washington's

ton. The passenger tariff was also cared for by means of light barges drawn by shifts of trotting horse teams, and the whole trip thus made in 3½ days. With the completion of the lines of the New York Central Railroad along the Hudson River and the Canal to Buffalo, however, business on the Erie Canal decreased greatly—although navigation was made free and tolls abolished in 1882.

New York State Barge Canal.—In November, 1903, an expenditure of \$101,000,000 to rebuild the Erie Canal was authorized by popular vote of the citizens of New York State. The new plans called for a depth of at least 12

\*Depth to be increased to 25 feet, and width to 150 to 200 feet, so that vessels can navigate the waterway from the head of Lake Superior to Prescott, on the River St. Lawrence, within 100 miles of Montreal. Total cost of improvement about \$45,000,000.  
 †Minimum depth. ‡Average width. §Estimated cost. ¶Tonnage in 1912, before enlargement.

way on the St. Lawrence canals, vessels of 1,500 tons will be able to go from Lake Erie to Montreal.

The Sault Ste. Marie ('Soo') Canal unites Lakes Superior and Huron. It is only 2 miles long, but boasts a larger tonnage of traffic than the Suez Canal. (See SAULT SAINTE MARIE.) It has long been a Canadian ideal to shorten the distance from Lake Superior to the sea. The Trent system of canals, which will eventually connect Lake Ontario with Georgian Bay via Lake Simcoe, has been constructed with this object. At present (1914), this system has been completed from Lake Simcoe to Healey Falls (160 miles). In 1899 surveys were begun for the purpose of connecting Georgian Bay through the intervening rivers and lakes with the Ottawa River system, and thence to Montreal. In 1903 all tolls on Canadian canals were abolished. (See CANADA, Canals.)

UNITED STATES.—As early as 1750 a canal had been dug in Orange county, New York, by Lieutenant-Governor Colden, for the transportation of stones. The

original plan, to extend the Chesapeake and Ohio Canal to Pittsburgh, and from here to Ashtabula at Lake Erie, was carefully worked out, but had to be postponed on account of the excessive cost. Otherwise Baltimore would possibly have grown to the size and importance of New York, whose greatness and pre-eminence is largely due to the Erie Canal and the Hudson River.

Erie Canal.—The beginning of the Erie Canal was made by the Western Inland Navigation Lock Company, formed in 1792. This company finished 6 miles of canal around the rapids at Little Falls, navigable for small barges going to Lake Ontario. In 1803 all canals built by it were bought by New York State, and a greater plan of connecting New York City with Lake Erie was suggested. Under Clinton, as governor, the canal was opened from Buffalo to Albany, in November, 1825, with a total length of 352 miles. With the opening of the Erie Canal the time of freightage was reduced from 20 days to 10 days, while the freight rate was reduced from \$100 a ton to \$3 a

feet, and a bottom width of at least 75 feet—dimensions which would accommodate barges of 1,000 tons capacity or more. The new canal leaves Lake Erie at Buffalo, follows the Niagara River on the shore line of Lake Ontario to the Oswego River, thence continues in a general easterly direction to its junction with the Hudson River at Waterford. It is to be completed in 1915. (See NEW YORK STATE BARGE CANAL.)

The Chesapeake and Ohio Canal was carried out for 186 miles, as far as Cumberland, by 1850, at an outlay of \$11,375,000; but its completion to Pittsburgh on the Ohio, making a total distance of 341 miles, has not yet been effected. Pittsburgh is now urging the construction of a canal north to Ashtabula on Lake Erie, the depth to be 16 feet, and the outlay \$33,000,000. In this way Pittsburgh would have direct connection with the Atlantic Ocean. The Morris Canal connects the Delaware at Phillipsburg with the Hudson at Jersey City, crossing a spur of the Alleghanies; it is 102 miles long, and

accommodates vessels of 80 tons.

The *Illinois and Michigan Canal*, which connects Lake Michigan with the Mississippi River, was opened in 1848. Its total length is 96 miles, with a total rise of 145 feet from the junction point with the Illinois River, at La Salle, to Chicago at Lake Michigan. The rise is surmounted by 17 locks, each 110 by 18 feet. The capacity is for 150-ton barges. A smaller canal, an addition to the Illinois and Michigan, and called the *Illinois and Mississippi Canal*, was started in 1892, and opened in 1907. This canal is 7 feet deep, 80 feet wide at the surface, with 37 locks, each 170 feet long and 35 wide. Beginning at Hennepin on the Illinois River, it goes 50 miles to the Rock River, and then 27 miles down the river to Rock Island, at the Mississippi. The capacity is for 600-ton barges.

The *Chicago Drainage Canal*, uniting Chicago with the Illinois and Des Plaines Rivers, is 40 miles long, 110 to 202 feet wide at the bottom, and 22 feet deep. (See CHICAGO DRAINAGE CANAL.)

The new *Cape Cod Canal*, from Barnstable Bay to Buzzard's Bay, Mass., started in 1909, will be 12 miles long and 30 feet deep, with a minimum bottom depth of 100 feet. It will cut off 100 miles, and the most dangerous portion, of the passage between New York and Boston. (See CAPE COD CANAL.)

**PANAMA CANAL.**—The construction of a canal at the Isthmus of Panama, to connect the Atlantic with the Pacific Ocean, was begun by a French company in 1881. The plan originally was for a tide-level canal 28 feet deep; but funds failing, a lock canal of 15 feet in depth was substituted. Work ceased in 1888, but was resumed in 1894 by a new company, and continued with a small force of workmen until the property was sold to the United States Government, which has completed a lock canal on original lines—by far the most important undertaking of its kind in the world, and the greatest engineering feat of history. For a complete account, see the article PANAMA CANAL.

See WATER TRANSPORTATION. **BIBLIOGRAPHY.**—Consult *Reports of International Congress on Navigation* (1902 and 1905); U. S. Bureau of Statistics, *Information in Regard to the Suez Canal and Monograph on the Great Canals of the World* (1903); Hertslet's *Report on Canals and Other Navigable Waterways of Belgium* (in *Diplomatic and Con-*

*sular Reports of British Foreign Office*, 1904); *Transactions of International Engineering Congress* (1905); Chicago Sanitary District Board, *Building Sixty Miles of Industries* (1907); Hepburn's *Artificial Waterways and Commercial Development* (1909); Moulton's *Waterways vs. Railways* (1912); Bellasis' *River and Canal Engineering* (1913).

**Canal Zone**, a strip of land 47 miles long and 10 miles wide, extending 5 miles on either side of the Panama Canal, from the Atlantic to the Pacific Ocean. By an agreement with Panama (ratified February, 1904), the United States received, in return for a payment of \$10,000,000 and an annual rental of \$250,000, the perpetual right of occupation of this territory, together with full control for police, judicial, sanitary, and other purposes; not including the cities of Colon and Panama, in which, however, jurisdiction was granted in all matters relating to sanitation and quarantine.

There were in 1912 9,770 Americans in residence, including 2,882 women, the remainder of the population being composed of Spanish, Italian and West Indian laborers, East Indian coolies, and a few Chinese. Schools have been established in the larger villages, which in 1912 accommodated 1,721 children.

The most important result accomplished by the United States in the Canal Zone has been the sanitation of the country. Swamps have been drained, streets cleaned and paved, and adequate sewage and water systems provided; while all buildings erected by the Government are effectively screened from mosquitoes. Yellow fever, malaria, and pneumonia, which decimated the French workmen, have either been stamped out or greatly reduced; so that the health rate of the Isthmus compares favorably with that of the United States. This work was done chiefly under the direction of Colonel Gorgas, who had already done such valuable work in Cuba.

By the Panama Canal Act of 1912, the government of the Zone was vested in a governor, to be appointed by the President of the United States and ratified by the Senate, together with such other officials as should be found necessary. In January, 1914, an executive order of the President established the permanent government of the Canal Zone, effective April 1. The President's order provided for several departments or divisions, all under the direction of the Governor, who

will report to the President through the Secretary of War, by which the Canal Zone is to be governed and the Panama Canal operated. The departments and divisions are: Department of Operation and Maintenance, Purchasing Department, Supply Department, Accounting Department, Health Department, and what amounts to a civil government department.

The Department of Maintenance and Operation is to be under the direction of an officer of the engineer corps of the U. S. army, who is to be acting governor in the absence or disability of the governor. The Health Department is to be under the direction of a chief health officer, who is to be an officer of the Medical Corps of the army.

Col. George W. Goethals, the builder of the Panama Canal, was appointed the first governor.

See PANAMA; PANAMA CANAL. Consult *Reports of the Isthmian Commission*; Frank's *Things as They Are in Panama* (1913).

**Canandaigua**, village, county seat of Ontario county, New York, at the north end of Canandaigua Lake, and on the Northern Central and New York Central Railroads; 28 miles southeast of Rochester. It is beautifully situated, and has many fine buildings and residences. It is the seat of Canandaigua Academy and Granger Place School for Girls. Its chief industries are canning, brewing, tanning, and the manufacture of agricultural implements, tinware, and cigars. Pop. (1900) 6,151; (1910) 7,217.

**Canandaigua Lake** stretches north and south from Ontario to Yates county, New York, and is 660 feet above sea level. It is a beautiful lake, 14 miles long and from 1 to 1½ miles broad, and surrounded by cultivated fields. Its waters are deep and abound in fish. Its outlet is Flint Creek, which flows into Clyde River.

**Cañar**, a central province of Ecuador. Area, 1,570 square miles. Pop. 64,000. Numerous Inca remains are found. Its capital is Azogues.

**Cañar**, town in above province; 25 miles north of Cuenca.

**Canara**, INDIA. See KANARA. **Canarium**, an Oriental genus of Amyridaceæ. Many of them yield edible drupes, timber, elemi resin, and black dammar gum (from *C. strictum*). *C. commune* is a native of the Moluccas, but introduced into many parts of tropical Asia. It is a tree about 50 feet high; its fruit is a drupe, of which the kernel is eaten raw, roasted, or made into bread. The tree also yields a resin, which

may be substituted for copaiba balsam, having like properties.

**Canary** (*Serinus canarius*), a species of passerine bird of the family Fringillidae, or Finches. It is found wild in the Canary Islands, Madeira, and the Azores, and has been extensively domesticated in Europe and America, where it is common as a cage bird, and is much esteemed for its musical powers. In its wild state the canary measures about 5 inches, and is olive or apple green above, and golden yellow below, with markings of brown on the head, rump, and flanks. It frequents the neighborhood of human habitation; builds its nest of moss, dry grass, feathers, hair, etc., in high, bushy shrubs or low trees; and produces from two to four broods in the course of a season.

The canary breeds readily in confinement, often three or four times a year, laying from four to six eggs each time; seems thoroughly reconciled to cage life; and in many cases becomes very tame. By careful selection and breeding the size has been increased, the color modified, and the powers of song cultivated. The canary not infrequently lives fifteen or sixteen years.

Scientific breeding has produced a number of distinct varieties. The Belgian Canary is one of the most highly prized. It has a small, sleek head, long, curved neck, and broad, prominent shoulders, giving it its characteristic hunch-backed appearance. Not unlike the Belgian variety is the Scots Fancy, a very slender bird with a long neck and graceful body. The Yorkshire is a long, thin, very fine and closely feathered bird, with neat wings and tail. The Lancashire, formerly much fancied, but now little bred, is one of the largest of the canary tribe. The Norwich canary is bred chiefly for its beautiful plumage. The Manchester Coppy has a crest of feathers radiating from the centre of the crown. The Border or Cumberland Fancy is a small, neat bird, with very close and almost waxy appearance of feather, close-fitting wings, and whip-shaped tail. The London Fancy is a pretty little yellow or buff bird, with black wings and tail. Other varieties are the Cinnamon Canary, so called from its beautiful color; the Lizard Canary, whose comparatively dull body plumage is spangled with gold or silver; and the Roller Canary, a variety kept solely for its song, and trained with great care by means of a bird organ or by another highly trained bird called a 'schoolmaster.' The finest singers come from the Harz Mountains. Hybrids, known as 'mules,'

are often produced by crossing with other finches.

The canaries seen in the United States are mainly importations of plain forms, preferably pure yellow, from Germany, whence many thousands are brought annually.

The care of the canary is very

**Canary Grass** (*Phalaris canariensis*), a grass of which the seed is much used, under the name of *canary seed*, as food for cage birds, and which is on that account cultivated in the south of Europe, and in certain districts of Germany and England. It has be-

Canaries.

1. Wild Canary. 2. Belgian. 3. Scotch Fancy. 4. Norwich. 5. Lizard. 6. Yorkshire.
7. Cinnamon. 8. Lancashire Coppy. 9. London Fancy. 10. Border Fancy.

simple; cleanliness and a plentiful supply of proper food and water are the chief requisites. Canary seed and rape should constitute the principal food; while green leaves, such as chickweed, and lime, in the form of cuttle-fish bone, should be supplied.

See CAGE BIRDS. Consult Wallace's *The Canary Book*; Robson's *Canaries, Hybrids, and British Birds in Cage and Aviary* (1912).

come naturalized in many parts of Northern Europe, including Great Britain, but is a native of Southern Europe and the Canary Islands, where it sometimes furnishes a wholesome and palatable addition to or substitute for wheaten flour. It is largely grown for seed in Southern California. It reaches a height of 2 or 3 feet, with a spike-like panicle of one inch or more. The large Reed Canary Grass (*P. arund-*

naceo), common on river banks, is an abundant source of coarse fodder; and Southern Canary Grass (*P. caroliniana*), or Apache Timothy, is also valued for for-

Canary Grass (*Phalaris canariensis*).

1, Flower; 2, Flower, with glume removed.

age. A striped variety is cultivated as 'Gardeners' Garters,' 'Ribbon Grass,' or 'Ladies' Traces.'

**Canary Islands**, a volcanic group of islands belonging to Spain, in the Atlantic Ocean, about 60 miles off the northwest coast of Africa, between lat. 27° 40' and 29° 25' N., and long. 13° 25' and 18° 16' W. The group includes seven large inhabited islands—Tenerife, Grand Canary (Gran Canaria), Palma, Lanzarote, Fuerteventura, Gomera, and Hierro (Ferro)—and a number of rocky islets, with a total area of 2,808 square miles.

The islands are bold and picturesque in outline, and mountainous in character, the chief elevations being volcanoes, of which the highest, the Peak of Tenerife (q. v.), rises 12,180 feet. There are no rivers, and on several of the islands water is very scarce. The springs on those better supplied are diverted by long

artificial channels for the purpose of irrigation. The equable temperature and moderate rainfall make the islands an ideal health resort. The mean annual temperature is about 70° F.; the minimum 60° F., and the maximum 86° F. The rainy season lasts from November to March, practically no rain falling in the summer and autumn.

Below 1,300 feet the vegetation is African in character, including the date palm, coffee tree, sugar cane, banana, orange tree, and the native dragon tree. For the next 1,500 feet, vines and cereals flourish; above this, various species of laurel and pine, notably *Pinus canariensis*, arborescent heaths, and the retama, a sweet-scented broom, are found. There are over 900 species of wild flowering plants on the islands, about 400 of which are peculiar to the group.

The soil responds well to cultivation, and agriculture is the chief industry. Wine, sugar cane, tobacco, wheat, and maize are produced, and large quantities of fruit and early vegetables are grown, especially bananas, potatoes and tomatoes. Cochineal was formerly an important product, and is still cultivated to some extent. Fisheries are of considerable importance, giving employment to some 10,000 persons. The only mineral product is pumice stone, which is found on the island of Tenerife. Fabrics of silk, cotton, and linen, hats, and baskets are manufactured. The women excel in lace making and embroidery; and there are small sugar, tobacco, and shoe factories.

Commerce is chiefly with Great Britain and Spain. The three main articles of export are bananas, tomatoes, and potatoes, shipments of which for 1913 were valued at \$9,382,469. Imports consist mainly of coal, foodstuffs, and manufactured goods. The

are electric tramways on Tenerife and Grand Canary; and a concession has been granted for a railway of about 50 miles from Santa Cruz to the interior of the island of Tenerife.

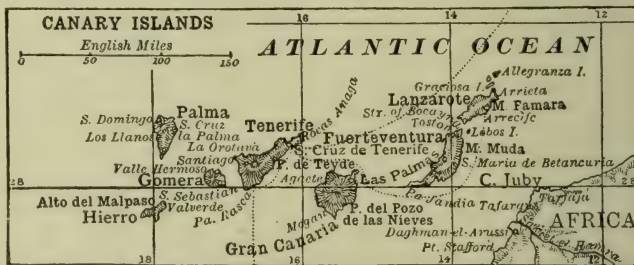

The Canary Islands form a Spanish province, with Santa Cruz as the capital. Tenerife, Palma, Gomera, and Hierro constitute one district under the provincial governor; Grand Canary, Lanzarote, and Fuerteventura form a second district under a sub-governor. The official religion is Roman Catholic. Pop. (1911) 419,809, mostly Spanish.

The Canary Islands are supposed to have been the *Fortunate Isles* or *Isles of the Blessed* (q. v.) of the ancients. They were rediscovered in 1334 by a French vessel, and were first taken possession of (1402) by a Norman, Jean de Bethencourt. The title later passed to the king of Spain, and after a struggle with the native inhabitants, the Guanches (q. v.), extending over the greater part of the fifteenth century, the Spaniards in 1495 made themselves masters of the whole archipelago.

See separate articles on the principal islands. Consult Olivia M. Stone's *Tenerife and Its Six Satellites*; M d'Estes' *In the Canaries with a Camera* (1909); A. S. Brown's *Madeira and the Canary Islands* (10th ed., 1910); E. and F. du Cane's *The Canary Islands* (1911).

**Canary Seed.** See CANARY GRASS.

**Canary Wine**, or TENERIFE, a dry white wine, famous from the sixteenth to the middle of the nineteenth century. Since that period it has lost its high position on the market. It is, moreover, inferior to Madeira (q. v.), which has largely replaced it, in all the properties of character, body, fulness, and bouquet. It was produced chiefly in the northwest of the isles around Tenerife. At the present time a Canary port

principal seaports, Las Palmas, on Grand Canary, and Santa Cruz, on Tenerife, are important coaling stations, and are among the most frequented ports in the world. Sailing vessels furnish inter-insular communication; there

and Canary sack are obtained from the south of Spain. The former is a fruity, tawny red wine somewhat like a port, and the latter a white wine of excellent flavor, which in body resembles Madeira.

**Canastota**, *kan-as-tō'ta*, village, New York, Madison county, on the Erie Canal, and the Lehigh Valley, the New York Central, and the West Shore Railroads; 21 miles east of Syracuse. Manufactures include furniture, wagons, farm implements, engines, cut glass, condensed milk, and canned goods. Pop. (1910) 3,247; (1920) 3,995.

**Canaveral Cape**, *ka-nav'er-al*, in Florida, near the middle of the Atlantic Coast. It has a lighthouse of the first order, 137 feet above high water.

**Canberra**, the capital of the Commonwealth of Australia, near the Cotter River; 150 miles southwest of Sydney. Situated on two commanding hills, it occupies an area of about 12 square miles in the Federal Territory, a tract of 900 square miles, ceded to the government by New South Wales in 1910. A strip of Federal Territory connects the capital with its port, on Jervis Bay, an almost completely landlocked harbor of sufficient size and depth to accommodate the entire British fleet.

The commission for city plans was awarded in 1912 to W. B. Griffin of Chicago, Ill., and in March 1913 the work of building was begun. Because of the war, however, operations were practically suspended for a term of four years. By deliberate design Canberra is to resemble in a general way the capital of the United States. From the Parliament building, as a centre, radiate wide streets to be occupied by other public buildings. The plans also provide for three large ornamental lakes, several public parks and recreation grounds, a market, and civic, educational, and residential sections. Canberra is the seat of the Duntroon Royal Military College, and at Captain's Point on Jervis Bay, is the Royal Australian Naval College.

About eight miles of railway have been completed within the Territory (1925). The Canberra-Queanbeyan line, five miles in length, connecting with the New South Wales system at Queanbeyan, was opened for goods traffic in 1914, and for passenger traffic in October 1923.

Parliament will meet in Canberra for the first time in 1927. With the removal of the Federal departments from Melbourne, the entire administration of the city and its public utilities will be under the Federal government. Pop. (1914) 1,714; (1924, estimated) 3,677.

**Canby**, EDWARD RICHARD SPRIGG (1819-73), American soldier, was born in Kentucky. He was graduated from West Point (1839), and served in the Seminole War (1839-42) and the Mexican War (1846-7); winning the

brevet of major at Contreras and Churubusco, and that of lieutenant-colonel at the City of Mexico. He took part in the Utah expedition (1857-60), and in the expedition against the Navajo Indians (1860-1). During the Civil War he was placed in command of the Department of New Mexico (1861-2), and drove out the Confederates under General Sibley; commanded New York City and Harbor during the Draft Riots of 1863; was in command of the Department West of the Mississippi in 1864-5; assisted in the capture of Mobile; and received the surrender of Gen. Richard Taylor in 1865. At the close of the war he was brevetted major-general for his services, and entered the regular army as brigadier-general. He served as military governor of South Carolina (1868), and afterward commanded the Division of the Pacific. He was killed near Siskyou, Cal., by the Modoc Indians while in conference with their leader.

**Canby**, WILLIAM MARRIOTT (1831-1904), American botanist, was born in Philadelphia. He engaged in the banking business, but devoted much time to the study of botany and the collection of specimens of the flora of the United States and Canada. He also served as botanist to the Northern Pacific Transcontinental Survey. His large herbarium of 30,000 species is now owned by the New York College of Pharmacy, and a smaller one by the Delaware Society of Natural History. From 1881 until his death he was president of the Wilmington Savings Fund Society.

**Cancale**, *kān'kal'*, seaside resort, department Ille-et-Vilaine, Northwest France; 6 miles northwest of St. Malo. Noted for its oysters. Pop. 8,000.

**Can'can**, or CHAHUT, a dance somewhat of the nature of a quadrille (q. v.), but characterized by high kicking and other suggestive movements; invented by Rigolboche, a notorious *danseuse*, about 1830.

**Cancao**, Cambodia. See HAI-TIEN.

**Can'cella'tion** (Latin *cancelare*, 'to make like lattice work,' 'to strike out by means of cross lines'), in Mathematics, signifies the elimination of a common factor in both numerator and denominator of a fraction. A fraction being a proportion, any common factor occurring in the numerator or denominator may be therefore eliminated without altering its value. Thus—

$$\frac{4}{8} = \frac{4 \times 1}{4 \times 2} = \frac{1}{2}$$

Algebraical expressions are simplified on similar principles.

**Canceling of Deeds**. A legal document is said to be *cancelled* when its force is destroyed by

some intentional act of the maker or other party having right thereto, or by the judgment of a court. A common form of cancellation is by striking out the signature, and also, if it be a deed under seal, by tearing off the seals. Courts of equity will cancel deeds which are marred by fraud, or which on other grounds would operate unjustly. A cancelled or destroyed deed does not revest the thing granted in the grantor, though it terminates all personal engagements established by the deed. Fraudulent cancelling, destroying, obliterating, or concealing of any deed forming the title or part of the title to land is a felony. See ALTERATION.

**Cellulus**. See CHANCEL.

**Cancer**, or CARCINOMA, is one of the two varieties of Malignant Tumor, the other being known as *Sarcoma* (q. v.). The term Cancer does not indicate a single distinct disease, like pleurisy or appendicitis, but is applied to a group, the members of which are similar in many respects, and quite different in others—especially as regards the degree of malignancy and the form of treatment. For all practical purposes, both carcinoma and sarcoma may be here considered under the heading of Cancer, as they are equally malignant.

Carcinoma may occur in the skin, mucous membrane, mouth, and intestinal canal, and in the stomach, uterus, heart, liver, and other organs. The new growth commences by a proliferation of the existing cells of the epithelial tissues of the body. Very often these proliferating cells form solid columns, enclosed in a framework of connective tissue, and in this form invade the surrounding normal tissue. The cells are medium sized or larger, with large nuclei; they are variously shaped, depending on the variety and the situation of the growth; and they resemble the cells of the tissue from which the growth arises. In cancer of the skin and mucous membrane the structure is peculiar and characteristic, the cells being arranged in concentric layers, looking very much like the cross section of an onion; this is called a 'pearl' formation.

**Growth**.—Particular emphasis is to be placed on the fact, now thoroughly established, that at its inception cancer is a local disease, restricted to a small area. If the new growth is not removed or destroyed, however, the cancer cells rapidly multiply, and invade the surrounding normal tissues; and sooner or later enter the blood or lymph vessels, and are borne with the current to adjacent lymph glands, and to other parts of the body, often at some distance from the primary growth. Wherever the cancer cells lodge, multiplication follows, and a sec-

ondary or metastatic tumor is the result. These secondary tumors resemble the primary growth in structure, and they may become, in turn, the centres for further dissemination of the disease. A typical example is to be found in cancer of the breast, in which invasion of the lymphatic glands under the arm eventually follows the appearance of the growth in the breast; and instances of secondary tumors in the intestinal tract, lung, and liver are common.

In a brief time the new growth undergoes degenerative changes, which terminate in the destruction of the tissue composing the cancer. If the growth is on the surface, ulceration occurs, with progressive destruction, and the discharge of a foul-smelling fluid. The patient becomes feeble and anæmic, with impairment of the nutritive functions and other systemic disturbances—the so-called *cancerous cachexia*.

Unlike the benign tumors, which have a dense capsule of fibrous tissue, serving to confine the growth within definite limits and prevent invasion of the surrounding tissue, there is no capsule in malignant tumors, and consequently there is nothing to prevent the cells from invading the normal tissues in all directions. This explains why removal of a benign tumor is followed by complete recovery; whereas in the case of a malignant tumor it is often impossible to go far enough into the tissues to extirpate the entire area invaded by the cancer cells.

**Distribution.**—Cancer is well-nigh universal in geographic distribution, and no country or district of the globe is free from its ravages. Claims have been made that certain races possess immunity to cancer. For a long time, for example, it was supposed that Japan was immune to a remarkable degree, but since that country has made such rapid strides in medicine, statistics have been published which show that its death rate from cancer is actually higher than in some European countries (*e.g.*, Spain). These statistics also confute the theory that those who restrict themselves to a vegetarian diet are not liable to cancer, for the peasants of Japan live largely upon rice.

Nor is the disease restricted to the human family, for it has been found extensively among other members of the animal kingdom, as cattle, horses, dogs, cats, birds, fish, molluscs, and reptiles.

**Cause.**—The essential cause of cancer is unknown, though many theories have been advanced to explain tumor formation. These may all be grouped under two general classifications: (1) those which assume the presence of some living organism, or the

theory of *parasitic origin*; (2) those which presume the cause is to be found within the body itself, or the theory of *biological origin*.

A strong impetus was given to the parasitic theory in the summer of 1925 by the work of Dr. W. E. Gye and J. E. Barnard in Great Britain. Dr. Peyton Rous, of the Rockefeller Institute had previously (1910) published an interesting study of a sarcoma-like tumor in the domestic fowl, tissue from which, crushed, suspended in suitable fluid, and filtered, was capable on injection of producing tumors of a nature identical with the growths from which the filtrate was obtained. Gye found that cultures of this same chicken tumor, treated by chloroform and injected into healthy chickens, did not produce tumors, but these cultures mixed with suitable cultures from human or animal carcinoma did produce a tumor of the Rous type. From this he concluded that the parasite is killed by chloroform but leaves in solution a certain tumor-forming substance. When a filtrate carrying the 'cancer parasite' is mixed with the killed culture, the two work together so as to produce, on injection, a tumor of the Rous type. Gye's colleague, Barnard, moreover, with a special photographic apparatus in which light of a very short wave length can be used to photograph details not visible under the ordinary microscope, was able to demonstrate spheroidal bodies in cultures of chicken tumors which these investigators believe to be parasites. This work has been generally considered as extremely interesting and suggestive, but many considerations still prevent its general acceptance as proving the presence of a parasite as the final causative agent of cancer.

Contradictory views are also held regarding the influence of heredity. Many cases are on record where cancer has appeared in several successive generations; but while heredity plays a rôle, it is believed to be not an important rôle.

An important advance has been the recognition of certain precancerous conditions, benign in every respect, but which at any time, as the result of irritation, may undergo a malignant change. Among these conditions are moles, warts, wens, birth marks, old scars, burns, lupus, and chronic white patches upon the tongue (leukoplakia); the irritation caused by sharp fragments of teeth, ill-fitting dental plates, and bridges; X-ray burns; injuries and blows, particularly to the breast; and chronic irritation such as is found among workers in pitch, tar, paraffin, and aniline dyes. Constant local irritation

of any character is dangerous, a common example being cancer of the lip following the irritation produced by a pipe ('smoker's cancer'). Cancer of the uterus often follows neglected tears occasioned during childbirth.

**Symptoms.**—Cancer is largely a disease of middle and advanced life, although it frequently appears in the young. Any lump, growth, chronic sore, or unusual discharge occurring after thirty-five years of age should be regarded with suspicion, and the advice of a competent surgeon sought at once. The absence of pain does not preclude the possibility of cancer, for pain is never a prominent symptom in the early stages. The rate of growth may be rapid or slow, depending on the variety: those varieties which contain a large amount of fibrous tissue do not generally grow as rapidly, nor are they as malignant, as those which contain a relatively large number of cells. The cancerous cachexia, described above, does not appear until late in the course of the disease.

Any of the following symptoms may be considered as danger signals: **Skin.**—Cancer here commences as a warty-like growth, which persists in spite of all simple medication, and which soon ulcerates and begins to spread. **Mouth and Lips.**—Any crack in the lip that does not heal readily is suspicious. In the mouth, any chronic sore or white patches should receive attention. **Stomach.**—Cancer of this organ is the most frequent, and the most difficult to recognize, for the symptoms are often very obscure. Pain after eating, nausea, eructation of gas and fluid, and later vomiting of blood and loss of weight are symptoms. **Intestinal Tract.**—The usual symptoms are colicky pain, obstinate constipation, and blood in the stools. **Breast.**—In 95 per cent. of cases the discovery of a lump is the first evidence. Pain may be absent, and is never important at first. **Urinary Organs.**—The presence of blood in the urine demands attention. **Uterus.**—Irregular or persistent bleeding, or a foul discharge, calls for immediate examination.

**Prognosis.**—According to statistics compiled by the U. S. Bureau of the Census for 1922 (published 1924), there were 80,938 deaths from cancer in the registration area of the United States (pop. 93,241,043), or 86.8 per 1,000 of population. While the total number of recorded deaths from cancer increases year by year, this does not necessarily prove that there is a relative increase in mortality. The statement has been made that all forms are on the increase, but this is not borne out by an

Epithelial wart from the back of the wrist of a worker in shale (paraffin distillation). Such warts give rise to the skin cancers common in workers in paraffin, pitch, some forms of tar, and to chimney-sweeps' cancer. (Greatly magnified.)

Ulcerating adeno-carcinoma of breast. The skin is being undermined and exfoliated by the tumor cells which in part (a) are reproducing perfectly the glandular structure of mamma, in part (b) growing as solid cords.

Early squamous-celled carcinoma (epithelioma) of the tongue, magnified 50 times to show all the features of a small but fully developed carcinoma.

Secondary deposit of adeno-carcinoma of liver growing in the lung. Note reproduction of structure of liver.

Malignant tumor of the thyroid gland, which, notwithstanding very close resemblance to the normal gland, and production of the typical secretion seen in the spaces, produces secondary growths especially in the bones. Such growths illustrate that what is known as 'benign' structure may be compatible with 'malignant' behavior.

Mixed tumor of the parotid region, containing fibro-cartilage and undifferentiated squamous-celled epithelium, cystic spaces lined by epithelium, fat and fibrous tissue.

(From William S. Bainbridge's 'The Cancer Problem,' Published by Macmillan & Co. By Permission of the Author.)

ILLUSTRATIONS OF TYPICAL CANCEROUS GROWTHS.

analysis of the records. There has been no apparent increase in cancer of the skin, uterus, ovary, and liver; there has been an apparent increase in cancer of the stomach, intestines, breast, and tongue; but this may be explained in part by improved methods of diagnosis and by the more careful recording of the causes of death. Whether the increase is real or only apparent has not yet been absolutely determined. Other statistics show that 1 in 8 women and 1 in 11 men over thirty-five years of age die of the disease.

This high death rate for cancer could be greatly reduced by an early recognition of the disease, followed by prompt and thorough surgical removal. If the operation is performed before the lymphatic glands are involved, the chances of a cure are decidedly good. The report of the results of operations for cancer at the Johns Hopkins Hospital shows 85 per cent. of cures before glandular involvement, and 42 per cent. after the glands had become affected. Statistics compiled by G. W. Crile show only 14 per cent. of cures after lymphatic invasion; and Winter of Prussia claims that 87 per cent. of his patients applied too late for permanent relief. Other investigators report that the victim of cancer does not seek advice until a year or a year and half after the onset of the disease. The excuses for delay are many—dread of an operation, and the tendency to wait until the symptoms are more urgent, being the most common. It should always be borne in mind that nothing is gained by delay, and that every day of waiting lessens the chances of a cure. A simple operation may be effective in the beginning, whereas a serious and dangerous operation later on may have only slight chances of success.

**Treatment.** — The remedial agents suggested or employed in the treatment of cancer include almost every drug and method known to man. Every now and then a new 'cancer cure' is announced, for there is no more lucrative field for the quack than the treatment of all varieties of tumors. Many of these so-called cures do positive harm to the patient; while others, harmless in themselves, cause a loss of valuable time. Cases of the spontaneous disappearance of a cancerous growth have been reported, and some of the alleged cures are based on this. Other 'cures' are due to an erroneous diagnosis of malignancy in the first place, and still others are reported before a proper length of time has elapsed, for a case cannot be said to be cured until at least five years after treatment, without recurrence.

As a matter of precaution, all sources of irritation should be removed immediately. If any of the symptoms indicated elsewhere in this article should appear, no time should be lost in seeking competent advice, and in commencing proper treatment. It is much wiser to remove all precancerous conditions at an early age, rather than to wait in the expectation that there will be no malignant change.

While there are methods of treatment that in some instances offer a degree of hope for the sufferer, the evidence from all sources points to the conclusion that surgery is the method of choice for all operable cancer. An operation, to be successful, should include the thorough removal not only of all diseased tissue, but of all neighboring lymphatic vessels and glands, even when they appear to be normal and healthy.

Among non-operative methods of treatment employed at the present time may be mentioned the x-ray, radium, and other radio-active substances, fulguration, electro-thermic coagulation, desiccation, diathermy, and a large number of extracts and sera. The lead treatment developed by Dr. Blair W. Bell of Liverpool probably represents the most important advance in the treatment of inoperable cancer since the introduction of x-ray and radium. All of these procedures have their advocates, and the best method or methods in a given case must be left to the judgment of the authority consulted.

**Cancer Research.**—The movement for scientific cancer research in the United States was inaugurated in 1898, when the New York legislature made a small appropriation for equipping and maintaining a laboratory. The money was placed at the disposal of the University of Buffalo, where a laboratory was established, under the directorship of Prof. Roswell Park. This was taken over by the State in 1901, and has since been known as the New York State Board of Health. In 1899 the Cancer Commission of Harvard University was organized, under the terms of a gift of Caroline B. Croft; in 1903 the Collis P. Huntington Fund for Cancer Research was instituted; and in 1912 the George Crocker Special Research Fund was established at Columbia University. The name has now been changed to the Institute of Cancer Research, founded by George Crocker.

Organized investigation into the nature of cancer, and what may be accomplished toward its cure or alleviation, has also been conducted by the Cancer Department of the Rockefeller Institute

for Medical Research; the Research Department of the New York Skin and Cancer Hospital; the laboratory of the St. Louis Cancer Hospital; the Loomis Laboratory of Cornell Medical School; the Memorial Hospital of New York; the American Association for Cancer Research (1912); and the Research Hospital of the New York State Institute for the Study of Malignant Disease (1913), an outgrowth of the State Laboratory mentioned in the above paragraph.

Important institutions in Great Britain are the Cancer Research Laboratories of the Middlesex Hospital, the London Cancer Hospital, and the Imperial Cancer Research Fund, established in 1902 under the auspices of the Royal College of Surgeons. In Germany in 1900 a department of cancer was added to the Royal Institute of Experimental Therapeutics at Frankfurt-on-Main. The work there was under the direction of the great scientist, Paul Ehrlich, and he made many important contributions to the experimental side of cancer, but after a few years, realizing the difficulty of the problem, he turned back to his original work on Chemotherapy and discovered salvarsan. In 1919 an Institute for Cancer Research was established in Berlin with Blumenthal as director. This replaces the old Institute for Cancer Research at the Charité Hospital in Berlin, of which von Leyden was director for many years. While not directly undertaking research, the German Committee for Cancer Research has not only stimulated investigations and obtained official recognition and facilities for such research, but has established an important journal for cancer research, the *Zeitschrift für Krebsforschung*, in 1904, which has appeared continuously since that time. In France there is an Association for the Study of Cancer at Paris, which publishes the important *Bulletin pour l'Etude du Cancer*. The International Association for Cancer Research was inaugurated at Heidelberg in 1906; since then it has held conferences at Paris (1910) and the last at Brussels (1913).

**Bibliography.**—Consult William S. Bainbridge's *The Cancer Problem* (1914); F. C. Wood's 'Review of the Advances in Our Knowledge and Treatment of Cancer in the Last Thirty Years' (*Medical Record*, July 3, 1915); Publications of the American Society for the Control of Cancer, notably *Essential Facts about Cancer* (1924); and *What Every One Should Know about Cancer* (1924).

**Cancer Control, American Society for,** a society incorporated in the State of New York, in

1922, whose main object is the collection and dissemination of information concerning the symptoms, diagnosis, treatment, and prevention of cancer, and the compilation of statistics in regard thereto. Its operations cover the United States, Hawaii, the Philippine Islands and Canada. It has an executive committee of 20 members whose work is directed by a managing director and small office staff. There is a chairman for each State and province. It works in close coöperation with the medical profession, State and local health boards, and the Red Cross, and each year endeavors to carry on an intensive campaign of a week to focus public attention on the subject of cancer.

**Can'cer**, a northern constellation, and the fourth sign of the zodiac, represented by the symbol ☉. In ancient Egyptian uranography Scarabæus replaced Cancer. It contains the star cluster known as the Præsepe (q.v.).  $\zeta$  Cancri is visually triple, the close pair revolving about one another in 59 years, while the third component of the system moves round them in a period of undetermined length. Irregularities in its motion show that it revolves about a close, invisible companion in  $17\frac{1}{2}$  years. It is a spectroscopic binary, the period being 3.4 days.

**Cancer Research.** See **CANCER**.

**Cancer Root** (*Epiphegus virginiana*), or **BEECHDROP**, a parasitic herb of the order Orobanchaceæ, growing on the exposed roots of beech trees. It has a branching stem, purple and white blossoms, and scales instead of leaves. The whole plant is powerfully astringent, and was at one time reputed to be of value in cancer. The Indian Pipe (*Monotropa uniflora*) is also known as cancer root, and shares the same repute in popular medicine.

**Cancer, Tropic of.** See **TROPICS**.

**Cancionero**, kân-thê-ô-nâ'rô (Spanish; Portuguese *cancioneiro*, 'song book'), in general, a collection of lyrical pieces by one or more authors; in particular, the designation of the official collections of the poetic guilds which flourished in the Middle Ages at the courts of Spain and Portugal. Among the more famous were the Cancionero of Alfonso de Baena, the Cancionero in the Limousin district, that of Lope de Stuñaiga, that of Fernando del Castillo (1511); while no fewer than seven others are in the National Library, Paris. In 1511 Fernando del Castillo printed at Valencia a *Cancionero General*, or general collection of poetry, the first book to which this well known title was given. Similar collections

were made of Portuguese poems as early as the thirteenth century. The term is also sometimes applied to a collection of poems by various authors on one subject, such as the *Vita Christi* (Sara-gossa, 1492).

**Can'erum O'ris**, known also as **NOMA**, **WATER CANCER**, and **WATER CANKER**, is a peculiar form of mortification or gangrene, arising apparently from defective nutrition. The disease usually occurs between the second and eleventh years, and is generally preceded by measles or some other disease. The following is the ordinary train of symptoms: more or less general disturbance of the system, accompanied by loss of appetite, followed by swelling of the salivary glands, and a profuse flow of fœtid saliva, which escapes from the mouth involuntarily during sleep; ulceration of the gums, which swell and become livid; looseness of the teeth; and the appearance of ash-colored spots on the gums and adjacent mucous membrane, which turn into dark-colored, sloughy sores. These sores spread rapidly by a gangrenous process, expose the bone, finally make a large aperture in the cheek, and may involve the tongue and palate as well.

**Treatment.**—Obvious measures are to remove the patient to pure air, to administer tonics, nourishing food, and (in moderation) stimulants; to touch the diseased parts with nitrate of silver, or glyceride of carbolic acid; and to wash the mouth frequently with peroxide of hydrogen or a weak solution of potassium permanganate. Surgical treatment may be employed. Death occurs in from 75 to 80 per cent. of cases.

**Candaba**, kân-dâ'vâ, town, Philippine Islands, in Pampanga province, Luzon, on the Pampanga River; 28 miles northwest of Manila. Fishing (in Candaba Lake) and weaving are carried on. Pop. (1918) 14,394.

**Candaee**, kan'da-sê, the hereditary title of the queens of Meroë, in Upper Nubia, has been specifically applied (1.) to the queen of Sheba who visited Solomon; (2.) to a queen of Meroë who twice invaded Egypt, and was twice defeated by the Roman general, Petronius; and (3.) to the queen of Ethiopia, whose high treasurer Philip converted to Christianity (Acts viii. 27).

**Candahar**, kân-da-hâr'. See **KANDAHAR**.

**Candesh**, kân-dâsh'. See **KHANDESH**.

**Can'dela**, commune, Italy, in the province of Apulia, 24 miles south of Foggia. It produces wine. Pop. 7,000.

**Candelabrum**, kan-de-lâ'brum, an object which in ancient and modern times has often

served the dual purpose of a candlestick and a lampstand. It was frequently designed according to elaborately ramiform or 'branched' patterns; was wrought in many metals, precious and base, as well as in several kinds of stone; and varied in height from three to ten feet. Specimens found in Pompeii prove candelabra to have been common among the Romans, both for sacred and domestic uses. A beautiful bronze specimen of the twelfth century is in Milan Cathedral, and several fine examples are in the British Museum.

**Candia**, kan'di-a, the largest town in Crete, midway on its north coast. It has a small artificial harbor (much silted); steamers to Athens, Syria, Smyrna, Constantinople, and Trieste, ir-

Bronze Candelabrum, Milan Cathedral

regularly), a large bazaar, and growing trade in island produce. The exports and imports each have an annual value exceeding \$1,500,000. The Venetian walls, port, and arsenal remain, and traces of other fine buildings. The mediæval Cathedral of St. Titus was demolished about 1880; a new Greek one was consecrated in 1893. The population (1920, 24,848) is Greek, with a few Moslems, Jews, and others.

Candia was founded in 823 by Saracens; it stood a famous siege (1667-9), when the Turks captured it from the Venetians; and was further damaged by earthquake (1856), and by bombardment (1897).

**Candia** is also used as an alternative name for Crete. See CRETE.

**Can'didate** (Latin *candidatus*, literally 'white robed,' Roman candidates being thus arrayed), any person who offers himself or is put forward for election or appointment to some post of honor. See ELECTIONS.

**Candle**, a rod of solidified tallow, paraffin, wax or other fatty material surrounding a wick. A chandler's apparatus has been found at Herculaneum, and a fragment of a candle, supposed to have been made in the first century, is in the British Museum; but candles are not mentioned in any writings before the end of the second century. Little advance in the art of candle making was brought about until the fifteenth century, when the process of moulding was introduced by de Brez. Wax and tallow were the only materials in use until toward the end of the eighteenth century, when spermaceti was introduced; and the manufacture of stearin began early in the nineteenth century. Candles are now made of tallow, stearin, paraffin, wax, spermaceti (qq.v.), and compositions. Paraffin wax for candle making is produced by several methods. (See PARAFFIN.) Stearic acid, or stearin, a substance largely employed in candle making, is obtained from tallow, or is a mixture of tallow and palm oil. See STEARIC ACID.

**Wicks** are usually made of fine cotton yarn. A wick must have good power of absorption, burn freely, and leave little or no ash; it must also be suited to the fatty matter employed. For moulded candles plaited or braided wicks are used; they are made flat, so that in burning they bend downwards into the flame and are totally consumed. Tallow dip wicks are bulky, and are loosely twisted.

**Manufacture.**—There are three modes of manufacturing candles—by pouring and rolling, for wax candles; by moulding, for most other varieties of candles; and by dipping, sometimes employed for tallow candles, hence called 'dips.' As wax cannot be moulded, on account of its tendency to stick to the mould, it must be poured over the wick. The wicks are fastened to a large horizontal wheel fixed over the projecting lip of a basin holding the melted wax, and the melted wax is poured over each in turn. When this has been done several times, the candles are reversed and the

operation repeated, as the wax flows to the lower end and thickens it. The candles are afterwards rolled under pressure, and trimmed with knife and gauge.

Spermaceti, paraffin, and stearin candles are moulded. The simplest form of mould is the

poured into the trough. When the candles in the moulds have solidified, the superfluous material is removed with a trowel. The machines now employed for candle-moulding will mould as many as 100 candles at one time. The moulds for the tips are made movable, so that when one set of

hand-frame, in which hand-made candles are moulded. A number of mould-pipes (up to two or three dozen), held together by a frame, open into a trough at the top. The wicks are stretched through these, and secured at top and bottom by pegs or wires. The frame is heated to a little short of the solidifying point of the fatty material, which is then

candles has been moulded they are ejected from the tubes by an upward push of the tips, and are caught in clamps suspended above the trough. When the clamps are in turn raised, the wicks extend down through the tubes to bobbins arranged underneath. When the next set of candles is moulded, the wicks of those suspended in the clamps

are cut, and the candles are taken out; and so the operations go on continuously. The moulds are warmed and cooled by a device admitting hot or cold water.

In dipping, the wicks are suspended from a frame and are repeatedly dipped into the melted tallow until the requisite thickness has been attained, the tallow being allowed to cool after each immersion. The ornamental patterns sometimes given to candles require special hand-moulds. Aniline or vegetable dyes are generally used for coloring, as mineral dyes interfere with the combustion. Polishing, to give an extra degree of gloss, is usually accomplished by rolling between cloth-covered rollers. Consult Lamborn's *Modern Soaps, Candles and Glycerine*; Brant's *Manufacture of Soap and Candles*; Wright's *Animal and Vegetable Oils, Fats, Butters and Waxes, their Preparation and Properties* (1921).

**Candleberry.** See BAYBERRY.

**Candlefish** or OOLACHAN (*Thaleichthys*), a small fish allied to the smelt, which is found in vast numbers in the river mouths off the northern Pacific coast of North America. It is about 12 inches long, greenish olive in color, with an oily flesh, fine in flavor, and often used for food. It owes its popular name to the fact that the flesh is so oily that it will burn like a candle; and the fish is dried and used by the Indians as a torch, as well as for food.

**Candlemas**, the 2d of February, the day on which the Roman Catholic Church annually commemorates the Purification of the Virgin Mary and the Presentation of Christ in the Temple (Luke ii:22ff). On the same day the candles for the use of the church services during the coming year are also consecrated. The festival is also observed by the Anglican Church and Lutheran churches. In the Armenian Church the sacred new fire is kindled on Candlemas Eve; not at Easter, as is the usage elsewhere.

**Candlenut**, or CANDLEBERRY TREES (*Aleurites triloba* and *A. moluccana*), evergreen trees belonging to the order Euphorbiaceae, which grow wild in the Pacific islands and other tropical places. They are characterized by large, thick, maple-like alternate leaves and clusters of small white flowers. The nuts are rich in oil, which is extracted for food and light, and is a drying oil used by painters, known as 'country walnut' or 'kekune-oil.' The nuts themselves when slightly baked and shelled, are strung on rushes, and enclosed in a screw-pine leaf, are sometimes used as torches for fishing. The kernel of the nut is edible when roasted,

and a dye is obtained from the fruit; the hard shell also supplies lamp-black for tattooing.

**Candle-power.** See ELECTRIC LAMPS; GAS, ILLUMINATING AND FUEL.

**Candle-tree** (*Parmentiera cerifera*), a small shrub or tree, native to Panama. It bears large white flowers at the nodes, followed by yellowish white edible fruit not unlike wax candles in appearance.

**Candlish**, ROBERT SMITH (1806-73), Scottish preacher and theologian, was born in Edinburgh. He became minister of St. George's, Edinburgh in 1833 and after the death of Dr. Chalmers (1847) became the leader of the Free Church. In 1862 he succeeded Dr. Cunningham as principal of the New College, Edinburgh, the divinity hall of his denomination. His works include *Contributions towards the Exposition of the Book of Genesis* (1843-62); *The Atonement: its Reality, Completeness, and Extent* (1st ed. 1845; 2nd ed., rewritten and enlarged, 1861); *Examination of Mr. Maurice's Theological Essays* (1854); *The Fatherhood of God* (first series of the Cunningham Lectures, 1864-65); *Sonship and Brotherhood of Believers* (1872); *The First Epistle of St. John Expounded* (1866); *Reason and Revelation* (1859).

**Candon**, kán-don', pueblo, Luzon, Philippine Islands, in the province of Ilocos Sur., on the coast road; 24 miles south of Vigan. It carries on an important coast trade, produces indigo, rice, and tobacco, and has manufactures of cotton and silk. Pop. (1918) 99,950.

**Candy.** See CONFECTIONERY.

**Candytuft**, a genus of hardy plants of the family Cruciferae. The annual species, *Iberis amara*, whose flowers are white, and *I. umbellata*, with flowers of different colors, by regulating the time of sowing can be had in flower at any time during spring, summer, or autumn. The perennial species are mostly beautiful white-flowering plants from three to nine inches high, usually evergreen and shrubby, and all hardy. The common evergreen candytuft, *I. sempervirens*, with several varieties, which bloom in April and May, is one of the best. *I. gibraltarica* is pink and white, with large flowers, but is not so hardy as the other kinds.

**Cane**, a name applied to certain small palms, as well as to varieties of the larger grasses, such as the bamboo and the sugar-cane, which have a slender, reed-like stem. Strictly speaking, the name should be applied only to the family of palms (*Calamus*) known as rattans. Owing to their lightness and strength, rattans are employed by the people of the East for the

making of baskets, chairs, ropes, and similar objects, and great quantities are exported for similar purposes. The cane walking-stick is the malacca (*Calamus scipionum*), a native of Sumatra, the stem of which is thicker than the rattan. The 'cane' or 'cane-brake' of the Southern United States is *Arundinaria macrosperma*, reaching a height of about 25 feet. It has broad and flat leaves, and furnishes a valuable supplement to winter pastures. The flattened stems were used in aboriginal basketry and for matting, and are now utilized for fishing rods and the like. The smaller cane (*A. tecta*), is also a fodder plant, and in its stalk, furnishes a coarse, strong fibre suitable for cordage.

**Canea**, ká-ná'a, town, Crete, residence of a high commissioner, is situated on the north coast; 60 miles west of Candia. The town has a pleasant European quarter. The small artificial harbor (medieval) is much silted but is protected by a long mole. The fortifications and citadel, as well as many other monuments, date from the Venetian period (thirteenth century). It has foundries, soap factories, and printing establishments. Pop. (1920) 24,946.

**Canella**, ka-nel'a, a genus of evergreen tropical trees, of which one, *C. alba*, called 'wild cinnamon,' is a native of the West Indies. It usually grows to a height of about twelve feet, and bears small violet flowers which yield a musklike fragrance. The fruit is a small black berry and the whole plant has a pleasant scent. 'Canella bark,' is stripped from the young branches, and has tonic properties.

**Canephorí**, ka-nef'ó-rí, (Gr. *κανηφόρος*, 'basket-bearer'), high-born virgins and other Athenian women selected to carry baskets containing the implements of sacrifice in the Panathenaic and other processions. Canephorí occur on the friezes of the Parthenon in the British Museum. In architecture canephorí are female figures bearing baskets on the head; such figures support light entablatures in the manner of caryatides, with which they are sometimes confounded.

**Canes Venatici**, ká'nēz vē-nat'i-si, the Hunting Dogs, a small constellation close behind the Great Bear, discovered by Hevelius. Its chief star, designated by Halley Cor Caroli, is of the third magnitude, and with a fifth-magnitude companion constitutes a pair delicately tinted in yellow and lilac. The 'Whirlpool' nebula, typical of the spiral class, was discovered in Canes Venatici by Lord Rosse in 1845.

**Cane Sugar.** See SUGAR.

**Cañete**, ká-nyā'tā, town, Peru, in the province of Cañete,

on Cañete River; 90 miles south of Lima and connected by rail with Cerro Azul. The chief industries are the growing and manufacture of sugar, hat manufacture, and fruit growing. Pop. 3,500.

**Canete, MANUEL** (1822-91), Spanish man of letters, was born in Seville. Strongly conservative in politics, his courtly poems are now largely forgotten, though some of his lighter verse (*Poesias*, Madrid, 1859) has undoubted merit. His best poems are *La paz de Cuba* and *El arbol seco*, but he is best remembered as a fine literary critic, and editor and biographer of his famous friend, the Duke of Rivas. He also wrote dramas—e.g. *El duque de Alba*, *La esperanza de la Patria*, and *El rebato en Granada*.

**Canfield, JAMES HULME** (1847-1909), American educator and librarian, was born in Delaware, O. He was graduated (1868) from Williams College and was admitted to the bar in Michigan. He was professor at the University of Kansas (1877-91), chancellor of the University of Nebraska, 1891-5, and president of Ohio State University, 1895-9. In 1899 he accepted the librarianship of Columbia University. He was secretary of the National Educational Association, 1887-9, and its president, 1890, and held office in lesser educational organizations. Besides numerous contributions to the periodical press, he published *Taxation, a Plain Talk for Plain People* (1883), *A Short History of Kansas* (1885), *Local Government in Kansas* (1887), and *The College Student and his Problems* (1901).

**Cang** (*cangue, kae*), a Chinese instrument of punishment for trifling offences, being a kind of wooden cage fitting closely round the neck, with the weight proportioned to the nature of the offence, but so constructed that the culprit cannot lie down or feed himself. It is not removed during the period of punishment, which may extend to two or three weeks. On the cang are inscribed the offence and the name of the criminal, who is generally left exposed at one of the town gates.

**Cangas de Tineo, käng'gäs dā tē-nā'ō**, town, Spain, in the province of Oviedo; 37 miles south of Oviedo. It has woollen and linen industries. Pop. (1920) 23,668.

**Canicatti, kā-nē-kāt'tē**, town, Sicily, in the province of Girgenti, 15 miles north of Girgenti. It produces wheat, grain and wine and has sulphur mines. Pop. 25,000.

**Canicular Days.** See DOG DAYS.

**Canidæ, kan'i-dē**, the name of the dog family. The Canidæ are much less highly specialized

forms than the cats, as is shown by their more numerous and less strictly carnivorous teeth, their blunt, nonretractile claws, and certain minor anatomical peculiarities. They have forty-two teeth in all—three small incisors on each side of upper and lower jaw, one large canine, four pre-

minor peculiarities. The wild dogs of Asia are placed in a separate genus, *Cyon*; while the genera *Otocyon* (Cape fox), *Lycaon* (Cape hunting dog), and *Icticyon* (American bush dog) differ from the type in some respects. See DOG, FOX, WOLF.

**Canigou, THE, kā-nē-gōō'**, a

Types of the Canidæ, or Dog Family

1. Fox. 2. Black-backed jackal. 3. Dingo. 4. Wolf.

molars, and two molars on each side in the upper jaw and three in the lower. Most of the dogs hunt in packs, combining to overthrow animals which would be too powerful for the efforts of individuals. The members of the family are widely distributed, the type genus *Canis* being truly cosmopolitan, though it is probable that the wild dogs of Australia were introduced by man. To the genus *Canis* belong dogs, wolves, jackals, and foxes, animals which differ from one another only in

snow-capped mountain (9,137 feet) at the eastern end of the Pyrenees, in the French department of Pyrenées-Orientales. Here, 5,600 feet above the sea, are famous manganese mines, which have been worked since the 13th century.

**Canina, kā-nē'nā**, LUIGI (1795-1856), Italian architect and antiquary, was born in Casale, Piedmont. He was professor of architecture at Turin, where he produced his standard work upon ancient architec-

ture — *L'Architettura Antica descrittave dimostrata coi Monumenti* (12 vols. 1832-44). He likewise carried on important excavations at Tusculum and on the Appian Way. His other books include *Indicazione Topografica di Roma Antica* (1831; 4th ed. 1850-1), and *Descrizione dell' Antico Tusculo* (1841).

**Canisius College**, ka-nish'us, a Roman Catholic institution of learning in Buffalo, N. Y., opened in 1870 and incorporated in 1883, under the control of the Fathers of the Society of Jesus and registered by the Regents of the University of the State of New York. The college offers four-year courses in Liberal Arts, Natural Science, and Business Administration, besides the two year pre-professional courses preparatory to the study of Law, Medicine, and Dentistry. In addition to the recognition accorded Canisius College by the Regents of the University of the State of New York, the college is also a member of the Catholic Educational Association. The library contains about 25,000 volumes. For recent statistics see Table under the heading COLLEGE.

**Canis Major**, the Dog of Orion, one of Ptolemy's southern constellations. Sirius is its leading star. The next to it in brightness,  $\beta$  Canis Majoris precedes it in rising by twenty-two minutes. R Canis Majoris is a variable star, undergoing partial eclipses once in twenty-seven hours.

**Canis Minor**, an ancient constellation representing the Dog of Icarus, is situated northward of Canis Major. Procyon is its chief star.

**Canister Shot**. See AMMUNITION; CASE SHOT.

**Canitz**, ká'nits, FRIEDRICH RUDOLF LUDWIG VON (1654-99), German poet, was born in Berlin. He was the opponent of the mannerisms and extravagance of the second Silesian school, and the champion of simplicity, elegance, and sound sense, taking Horace and Boileau as his models. The first collected edition of his poems, *Nebststunden unterschiedener Gedichte*, appeared anonymously in 1700; a complete edition, with name and biography, in 1719. He wrote mainly occasional verse, odes, and satires, his work being at times characterized by genuine feeling, although somewhat stilted and bombastic.

**Canker**, a disease of fruit trees characterized by the splitting and death of part of the bark. Among the commoner causes of this condition may be mentioned careless pruning, planting in undrained soil, and excessive autumnal growth; but much the most important form

of canker is that caused by the growth of various fungi, which, effecting an entrance through some small wound of the bark, spread rapidly, destroying the bark in its course. Around the wound thus formed the bark grows abnormally, and presents an areola of thick, warty excrescence.

Among the more important of these fungi are *Nectria ditissima*, which causes European apple tree canker, *Nummularia discreta* which causes Illinois apple canker, *Sphaeropsis malorum*, the cause of New York apple tree canker and *Gloeosporium mali-corticis*, causing the Oregon apple canker. Canker often begins at the point of junction of two branches. In early autumn the fruits of the fungus may be seen, in the form of white specks, in crevices of the overgrown bark surrounding the wounds. In the spring another form of fruit, consisting of tiny reddish balls, appear in the same situation. Much grafted and budded trees are liable to canker. Young branches that are attacked should be cut off. When thick branches are affected, all the wounded parts should be cut away, and the cut surfaces luted with clay or protected with a coat of gas-tar. Grafts should not be taken from diseased trees, as parts that appear to be sound may contain the fungus in their tissues. The white stage of the fungus can be killed by applying with a brush a solution of sulphate of iron, one pound to a gallon of water.

**Cankerworm**, two destructive caterpillars of geometrid moths—the spring cankerworm (*Paleacrita vernata*) and the autumn cankerworm (*Alsophila pometaria*)—found in the United States from Maine to Texas. The spring species is about an inch long, naked, dark green and has a pair of prolegs on the hind end, and a single pair a short distance in front, and three pairs of true legs near the forward end of the body. The autumn cankerworm is very similar but has an additional pair of prolegs near the hind end. The eggs are laid on fruit and shade trees, and the larvæ frequently destroy the foliage of whole orchards in a few days. Spraying the trees with arsenicals, if thoroughly done, will kill the worms.

**Canmore**. See MALCOLM III.

**Canna**, kan'a, or INDIAN SHOT, ornamental plants belonging to the order *Cannaceæ*. They have ornamental leaves and large irregular flowers, red, orange, or yellow, in blazing tints and are popular in gardens and parks. They are natives of tropical and subtropical countries, and are therefore not hardy. Propagation is by division of the roots or

by seeds. The latter are so hard that it is desirable to file through their outer coats and soak them in water for twenty-four hours previous to sowing. The seeds are best sown in heat in spring, and as the plants are injured by frost they should not be planted outside until the weather is settled. Division of the roots should be performed in March. In autumn the outdoor plants must be lifted and placed in a greenhouse or cellar, preferably being covered with a little dry soil. The old tall-growing plants with inconspicuous flowers are now almost replaced by the large-flowered dwarfish plants known as Crozy's hybrids. *C. indica* is the Indian Shot, with red-spotted flowers; *C. iridiflora* of Peru, with brown and crimson flowers, has been combined with *C. flaccida*, native to our Southern states, to form many hybrids known as Italian canna. *C. edulis* is cultivated in the tropics for the starch in its roots.

**Cannabis**, kan'a-bis, a genus of plants belonging to the order *Urticaceæ*, contains a single species, *C. sativa*, the common hemp. This is an annual plant of from three to ten feet in height, covered with fine hairs. The leaves are digitate, composed of from five to seven narrow leaflets. It is believed to be a native of India and Persia, but is now widely grown as a fibre plant. Herodotus referred to the cannabis as a Scythian plant. It has long been known as an intoxicant, and has also long been used in medicine. It is the essential ingredient in the Indian intoxicant known as bang. *Cannabis indica* consists of the dried flowering tops of the female plants, and

Common Hemp

1, Male flower; 2, female; 3, fruit; 4, seed.

from these an extract and tincture are prepared for use in chronic spasmodic affections, as asthma, whooping cough, and migraine. See HEMP.

**Cannæ**, kan'ē, ancient town, Italy, in the province of Bari; 9 miles southwest of Barletta. In 216 B.C. it was the scene of Hannibal's disastrous defeat of the Romans under Lucius Paulus and Gaius Varro (see HANNIBAL).

**Cannel Coal**. See COAL.

**Can'nelton**, city, Indiana, county seat of Perry county, on the Ohio River, and on the Southern Railway; 133 miles southwest of Indianapolis. There are large coal mines and sandstone quarries in the vicinity, and the city has saw, roller, and cotton mills, potteries, brickyards, furniture and broom factories. Pop. (1910) 2,130; (1920) 2,008.

**Cannes**, kân, seaside resort, France, in the department of Alpes-Maritimes, on the French Riviera, 20 miles southwest of Nice. Opposite it, and separated from it by the Rade de Cannes, lie the Iles de Lérins (q.v.). Hills, rising to Le Cannet, two miles distant, cut off the northern winds and render the climate one of the most equable in Europe. These natural advantages have won for Cannes the title 'Pearl of the Riviera' and have made it one of the most popular of the Mediterranean resorts. The Promenade de la Croisette and the Casino Municipale are of special interest.

Cannes was founded by the Romans on a promontory between their *Via Aurelia* and the sea. During the Middle Ages it was held as a fief by the convent of the Lérins, and Abbot Adelbert began to build the Vigie or watch-tower in 1070. It was repeatedly attacked by the Barbary pirates, was twice entered by Charles v., and during the wars of religion was sacked by the Duke of Savoy. Its popularity as a resort dates from 1831, when Lord Brougham settled here. Its industries are concerned with the production of perfume, soap, glassware, fruit, and olive oil. Fishing is also of importance. Pop. (1921) 30,907.

**Can'nibalism**, the practice of eating human flesh is still observed among primitive peoples and in the past held its place even among tribes of a comparatively high level of culture. It has been inspired by a variety of motives, ranging from simple economic necessity to filial respect.

A modified form of cannibalism, based upon vastly higher instincts than the savage promptings of famine, has been developed by the belief that one may acquire the dominant qualities of a man or an animal by eating a portion of the dead body, notably

the heart, an important stipulation being that it be eaten raw, with all its virtue unimpaired. A classical instance is that of the Issedones mentioned by Herodotus (iv. 26).

The eating of one's kinsfolk—*endophagy* or *endocannibalism*—was practised as a pious funeral rite by the ancient Egyptians and Libyans, as appears from the discoveries of Flinders Petrie. In such cases the act of cannibalism was not preceded by murder, but was, on the contrary, intended as a reverent method of disposing of the corpse of one's relative who had died a natural death. Similarly, aged relatives and newborn children are eaten by some of the primitive tribes of Australia—a custom intelligible enough on the principle that 'the life is not allowed to go out of the family.'

Cannibalism may be traced in the early history of many peoples. In the British Isles, Strabo points out that certain tribes in Ireland were reported to be cannibals; while St. Jerome asserts that the Attacotti of Argyllshire and Dumbartonshire delighted in the taste of human flesh. The frequent recurrence of human bones among the animal remains in the kitchen middens of Skerrabrae, in Orkney, has also been held to testify to the cannibal proclivities of the dwellers there. Although ceremonial cannibalism was common in Mexico, the practice was never prevalent in North America; in South America it was general among various native tribes, notably the Caribs, Tupi, and Mesayas.

Of living races who practise cannibalism the natives of New Guinea and some Central African tribes (Mangbatu, A-Zandeh, Fans) are the most conspicuous. The Maoris of New Zealand and the Fiji Islanders have, however, now quite relinquished this practice, once so widespread among them—the last recorded case amongst the former having occurred in 1843.

Consult R. S. Steinmetz' *Endocannibalismus*; Loeb's *The Blood Sacrifice Complex* in *Memoirs of American Anthropological Association* (1923).

**Can'niff**, WILLIAM (1830–1910), Canadian physician and author, was born near Belleville, Ont. He was graduated from Victoria College, Coburg, and studied medicine in Toronto, New York, and London. He served during the Crimean War in the English Royal Artillery and on his return to Canada became professor of general pathology, and subsequently professor of surgery, at Victoria College. During the American Civil War he attended the hospitals in Washington, and served for a

short time in the Army of the Potomac. In 1867 Dr. Canniff took a leading part in founding the Canadian Medical Association. He was a delegate to the International Medical Congress at Paris (1867), was a staff-editor of the *Canadian Medical Journal*, and published *Principles of Surgery* (1866), *The Settlement of Upper Canada* (1869), *Canadian Nationality* (1875), and *The Medical Profession in Upper Canada* (1894).

**Canning**. See FOODS, PREPARED.

**Canning**, CHARLES JOHN, EARL (1812–62), British statesman, the third son of George Canning (q.v.), was born in Gloucester Lodge, near Brompton. He was educated at Eton and Oxford and in 1841 was appointed under-secretary of foreign affairs under Sir Robert Peel. Having demonstrated his great administrative abilities as Postmaster-general in Lord Aberdeen's cabinet (1853), he was chosen in 1856, by Palmerston, to succeed Lord Dalhousie as governor-general of India. Although he was severely criticized at the time of the Indian mutiny, it was later generally conceded that he had shown courage, wisdom, and firmness in this crisis. He became first Viceroy of India in 1858, and the following year was created earl.

**Canning**, GEORGE (1770–1827), British statesman, was born in London. He was educated at Eton and at Oxford, studied law, and in 1794 entered Parliament for Newport, soon proving himself a brilliant debater. His gift of wit and satire also found an outlet at this time in the pages of the *Anti-Jacobin* (1797–8), established to ridicule the excesses of the so-called 'revolutionaries.'

In 1796 Canning became under-secretary for foreign affairs; he was a member of the Indian commission in 1799–1800, paymaster general in 1800–01, and treasurer of the navy in 1804–06. He refused office in the 'Ministry of All the Talents' (1806) but became foreign secretary in the Tory administration which succeeded it (1807). Throwing himself with energy into the war against Napoleon, he planned the capture of the Danish fleet (1807), which established England's maritime supremacy, and vigorously supported the Spaniards in the Peninsula (1808). The failure of the expedition to Walcheren (1809) led to a duel between Canning and Castlereagh, the secretary of war; and as Canning refused thereafter to work with Castlereagh, he did not again hold prominent office until 1822. In the meantime he was member of Parliament for Liver-

pool (1812-22), was ambassador-extraordinary at Lisbon (1814), and president of the Indian Board, with a seat in the cabinet (1816-21), where he supported the coercive domestic policy of the government.

Succeeding Castlereagh as foreign secretary in 1822, Canning made it his policy to hold the balance between continental liberalism and the absolutism of the 'Holy Alliance.' Hence he asserted the principle of non-interference in the internal affairs of foreign states, and recognized the independence of Spain's American colonies (1823). He protected Portugal from Spanish intervention (1826), and so far allowed the claims of Greek independence

Joseph G. Cannon

as to propose the alliance of England, France, and Russia, which resulted (after his death) in the battle of Navarino. The retirement of Lord Liverpool in 1827 placed Canning at the head of the government, but he did not retain the support of Wellington, Peel, and the more unbending Tories. His premiership lasted only four months, a severe chill aggravated by mental anxiety causing his death on August 8, 1827. He was buried in Westminster Abbey.

Canning's Reciprocity Act of 1823, and his measure to modify the corn laws—defeated by Wellington in the Lords (1827)—carried out the free-trade policy of Pitt, and anticipated that of Peel; while his efforts to secure Catholic emancipation in the bills passed by him through the House of Commons (1812 and 1825) made possible the Emancipation Act of 1829. His speeches are open to the charge of over-elaboration and excessive polish, but their cogency and wit constitute them otherwise models of parliamentary eloquence.

Consult Stapleton's *Political Life of Canning*, and *Canning and his Times*; Marriott's *George Canning and his Times*; Temperley's *Life of Canning*.

**Cannizzaro**, kăn-nēt-tsā'rō, STANISLAO (1826-1910), Italian chemist, was born in Palermo. He studied medicine and chemistry in Palermo and in Pisa and became professor of chemistry at Alessandria in 1851, at the University of Genoa in 1855, in Palermo in 1861, and in Rome in 1871. He cleared up Avogadro's hypothesis as to the difference between atomic and molecular weights, thus affording strong confirmation of the atomic theory of the structure of matter and contributing to the development of modern chemistry.

**Cannock**, kan'uk, town, England, in Staffordshire, 7½ miles northwest of Walsall. Industries include tile making, the manufacture of edge tools, and coal mining. Pop. (1921) 32,321. **CANNOCK CHASE**, lying between Lichfield and Stafford, was originally a wooded district devoted to hunting, but is now a heath, with coal measures, and with iron-stone beds beneath the coal.

**Cannon**, SEE ARTILLERY; GUNS.

**Cannon, ANNIE JUMP** (1863- ), American astronomer, was born in Dover, Del. She was graduated from Wellesley College in 1884, was an assistant at the Harvard College Observatory (1897-1911), and in 1911 became curator of astronomical photographs. She made regular visual observations of variable stars of long period with a six-inch equatorial telescope, and discovered 200 variable stars, four new stars, one spectroscopic binary and numerous stars having bright lines or variable spectra. Her publications include a bibliography of variable stars comprising about 75,000 references, a catalogue of 225,000 stellar spectra, which fills nine quarto volumes, *Harvard College Observatory Annals*, and short papers and notes on stellar spectra. She is a member of the American Astronomical Association, a Fellow of the American Association for the Advancement of Science, an honorary member of the Royal Astronomical Society (British), and a member of the American Philosophical Society.

**CANNON, JOSEPH GURNEY** (1836-1926), American political leader, was born in Guildford, N. C., of Quaker parents. His father, a country doctor, was drowned when Joseph was fourteen, and the boy was forced to leave school and work in a country store. He later became apprentice in a law office, and in 1858 began practice in Douglas county, Ill. From 1861 to 1868

he was State's attorney in Vermillion county and soon became a prominent leader of the Republican party in Illinois. He was representative in Congress from 1873 to 1891, from 1893 to 1912, and again from 1914 until his voluntary retirement in 1923, a period covering half a century with the exception of four years. He was chairman of the Committee on Appropriations from 1895 to 1903, and was noted for his opposition to all extraordinary expenditures. He was elected Speaker of the 58th, 59th, and 60th Congresses, and of the 61st Congress, also, but only after opposition, which resulted in a modification of the rules of the House. Immediately after adjournment of this Congress (1909), opposition developed to his further re-election as Speaker based mainly on his methods, deemed to be arbitrary, and his Payne tariff record, and in 1910 he was succeeded by Champ Clark, Democrat.

Cannon was often attacked as a reactionary, as a 'hide-bound protectionist,' and an impedier of progress, but his personal honesty and integrity were never questioned, and his personal popularity was great. He was familiarly known as 'Uncle Joe.'

**Cannon-ball Tree** (*Couroupita guianensis*), a South American tree belonging to the order Myrtaceæ. It bears round fruit with a hard, woody rind, used as a drinking-cup by the natives.

**Cannon Bone**, the single bone formed in many artiodactyle ungulates by the fusion of the third and fourth metacarpals or third and fourth metatarsals, the fusion producing a single strong bone with a complicated method of articulation to the two digits below. This bone gives length and rigidity to the limb, and is a mark of specialization in the animals in which it occurs. In pigs, as the least specialized of artiodactyle ungulates, there are no cannon bones, the metacarpals and metatarsals being free from one another. Cannon bones are best developed in the ruminants—e.g., cow and sheep.

**Cannon Pinion**, in watchmaking, the small cogged wheel to which the minute hand of a watch is attached. See HOROLOGY.

**Cannstatt**, kăn'shtät, or KANNSTATT, town, Germany, in Württemberg, stands on the Neckar, 2½ miles east of Stuttgart, with which it was incorporated in 1905. It is famous for its hot saline springs and baths (water 62.5°-66° F.) and is a flourishing industrial place, manufacturing machinery, zinc wares, electrical apparatus, Daimler motors, cloth, and bricks. It has, also, iron works and railway repair shops. Good fruit and

wine are grown. The waters were known to the Romans, who established baths here in the eighth century. Pop. 27,000.

**Cannula**, a small tube used in surgery, through which any abnormal collection of fluid is drawn from the body.

**Cano**, *ká'nō*, ALONZO (1601-67), Spanish painter, sculptor, and architect, was born in Granada. Having gone to Seville, he studied painting under Pacheco and sculpture under Juan Martínez Montañes, and painted in that city, Madrid, and Granada, where he founded a school. Philip iv. nominated him 'painter to the king' and royal architect. His work is characterized by boldness of design, facility of handling, a knowledge of chiaro-scuro, and purity of flesh tints. Most of his paintings are in Seville, others in the Prado Museum at Madrid, a Madonna in the cathedral at Malaga, and the *Apostle Paul* in the Dresden Gallery. His best statue is the *Madonna and Child* in the Church of Nebrissa. *The Vision of St. John the Evangelist* is in the Wallace Collection, London. His chief architectural work is the cathedral at Granada.

**Cano**, JUAN SEBASTIAN DEL (c. 1460-1526), Spanish navigator, took part in Magellan's voyage around Cape Horn (1519), and on the death of his leader in the Philippines (1521) assumed command of the expedition. In the sole surviving ship of the fleet he returned, by the Cape of Good Hope, to Spain (1522), and was thus the first circumnavigator of the globe. Cano was lost while on a second expedition to the West Indies.

**Canoe**, a light boat without any fixed fulcrum to assist the user of the paddle by which the canoe is usually propelled. The canoeist, accordingly, always sits with his face toward the bow. Canoes are constructed of many different materials and in a great variety of shapes. In their simplest form they are lengths of tree trunks rudely shaped and hollowed out. 'Dug-outs' of this description were used by many primitive peoples, and the form is still to be seen in the *kisúis* floating on out-of-the-way Indian waters. As used in Greenland waters, the canoe is flat-bottomed and flat-sided, but the ordinary Eskimo canoe has a curved whalebone framework, over which seal or walrus hide is stretched. Some native canoes have decks, others are fitted with outriggers; some are barely large enough for a single occupant, while others, especially the 'war canoes' of the Pacific Islanders, carry from forty to fifty persons.

'Rob Roy' canoes, so-named by their originator, John Mac-

Gregor (q.v.), who travelled many miles in them, are from 12 to 15 feet long, with a beam of from 26 to 30 inches and a depth of from 10 to 16 inches. The paddle is usually double-bladed, 7 feet long, with 6 inches of breadth in the blade. A mast with a light sail can be hoisted if desired. An ordinary travelling

to resist the action of the water. The birch-bark canoe of the Indian was the first type employed in America, and is still in use, although it has been generally supplanted by craft of lighter wood. It is sharp at both ends, has a rounded bottom with no keel, and is propelled by a single blade or half-paddle, although

Types of Canoes

a. Ancient dug-out (British Museum). b. Eskimo kayak. c. Kootenay Indian birch-bark canoe. d. Canadian birch-bark, or wood canoe. e. Solomon Islands canoe. f. Vanatahi canoe, Paumotu Archipelago. g. 'Rob Roy' canoe. h. Outrigger canoe, Pacific Islands. i. Peruvian canoe from Lake Titicaca, made of grass or palm and rope.

'Rob Roy' canoe weighs about 70 pounds, and will float with its paddle and 10 pounds of luggage in 5 inches of water. The 'Rob Roy' is generally built of oak, with a cedar deck.

Canoes are built of many kinds of wood, but mahogany, cedar, and basswood are the favorites; many are made of paper and some of canvas especially treated

double-bladed paddles are used, mainly in racing, and a keel is sometimes provided for its stabilizing qualities. Canoes of this description are common on rivers, lakes, and streams in America, the type being varied according to the waters where it is to be used.

A good type of American paddling canoe for two men is one

16 feet long, 32 inches beam, 7½ inches freeboard, and 4 inches draught. It displaces about 480 pounds, of which 72 pounds would account for the canoe and her gear, and about 308 pounds for the crew, leaving 100 pounds for camping paraphernalia and other supplies. Generally the canoe is built for the owner, its size depending upon its use and the weight it will have to carry, the figure being brought as low as possible to provide for portages. Canvas-covered canoes are equipped with two cane seats but most all-wood canoes are not. The Indians knelt on the bottom of the canoe when paddling and this is probably the best method, but for long periods it often proves tiresome.

Racing canoes are built upon the plans of racing shells—with enough buoyancy to hold the paddler. Sailing canoes are constructed along the same lines as paddling canoes, but have cross beams to stand the strain of the masts and sails. The *spoonson* is an ordinary canvas-covered canoe to which have been added air chambers on either side. It is especially adapted for sailing and for fishing.

The chief body of canoe organizations in America is the American Canoe Association, with geographical Divisions along the Atlantic coast. Each Division has its annual meet and races, while the Association has a two weeks' encampment each year among the Thousand Islands on the St. Lawrence, with sports and races.

Consult MacGregor's *A Thousand Miles in the Rob Roy Canoe*, *Rob Roy on the Baltic*, and *Rob Roy on the Jordan*; Baden-Powell's *Canoe Travelling*; Steele's *Canoe and Camera*; Miller's *The Boys' Book of Canoeing and Sailing* (1917); Jessup's *The Boys' Book of Canoeing* (1926).

**Canon**, in ecclesiastical usage a rule of faith or practice, established by competent authority. The body of these rules constitutes the Canon Law (q.v.) of the Roman Catholic Church.

The *Canons of the Church of England*, 141 in number, were framed at the Hampton Court Conference (1604). In 1640 they were revised by Convocation and seventeen new canons were added. The Book of Common Prayer as revised in 1661 and legalized by the Act of Uniformity under Charles II. (1662) is the latest rule of church order and discipline of the English Church. The canons therefore must be interpreted by its rubrics.

The *Scottish Book of Canons* is a code issued by the bishops in Scotland under mandate of Charles I. After being revised by Archbishop Laud and confirmed

by letters-patent under the Great Seal (1635), they were published at Aberdeen in 1636. This code limited the power of the church courts so far as to make their findings subject to the bishop's ratification, while it also asserted the king's supremacy in matters ecclesiastical.

The term canon is also applied to any official church list, as of those worthy of commemoration in the liturgy (whence the term canonization, q.v.), and to a class of long and elaborate hymns used in the Greek Church at the morning service, founded mainly on the Old Testament canticles.

For the canon of the mass, see MASS, and for the canon of Scripture, the authoritative list of books constituting the Bible, see BIBLE.

**Canon**, a member of the chapter of a cathedral or collegiate church, living in a community under definite rules. The organization of the clergy of a see into a community dates from the fourth century, and the formulation of a rule of life from the eighth, when Chrodegang, bishop of Metz, drew up a clearly defined set of rules for his clergy. This rule was adopted by other cathedrals and formed the basis of the rule for canons adopted in 816 by the Council of Aix-la-Chapelle. Thereafter it became a common practice for large and important churches (not cathedrals) to adopt an organization similar to that of the cathedral chapter. Such churches were termed 'collegiate churches.' The rule was also adopted by certain bodies of regular canons, unconnected with any cathedral or collegiate church, who formed (1067) what was practically a new monastic order, living in 'houses' of their own. Owing to their strict adherence to the teaching of St. Augustine, these became known as Augustinian canons. In the British Isles, at the time of the Reformation, they possessed nearly two hundred and sixty houses in Ireland, over two hundred in England, and twenty-five in Scotland.

The canons attached to wealthy cathedrals and collegiate churches had by the 11th century, and indeed considerably earlier, largely given themselves up to lives of dignified ease. Papal edicts were issued in 1059 and 1063, binding them to a community life and the renunciation of private property. Following the Reformation most of the old foundations disappeared, the Lateran Canons and Premonstratensians being the chief who still exist. After the church attained to wealth and power, canons were often chosen for their administrative abilities;

and even after the decay of the canons regular, canons secular were still deemed necessary for the administration of church property, not only in the Roman Catholic Church, but also in the Protestant Episcopal churches. The name is now applied to certain clergy who form a sort of council to the bishop and perform certain duties in the cathedral church.

**Canon**, in music, a species of composition written strictly according to rule—whence the name. A canon may be composed in two, three, or more parts, and invariably consists of a melody executed by one part, and imitated, note for note, by another part, beginning some beats later at either the same or a different pitch. More 'canons' than one may be maintained at the same time, and they are applicable to both vocal and instrumental music. Canonic imitation first appeared in the compositions of the 12th century. For examples, consult Purcell's *Gloria Patri* in his Collection; also Ouseley's *Treatise on Counterpoint, Canon, and Fugue*.

**Cañon**, kan'yun, or CANYON, a name signifying 'a gorge,' applied originally to the deep, narrow gorges in the Western United States, cut by rivers in the solid rock, the most notable example being the Grand Cañon of the Colorado. The causes which have produced these remarkable gorges include, in addition to the cutting action of the streams, first, a process of continuous uplift, which has maintained the rapid flow of the river, and counteracted its deepening action; second, the arid climate, which has prevented the disintegration of the rocky walls by frost and springs, and maintained their vertical character. See GRAND CAÑON OF THE COLORADO.

**Cañon City**, city, Colorado, county seat of Fremont county, on the Arkansas River, and on the Atchison, Topeka and Santa Fe and the Denver and Rio Grande Railroads; 90 miles southwest of Denver. It is beautifully situated at the mouth of the Grande Cañon of the Arkansas, at an altitude of 5,343 ft. The city has a public library, is the seat of the State penitentiary and State armory and has rich coal mines in the neighborhood. It is also an agricultural, horticultural, and live-stock centre. Its zinc-lead smelting works are among the largest in the world. Manufacturing industries include a publishing and printing plant, a large light and power plant, gas plant, canning factories, creameries, foundry and machine shop, artificial ice plant, bottling

THE GRAND CAÑON OF THE COLORADO

Vol. II.—March '27

works, stone quarries, cement plants, and pressed brick factories. Hot mineral springs and mild climate make the city an important health resort. Pop. (1910) 5,162; (1920) 4,551.

**Can'ones**, originally a woman who took a vow to remain unmarried and gave herself to good works, living in her own home. Later the church permitted and encouraged women to associate themselves under rules somewhat similar to those of canons and eventually two great sections developed, regular and secular. The regular canonesses practised a life of austerity and poverty, but the secular canonesses were allowed to possess property to an unlimited extent, and their duties consisted merely in instructing young girls in such accomplishments as the arts of illuminating missals and ecclesiastical embroidery. Indeed, from the time of its inception, during the reign of Louis le Débonnaire (778-840), down to the Reformation, this order was for the most part rather a retreat for women of good birth than a truly conventual order. Many chapters of the secular canonesses became Protestant at the Reformation (e.g. those of Gandersheim and Quedlinburg in Germany), and continued to exist with little alteration from their former life.

**Canon'al Hours**, certain hours of the day set apart by church canon for prayer and devotion. These hours were eventually arranged as follows: Prime, 6 A.M.; Tierce, 9 A.M.; Sect, at noon; None, 2 or 3 P.M.; Vespers, about 4 P.M.; Compline, 7 P.M.; Matins and Lauds, at midnight or day-break. In the Church of England the term refers to the time during which marriage may be legally solemnized: i.e. 8 A.M. to 3 P.M.

**Canoniza'tion**, the formal process by which the Roman Catholic Church bestows on a person the title of 'saint' and enrolls his or her name on the list of saints, the *Canon Sanctorum*.

In the primitive Christian church the germs of the modern custom are to be found in the honors publicly paid to the martyrs. For many centuries the appellation of saint was given to individuals by popular acclamation. Martyrologies, menologies, calendars, and the like, were composed, which gave with more or less discernment and authority the names of the generally acknowledged saints, while it would fall to the bishop to decide to whom he should assign a feast-day or ritual commemoration within the limits of his own jurisdiction.

It was not until a compara-

tively late period that a regular form of procedure equivalent to canonization was adopted. The earliest acknowledged instance of a solemn decree of canonization is that of Udalric or Ulric, bishop of Augsburg, declared to be a saint by John XVI. in 993 A.D. Alexander III. (1170) reserved the right of canonizing exclusively to the Holy See. Urban VIII., in two constitutions, 1625 and 1634, made more stringent regulations, and laid down the procedure in cases of canonization, which, with slight modifications, is in force at the present day.

In modern times the person who is thus honored must have first passed through the intermediate stage of beatification. This ceremony, which takes place publicly in St. Peter's at Rome, after a lengthy and minute inquiry into the life of the candidate, and conclusive proof that he has worked miracles, consists of the solemn publication of the decree by the Pope. After at least two miracles performed subsequent to beatification, and a further searching inquiry, canonization may follow, an interval of at least fifty years between canonization and death being generally insisted on.

The miracles alleged to have been wrought through the intercession of the beatified one are subjected to the keenest scrutiny, and any doubt attaching to them is dwelt upon by the *promotor fidei* (popularly known as *advocatus diaboli*, 'the devil's advocate'). The question is then considered by three successive 'congregations' over the last of which the Pope presides; and a form of decree is drawn up authorizing the crowning act of canonization. This high ceremonial is proceeded with in St. Peter's, in the presence of the Pope, the Sacred College, other dignitaries of the church, and the clergy and people. A day is also fixed for the annual commemoration of the saint. The standard work on this subject is the *De Beatificatione . . . et Canonizatione Beatorum* (1766) of Pope Benedict XIV. (Prospero Lambertini).

In the Greek Church the ceremony of canonization takes place in the presence of the Patriarch, who causes the testimony of witnesses to be examined in a synod of bishops assembled for that purpose, but the ceremony is seldom performed.

**Canon Law**, in the Roman Catholic Church the body of church laws. The word 'canon' was first applied to the injunctions of the founders of Christianity and to matters of common consent, and later, also, to the decrees of councils and of the Popes. The first

collections of canons were Greek. One of the earliest is the so-called *Apostolic Canons*, consisting of eighty-five precepts and rules usually appended to the eighth book of the *Apostolic Constitutions*. They range in date from the second to the fifth century and certainly are not of apostolic authorship. About 500 Dionysius Exiguus of Rome translated fifty of the *Apostolic Canons* into Latin and added about 200 canons of councils. He also made a collection of papal decretals and the two works united for a time passed as the authoritative collection of the Western Church. About 1140 Gratian, a monk and teacher of law at Bologna, compiled his *Decretum*, which soon superseded all earlier efforts. In course of time it became customary to join with the *Decretum* four other works, viz.: the *Decretals* of Gregory IX. and of Boniface VIII., the *Clementine Constitutions*, and two books of *Extravagantes*, the whole constituting the *Corpus juris canonici*. This is frequently meant when reference is made to the canon law. But it should be borne in mind that many different collections were used at different times and in different places and the issue of new decretals and inevitable developments soon made any particular attempt at codification incomplete.

The Canon Law has naturally been of the greatest importance in Roman Catholic countries, but its influence on the legal systems of other countries and on international law has been great.

The best edition of the *Corpus* is Friedberg's (2 vols., 1879-81). Consult, also, histories of the canon law by Schulte (3 vols.) and Hinschius (4 vols.), the English translation of *Apostolic Canons* by T. MacNally, and Mansi's collection of the canons of councils (31 vols., 1759-98).

**Can'onsburg**, borough, Pennsylvania, in Washington county, on Chartier's Creek and on the Pennsylvania Railroad; 19 miles southwest of Pittsburgh. Its industries include steel mills, potteries, bridge works, and a can factory, and there are large mines within a radius of a few miles. The Pennsylvania Training School known as Morganza is a mile from the city. Canonsburg was founded in 1802, and was formerly the seat of Jefferson College, until its union with Washington College (see WASHINGTON AND JEFFERSON COLLEGE). The 'Old Black Horse Tavern,' which was recently torn down, was the home of the Whiskey Rebellion. Pop. (1910) 3,891; (1920) 10,632.

**Canopus**, a lustrous southern star in the constellation Argo,

about half a magnitude fainter than Sirius. It is immeasurably remote, and must accordingly be of prodigious real magnitude. Its spectrum is of early solar type.

**Canopus**, ka-nō'pus, an ancient town in Egypt, about 15 miles northeast of Alexandria. It was near the modern Aboukir and the westernmost mouth of the Nile, hence called the Canopic mouth. The town was famous for a temple of Serapis, and for its luxury, and was a favorite resort of the Alexandrians. Canopic vases, with tops shaped like human heads, to hold the viscera of embalmed bodies, were manufactured here.

**Can'opy**, the protecting covering held over the heads of monarchs and other dignitaries, or the covering suspended over a bed. In architecture the term indicates the stone 'awning' erected over a tomb or seat, the roof-like ornament surmounting a niche, or the decorative mouldings over a door or window.

**Canosa**, kā-nō'sā, town, Italy, in the province of Bari; 16 miles southwest of Barletta. It is the seat of a cathedral of Byzantine style, with interesting columns and a richly carved pulpit. There is trade in oil and wine. As Canusium, Canosa was in early times one of the chief commercial towns of Italy. Pop. (1921) 26,172.

**Canossa**, kā-nō'sā, village, Italy, in the province of Reggio nell' Emilia, 14 miles southwest of Reggio, is famous for its castle (now in ruins), where the German Emperor Henry IV. (q.v.) humiliated himself before Pope Gregory VII. in 1077.

**Canova**, kā-nō'vā, ANTONIO (1757-1822), Italian sculptor, reviver of the classic school, was born in Possagno, near Venice. He received instruction in the use of the sculptor's tools from his grandfather and worked under the Venetian sculptors Torretto and Ferrari. His first works, executed when he was still in his teens, were statues of *Orpheus* and *Eurydice*, now preserved in the palace at Asolo. The best work of this early period is his *Dædalus and Icarus*, in the Venetian Academy. In 1780 Canova went to Rome, where he soon became imbued with enthusiasm for classic antiquity, applying himself zealously to the antique and producing, among other groups, *Theseus Vanquishing the Minotaur*, *Psyche and the Butterfly*, several representations of *Cupid and Psyche*, and *Venus and Adonis*. In 1798 troubled conditions in Rome led him to spend several years in travel with his friend and patron Prince Rezzinoco. On

his return he executed *Perseus with the Head of Medusa* for the Vatican, *Venus*, and the *Three Graces*. In 1802 and 1810 he was in Paris, where he modelled various statues of Napoleon and his family, and in 1815 he was sent to France as emissary of the Pope to seek the return of art treasures removed by Napoleon. As a reward for his successful accomplishment of this mission, he was made Marquis of Ischia.

Besides the works already spoken of, may be mentioned the following, which include some of the sculptor's most celebrated works: *Mars and Venus*; *Hebe*, of which he made various replicas; the monument to Maria Christina, Archduchess of Austria; *Pius VI.*; *Hercules and Lichas*; *The Kneeling Magdalen*; a statue of George Washington, and many portrait busts of contemporaries.

**Canovas del Castillo**, kā'nō'vās del kās-tē'l'yō, ANTONIO (1828-97), Spanish statesman and historian, was born in Malaga. At an early age he became interested in politics and was a member of the Cortes (1852), director-general of the administration (1858-61), and minister of the interior (1864). He was banished after the revolution of 1868 but returned in 1869 and was one of the leaders in the movement to put Alfonso on the throne. He became premier in 1875 and held that office with various intervals until his assassination by an anarchist in 1897. He was a member of the Spanish Academy from 1865, and from 1890 onwards edited and directed the publication of the co-operative *Historia general de España*. Among his works are *Estudios literarios* (1868), *Problemas contemporáneos* (1884), *Estudios del reinado de Filipe IV.* (3 vols. 1888-90). Consult Creux's *Antonio Canovas* and Pons y Humbert's *C. del Castillo*.

**Canrobert**, kān - rō - bār', FRANÇOIS CERTAIN (1809-95), marshal of France, was born in St. Céré. He entered the army in 1828 and distinguished himself in the Algerian wars (1835 and 1841-51). Upon the outbreak of the Crimean War he commanded the first division of the French army, and on the death of Marshal St. Arnaud became the French commander-in-chief. He was twice wounded at the battle of the Alma, and again at Inkerman, but he completed the lines of investment at Sebastopol. Owing, however, to differences with Lord Raglan, he resigned his command in May 1855. In the Italian war he was present at Magenta and Solferino (1859), and in the Franco-German War (1870) commanded the

Sixth Army Corps, sustaining the disastrous defeats of Wörth and Gravelotte. Besieged in Metz with Bazaine, he shared in the surrender, and was imprisoned in Germany. After the war he entered political life and became a Senator. Consult *Biographies*, in French, by Martin and Bapst.

**Canso**, a cape at the north-eastern extremity of Nova Scotia, on the south side of Chedabucto Bay. The town of Canso (pop. 1,600) is the western terminus of several Atlantic cables.

**Canso**, STRAIT OF, a body of water, about 17 miles long, connecting the Gulf of St. Lawrence with the Atlantic Ocean and separating Nova Scotia from Cape Breton Island.

**Cant**, generally a corner, angle, or niche. In architecture, it indicates the corner of a square cut off octagonally. In building, a cant brick is one cut on the splay. In nautical language, it describes a tilt or inclination, or ship's timber near the bow or stern, lying obliquely to the keel.

**Cantab.** (*Cantabrigiensis*), of Cambridge, England.

**Cantabile** and **Cantilena**, kān - tā'bē - lā, kān - tē - lā'nā, musical terms denoting a smooth-flowing, sustained method of performance, as contrasted with the interchange of *fortissimo* and *pianissimo* passages.

**Cantabria**, the name applied in ancient times to a district of Spain on the southern coast of the Bay of Biscay. It was the home of the Cantabrians (q.v.).

**Canta'brian Mountains**, a chain of mountains, an offshoot of the Pyrenees, in the northern part of Spain, extending for about 375 miles eastward from Cape Finisterre to the western end of the Pyrenees. They reach their greatest height, 8,700 feet, on the border of Asturias and León. They are rich in coal and iron. Different portions of the range have particular local designations.

**Cantabrians**, or CANTABRI, the name applied in ancient geography to the inhabitants of the part of Spain lying to the south of the Bay of Biscay (the *Mare Cantabricum* of that people), and corresponding more or less closely to the modern provinces of Asturias, Santander, Viscaya, and Guipuzcoa, though it was latterly restricted to Asturias and Santander. They were brave and martial in character and though compelled to acknowledge the supremacy of Augustus (25 B.C.), and defeated by Agrippus, they were never completely subjugated. The Basques claim descent from this brave people.

PERSEUS WITH THE HEAD OF MEDUSA

*The famous statue by Canova in the Vatican Museum*

**Cantabricum Mare**, ancient name of the Bay of Biscay (q. v.).

**Cantauczenus**, kan-ta-kū-zē'nus (c.1292-c.1380), John VI., emperor of the East, was born in Constantinople. He was prime minister under Andronicus the younger in 1328, and in 1341 became regent for John Palæologus. He subsequently seized the throne (1342), and after six years of civil war, was recognized as joint-emperor with Palæologus. In 1354 a popular revolt in behalf of Palæologus forced Cantauczenus to resign, and he retired to a monastery, where he wrote the history of the empire from 1320 to 1360.

**Cantagallo**, kan-ta-gál'lo, town, Brazil, in the state of Rio de Janeiro; 100 miles northeast of Rio de Janeiro. The chief products are coffee, sugar, and salted meats. Pop. (1921) 29,856.

**Cantal**, kán-tál', department of Central France, in the former province of Auvergne; area 2,229 square miles. The centre of the department is occupied by a large volcanic mass, the culminating point being Plomb du Cantal (6,095 feet). From this mass flow, north and west, the rivers Dordogne and Truyère. The northeast of the department is drained to the Loire basin. The chief products are rye, buckwheat, potatoes, and chestnuts. The natural beauties and the numerous mineral springs attract many tourists. Coal, marble, and antimony occur. Aurillac is the capital. Pop. (1921) 199,402.

**Cantaloupe**. See MELON.

**Cantarini**, kán-tá-rē'nē, SIMONE (1612-48), known also as Simone da Pesaro, Italian painter and etcher, was born near Pesaro. He was a pupil of Guido Reni, and so closely imitated that painter that his works have sometimes been attributed to his master. His paintings deal chiefly with Scriptural subjects, but include, also, a fine portrait of Guido, in the Bologna Gallery. As an etcher his reputation is high.

**Cantata**, kan-tá'ta, literally a composition to be sung, as opposed to one to be played (sonata). The earliest form consisted of a recitative (developed from the early opera) given by one person to a simple accompaniment on lute, cello, harpsichord, or other instrument, the text being a short drama or story in verse. An advance in style was made by the addition of an air repeated more or less regularly, and two types became general—the *cantata da chiesa*, which had a sacred subject, and the *cantata da camera*, with a secular subject.

Whether or not Carissimi

(q. v.) is the inventor of the cantata, to him is due its transference, in the seventeenth century, to the church from the chamber. Showing a strong instinct for treating the voice instrumentally, he brought to the cantata new brilliance and expressiveness, through a freer type of melody and variety of accompaniment. Other writers of the period who improved upon the recitative were Lotti, Marcello, Gasparini, and Cesti.

The beginning of the eighteenth century saw the development of a more extended form, in which various movements were incorporated. Domenico Scarlatti and Pergolesi produced splendid works, of which the latter's *Orfeo ed Euridice* is perhaps most notable. The end of the line of composers using the single voice came with Handel, whose accompaniments included strings and oboes. A special form developed in the church-cantata of Germany, created with a congregational participation in mind. Vocal resources were expanded, several movements were used, and the chorus was an important feature. The organ, alone or with some orchestral groups, furnished the accompaniment. Cantatas were composed around certain church days and various other religious occasions, and a style resulted calling for church presentation only. Bach enriched the literature by a long list of church-cantatas, as noble in conception as they were masterful in execution. Other cantatas sprang up around individual characters, and from this to the larger occasional type in the national cantata was but a step.

The nineteenth century saw an enlargement of subjects for the cantata, due in part to the romantic elements in music, which began to be felt more strongly early in the century; while the presentation of more elaborate works became possible through the active work of numerous choral societies. To the names of composers already given, should be added, as significant contributors, Beethoven, Brahms, Mendelssohn, Schubert, Schumann, and Wagner (qq. v.).

**Canteen'**, a soldier's wooden, leather, or metallic flask for water or other liquid, of about two to two and a half pints capacity. On the march it is carried slung over the shoulder or hooked to the waist belt. The canteen used in the United States Army is made of aluminum and is provided with a closely fitting, removable cover of heavy duck, lined with felt. An aluminum cup made to fit over the lower half of the canteen is also carried within this

cover. In the British Army the canteen is a combination of pan, plate, or dish of tin covered with thin leather, and is carried strapped either to the knapsack or to the waist belt.

The word canteen is also applied to the store and recreation centre, officially known in the United States Army as the Post Exchange, established in every army garrison and governed by regulations of the War Department. The purpose of the Post Exchange is to serve primarily as a club for the enlisted men and as a store to furnish them and other military inhabitants of the post with various commercial articles at the lowest price consistent with good quality. It is managed on a co-operative basis under the direction of a commissioned officer detailed for that purpose, the profits being divided on a *pro rata* basis among the different organizations participating and used by them for the improvement of the enlisted men's messes and for similar purposes. Under special regulations of the War Department, the amount of a soldier's indebtedness to the Post Exchange may be charged against him and collected on the monthly pay rolls. The building in which the Post Exchange is housed is provided by the government and generally contains a gymnasium, reading rooms, restaurant, billiard and pool rooms, in addition to the co-operative store. Previous to 1901, the sale of beer and light wines, but not of spirituous liquors, was permitted in the Post Exchanges; in that year the anti-canteen law, forbidding their sale, went into effect.

In the British army there is a canteen in every post and camp. It is divided into two parts: the wet canteen, where private soldiers can purchase ale, beer, and mineral water, and the dry canteen for the sale of groceries.

**Cantemir**, kán'tye-mēr', or KANTEMIR, ANTIUCHUS DMITRIEVITCH (1709-44), Russian satirist and diplomatist, son of Dmitrii Cantemir (q. v.), was born in Constantinople. In 1730 he was appointed Russian ambassador to London, and in 1738 to Paris. He wrote several poems of a pungently satirical type, translated into Russian the *Salives* of Boileau, Montesquieu's *Lettres Persanes*, and many classical works, and may be considered to have introduced the pseudo-classical spirit and ideals into Russian literature.

**Cantemir**, DMITRII (1673-1723), prince of Moldavia, and Roumanian historian. In 1687 his brother Antiochus became prince of Moldavia, and Dmitrii was sent as a hostage to Constantinople, where he seized the opportunity to learn the chief

Oriental languages (Turkish, Arabic, Persian), and to study Turkish history. At the beginning of the war with Russia (1710), he was sent to Moldavia, where he betrayed the interests of the Porte and formed an alliance with Peter the Great. The disastrous defeat of Peter at the Pruth (1711) forced him to fly to Russia, where he received high favors from the tsar. Among his numerous works, written in Roumanian, Latin, Greek, and Turkish, are *History of the Growth and Decay of the Ottoman Empire* (Eng. trans. by N. Tindal, 1756), *Moldavia Descrip̄tio* (1769), and *Cronica Moldo-Valachiei* (1837). His

the building's area. In 1174 a fire partially destroyed it, but the following year rebuilding was commenced and by 1180 the east transepts, St. Thomas' Chapel, Becket's Crown, and the crypt were completed. In the fourteenth century the old nave was pulled down and the present nave and transepts built, and the following century additional chapels and the beautiful central tower, known as Bell Harry or the Steeple, were erected.

The cathedral, as reconstructed, is a magnificent double cruciform structure, 545 feet long and 156 feet broad at the eastern transepts. The nave is

in which the martyr's skull is said to be preserved. The Corona also contains the ancient stone chair used at the enthronement of all bishops. The spacious crypt, dedicated to the Virgin, contains a stone coffin said to hold the bones of a Becket. Its south aisle is walled off to form a temple for the French Protestants who have worshipped there since 1568.

The cathedral contains many interesting and notable monuments, chief among which are the coffin of Stephen Langton; the tombs of Edward the Black Prince and of Henry IV. and his queen; the tomb of Cardinal Pole, the last Roman Catholic

Canterbury Cathedral

The fine central tower, known as Bell Harry or the Angel Tower, is 234 feet high.

works were published in Roumanian, in 7 volumes (1872-83).

**Canterbury**, kan'ter-ber-i, city and municipal and parliamentary borough, England, in Kent, famous as the ecclesiastical metropolis of England; 55 miles southeast of London. It is pleasantly situated in a valley watered by the Stour. The main feature of the town is the Cathedral, on the site of the ancient monastery church of St. Augustine destroyed by fire in 1067. The most ancient parts now extant are fragments of the edifice erected by Archbishop Lanfranc (1070-89); his successor, Anselm, rebuilt the eastern end, and Prior Conrad nearly doubled

well lighted and stately; an elaborate fifteenth-century screen separates it from the choir. The northwest transept, the scene of the murder of Thomas à Becket, known as the Martyrdom, contains a small stone slab to mark the spot where the archbishop is said to have fallen. To the east of this transept is the Lady Chapel, a late Perpendicular building with rich fan-vaulted roof. East of the choir, behind the high altar, is Trinity Chapel, which formerly contained the shrine of Thomas à Becket, demolished by Henry VIII. in 1538; and at the easternmost end is the circular chapel called the Corona or Becket's Crown

archbishop; and the memorial to Archbishop Benson (d. 1896). Adjoining the cathedral on the west and northwest are extensive monastic buildings, the cloisters, library, chapter house, and deanery. A little to the east is St. Augustine's College, a missionary training school, occupying some of the restored buildings of St. Augustine's ancient monastery.

Other features of interest in the town are the remains of the ancient city wall and gates; the Beaney Institute, in which are the town museum, library, and art collections; the Guildhall; St. Martin's Church, parts of which date from the fourth cen-

ture; the Hospital of St. Thomas; and several mediæval houses. Canterbury is an important British military station, the home of the cavalry school and riding establishment of the army.

A town or settlement appears to have existed here previous to the Roman invasion. St. Augustine founded a priory and an abbey (605) at Canterbury, and upon his designation as archbishop, established his seat here. The city was taken by the Danes in 843, 852, 918, and 1011, when 43,000 persons are said to have perished. Canute assisted in rebuilding the town, which at the time of the Conquest enjoyed a high reputation. The most notable event in the history of the cathedral and of the city was the murder of Archbishop Thomas à Becket (q. v.) in 1170, and the subsequent penance performed here by Henry II. In the reign of Queen Elizabeth, Walloons settled in Canterbury and introduced silk-weaving; on the revocation of the Edict of Nantes, in 1685, they were joined by French Huguenots. Pop. (1921) 23,738.

Consult Dean Stanley's *Historical Memorials of Canterbury*; Withers' *The Cathedral Church of Canterbury*, in Bell's *Cathedral Series*; Willis' *The Architectural History of Canterbury Cathedral*.

**Canterbury**, district, South Island, New Zealand, with an area of 13,858 square miles. It is a rich agricultural and pastoral region. The principal products are wool, grain, frozen and preserved meat, skins, hides, leather, butter, and cheese. Christchurch is the capital and Lyttelton the chief port. Canterbury was founded in 1850 by a band of colonists, all members of the Church of England. Pop. (1921) 199,034.

**Canterbury**, ARCHBISHOP OF. See ARCHBISHOP.

**Canterbury Bell**. See CAMPANULA.

**Canterbury Tales**. See CHAUCER.

**Cantharides**, kan-thar'i-dēz, zoologically the name of a subfamily of the Cantharidæ, or Blister Beetles, to which *Cantharis* or *Lytta vesicatoria*, the 'Spanish fly,' belongs. The blister beetles are remarkable not only for the vesicating properties of the substance which can be extracted from their bodies, but also on account of their life history, which is singularly complicated. *Epicauta vittata*, an American cantharid, which lives on the eggs of locusts, displays no less than eight stages in development, including two pupal. In Europe species of the genus *Meloe* are common, the larvæ feeding on bees' eggs, and later on honey. The blister-

ing fluid apparently protects the beetles from the attacks of insect-eating animals.

Cantharides are used in medicine for blistering purposes, as a counter-irritant in neuralgia, and internally, in small doses, as a diuretic and stimulant to the urinary and reproductive organs. Taken internally, in large doses, they are extremely poisonous. Symptoms of poisoning, though in a minor degree, may also come on after too free blistering. The drug is prepared from the beetle *C. vesicatoria*, which is collected chiefly in Hungary, killed in vinegar, dried, and pounded. There are several officinal preparations.

**Canticles**, commonly called the SONG OF SOLOMON, or SONG OF SONGS, a short book of the Hebrew Scriptures, one of the five Megilloth, or Rolls. Apparently an erotic lyric, its admission into the Hebrew canon of Scripture was secured only after much controversy as to its real meaning, and to this day its interpretation is a matter of debate. The Jewish rabbis and the early Christian exegetes (e.g. Origen) generally regarded it as an allegory, intended to express Jehovah's love to Israel or Christ's to the church ('the bride') in the language of human affection. This view has still its adherents. At present, however, the literal interpretation holds the field, but in two forms: (1) the dramatic, according to which either two main characters, Solomon and the Shulamite maiden, or three (the shepherd lover being added) are represented—held by Delitzsch and Ewald respectively; and (2) the lyrical, developed mainly by Karl Budde, who understands the Song as a collection of nuptial lyrics, like those used among the Syrian peasantry at the present day: the married pair are king and queen for the marriage week. The former hypothesis, emphasizing the dignity and value of true and chaste love, leaves the booklet a legitimate place in the canon. Many passages are of extraordinary literary beauty—e.g. viii. 6-7. The presence of foreign words in the Song indicates a date not earlier than the 3rd century B.C.

Consult Driver's *Introduction to Literature of the Old Testament*, for a full account of the dramatic hypothesis in both forms. Cheyne, in the *Encyclopædia Biblica* (subject 'Canticles'), sets forth the lyrical theory, and J. W. Rothstein, in Hasting's *Dictionary of the Bible*, iv. (subject 'Song of Songs') attempts to combine the two theories.

**Cantilan**, kan-te-lan', pueblo, Mindanao, Philippine Islands, in the province of Surigao, at

the mouth of the Surigao River; 47 miles southeast of Surigao. Pilots are taken aboard here for Surigao Strait. Pop. (1918) 18,594.

**Cantilena**. See CANTABILE.

**Cantilever**, kan'ti-lev-er, essentially a bracket, or structure extending horizontally from a fixed base, by which alone it is supported. The principal characteristic from a technical standpoint, is the reversal of strains in the members of the cantilever structure as compared with those of the regular girder or truss, where the compression strain is in the upper parts and the tension strain in the lower, while in the cantilever the tension is on top and compression at the bottom. The jumping board on a bathing pier is a familiar example.

In architecture the cantilever is largely used for the support of balconies and other projecting portions of a building, filling often an important place also in the ornamental system of the structure. In modern railway stations the roofing of island platforms, the so-called 'umbrella' sheds, is frequently carried on light steel cantilevers, obviating the use of pillars or other supports where they would be more of an obstruction to the traffic. Some of the earliest known bridges, of a span too great to be crossed by a single log, were constructed on the cantilever principle, examples of this type existing at the present day in India and Japan. A balk of timber was laid on either bank, projecting over the stream, the landward ends being securely embedded in banks of earth or walls of masonry. A third timber rested on the free ends of each, connecting them and forming the bridge.

In modern engineering practice the cantilever principle is adapted in bridging spans too great to be conveniently crossed by girders alone, and for which the suspension system would not be suitable. For instance, on the Forth Bridge, Scotland, each pier supports two cantilevers, which stretch out horizontally on either side and balance each the weight of the other, the outer ends being connected by short girders at the centre of every span. The bridge over the Indus at Sukkur, on the other hand, reverts more in principle to ancient forms of design, its cantilevers extending from either bank, and depending for their stability on holding-down chains to the ground behind. (See BRIDGES.)

In the United States a striking example of cantilever construction is found at the great race tracks at Monmouth Park, N. J., where the roof over the grand

stand is built after the cantilever principle.

**Cantire.** See KINTYRE.

**Canto Fermo.** See PLAIN SONG.

**Canton,** in Heraldry, one of the subordinaries. See HERALDRY.

**Can'ton'**, in Switzerland (q.v.), a geographical administrative area or state having its own laws and a local government which deals with domestic affairs. In France (q.v.) the term is applied to a subdivision of the arrondissement.

**Canton** (Chinese *Kwang-chau-fu* or *Sheng-cheng*), city, China, capital of the province of Kwangtung, and the first Chinese port to be opened to European trade, is situated on the Pearl River; 70 miles north of Macao, and 90 miles northwest of Hong-kong. It is surrounded by walls of brick and sandstone and by a moat about 6 miles in circumference; it is, moreover, divided by a second wall, running east and west, into two unequal parts—the Old or North City, and the smaller New or South City.

Without the walls, on either side of the river, are the suburbs, while banked along the stream lie thousands of sampans or native water craft, on which a great part of the native population make their permanent homes. South of the western suburb, and separated from it by a canal crossed by two bridges, is *Shameen*, the foreign residence section and the seat of the chief consulates.

Since 1917 Canton has had an up-to-date tram system, and considerable expenditures have been made for street improvements. The city has an electric lighting plant, Chinese owned, a Water Supply Company capable of handling 7,000,000 gallons of water daily, and telephone service. A number of modern European buildings have been constructed, including a large department store. Many of the streets, however, are narrow and crooked, lined with low, red-roofed structures of brick, stone, or wood. Overtopping these are the Plain Pagoda, erected as a Moslem Mosque more than a thousand years ago; the Flowery Pagoda; the Gothic shafts of the French Roman Catholic Cathedral; and the towers of the numerous pawnshops. There are a large number of temples, of which the most famous is the Buddhist Temple on the Island of Honan. Missionary enterprises include the famous Canton Christian College, the Medical Mission Hospital, and numerous schools and theological seminaries.

Many distinctively Chinese industries are carried on in Canton, notably the making of blackwood furniture, tortoise-shell and

lacquer ware, stoneware, fans, and pottery. Silk, cotton goods, embroideries, paper, tea, and metal ware are also manufactured.

Canton was formerly the chief commercial city of China; but with the opening of other ports and with the development of Hong-kong it has declined in importance, though it has still a large trade. In 1919 the total value of the foreign trade was \$111,749,151, of which \$47,073,094 represented imports and \$64,676,057 exports. The principal articles of export are raw and waste silk, leather, firecrackers and fireworks, matting, cassia, tea, and tobacco. Imports include cotton goods, metals, kerosene, cigarettes, opium, rice, sugar, and salt fish. Pop. (1920, est.) 1,367,680.

**History.**—The history of Canton dates back to several centuries before the time of Christ. Foreign traders appear to have visited it as early as the eighth century A. D.; and in the seventh century the East India Company, following in the wake of Portuguese, Spanish, and Dutch traders, established a monopoly of the foreign trade which lasted until 1834. The attitude of the natives toward foreigners brought a declaration of war by Great Britain in 1839, and the city was invested in 1841; but it was saved from attack by payment of a heavy ransom, and in 1842 was named as one of the five treaty ports. It was again attacked in 1857, and was occupied by a French and English garrison until 1861; since that year it has been open to all nationalities.

**Canton,** town, Connecticut, Hartford county, on the Farmington River, and the Central New England Railroad; 15 miles northwest of Hartford. It has manufactures of edge tools. Pop. (1910) 2,735; (1920) 2,549.

**Canton,** town, Illinois, Fulton county, on the Toledo, Peoria, and Western, and the Chicago-Burlington, and Quincy Railroads; 28 miles west of Peoria. Farming implements, patent racks, marble tile and brick, brooms, cigars, flour, cigar boxes, overalls and shirts, ice cream, sash, doors and other lumber products are manufactured, and there are foundries and machine shops. Coal mining is carried on. Pop. (1910) 10,453; (1920) 10,928.

**Canton,** town, Massachusetts, Norfolk county, on the New York, New Haven, and Hartford Railroad; 14 miles southwest of Boston. It is the seat of Massachusetts Hospital School. Woolen, rubber, and felt goods, sizing, stove and shoe blacking, and electrical supplies are manufactured. Pop. (1910) 4,797; (1920) 5,945.

**Canton,** city, Mississippi, county seat of Madison county, on the Illinois Central Railroad; 23 miles north of Jackson. The manufactures include lumber, brick, cotton gins and compresses, cotton-seed oil, and an ice factory. Cattle, hogs and sheep are raised. Pop. (1910) 3,929; (1920) 3,252.

**Canton,** town, Missouri, Lewis county, on the Mississippi River, and the St. Louis, Hannibal, Quincy, and Burlington Railroad; 125 miles northwest of St. Louis. It is the seat of Christian University (Christian). It has a large planing mill, button factories, canning and pickle works, and a creamery. Pop. (1910) 2,218; (1920) 3,252.

**Canton,** village, New York, county seat of St. Lawrence county, on the Grass River, and the New York Central Railroad; 18 miles southeast of Ogdensburg. St. Lawrence University (Universalist), Universalist Theological School, and State School of Agriculture are situated here. Foundry products, flour and feed are manufactured, and there is a large milk plant. Pop. (1910) 2,701; (1920) 2,631.

**Canton,** city, Ohio, county seat of Stark county, on the Baltimore and Ohio, the Pennsylvania, and the Wheeling and Lake Erie Railroads; 58 miles by rail southeast of Cleveland, and 101 miles east of Pittsburgh. The principal buildings and institutions include the Federal Building, City Hall, City Auditorium, County Court House, Aultman, Aultman Annex, and Mercy Hospitals, County Workhouse, County Home, and Public Library. There are public parks covering 173 acres, two monuments to the soldiers of the Spanish-American War, and a national monument to President McKinley, whose remains lie in the mausoleum in Westlawn Cemetery.

Canton is an important manufacturing city, its industrial establishments, according to the U. S. Census of Manufactures for 1919, numbering 287, with \$102,977,000 capital, and products valued at \$124,292,924. Leading articles of manufacture are steel and steel fabricated products, such as steel ceilings, roofing, furniture, enamelled ware, bridges, safes, roller bearings, and special machinery; brick and clay products; rubber sundries; watch cases and movements; electric sweepers; cutlery and castings of all descriptions. Shale of the finest quality for the manufacture of brick and tile, clay, limestone, and coal are found in the vicinity. The city was settled in 1805. Pop. (1900) 30,667; (1910) 50,217; (1920) 87,091.

**Canton,** city, South Dakota, county seat of Lincoln county,

on the Big Sioux River, and the Chicago, Milwaukee, and St. Paul Railroad; 50 miles north-east of Yankton. It is the seat of Augustana College and the U. S. government asylum for insane Indians. It has grain elevators and manufactures ploughs, gasoline engines, and cement block machinery. Pop. (1910) 2,103; (1920) 2,225.

**Canton, JOHN** (1718-72), English electrician, was born in Stroud, Gloucester. In 1737 he settled as a schoolmaster in London, and becoming famous for his experiments in electricity, was elected a fellow of the Royal Society in 1749. He repeated and verified Franklin's experiments and hypotheses; invented an electroscope and an electrometer; originated experiments in induction; was the first to make powerful artificial magnets; and in 1762 demonstrated the compressibility of water. His name is associated with 'Canton's phosphorus,' discovered by him in 1768.

**Canton'ment.** In order to maintain the efficiency of a command, the troops composing it must have adequate shelter. Shelter for troops comes under one of the following heads: cantonment, camp, bivouac, or billet.

When troops are occupying buildings in towns or villages or huts specially constructed, they are in cantonments; if sheltered under canvas, they are in camp (see CAMPS); if resting upon the ground without shelter, they are in bivouac; and if assigned to public or private buildings as quarters, usually without disturbing the occupants and for a short period only, they are billeted (see BILLETING). As bivouacs are not resorted to except under emergencies, and billeting is not customary in the United States, temporary shelter for troops in the United States is either in camps or cantonments.

After the entrance of the United States into the Great War a number of cantonments were erected in all parts of the country for housing the army. The building of the cantonments was authorized in May, 1917; the last site was secured on July 6, and on September 4 accommodations were ready for 430,000 men. This capacity was shortly increased to 770,000, an average capacity per cantonment of 48,000.

The cantonments were laid out according to a general plan drawn up in the Quartermaster General's Office of the War Department. The buildings were standardized and of a size appropriate to the organization for which they were intended. The construction included two story barracks for the men and barracks for officers, offices, infirmaries,

storehouses, bakeries, cold storage and ice plants, Y. M. C. A. buildings, hospitals, and water and sewer systems.

For the names and location of the National Army cantonments see CAMP, MILITARY.

**Canton River** (Chinese *Chu-kiang*, 'pearl river'), an arm of the delta of the Si-kiang, province of Kwang-tung, China, is formed by the Si-kiang and Peking Rivers. About 45 miles below Canton the river receives the name of *Boca Tigris* ('Tiger's Mouth'); here the entrance is guarded by the Bogue Forts, taken by the British in 1841 and 1856. It is the main approach to Canton and the total length is 100 miles.

**Cantor.** See PRECENTOR.

**Cantù, kan-tōō', CESARE** (1804-95), Italian historian and novelist, was born in Brivio, near Milan, and was for a short time professor of the Italian language and literature at Sondrio, Como, and Milan. For strictures passed on the policy of the Austrian government, in his *Ragionamenti sulla Storia Lombarda nel Secolo XVII*. (1832-3), he was imprisoned, and during his detention wrote the historical novel, *Margherita Pusterla* (1838). His chief work, however, is his monumental *Storia Universale* (1836-42), in 35 volumes, of great polemic and literary value.

**Canuck'**, a nickname in the United States for a Canadian; in Canada, used by the English for a French Canadian.

**Canusium, Italy.** See CANOSA.

**Canute, ka-nūt', CNU** or **KNUT**, called **THE GREAT** (995-1035), King of England, Denmark, and Norway, was the son of Sweyn of Denmark. On the death of his father, during an invasion of England, Canute was proclaimed king of that country, but his supremacy was contested by Edmund Ironsides, son of Ethelred I, who was at that time a refugee in Normandy. In the struggle which ensued Edmund was betrayed by his own adherents, and a treaty was concluded whereby the northern part of the island was assigned to Canute and the southern part to Edmund. Within a short time, however, Edmund was treacherously assassinated, and Canute was proclaimed king of all England. On the death of his brother Harold, in 1019, he became king of Denmark also.

Up to this time Canute's reign was characterized by relentless cruelty and persecution but upon succeeding to the throne of Denmark he seemed to undergo a change of heart. He conciliated the higher clergy by his liberality, and secured his position still further by the creation of a standing army. The union with

England was beneficial to Denmark, which borrowed clerks, scholars, and architects from the more civilized land to build churches and found schools. Canute overawed and partially subjugated the Wendish pirates; and when the kings of Norway and Sweden, profiting by his absence in England, invaded Denmark, Canute, hastening back, checked them at the battle of Helgeaa (1026). In 1027 he made a pilgrimage to Rome, and in 1028 invaded Norway, and added it to his dominions. He died at Shaftesbury, and was buried at Winchester.

**Canute IV.,** called **THE SAINT**, king of Denmark (d. 1086), was elected king in 1080. He built many churches, including the Cathedrals of Roskilde and Lund, conferred many privileges upon the clergy, brought in foreign scholars to spread learning and culture, and endeavored to abolish serfdom. His rigorous rule finally provoked a popular rising, and he was murdered in St. Alban's Church, Odense, Denmark. He was canonized in 1101, and is regarded as the patron saint of Denmark.

**Canvas,** a strong, heavy cloth, made of cotton, flax, hemp, or jute. The fibres are spun and woven in the same way as linen (q. v.). Though canvas for sail-cloth and tarpaulins is sometimes woven from cotton and other fibres, the finest and strongest kinds are made from flax.

**Canvasback Duck** (*Aythya valisineria*), a fresh-water duck, widely distributed throughout North America. It breeds in Canada, and passes the winter in the United States, near the Great Lakes, in the Mississippi Valley, and especially around Chesapeake Bay. It is about 21 inches long; the head and neck are colored a dull reddish brown; the lower neck, breast, rump, and tail coverts are black; the back and sides gray, finely marked with wavy lines and dots, like coarse canvas. It greatly resembles the redhead duck (q. v.), from which it may be distinguished by its longer, darker head and wedge-shaped beak. It is highly prized for the table on account of its delicate flavor.

**Canyon,** or **CAÑON**, a deep gorge with steep sides. See GRAND CANYON.

**Canzone,** kan-tso'nā, an Italian and Provençal form of poetry, used chiefly for love themes. The earliest Provençal specimens date from the twelfth century, those in Italian from the thirteenth. The number of stanzas varies, five or six being the most common, the last stanza invariably shorter than the others. The Provençals usually carried the same set of rhymes through all the stanzas; but

the Italians mostly introduced fresh rhymes into each stanza. Dante, Petrarch, Tasso, and Leopardi all wrote in this *genre*. For the spread of the canzone from Italy see *PROVENÇAL LANGUAGE AND LITERATURE*. In music, canzone and canzonet are songs in two or more parts.

**Cao-Bang**, ká'ô-bàng', or KAO-BANG, district, Tong-king (q.v.), consisting of mountainous country, rich in forests and minerals; area about 3,000 square miles, and pop. about 70,000. The capital of the same name is 72 miles northwest of Lang-son. Pop. 6,000.

**Caouthoué**, kō'chōók. See RUBBER.

**Cap.** See BONNET; PERCUSSION CAPS; MAINTENANCE, CAP OF.

**Capacity**, in electricity. See ELECTROSTATICS.

**Capacity**, in law, signifies the power of exercising legal rights. In strict language there is a distinction between the possession of such rights and the power of exercising them. A slave, for example, generally has no rights, while a free-born infant has rights, but is in the meantime unable to make use of them. This distinction was of importance in Roman law, but may now be neglected.

**Incapacity** may arise from youth, insanity, sex, coverture, alienage, conviction for crime, bankruptcy, and the like. The legal disabilities arising from sex and coverture and alienage have been largely removed by statute, though unnaturalized foreigners are not generally admitted to full political privileges. The rules governing legal capacity vary in relation to the matter in hand.

**Capaneus**, ka-pá'nē-us, Greek hero who took part in the first expedition of the Seven against Thebes. While attempting to scale the walls he was struck by lightning by Jupiter. Consult Æschylus' *Seven Against Thebes*; Euripides' *Phœnissæ*.

**Cap-à-pie**, kap'à-pē' (French, 'head to foot'), in the military language of the Middle Ages, a term applied to a knight or soldier armed at all points, or from head to foot, with armor for defence and weapons for attack.

**Cap de la Hague**, kap de là'äg', promontory, France, in the department of Manche, forming the extremity of the peninsula of Cotentin. It extends into the English Channel about opposite the island of Alderney and protects the roadstead of La Hogue. This roadstead was the scene of a great naval battle between the French against the Dutch and English in 1692.

**Cape.** For articles on the prominent Capes, see the princi-

pal word, as AGULHAS, CAPE; ANN, CAPE; CLEAR, CAPE, and many others.

**Cape Ant Eater**, or AARDVARK (*Orycteropus capensis*), a South African mammal usually placed in the order Endentata (q.v.); though it shows few obvious affinities with the typical members of that order. It is a nocturnal burrowing animal, feeding

Cape Ant Eater

on termites and ants. It is ungainly and ugly in appearance; the teeth are numerous and complex, and are unlike those of any other mammal. The mouth is elongated and tubular, the tongue vermiform. A few bristly hairs are scattered over the surface of the body; the ears are large and erect; the tail much elongated. When pursued, it can burrow itself out of sight in a few minutes, working inward with great rapidity. Three species are

from which it is separated by the Strait of Canso; area, 3,120 square miles. The surface is broken by several ranges of low hills, rising to an elevated plateau (1,200 feet) in the north. Triangular in form, the island is deeply indented by bays and harbors. An arm of the sea, the *Bras d'Or* ('Arm of Gold'), enters from the east coast, enlarging into Bras d'Or Lake (q.v.), and penetrates to within a mile of St. Peter's Bay, with which it is connected by St. Peter's Canal. The beautiful scenery around the shores of this lake and the salubrity of the climate have made Cape Breton Island a favorite tourist resort. There are deposits of coal, iron ore, marble, and gypsum. The principal exports are timber, fish, iron ore, and coal. The capital is Sydney, which has iron and steel works, and steamship connection with Port Aux Basques, Newfoundland.

Cape Breton Island was assigned to France by the Peace of St. Germain (1654). After the loss of Acadia (1713), the town and harbor of Louisburg (q.v.) were elaborately fortified and became the headquarters of the French operations against the

known—one in South Africa, another in Senegal, a third in Southern Nubia. See ANT EATERS.

**Cape Breton Island**, brit'un or bret'un, rocky island of irregular form, Canada, at the eastern extremity of the province of Nova Scotia (q.v.), of which, politically, it forms a part, and

English colonies. The fortress was captured by the British in 1758, and its possession was confirmed by the Treaty of Paris (1763). At first a part of Nova Scotia, it was erected into a separate colony, but in 1819 was again annexed to Nova Scotia. Pop. (1921) 97,200, mainly of Scottish Highland descent.

**Cape Buffalo.** See BUFFALO.  
**Cape Coast Castle,** town, West Africa, in the British colony of Gold Coast, formerly its capital; situated on the coast in about 1° 10' w.; 315 miles west of Lagos. It is of some commercial importance and has a trade in ivory, gold and palm oil. It was first settled by the Portuguese in 1610 and in 1652 the Swedes built a castle there. The Dutch captured it in 1659 and in 1664 it was taken by the British who have held it since that date. Pop. (1921) 15,000.

**Cape Cod,** peninsula of Massachusetts, practically coextensive with Barnstable County. It is formed like a hook, enclosing Cape Cod Bay, and is about 65 miles long. On Race Point, the northwestern extremity, is a light of the fourth order. There are numerous lights at the harbors on the western side; and on the Atlantic Coast, Highland Light, 183 feet above high water, is of the first order. Barnstable (q.v.), on an inlet of Cape Cod Bay, is the largest town. The native inhabitants are mainly descendants of the original Pilgrim settlers. The peninsula consists almost entirely

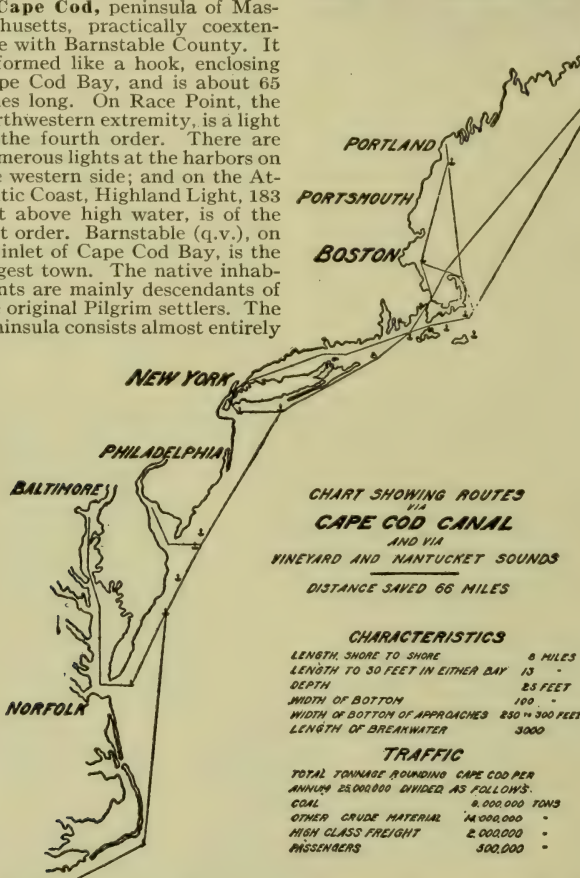

the Pilgrims recognized the need of a direct waterway connecting Barnstable and Buzzards Bay. As early as 1627 they had established a trading post on the shore of Buzzards Bay (at the present entrance to the canal), which was one point in the direct trade route between the Plymouth colony and the Dutch colony at Manhattan Island. This route Governor Bradford, in his diary, described in part as follows:

'For our greater convenience of trade, to discharge our engagements, and maintain ourselves,

narrow canal about three miles in length were seriously considered. In 1697 a resolution was passed by the General Court of Massachusetts, providing for the appointment of a committee of three persons 'to view a place for a passage' between the two bays, but there appears to have been no official report by this committee. In 1776 the General Court passed a resolve providing for the appointment of a committee 'to repair to the town of Sandwich and to view the premises and report whether the cutting of a canal . . . be practical or not, and authorizing the committee 'to employ any necessary surveyors or assistants for that purpose.' The survey was begun, but the military events of 1776 rendered it advisable to discontinue the work. In 1791, and at more or less irregular intervals thereafter, the matter was considered by the State legislature. In 1880 a charter was granted to a construction company, and the work was actually begun, but owing to lack of funds the project was abandoned and the charter was surrendered.

On June 1, 1899, the legislature granted a charter incorporating the Boston, Cape Cod, and New York Canal Company, under which the company began in 1909 to construct the present canal. It was formally opened for partial operation on July 29, 1914, the event being marked by a holiday celebration and appropriate exercises, and it has since been completed. Certain engineering facts are as follows: Length of canal proper, 8 miles; total length to 30 foot depth in both bays, 13 miles; minimum depth at low water, 25 feet; minimum bottom width, 100 feet; bottom width of approaches, 250 to 300 feet; deepest cut (below tide water), 29 feet; estimated amount of material excavated, 17,000,000 cubic yards.

As the canal at each end, and for a considerable portion of its route, follows the natural course of small streams which formerly floated boats of light draft, the actual work of excavation, principally through sand, was not difficult from an engineering point of view. No locks were found necessary because the flow of the tide and the tidal differences between the two ends of the canal were not sufficient to require them. Three bridges spanning the canal were required. One of these, a railroad bridge of the Strauss-Bascule type, having a span of 160 feet, was erected at the Buzzards Bay entrance, and two highway bridges—one at Bourne and the other at Sagamore—have also been constructed. The canal is lighted by electricity, the lights being on

of sand, but is favorable to cranberry culture, which is extensively carried on. The fisheries afford the chief occupation, and the men are excellent sailors.

In 1909-14 a canal across Cape Cod, from Barnstable Bay to Buzzards Bay was constructed, which enables vessels to avoid the dangerous trip around the Cape. See CAPE COD CANAL.

**Cape Cod Canal,** a canal connecting Buzzards and Barnstable Bays, off the coast of Massachusetts. Soon after their arrival at Plymouth in 1620,

we have built a small pinnacle at Manomet, a place on the sea twenty miles to the south, to which by another creek on this side [Scusset] we transport our goods by water to within four or five miles, and thence carry them overland to the vessel, thereby avoiding the compassing of Cape Cod with those dangerous shoals, and make our voyage southward with far less time and hazard.'

During the remaining years of the seventeenth century, plans to connect the Scusset River and the Herring River by means of a

poles placed opposite each other 500 feet apart on either side of the canal, and other necessary aids to navigation have been provided.

In order to prevent the accumulation of sand at the mouth of the canal where it opens into Barnstable Bay, a granite breakwater, 3,000 feet in length, was built to the northward of the channel. It was also found necessary to riprap with granite the banks of the canal for portions of its length in order to prevent erosion of the sand.

The depth and width of this canal compare favorably with corresponding dimensions of the great ship canals of the world, and permit of the passage not only of vessels engaged in coastwise freight and passenger traffic, but also of the smaller vessels of the navy, including even naval cruisers—for which, in the event of naval engagements, an inside water route might prove of great strategic importance. This latter consideration led to the proposal that the canal be purchased and operated by the Federal Government as a measure of defence and bills to that end were introduced into Congress with the result that in March, 1928, the canal was purchased by the U. S. Government for the sum of \$5,500,000.

The distance between Boston and New York City by way of Vineyard Sound is 334 statute miles, and by way of the canal 264 statute miles, the latter route being shorter by 70 statute miles, and making possible a saving of about four hours in time of transit. The possible saving in life and property by the use of the canal route may be indicated by the fact that in 1843-1903 over 700 lives, and property averaging at least a half-million dollars a year, were lost in wrecks occurring between Gay Head and Provincetown.

The Cape Cod Construction Company (August Belmont, president, and William Barclay Parsons, chief engineer) was formed to do the actual construction work, and this company contracted to dig the canal and build the necessary wharves, breakwaters, etc., for the sum of \$11,990,000, payable \$6,000,000 in first mortgage, 5 per cent. gold bonds, and the remainder in stock of the company. The actual cost of construction was approximately \$13,500,000.

Consult W. B. Parsons' *The Cape Cod Canal* (*Annals of the American Academy of Political and Social Science*, January, 1908); *Reports of the Massachusetts Board of Harbor and Land Commissioners* (1907-15); *Opening of the Cape Cod Canal* (*Scien-*

*tific American*, Aug. 15, 1914); *Cape Cod Canal—Interesting Facts for Navigators* (issued April 20, 1915); *Moody's Manual of Railroads and Corporation Securities* (vol. ii., 1916).

**Cape Colony.** See CAPE OF GOOD HOPE.

**Cape Fear River**, river, North Carolina, rising in the northern part of that State, flowing southeast, and emptying into the Atlantic Ocean after a course of about 300 miles. It is navigable for 150 miles, to Fayetteville. Rice fields are a feature along its lower course.

**Capéfigué**, kâp-fêg', JEAN BAPTISTE HONORÉ RAYMOND (1802-72), French historian, was born in Marseilles. In 1821 he went from Aix to Paris to complete his juridical course, but after 1831 devoted himself to literature. His works, which are still read for their picturesque and piquant style, comprise nearly one hundred volumes, and include *Histoire de Philippe Auguste* (1829); *Histoire de la restauration* (1831-3); *Richelieu, Mazarin, et la Fronde* (1835-6); *Philippe d'Orléans* (1838); *La ligue* (1843).

**Cape Girardeau**, jê-râr-dô', city, Missouri, in Cape Girardeau County, on the Mississippi River, and on the St. Louis-San Francisco Railroad; 98 miles southeast of St. Louis. It is the seat of St. Vincent's College (Roman Catholic), Convent of the Sisters of Loretto, and a State normal school. There is a large river and railroad trade. Manufactures include lime, bricks, flour, lumber, tobacco, malt, Portland cement and mineral paint. Pop. (1910) 8,475; (1920) 14,258.

**Cape Haitien**, hâ'tê-en, or LE CAP, city and seaport, Haiti, situated on a commodious harbor on the north coast; 85 miles north of Port au Prince. It is connected by cable with France, Santo Domingo, and South America. Exports include coffee, cacao, logwood, and honey. Under the rule of the French it was the capital of the colony. The city was the scene of a terrible earthquake in 1842, and suffered from bombardment by the British in 1865. Pop. 20,000.

**Cape Horn.** See HORN, CAPE.

**Cape Hunting Dog**, a dog belonging to the family Canidæ, found in many parts of Africa. It is somewhat like a mastiff, but is brightly colored, and irregularly spotted with white or yellow outlined in black. It resembles the hyena in having only four toes on each foot, but is dog-like in habit, and hunts in packs, which sometimes ravage the sheep farms of South Africa.

**Cape Jasmine.** See JASMINE.

**Capel**, kap'el, THOMAS JOHN (1836-1911), English Roman Catholic clergyman and educator. He was one of the founders and vice-principal of St. Mary's Normal College, London, and rector of the Roman Catholic University of Kensington (1874-8). In 1883 he went to the United States on a lecturing tour, and later settled in San Francisco, Cal. He had a fine presence, a ringing voice, and a winning personality, and is delineated in Disraeli's *Lothair* under the character of Catesby. His writings include *Great Britain and Rome* (1881); *The Pope the Head of the Church* (1885).

**Capelin**, kap'e-lin, or CAPLIN (*Mallotus villosus*), a small fish, six to eight inches long, resembling a smelt. It occurs in great shoals in all northern seas, and is found as far south as Cape Cod on the east. It deposits its eggs along the Arctic Coast, and is useful both as a food fish and a bait for cod.

**Capell**, kâ'pel, EDWARD (1713-81), Shakespearean commentator, was born in Thorston, near Bury St. Edmunds. Appointed deputy inspector of plays in 1737, he devoted himself to the study of Shakespeare, transcribing his works, it is stated, ten times. In 1768 an edition of Shakespeare in ten volumes appeared which cost Capell twenty years' labor. The first part of the commentary was issued in 1774, and in 1783, two years after his decease, the complete work was published. As a textual critic, Capell was singularly acute.

**Capella**, ka-pel'a (=  $\alpha$  Aurigæ), one of the three brightest stars in the Northern Hemisphere (photometric magnitude 0.21). In 1899 it was discovered simultaneously by Campbell of Lick Observatory and Newall of Cambridge Observatory to be a spectroscopic binary (see SPECTROSCOPIC BINARIES), composed of two sun-like bodies, revolving in a period of 104 days. The fainter member of the pair gives light of a somewhat less 'advanced' spectral type than the primary. Its actual light power must centuple that of the sun. Its parallax of 0".09 corresponds to a distance of 36 light years, and it is receding from the sun at the rate of 15 miles a second.

**Capella**, MARTIANUS MINEUS FELIX, learned author who flourished about the fifth century, was born in North Africa. The work which has preserved his name to posterity is the *Satyri-con*, an encyclopædic compilation drawing its material mostly from Pliny and Varro, highly esteemed during the Middle Ages as a work of reference. It consists of nine books, a curious medley of prose

and poetry, full of all sorts of data but of no literary value.

Capella, or a Aurigæ

**Capello**, kâ-pel'lo (CAPPELLO), BIANCO (c. 1542-87), Tuscan grand duchess, was born in Venice, of a noble family, and eloped with a banker's clerk, Pitro Buonaventuri, who took refuge with Francesco de' Medici, son of the grand duke of Tuscany, at Florence. Francesco, himself married to an archduchess of Austria, was attracted by Bianca's beauty, and, succeeding to the grand-ducal throne on the death of his father, caused the death of Buonaventuri in 1570. Six years later Bianca pretended to give birth to a son, the child being obtained clandestinely; and on the death of the grand duchess, Francesco was persuaded to marry Bianca (1579). After the death of Francesco's son by his first duchess, Bianca manoeuvred to gain the good will of her enemy, Cardinal Fernando de' Medici, Francesco's brother and probable heir; but it has been surmised that the Cardinal poisoned them, as both Francesco and Bianca died a few days after meeting him at Poggio à Cajano. Several tragedies have been written, based on her career.

**Cape May City**, summer resort, New Jersey, in Cape May County, on the Pennsylvania and the Reading Railroads; 40 miles southwest of Atlantic City, and 82 miles by rail south of Philadelphia. It has a fine beach 5 miles long, a boardwalk, convention hall, recreation piers, and splendid bathing facilities. There are fishing and canning industries. Two miles west is the point from which the city takes its name, Cape May, the southern extremity of New Jersey (see MAY, CAPE). It was the first city in New Jersey to adopt the city manager form of government. Pop. (1910) 2,471; (1920) 2,999.

**Capen**, EDWARD WARREN (1870- ), American sociologist, was born in Jamaica Plain, Mass. He was graduated from Amherst College (1894), Hartford Theological Seminary (1898), and Columbia University (PH.D., 1904). From 1904 to 1907 he was engaged in historical researches for the American Board of Commissioners for Foreign Missions, and from 1907 to 1909 in special sociological and missionary research in the Far East. He was instructor (1911-14), associate professor (1914-17), and dean (since 1919), of sociology at the Kennedy School of Missions, and since 1917 has been professor of sociology at the Hartford Seminary Foundation. In 1912 he was ordained in the Congregational ministry. His published works include *Historical Development of the Poor Law of Connecticut*; *Sociological Progress in Mission Lands* (1913) and many articles and pamphlets.

**Capen**, kâ'pen, ELMER HEWITT (1838-1905), American educator, was born in Stoughton, Mass. He was graduated from Tufts College (1860), studied law, but later entered the Universalist ministry (1865), and was pastor of churches in Gloucester, Mass., St. Paul, Minn., and Providence, R. I., until his appointment as president of Tufts College in 1875. He also gave instruction in ethics and political economy.

**Cape of Good Hope**, popularly regarded as the most southerly promontory of Africa, though it is half a degree to the north of Cape Agulhas, which forms the turning point from south to east on the voyage from Europe to India. It was discovered in 1486 by Dias, a Portuguese navigator but its importance was not realized until in 1497 Vasco da Gama rounded it on his voyage from Lisbon to Calicut.

**Cape of Good Hope**, formerly CAPE COLONY, province of the Union of South Africa, situated at the southern extremity of the African continent, and bounded by the Orange River, Bechuanaland Protectorate, Orange Free State, Basutoland, and Natal on the north; by the Indian Ocean on the east and south; and by the Atlantic Ocean on the west. It comprises the colony proper, East Griqualand, Tembuland, Transkei, Walfish Bay, Pondoland, and Bechuanaland (qq.v.). Area, 276,995 square miles.

**Topography and Climate.**—Broadly speaking, the Cape of Good Hope may be described as a series of terraces rising like steps from a narrow coastal plain and merging in the great South African tableland, only a small

portion of which lies within the province. The principal mountain chain, which forms the southern rampart of this tableland, follows the coast line of the cape at a distance from it of about 150 miles, attaining an average elevation of 6,000 to 8,000 feet, and culminating in Compass Berg, 8,500 feet above the sea. As it traverses the province in a southwest, west, and northwest direction, this chain is known successively as the Drakenberg or Quathlamba Range, the Stormberg, the Sneeuberg, the Nieuveld and Roggeveld Mountains, and the Kamiesberg. Separated from it by an arid plateau, known as the Great Karroo (see KARROO), is a central chain of mountains including the Cedarberg, Zwarteberg, Groote River, Zuurberg, and other ranges. Still farther south another chain, rising from the lowland which borders the sea, follows a parallel course.

The coast line is unbroken by gulfs and inlets, and there are practically no navigable rivers, such streams as there are being subject to violent floods and long periods of drought broken by sudden and torrential thunderstorms.

Generally speaking, the climate is healthful, though the alternations of heat and cold have a wide daily range. It is warm, moist, and equable on the coast; colder and drier in winter and hotter in summer in the midlands; and still drier and more bracing in the northern highlands. The average maximum temperature in January, the hottest month, varies from 92° F. at Kimberley to 76° F. at Port Elizabeth; the average minimum for July, the coldest month, from 29° F. at Aliwal North to 49° F. at Port Elizabeth. The annual rainfall ranges from a few inches in the northwest and on the Great Karroo, to 20 to 34 inches in the neighborhood of Cape Town.

**Flora and Fauna.**—The flora of the Cape of Good Hope is rich and varied near the coast, growing sparser toward the interior. Beautiful heaths in great variety are found about Cape Town, numerous subtropical plants occur on the eastern coastlands, and small thorny mimosas or acacias, other shrubs, and bulbous plants clothe the Karroos after the spring rains. Forests are few, being confined to an area of 550 square miles on the southern slopes of the coastal hills. The principal timber trees are the tall yellow woods (*Podocarpus*), the valuable stinkwood or laurelwood (*Ocotea bullata*), the sneezewood (*Pteroxylon utile*), and the black ironwood (*Olea laurifolia*).

The wild animals of the South African veldt have been nearly all

destroyed. A few elephants and buffalo are preserved in the Knysna Forest; there are some bontebok near Cape Agulhas, a few boschbok in the eastern districts, and large herds of springbok. Among other animals are the steenbok, leopard, cheetah, hyena, jackal, aard wolf, Cape wild dog, ant bear, and scaly ant eater. Reptiles include the crocodile, cobra di capello, and puff adder. Birds are numerous, the ostrich being of considerable economic importance.

**Mining.**—The province is rich in mineral resources. The most productive diamond mines in the world are located at Kimberley (q. v.), and diamonds are also obtained from alluvial diggings along the banks of the Vaal. Copper is found throughout the district of Namaqualand, and there are extensive coal deposits in the Stormberg. Iron and lead ores, gold, manganese, tin, and asbestos are also found. In 1914 the diamond output amounted to 1,350,536 carats, valued at \$17,720,360; 14,369 tons of copper were shipped; and 53,621 tons of coal were mined.

**Agriculture and Stock Raising.**—Of the three chief industries of the Cape—mining, agriculture, and stock raising—agriculture is by far the least important, the inadequate water supply, long droughts, and sudden and severe storms combining to render crops extremely uncertain. The principal products are wheat, barley, oats, mealies or Indian corn, potatoes and other European vegetables, tobacco, and a wide variety of fruits, including, besides the indigenous 'Cape gooseberry,' apples, pears, figs, apricots, peaches, oranges, limes, pomegranates, quinces, bananas, walnuts, and almonds. There are large vineyards in the western part of the province, and wine, brandy, and raisins are produced.

Stock farming is carried on much more extensively than agriculture, practically all the land, with the exception of the rough mountain districts and the most arid deserts, being suitable for pasturage. Sheep, cattle, Angora and other goats, horses, and ostriches are raised, wool, mohair, and ostrich feathers constituting important products. At the beginning of 1914 sheep numbered 18,594,746, and goats 7,732,912.

**Manufactures** have not as yet been extensively developed. The timber of the colony is suited for wagon making and for articles of furniture; and these trades have been carried on. A beginning has been made in the manufacture of woollen fabrics, and leather has

been manufactured. Other industries include harness and saddle factories, flour mills, foundries, and breweries.

**Railways.**—At the beginning of 1915 there were 8,982 miles of railway in the province, of which 8,486 were owned and controlled by the Federal Government. The principal lines are that from Cape Town north to the Belgian Congo (see CAPE TO CAIRO RAILWAY); that from Port Elizabeth to the Orange River, which joins the lines of the Orange Free State and the Transvaal; and that from East London to the Orange Free State. There are also numerous branch lines and shorter independent roads. Steamship and cable communication with Europe, Asia, and Australia exists.

**Commerce.**—The greater part of the foreign trade is with the United Kingdom. In 1915 this was estimated at \$35,950,995 in exports, exclusive of diamonds, and \$44,502,505 in imports. The leading exports to that country and their value in 1914 were: diamonds, \$27,354,495; wool, \$15,743,910; feathers, \$6,160,805; skins and furs, \$4,702,295; mohair, \$4,133,285; copper, \$1,817,395; raw hides, \$1,669,655; maize, \$678,745. The chief imports were cotton goods, woollens, clothing, machinery, iron and steel goods, boots and shoes, and carriages.

**Population and Language.**—The population in 1904 was 2,409,809; in 1911 it was 2,564,965, of whom 582,377 were whites, 7,690 Asiatics, 1,519,939 Bantus, and 454,959 mixed and other colored races. The chief cities are Cape Town, Kimberley, Port Elizabeth, and East London.

The native population may be divided into the Bushmen, the earliest aboriginal race, now almost extinct; the Hottentots, chiefly in the western provinces; and the great Bantu race, living in the east and northeast of the colony, and known as Kaffirs (see BUSHMEN; HOTTENTOT; KAFFIRS). In addition, there are Malay, Indian, and Chinese immigrants, and descendants of Buginese imported originally as slaves by the old Dutch East India government.

English is the language spoken officially throughout South Africa, and is the language of commerce, but Dutch, or rather the peculiar South African variety of Dutch known as the *Africander Taal* (see TAAL), is used by many people.

**Education and Religion.**—The educational system of the Cape includes all classes, European and native, and admits of a gradual progress from the third class un-

denominational school through second and first class schools and college. There are also special industrial schools and poor schools for European children, state aided mission schools for the natives, aborigines' schools for the children of the native territories, and training and evening schools for both Europeans and natives. Education is compulsory for European children in by far the greater part of the province. In 1915 government aided schools numbered 4,593, with an enrollment of 103,909 European and 135,104 non-European pupils. Institutions of higher learning include the South African, Victoria, Rhodes University, and Huguenot Colleges, and a number of denominational schools.

**Government.**—Since 1872 the Cape of Good Hope has been under a responsible government, and since 1910 it has been a province of the South African Union, being represented in the Union Parliament by 8 members in the Senate and 51 in the House of Assembly. It is presided over by an administrator, appointed for five years by the Governor-General of the Union, and an executive committee of four elected by the provincial council.

**History.**—The Cape of Good Hope was first rounded by the Portuguese voyager and discoverer, Bartholomeu Diaz (q. v.), in 1486, and for a century and a half was used occasionally by Portuguese, English, and Dutch mariners engaged in the Eastern trade. In 1652 the Dutch East India Company took possession, and initiated a period of monopolistic and repressive control that lasted until the end of the eighteenth century. British forces occupied the colony in 1795 and again in 1806, and in 1814 it was ceded in perpetuity to the British crown. At that time the area was only about 120,000 square miles, and the population a little over 60,000. In 1820 the Eastern Province was founded by British colonists known as the 'Albany settlers.'

In 1834 the emancipation of the slaves in Cape Colony provoked wide discontent among the Dutch farmers (Boers), and from 1836 to 1840 great numbers of them migrated, or *trekked*, beyond the Orange River and into what is now the province of Natal (q. v.). Meanwhile, the northward advance of the British and the continual raids on the colonists' cattle made by the Kaffirs resulted in what is known as the Kaffir wars, nine in number. The first took place in 1811; the second in 1819, when the colony was extended to the River Keiskamma;

the third in 1834, when the boundary was advanced to the River Kei; the fifth in 1850-3, resulting in the formation of British Kaffria as a crown colony and a native reserve for the Kaffirs, later incorporated with Cape Colony (1865); the ninth and last in 1877, resulting in the annexation of the Transkei.

A new impetus to development was given by the discovery of diamonds in the districts north of the Orange River in 1867, and of the four richest diamond mines in the world in 1870 (Dutoitspan and Bultfontein) and 1871 (Kimberley and De Beers), resulting in the annexation of the Diamond Fields. In 1869 took place the incorporation of Basutoland; in 1874, of East Griqualand; in 1876, of Fingoland and No Man's Land; in 1877, of West Griqualand; in 1885, of Tembuland, Galekaland, and Bomvaneland. Pondoland was annexed in 1894, and British Bechuanaland in 1895; while toward the west, Walfish Bay, in Great Namaqualand, became part of the colony in 1884. In 1881 took place the first Boer war; one of its principal results was the formation of the Africander Bond (q. v.).

Among more recent events which have greatly influenced the political life of Cape Colony have been the Jameson Raid of 1895, and the Boer War of 1899-1902 (see SOUTH AFRICAN WAR). Cecil Rhodes played an important part in the history of the colony, and was prime minister in 1890-6. In 1903 the Cape Parliament accepted the African Customs Convention, with a view of forming a South African Customs Union, which was joined by Natal, Orange River Colony, and Bechuanaland Protectorate. In June, 1909, the Colony adopted the constitution framed for the South African Union, and May 31, 1910, became a province of that commonwealth. See SOUTH AFRICAN UNION.

**Bibliography.**—Consult Theal's *Records of Cape Colony* (23 vols.); Brand's *Union of South Africa* (1909); S. Playne's *Cape Colony* (1912); *Statistical Year Book of the Union of South Africa* (annual).

**Cape Pigeon**, or CAPE PETREL, sailors' names for a big petrel (*Daption capensis*), numerous about the Cape of Good Hope, and thence southward to the Atlantic islands.

**Capercailzie**, kap-er-kāl'yī, or -zī, or kā-per-, CAPERCAILLIE, WOOD GROUSE, or COCK OF THE WOODS (*Tetrao urogallus*), a large game bird, widely distributed throughout Europe in the hilly pine forests, for which it is natu-

rally adapted, but especially plentiful in Sweden. The general color of the adult male is brownish black, minutely freckled with grayish white and with lighter brown; the quill feathers dark brown; the tail feathers nearly

Capercailzie.

black, some of the longer tail coverts on the sides of the tail tipped with white; the chest of a shining dark green. The general color of the female and of young males is dark brown, freckled with yellowish brown. The feet are feathered to the toes, but these are naked. It feeds on berries, seeds, worms, insects, etc., and on the young shoots of the pine. The female makes her nest on the ground, and lays from six to twelve eggs, of a pale reddish or yellowish brown, spotted with other shades of brown. Like the blackcock, the capercailzie is polygamous. In spring the males indulge in untiring love song, and in grotesque play to attract the females. Fights between rival males are of common occurrence.

**Cape River.** See SEGOVIA RIVER.

**Capern**, kā'pĕrn, EDWARD (1819-94), English poet, born at Tiverton, Devonshire. Under the pseudonym of 'the Rural Postman of Bideford,' he published *Poems* (1856), *Ballads and Songs* (1858), *Devonshire Melodist*, with music (1862), *Wayside Warbles* (1865), *Sun Gleams and Shadow Pearls* (1881), which obtained some appreciative recognition from Landor, Dickens, Kingsley, and Tennyson.

**Capernaum**, ka-pŭr'nā-um, meaning 'the village of Nahum,' was in the time of Christ a prosperous place, is called 'his own city' (Matt. ix. 1), and was one of the three which he upbraided 'because they repented not.' The site generally accepted from the fourth century is Tell Hum, on the northwest coast of the Sea of Galilee. Condor believes that this place has no claim to be regarded as the real site of Capernaum, and prefers Khan Minieh, beside the spring Et Tineh, in the northeast corner of the plain of Genesaret.

**Ca'pers** are the pickled flower buds of the caper bush (*Capparis spinosa*). They have an agreeable pungency of taste, with a slight bitterness, and have long been in use as a condiment and ingredient of sauces. They are of a grayish-green color, to improve which copper is sometimes used; this, however, as in the case of other pickles, renders them poisonous.

The *caper bush* is a native of the Mediterranean countries, and is cultivated in some parts of the south of France and in Italy, but most of all in Sicily. It is a trailing, rambling shrub, loving dry places, and often growing on rocks or walls. It begins to flower early in summer, and continues flowering till winter. The buds are gathered every morning, and are immediately put into vinegar and salt.

**Ca'pet**, the family name of the third Frankish dynasty, which ruled France in the direct line from 989 to 1328, and through the collateral branches of Valois and Bourbon till the French Revolution (1789). The founder of the house was Hugh Capet (see CAPET, HUGH). For an account of the Capetian dynasty, see FRANCE, *History*.

**Capet**, HUGH (c. 938-996), king of France, son of Hugh the Great, duke of Francia and count of Paris. The origin of the Capetian house is obscure. It may probably be traced to a Teutonic stock. The Capetians had for long identified themselves with the Western or French portion of the Caroling empire, in particular with Paris and the Ile de France. The defence of Paris against the Northmen in the famous siege of 885 had been the work of Odo, great-grandfather of Hugh. Hence in the break-up of the Caroling empire it was natural that the Western Franks should look to the Capetians for leadership. In his early years Duke Hugh was a kind of mayor of the palace to the Caroling kings; but in 987, on the death of the Caroling Lothair, he was elected king.

Hugh's reign was not remarkable. He married Roxale, widow of the Count of Flanders, and held the emperor and the Church at arm's length; but he was obliged to pay for the support of his feudal neighbors by large gifts of royal domain. He laid, however, the foundations of a dynasty which endured uninterceptedly for more than 800 years.

**Cape to Cairo Railway**, a project, originally conceived by Cecil J. Rhodes (q. v.), for a great African trunk line running from Cape Town, at the southern extremity of the continent, to Cairo

CAPE TOWN.

1. Cape Town from the sea, showing Table Mountain and Devil's Peak. 2. The Houses of Parliament. 3. Cape Town, looking to Lion's Head, from the Tower of the Post Office.

at the north. The direct distance between the two termini is about 5,700 miles, and over 2,000 miles of lake and river way available for traffic lie between, reducing the distance to be covered by rail to something like 4,000 miles. As originally planned, the railway was to follow an all British route, but the awarding of the region between Uganda and British East Africa to Germany in 1889 made it necessary for the line, after leaving Rhodesia, to pass through either Belgian or German territory before entering the British possessions farther north.

In 1867 the only railway line in South Africa ran between Cape Town and Wellington, a distance of 40 miles. Kimberley was reached in 1885; the section from Kimberley to Vryburg was opened in December, 1890; and that from Vryburg to Buluwayo in 1897. At this point the Rhodesian Company began construction shortly before the outbreak of the Boer War in 1899.

By 1904 the road had progressed to Victoria Falls, where it crosses the Zambezi River by the highest bridge in the world, a steel cantilever structure, 650 feet long and 380 feet above flood water. By 1906 it had reached Rhodesia Broken Hill Mine, and in November, 1909, it had been carried to Bwana Mkubwa, on the southern border of the Belgian Congo. From that point it extends through the great copper districts of Katanga, passing from Elizabethville to Kambove, and thence to the Biano plateau, on its way to Bukama, from which it was about 100 miles distant in 1916. At that time the total length of line from Cape Town was 2,500 miles.

In the north, the first link in the Cape to Cairo system is the Nile trunk of the Egyptian State railways, which runs from Cairo to Shellal, just above Assuan and the First Cataract. From here a two-days' steamer journey connects with the main line of the Sudan Government Railway from Wadi Halfa to Khartum, completed in 1899. The line was extended to Sennar on the Blue Nile in 1910, and from that point has been carried due west to Kosti, on the White Nile, 238 miles from Khartum. The railway construction programme of the Sudan calls for the extension of the road as rapidly as possible to Gondokoro, just over the Uganda border, whence Uganda will probably carry it to Lake Albert, with a branch to the outlet of Victoria Nyanza. From Lake Albert any of several routes may be taken. The one which seems most likely of early com-

pletion will run southwest to Stanleyville in the Belgian Congo, thence by a line already completed to Ponthierville, then 196 miles by steamer to Kindu, whence there is a line in operation to Congolo. From Congolo connection may be made with Bukama by steamer. A more easterly route by way of Victoria Nyanza to the southern extremity of Lake Tanganyika, and thence to Elizabethville, will probably ultimately be used.

Subsidiary side lines will join the main line at various points to form a complete continental system. Of these the most important yet built are that to the Red Sea Coast and that through Portuguese East Africa to Beira. Another line in course of construction will run from Elizabethville to Benguella on the west coast, 1,000 miles distant.

**Cape Town**, capital of Cape of Good Hope province, and metropolis of South Africa, is beautifully situated at the base of Table Mountain, and on the shores of Table Bay. The view of the town from the bay, with the steep and massive mountain close behind it, is most imposing. Another imposing prospect is that which opens up to the traveller who ascends behind the town, and gazes over it on Table Bay, with Cape Town at its feet. The town lies to the north of the Cape peninsula, which stretches due south for 18 miles to Cape Point lighthouse. On the south side of the neck of the peninsula lies the large curve of False Bay, with its minor anchorages of Simon's Bay and Kalk Bay, the latter used especially by Malay fishermen. The harbor entrance is defended by a castle. Mean annual temperature, 63° F.; annual rainfall, about 25 inches.

Table Bay is a poor natural harbor, exposed to the north and northwest gales of winter; but at an expenditure of \$25,000,000 a good harbor and dock have been constructed. Shipping in the bay is sheltered by a breakwater (3,640 feet long), and there are wet docks, a dry dock, and a government patent slip. An outer harbor, with minimum depth of 27 feet, is under construction. The city is the terminus of the Cape to Cairo Railway (q. v.).

Cape Town was laid out by its Dutch founders with mathematical preciseness—the main thoroughfares crossing one another at right angles. The beautiful government gardens in the heart of the town serve the purposes of a public park. The town is the see of an Anglican and a Roman Catholic bishop; has fine government buildings, especially the Parliament House, and municipal

buildings; the English cathedral, South African College, South African Museum and Library, Grey Library, and Botanic Gardens. The University of the Cape of Good Hope (1873) is an examining body, with affiliated colleges. The Observatory (1820) is the finest in the Southern Hemisphere. The environs are charming. One one side are the seaside suburbs of Sea Point and Green Point; on the other, through shady woods, a succession of populous suburban districts, connected by steam and electric railways, such as Woodstock, Maitland, Mowbray, Rosebank, Rodebosch (noted for its college), Newlands, Claremont, and Wynberg. Cape Town is the seat of the legislature of the Union of South Africa, of the provincial government, and of the provincial division of the Supreme Court. It was founded by the Dutch in 1652. Pop. (1915) 69,000, of whom 30,000 were white; pop. with suburbs, 160,000.

**Cape Verde Islands**, vîrd, a group of islands belonging to Portugal, in the Atlantic Ocean, lying about 350 miles west of Cape Verde on the west coast of Africa, between lat. 17° 13' and 14° 47' N. and long. 22° 40' and 25° 22' W. They include ten inhabited islands—Santo Antão, São Vicente, Santa Luzia, São Nicolão, Boa Vista, Sal, Maio, São Thiago (Santiago), Fogo, and Brava—and four uninhabited islets, with a total area of 1,480 square miles.

The islands, which are volcanic in origin, are separated from one another by deep passages, and are extremely mountainous, the loftiest point being a volcanic peak on the island of Fogo, 9,157 feet above the sea. There are several good harbors, notably that of Porto Grande on the island of São Vicente, which is important as a coaling station, and that of Praia on the island of São Thiago. Seen from the sea the islands present an arid and uninviting appearance; but the inland valleys, especially in years of abundant rainfall, are clothed with verdure. The climate is hot and unhealthful, the summer temperature ranging from 80° to 90° F. near the coast. The rainy season lasts from August to October, and during January and February the harmattan, a dry east wind from the continent, is felt. The flora is tropical.

Coffee is the chief crop, and the physic nut (*Jatropha curcas*), maize, millet, sugar cane, manioc, indigo, oranges, pumpkins, and sweet potatoes are raised. Aside from agriculture, the principal industries are cattle raising, the making of straw hats, lace, and

embroidery, the manufacture of sugar, spirits, salt, and cotton textiles, and fish curing. Commerce is chiefly with Portugal and the Portuguese possessions on the neighboring African coast. Exports include coffee, medicinal produce, millet, sugar, spirits, salt, hides, and fish.

The Cape Verde Islands are a Portuguese colony under a governor-general residing at Praia. The inhabitants are chiefly mulattoes and negroes, with some Portuguese. Pop. (1912) 143,929.

The islands were discovered by Cadamosto in 1457, and colonized by Prince Ferdinand, to whom they were granted by Alfonso v. of Portugal. They were later bestowed upon Prince Emanuel, and upon his succession to the throne (1495) became a part of the dominions of the crown.

**Cape York Peninsula**, North Queensland, Australia, separates the Gulf of Carpentaria from the Pacific Ocean. Its apex projects into Torres Strait and terminates in Cape York.

**Capias**, ká'pi-as ('thou mayest seize'), the short name of several writs directed to the sheriff requiring him to arrest the person named therein. They have been superseded for most purposes by the writ of attachment. See ATTACHMENT.

**Capillaries**. The name capillary (from *capillus*, 'a hair') is given to the minute vessels which form the connection between the

of fine, nucleated epithelial cells, placed edge to edge. The blood moves at its slowest in the capillaries, and in the case of inflammation of any part the white blood corpuscles pass through their walls. See CIRCULATION OF THE BLOOD.

**Capillaryity**. When a number of clean glass tubes of very fine bore, each open at both ends, are

Capillaryity.

A, Glass tube in water; B, in mercury.

immersed in water, the water rises in each to a higher level than at which it stands outside, and the finer the bore the greater is the height of the water. Phenomena of this kind are called *capillary phenomena*, since they are evident in narrow, hairlike tubes only. These phenomena seem to be in contradiction to hydrostatic principles, but the contradiction is only apparent.

The explanation lies in the existence of tension in the surface layers of a liquid. Many facts make the existence of this tension evident, notably the spontaneous contraction of liquid films, such as soap films. Now, any film which tends to contract tends to become a plane if free to do so; and if kept curved, it presses toward the concave side. This explains the tendency of a drop of liquid to become spherical. The surface becomes as small as possible consistent with the condition of holding a given amount of liquid, and the sphere is the smallest surface enclosing a given volume.

Again, a liquid which rises in a capillary tube is observed to be always concave upward. Hence there is less pressure in the interior of the liquid immediately below the surface than there is above. That is to say, the pressure just below is less than the atmospheric pressure; and the atmospheric pressure is reached *inside the tube* only at some distance below the surface. But outside the tube, at the surface of the liquid, the pressure is atmospheric. Hence, by hydrostatic principles, the liquid must rise in the tube until the hydrostatic condition is satisfied.

The reason for the water climbing up the sides of a glass tube, so as to make the surface concave upward, lies in the greater attraction of water to glass than of water to water. If in any liquid the attraction of liquid for liquid exceeded that of liquid for solid, the surface would become concave downward, and the liquid would not rise so high inside as outside the tube. This occurs, for example, in the case of mercury in a glass tube. Consult C. V. Boys' *Soap Bubbles* (new ed. 1912); Tait's *Properties of Matter*.

**Capistrano**, ká-pēs-trá'nó, GIOVANNI DI (1385-1456), Italian Franciscan preacher, born at Capistrano in the Abruzzi, and entered the Franciscan Order in 1416. He preached against the Fratricelli and other heretical orders in Italy, and with Bernhardin of Siena helped to reform his order. He was twice vicar-general, and his eloquence won back to the church many Hussites of Moravia, to which country he was sent as papal legate in 1451. After the capture of Constantinople (1453) he preached a crusade against the Turks, who then threatened to overrun Western Europe. In 1456 he conducted 40,000 Christians to Belgrade, to the assistance of John Hunyady (q. v.), and greatly contributed to deliver that town from the Turks. He was canonized in 1724. His chief work is a treatise on the *Authority of Pope and Council*.

**Capital**, in architecture. See COLUMN.

**Capital**, in economics, has been defined as that portion of a man's wealth from which he derives, or expects to derive, an income. Some economists employ the term with an attempt at greater precision, limiting the term to the instruments and materials of production which are themselves the result of industry. Land and other natural resources are thus excluded from capital. It is generally agreed that the conception of capital involves an element, as it has been called, of *prospectiveness*, and also an element of *productivity*. Different writers have laid special stress on the one or the other of these characteristics. A regard for the future rather than the immediate present obviously leads to the accumulation and employment of capital; an increase of wealth is no less manifestly the result of such action.

Capital has sometimes been classified as *fixed* and *circulating*. Fixed capital is embodied in a more permanent form, and fulfils its functions by repeated use. Circulating capital, on the contrary, is continually changing its shape or ownership. Machinery

Diagram of Capillaries.

A, Artery; V, vein; C, capillaries.

terminal branches of the arteries and the commencements of the trunks of the veins. These vessels are of various sizes, some admitting only one blood corpuscle at once, while others are large enough to allow the simultaneous passage of two, three, or more corpuscles. In muscular tissue, they run for the most part parallel to one another; in other cases (as around fat cells) they have a spherical arrangement; and in the skin and in parts of the intestines they form loops. Their walls are

furnishes a conspicuous example of the first kind; materials transformed into manufactured goods are a typical illustration of the second. The distinction is one of degree rather than kind: for the most durable capital perishes in time; and, to some extent at least, all capital is continually being consumed and reproduced.

Another classification of capital has been based on the fact that it may be found in a form to satisfy wants either directly or indirectly—called *consumption capital* and *auxiliary capital*. When goods are made in anticipation of demand, when elaborate machinery is used to produce a great variety of distinct patterns, when a large number of workers of different degrees of skill and strength are collected in one building, the work of organization and direction grows more arduous and prominent; and the employer to whom this special duty falls has been separated by recent economists from the capitalist, who, whether distinct from or identical with him, furnishes the capital needed.

To create capital it is necessary that production should exceed consumption. In other words, men must pay regard to the future as well as to the immediate present, and must save accordingly. But to say that all capital is the result of abstinence or saving is misleading. The development of capital is the result of complex processes of discovery, accumulation, and adaptation, which must be studied from history. With the growth of modern invention the margin between what is produced, and what is reasonably necessary for the satisfaction of human wants, has vastly increased. Hence there has come about that immense development of capital with productive powers almost unlimited.

*Capitalism* is the name applied by socialists and collectivists to that condition of society in which capital belongs to private individuals, as opposed to the ideal state in which all means of production, including both land and capital, will be publicly owned. Socialists lay emphasis on the immense power afforded by capital in the so-called exploitation of the worker, who is dependent on the labor of his hands. See *ECONOMICS*; *INTEREST*; *LABOR*; *LAND ECONOMICS*; *PROFITS*; *WAGES*. Consult E. von Böhm-Bawerk's *Capital and Interest* and *Positive Theory of Capital* (Eng. trans.); Karl Marx' *Capital*; Taussig's *Wages and Capital*; Mallock's *Critical Examination of Socialism*.

**Capital Account** is a statement of the resources of a company or business, consisting of moneys contributed by share-

holders or lenders, and accumulations of income, which are laid out either in investments or permanent stock, including land. Expenses incurred in purchasing, renewing, and improving stock, losses on investments, etc., are charged against this account.

The *Revenue Account*, on the other hand, deals with receipts obtained, and outlays, losses, etc., incurred in the actual working of the concern. It is highly important that these two accounts should be kept strictly separate, and that neither be credited or debited with sums which properly belong to the other. See *BOOKKEEPING*.

**Capital of Corporations.** In ordinary business usage, the capital of a corporation consists of its securities, at their par value. It includes not only the various forms of stocks, but the bonds issued by the corporation as well. Stocks and bonds not actually placed upon the market, but held in the corporation's treasury for sale in case of certain contingencies, are also reckoned as a part of the capital of the concern.

The capital of a corporation bears no close relation to the value of the property of the corporation. In some cases the total value of the property exceeds the aggregate capitalization, and in these the company is said to be under-capitalized. More frequently the capital exceeds the value of the property, when the corporation is said to be over-capitalized. See *CORPORATION*; *STOCK AND STOCKHOLDERS*.

**Capital Punishment**, that form of punishment which deprives the offender of life. It includes all punitive methods of destroying life, though originally the term was restricted in meaning to the act of cutting off the head.

In the simple, homogeneous groups on the lowest cultural levels capital punishment was seldom inflicted. Occasionally members of those groups were put to death, but such acts were not clearly punishment; the purpose apparently being rather to purify the group or to make a sacrifice to the spirits than to make the individual suffer. If a person was found guilty of witchcraft, he was put to death, his body was buried in foreign soil, his property, wife, and children were destroyed, and even the use of his name was prohibited. But even this annihilation was for the purpose of wiping out a contamination, rather than of punishing the offender.

From the conditions existing in the lowest cultural groups to the present, no distinct trend has been apparent until the last century and a half. Rapid in-

creases in the use of capital punishment were followed by rapid decreases. It has prevailed most in situations where internal conflict developed—as where by military power one group secured control over another or where there were marked differences in political loyalty or in religious belief—and in periods of great disorganization. It has also tended to flourish when the leaders have been isolated from the rank and file of the population by caste systems.

The use of the capital penalty is determined generally not by the material culture of any group or state, but by the social relations between the individuals of the group. When relations are intimate and the members are essentially of the same culture, there is little resort to this penalty; when there are artificial barriers between classes and when contacts are infrequent and lacking in intimacy, it can be inflicted by certain members upon others with little loss of equanimity. As democracy has spread, therefore, and human contacts have been facilitated by the development of means of communication, there has been a general tendency for capital punishment to wane. This tendency became apparent in different countries at different times.

In Frankfort-on-the-Main, 317 persons were executed in the fifteenth century, 248 in the sixteenth, and only 140 in the seventeenth. In the cantons of Zürich and Schwyz, Switzerland, the number of executions was 572 in the sixteenth century, 336 in the seventeenth, and 149 in the eighteenth. In Great Britain, on the other hand, the number of crimes for which capital punishment might be inflicted was increasing during this period: there were only 17 capital offenses in the early part of the fifteenth century in England, but more than 200 in the last part of the eighteenth century, and it was not until 1839 that the number was as small as it had been four centuries earlier. Most of the capital offenses were added during the period of social disorganization incident to the industrial revolution, when property owners were clamoring for protection, and the common people were losing much of their respect for the old codes. But in spite of the great increase of offenses punishable by death it is probable that no great increase in legal executions took place. In the seventy-five years ended in 1814, about 25 per cent. of the capital penalties were executed, but in the period 1813-19 the percentage had dropped to 10, and in 1827-33 to 4. Sweden abolished capital punishment in 1921.

The methods of producing death have included beheading, hanging, burning, boiling, breaking on the wheel, strangulation, suffocation, burying alive, drowning, stoning, crushing, piercing, precipitation from a height, tearing apart, and combat in an arena. Impaling and immuring were abolished in Switzerland about 1400, execution by drowning in 1615. Burning at the stake was used in Berlin as late as 1786. In England boiling to death was abolished as a method of execution in 1547, and burning in 1790. In some cases the offender was first hanged and his body was then mutilated, but the general practice in England in later days was to gibbet the body, that is, hang it to the gallows in chains, frequently after soaking it in tar, so that it would remain for a long time as a warning to others.

In America there were at no time so large a number of offenses punishable by death as in England. Most of the colonies listed no more than twelve capital offenses at any time, though Pennsylvania once had as many as seventeen. The method of inflicting death during the colonial period was almost invariably hanging. Since the colonial period there has been a growing distaste for the use of capital punishment, evidenced by a somewhat constant reduction in the number of capital offenses: Ohio in 1788 limited the death penalty to murder; Pennsylvania did the same in 1794; Rhode Island in 1838 reduced the number of capital offenses from ten to two, and in 1892 the Federal Government reduced the number from seventeen to three. At present twelve States permit capital punishment for one offense only, eight restrict it to two offenses, and only two States list as many as six capital crimes.

Another indication of the present attitude in the United States is the movement toward total abolition of the death penalty. One State abolished the death penalty in 1847, four others were added to this list by 1876, one more in 1897, one in 1907, and eight between 1911 and 1917. This makes a total of fifteen States that have abolished capital punishment up to the present time, but its restoration in seven of the States, leaves only eight with absolute prohibition of the death penalty at the present time (1926). Of the seven that restored the penalty, five passed the law forbidding it during or just before the World War and restored it after a short experience, the average period before restoration being less than four years. No State that has gone as long

as eight years without capital punishment has reverted to it.

The number of States that make capital punishment possible but not compulsory for any offense is increasing. In these States discretion is placed in the hands of the jury or of the judge. In 1918, twenty-four States were in this group; between 1918 and 1923 eight more were added, of which four had previously prohibited the death penalty, and four had required it for certain offenses. Still another tendency is toward reduction in the total number of legal executions. In some States, as Pennsylvania, this is not evident, but in the United States as a whole, it is certainly the case. In the five years ended in 1895, for example, there were 145 legal executions in the country; in the five years ended in 1917 only 96.

Efforts to secure methods that will produce death as swiftly and painlessly as possible and the tendency to exclude the public from executions show an increasing desire on the part of the people to mitigate if not entirely do away with capital punishment. In 15 States the death penalty is inflicted by electrocution (q.v.); in one (Nevada) by asphyxiation. In Utah the victim may choose hanging or shooting.

Capital punishment is the point at which the two principal theories of criminal law meet in conflict. Can society be more surely protected by treating the offender in a way designed to deter other prospective criminals, or by treating him in such a way as to prevent him from further crimes and develop him as far as possible along the lines of good citizenship? On this issue the controversy has settled into a difference of conclusions regarding the comparative deterrent effect of capital punishment and long-term imprisonment.

Evidence as to whether in the existing situation capital punishment is correlated with a lower murder rate than long-term imprisonment, is unsatisfactory. The only available figures are the statistics of homicides for the registration area of the United States; but since homicide includes excusable and justifiable killings, as well as murder and manslaughter, no conclusions on this basis can be regarded as more than approximations.

The homicide rate is almost exactly twice as high in the States that have retained capital punishment as in those that have abolished it. In 1922 the average homicide rate in the North Central States having the death penalty was 7.7; in the North Central States that had abolished the death penalty it was 4.4.

The median homicide rate in 1922 in cities of 100,000 or more in States that had capital punishment was 8.1; in similar cities in States without capital punishment it was 6.5. In every such comparison that can be made, the general conclusion seems to favor the abolition of the death penalty. The probability remains, however, that in those States abolishing the penalty this step was taken for the very reason that the homicide rate was already low.

It is often claimed that some States which have abolished capital punishment have been compelled to restore it because of the great increase in murders, and that with the restoration murders have again decreased. The homicide statistics, however, are not in agreement with this assertion. In Missouri, for example, where the penalty was abolished early in 1917, the homicide rate that year was higher than it had been in 1916; it decreased in 1919 and 1920, after the death penalty was restored, but in 1918, the only complete year in which the death penalty was prohibited, it was almost exactly the same as in 1916 and in 1921, when the penalty was legal. Moreover, the changes that occurred in Missouri were almost exactly parallel to those that occurred in about half of the other States; in both direction and extent from 1916 to 1921 they were almost identical, year by year, with those of Ohio, though no action was taken in Ohio regarding the death penalty. The changes in the other States that abolished and restored the death penalty are of the same nature. Statistics, thus, furnish no justification for the contention that capital punishment as it now exists is a more effective deterrent from murder than is long-term imprisonment. The evidence, unsatisfactory as it is, points somewhat more definitely to the opposite conclusion, but it seems more reasonable to conclude that there is no appreciable difference in the deterrent effect of the two existing methods of dealing with murderers.

Other arguments than the general one discussed above in favor of capital punishment may be briefly summarized. It is maintained that the death penalty is less costly than the long-term segregation of prisoners; that the death penalty is a method of ridding society of defectives; that if the death penalty is abolished, lynchings will increase since the public demands the death of the murderer (though there is no statistical evidence in favor of this, and there is some evidence against it). It is further argued

that unless murderers are put to death they will be released by pardon or parole, an argument which loses its force in view of the fact that in most of the States the pardon evil has been largely eliminated.

The principal arguments against capital punishment are as follows: It lowers the general appreciation of life; it makes the victims into heroes and martyrs for other criminals; the penalty is irreparable in case of error; it has a bad effect on the morale of the institution in which the penalty is inflicted; it is inconsistent with the general policy that is being developed for the treatment of offenders; it concentrates emotions on the evil that is already done rather than on the removal of the conditions which produced the evil; it is the primary reason for delay and inefficiency in the existing courts.

Consult Liepmann's *Die Todesstrafe* (1912); *Handbook on Capital Punishment, Prison Leaflets No. 38*, by the National Committee on Prisons and Prison Labor (1916); *Bulletin 25*, on *Capital Punishment*, of the Mass. Constitutional Convention (1917); *Bye's Capital Punishment in the United States* (1919); *Lawes' Man's Judgment of Death* (1924); *Gillin's Criminology and Penology* (1926).

**Capitals** (*majuscula*), in contradistinction to Small Letters (*minuscula*), are larger and differently shaped letters employed in writing and printing to help the eye, to relieve the uniformity of the page, to increase the facility of keeping and finding the place, to mark the beginnings of sentences, proper names, etc. Among the ancients, and during the earlier part of the Middle Ages, no distinction between capitals and small letters was known; in a sense, writing was originally all capitals.

In English printing and writing, capital letters are now employed as the initial letters of words which have some special distinction—all proper names and their derivative adjectives, all nouns which refer to the Divine Being, the pronoun I, the first words of new sentences and of lines of poetry. Official titles and the technical words of a treatise may be singled out by the use of an initial capital. In headings and in book titles whole words are printed in capitals, and even the first word of a chapter or paragraph may be printed in the same way.

In German all substantives begin with a capital letter, but adjectives formed from proper names, as *englisch*, *französisch*, and the like, are not generally capitalized. The French use capitals sparingly.

SMALL CAPITALS are so called

as being smaller than the initial capitals. See ALPHABET. **Capital Stock.** See STOCK AND STOCKHOLDER.

**Capito**, ká'pē-tō, or KÖPFEL, WOLFGANG FABRICIUS (1478-1541), German reformer, was born in Alsace, entered the Benedictine order, and became professor of theology at Bâle (1513). He approved of Luther's action, but nevertheless in 1519 entered the service of Albert of Mainz; and it was not till some years later that he finally declared for the Reformation. He was a member of the conferences of Zürich and Marburg, and in 1530, with Bucer, he prepared the *Confessio Tetrapolitana*, the confession presented to the Diet of Augsburg by the four cities of Strassburg, Constance, Memmingen, and Lindau, a few days after the presentation of the *Confessio Augustana* of the Saxon theologians.

**Capitol** (Latin *Capitolium*), the great national temple of ancient Rome, situated on the southern summit of the Capitoline Hill—*Mons Capitolinus*. The hill terminates at its southern extremity in a precipice with an abrupt fall of 80 feet—the 'Tarpeian Rock,' over which state criminals were thrown. On its northern summit stood the *Arx* or citadel of Rome, the site of which is now occupied by the Church of S. Maria in Araceli. On the Capitoline Mount was also the temple of Jupiter Tonans, built by the Emperor Augustus; and the magnificent *Tabularium*, built by Quintus Catulus, 73 B.C., in which the archives were kept.

The Capitol was founded by Tarquinius Priscus, and completed by Tarquinius Superbus. It was burned down during the civil wars (83 B.C.), was rebuilt by Sulla, was burned again by the soldiers of Vitellius (69 A.D.), rebuilt by Vespasian, but burned a third time in the reign of Titus (80), and splendidly restored by Domitian, whose structure lasted to a late period of the empire. In the Capitol the Sibylline books were stored, and here the consuls on entering upon office offered up sacrifices and made their vows; hither also the victorious general on his triumph was borne in his triumphal car to give thanks to Jupiter.

The modern Capitol (*Campidoglio*), built on the site, and part of the basement of the ancient Capitol, was designed by Michelangelo, but is one of his inferior works. It comprises the Palazzo Senatorio, the Capitoline Museum, and the Palazzo dei Conservatori.

An account of the United States Capitol is given in the article on WASHINGTON; the

State capitols are described in the articles on the capital cities.

**Capitoline Games**, games instituted at Rome by Camillus (390 B.C.), in honor of the preservation of the Capitol from the Gauls. After a period of discontinuance, they were again instituted as a quadrennial event by Domitian, 86 A.D.

**Capitoline Hill.** See CAPITOL. **Capitularies**, a term applied to certain edicts issued by the Frankish kings. They are distinguished from other classes of mandates by their division into chapters and by the fact that they are attested by no seals or signatures. They were probably put into execution by the rulers in person and attained their greatest importance under Charlemagne and Louis the Pious. They contain regulations for all departments of secular and ecclesiastical life, instructions for officials, particularly the *missi dominici*, and modifications of the old tribal law. A first collection of them was made in the ninth century by Ansegis, an abbot of Fontanelle. Modern editions have been published by Baluze (1687) and Boretius (1883).

**Capitulation**, the act of surrendering to an enemy upon specified terms contained in a convention or other instrument, also known as a capitulation. Such agreements being made by virtue of an implied power confided to generals and admirals, do not as a rule require the ratification of the supreme power unless such ratification is expressly reserved in the act itself. Being bargains in the common interests of both contracting parties, they vary greatly according to the condition of the party contemplating surrender and the generosity of the victor. The surrendering force may become prisoners of war with certain privileges, or may be sent home on undertaking not to bear arms for a limited period; the inhabitants of a besieged place may be promised security of religion and of private property. Under more honorable forms of capitulation, the garrison of a besieged fortress may march out with 'honors of war,' leaving the fortress and its warlike material in the hands of the victor. A stipulation affecting the political constitution or administration of a place, or for a perpetual cession of it, is *ultra vires*, and amounts to a *sponsion*, which must be confirmed by express or tacit ratification.

The Brussels Conference of 1874 laid down (Art. 46) the following rules to regulate capitulations:—'The conditions of capitulations shall be discussed by the contracting parties. These conditions should not be con-

trary to military honor. When once settled by convention, they should be scrupulously observed by both sides.' See INTERNATIONAL LAW.

The term capitulation is also applied to an arrangement between Christian and non-Christian, or civilized and semi-civilized powers, by which the latter surrender to the former the civil and criminal jurisdiction they would naturally possess over the subjects of such Christian or civilized powers resident among them. A notable example is furnished by the capitulations whereby Turkey formerly extended extra-territorial rights and privileges to foreigners resident within its boundaries or in its dependencies. These were discontinued by the Treaty of Lausanne (1923).

**Capiz**, ká'pēth, province, Philippine Islands, occupying the northern coast of the island of Panay, on the Visayan Sea; area 1,661 square miles, including adjacent islands. A semi-circular range of high mountains, enclosing a low and fertile plain, separates it from Iloilo and Antique, the other two provinces of the island. The Capiz, or Panay, the principal river, is navigable well into the interior for large native craft. Sugar, corn, rice, indigo, hemp, chocolate, and cattle and horses are produced. Gold and iron are found, and portions are thickly wooded. The leading manufactures are alcohol, silk, cotton, sacks, hats, baskets, hemp, and wine. The capital is Capiz, 242 miles southeast of Manila. Pop. (1918) 283,975.

**Capiz**, pueblo, capital of the province of Capiz, Panay, Philippine Islands, on the left bank of the Capiz River, 4 miles from its mouth. The river is navigable to the city, which is a port of call for steamers. Rice is exported. Pop. (1918) 22,022.

**Caplin**. See CAPELIN.

**Capmany y Montpalau**, kap-má'nē ē mōn-pá-lá'ōō, ANTONIO DE (1742-1813), Spanish man of letters, was born in Barcelona. His principal works are *Teatro histórico crítico de la elocuencia castellana* (1786-94), *Filosofía de la elocuencia* (1777), and *Memorias históricas sobre la marina, comercio y artes de la antigua ciudad de Barcelona* (1779-92).

**Cap Martin**, kap mār-tai', a winter health resort on the Mediterranean coast of the French department of Alpes-Maritimes, situated between Mentone and Monaco.

**Cap'nomaney**, divination by observation of the smoke from incense or a sacrifice. Thin smoke ascending directly was interpreted as a favorable augury.

**Capodistria**, ká-pō-dēs'tri-á,

town, Italy, in Istria (anc. *Ægida* and *Justinopolis*), 9 miles south of Trieste. It is an attractive town of Venetian aspect, built on a small rocky island connected with the mainland by a causeway. The Cathedral is a beautiful Gothic building with a fine campanile. The chief industries are fishing, preparing salt from sea water, and fruit growing. In 1278 Capodistria came under Venetian rule; in 1797 it became an Austrian possession, and after the Great War was restored to Italy. Pop. (1920) 8,192.

**Capo d' Istria**, ká'pō dēs'trē-ā, or CAPODISTRIAS, JOHN ANTONIO, COUNT (1776-1831), Greek political leader, was born in Corfu, studied medicine, but devoted himself to politics. He held various important positions in the Ionian Islands during their occupation by the Russians (1802-7), and on their reversion to France, after the Treaty of Tilsit (1807), entered the diplomatic service of Russia, becoming, conjointly with Count Nesselrode, secretary for foreign affairs. In 1827 he was elected president of Greece. His administration was marked by scenes of strife, jealousy, and suspicion, his undoubted Russian bias led to popular dissatisfaction, and on Oct. 9, 1831, he was assassinated by Constantine and George Mavromichalis, brother and son of a man whom he had imprisoned. Capodistria was a man of high ambition, intense patriotism, and good moral character, but his strict ideas and lack of sympathy with the lax methods then prevailing, made his administration a virtual failure.

**Capadocia**, kap-a-dō'shi-ā, a division of Asia Minor, varying in extent at different periods in its history. It is said to have been originally inhabited by a Hittite population, probably mixed with Semitic Syrians. After 560 B.C. it became part of the Persian Empire and remained so until about 330 B.C., the time of Alexander's conquests. For a time it belonged to the Syrian kingdom, and was then governed by independent kings. On the death of King Archelaus at Rome, A.D. 17, the Emperor Tiberius made it a Roman province. In Roman times it extended north to Pontus, south to Cilicia and the Taurus mountains, east to Armenia, and west to Lycaonia and Galatia. The chief cities were Mazaca (afterwards known as Cæsarea), Tyana, and Melitene.

**Cappel**, ká'pel, or KAPPEL, village, Switzerland, in the canton of Zürich, 10 miles south of Zürich. It is celebrated as the scene of the death of Zwingli (q.v.), the leader of the Prot-

estants, on Oct. 11, 1531, when he was engaged against the Roman Catholic forces. Pop. (1920) 641.

**Cap'pon**, JAMES (1855- ), Canadian writer and educator, was born in Dundee, Scotland. He was educated in Glasgow University and, after spending two years in Italy studying modern languages and lecturing on English literature, became corresponding tutor in Queen Margaret's College, Glasgow. In 1888 he was appointed professor of English language and literature in Queens University, Kingston, Ont. He is one of the editors of the *Queen's Quarterly Magazine*. His published works include: *Britain's Title in South Africa*, *Studies in Canadian Poetry*, *The Sectarian Principle in the Canadian Constitution*, *What Classical Education Means*, *Charles G. D. Roberts* (1924).

**Capponi**, káp-pō'nē, GINO, MARCHESI (1792-1876), Italian statesman and historian, was born in Florence. After travelling for a time in England, he settled in his native city and founded, first, the *Antologia Italiana*, modelled upon the *Edinburgh Review*, and later the *Archivio Storico Italiano*. In 1848 he became for a time the head of the government of Tuscany, and in 1860, after the unification of Italy, was made a senator. Although he had become blind, he assisted in the preparation of the *Vocabolario* of the Accademia della Crusca, and of the improved edition of Dante's *Commedia*. His most important work is *Storia della repubblica di Firenze*.

**Capps**, EDWARD (1866- ), American educator, was born in Jacksonville, Ill. He was graduated from Illinois College in 1887, was an instructor in Latin at Yale University (1890-92), and in 1892 became professor of Greek language and literature in the University of Chicago. In 1907 he left Chicago to accept the professorship of classics in Princeton University. In 1918 he was appointed trustee and chairman of the managing committee of the American School of Classical Studies in Athens. He was American Red Cross Commissioner to Greece in 1918-19, and Envoy Extraordinary and Minister Plenipotentiary to that country in 1920-21. Among his numerous publications on the classics are: *From Homer to Theocritus*; *Chronological Studies in the Greek Tragic and Comic Poets*; *The Plot and Text of Menander's Epitrepotes*.

**Caprera**, ká-prá'ra ('goat island'), a bare, rocky island off the northeast coast of Sardinia. It has an area of about 10 square miles and is connected

with the island of La Maddalena by a swing bridge. It was the favorite residence of Garibaldi during the last thirty years of his life, and there he died in 1882. His home, Casa Bianca, has been arranged as a museum.

**Capri**, kă'prĕ, Italian island, in the Bay of Naples; 20 miles south of Naples. It is about 4 miles long and 2 miles wide, with a rugged surface and precipitous coasts abounding in caves and fantastic rocks; area 5¾ square miles. The highest point is Mount Solaro (1,920 feet), in the western part. Capri is famous for its sunshine, pure air, and luxuriant vegetation, and is a favorite resort of foreigners as well as of Neapolitans. Features of interest are the Blue Grotto, a cavern entered by a low, narrow opening from the sea, filled with a strange blue light; the villas of Tiberius now in ruins; a ruined castle; and the Arco Naturale, a fantastic archway in the rocky cliffs. The chief industry is fishing; fruit, oil, and wine are produced. Capri and Anacapri are the principal towns.

Capri was undoubtedly inhabited in prehistoric times. It was once Greek, and later Roman, being long the home of Tiberius. In 1806 it was taken by the British, in 1808 retaken by the French, and in 1813 restored to Ferdinand I. of the Two Sicilies. Pop. (1920) 6,858.

**Capriccio**, kă-prĕt'chō, or CAP-PRICE, in music, a form of composition not governed by any set rules. The term is also applied to a painting or engraving made under like conditions.

**Capricornus**, an ancient constellation, and the tenth sign of the zodiac, that of the winter solstice. Its symbol is ♊. Its premier star is a naked-eye pair, composed of  $\alpha_1$  and  $\alpha_2$  Capricorni, of third and fourth magnitudes respectively. The former is telescopically double, the latter closely triple.

**Caprification**, a process of pollination essential to the development of the Smyrna fig, consisting in the transfer of pollen from the wild fig or caprifig, known also as the male fig, by a small insect, *Blastophaga grossorum*. Most fig growers concede that for every hundred Smyrna trees there should be from three to five caprifig trees planted, preferably in one corner or side of the orchard, toward the prevailing wind. Various containers, as wire or wooden baskets, are used to distribute the caprifigs through the orchard, or the figs, strung on string or raffia, are hung on the limbs of the trees to be fertilized. The pollen-laden insect crawls from the caprifig to the Smyrna fig,

and fertilization ensues. Caprification has been successfully introduced into California.

**Caprifoliaceæ**, the Honey-suckle family, a family of annual and perennial herbs, shrubs, and trees, of wide distribution. They have opposite leaves and flowers arranged in heads or whorls. Among the genera are *Lonicera*, *Linnaea*, and *Viburnum*.

**Caprivi de Caprara de Montecuculi**, kă-prĕ've dă kă-pră'ră dă mōn-tă-kōō'kōō-lĕ, COUNT GEORG LEO VON (1831-99), German Chancellor, was born in Charlottenburg. He served with distinction in the Danish (1864) and Austrian (1866) campaigns; and in the Franco-German war of 1870 he acted as chief of staff to the 10th Army Corps, distinguishing himself in the battles of the Loire. In 1884 he succeeded Von Stosch as head of the Admiralty, which service he reorganized. On Bismarck's retirement, in March, 1890, General von Caprivi became Imperial Chancellor and Minister for Foreign Affairs. In 1892-3 he passed the German Army Bill; but in October, 1894, he suddenly resigned, owing to friction with Count Eulenberg on the question of the Agrarian League malcontents.

**Caproic Acid** is known in eight isomeric forms. Normal caproic acid,  $C_6H_{11}COOH$  is one of the products of the butyric fermentation of sugar. It can be made by the oxidation of hexyl alcohol and is an oily liquid with a faint disagreeable odor. Its specific gravity is .945 at 0° C.; melting point - 2° C., and boiling point 205° C.

**Capron**, kă'prun, ALLYN (1846-98), American soldier, son of a hero of the Seminole and Mexican wars, was born in Tampa, Fla. He was graduated (1867) from West Point, receiving a commission in the 1st U. S. artillery regiment, and acquired a high reputation as an artilleryman. His service was principally in the West, and he distinguished himself at the battles of Wounded Knee and Drexel Mission in the campaign of 1890 against the Sioux. In the Spanish-American War, he took part in the Cuban campaign, and opened the siege of Santiago, at El Caney, also witnessing its surrender. He died soon afterward from typhoid fever contracted in Cuba.

ALLYN KISSAM CAPRON (1871-98), his son, commissioned second lieutenant of cavalry, 1893, was made a captain in the 'Rough Riders' and was mortally wounded at the battle of La Guasima, being the first American officer killed in the Spanish American War.

**Capella**. See SHEPHERD'S PURSE.

**Cap'sicum**, a genus of tropical shrubs belonging to the order Solanaceæ, including about 90 species, all indigenous to tropical America. They grow to a height of from one to six feet, and have small greenish white flowers and simple ovate leaves. The fruit is a long, membranaceous pod, variable in shape and size, generally red when ripe, and

1. Corolla. 2. Calyx, with ovary and pistil

commonly known as red or cayenne pepper. The fruits are dried and exported as capsicums, chillies, or, when powdered, as cayenne pepper. The green fruits are sometimes pickled and are used for making chilli vinegar. When used with meat they form the Mexican 'tamale.' The best known species, *C. annuum*, has many varieties, chief of which are *C. conoides*, an extremely acid variety known as tabasco; *C. grossum*, with large, fleshy, firm fruits, mild in flavor, known as bell pepper; and *C. cerasiforme*, with a small, extremely pungent fruit. The dried fruit of *C. frutescens* is used medicinally, especially as a rubefacient and local stimulant in neuralgia and rheumatism.

**Cap'stan**, a machine for raising heavy weights, especially on

shipboard. A ship's capstan was formerly a massive column of timber, cylindrical in form but smaller at the centre than at either end, and having its upper part pierced with holes to receive the bars or levers. It worked on a spindle fastened to the deck below, and was used for winding a cable in or out, or for any other purpose where extraordinary effort was necessary, as for hoisting heavy cargo or masts. With the introduction of steam, capstans were made of iron or steel instead of wood, although they were, as a rule, still fitted in such a manner as to be worked alternately by means of bars manned by part of the crew. In modern ships electrically-driven capstans are generally used, but much of the work formerly done by upright capstans is now performed by means of steam winches with a horizontal axis.

**Cap'sule**, in botany, the name given to those fruits which, when they are ripe and dry, open to allow the seeds to drop out. See FRUIT.

**Capsule**, in anatomy, the membranous covering surrounding such organs as the spleen and kidney.

**Captain**, a military officer holding intermediate rank between a first lieutenant and a major in the U. S. Army, the command corresponding to the grade being a company, troop, or battery. The captain is responsible for the appearance, instruction, drill, discipline and efficiency of his command; for the care and preservation of its equipment; and for the proper performance of duties connected with its subsistence, pay, clothing, company funds, accounts, reports, returns, etc. He requires his lieutenants to assist in the performance of all company duties; selects the non-commissioned officers, who are appointed by the next higher administration commander; appoints the first sergeant, quartermaster sergeant, cooks, mechanics, musicians, etc., etc. Captains in the U. S. Army are often post commanders. In European armies, where companies are larger, all captains are mounted.

A captain in the U. S. Navy has the assimilated rank of colonel in the army, and his corresponding command is a war vessel, senior captains generally commanding battleships, and those lower on the list vessels of various classes. A naval captain's duties in reference to his command are similar to those of an army captain, but involve a far higher degree of responsibility for life and property.

**Caption**, the title or heading of a legal paper, designed to show the authority by which it

is issued. It is used in indictments, depositions, etc., but is no part of the indictment itself. In Scotch law a caption is a warrant for the apprehension of a debtor.

**Capua**, kap'ū-a, town and episcopal see, Italy, in the province of Caserta, on the Volturno River, 20 miles northwest of Naples. The chief features of interest are the cathedral, founded in 856 but with the exception of the beautiful campanile almost entirely rebuilt; the museum, with valuable sculptures; and the fine bridge across the Volturno, built by Trajan. Pop. (1920) 9,832.

The ancient city of Capua, once a rival of Rome, and long famous for its luxury, was founded by the Etruscans, about 3 miles to the south of the modern town. The basis of its wealth lay in its flourishing industries — its purple stuffs, leather goods, scarlet dyes, and fine linens — and the extraordinary fertility of the adjacent Campanian plains. It was famous, also, for its pottery, its horses, and its perfumes, and was the seat of a celebrated gladiators' school. The revolt of the gladiators under the leadership of Spartacus broke out here in 73 B.C. Capua allied itself with Rome in 343 B. C., but in 216 espoused the cause of Hannibal, for which, in 211, it was sternly punished by Rome. Cæsar helped to re-establish it, and its prosperity lasted until the barbarians overran Italy. After being devastated successively by Goths, Vandals, and Longobards, the city was finally destroyed by the Saracens in 840; the modern city was founded about sixteen years later. In 1860 Garibaldi and his forces defeated the Neapolitans outside Capua.

**Capuana**, kā-pōō-ā'nā, LUIGI (1839-1918), Italian novelist and critic, was born in Mineo in Catania (Sicily). His dramatic and literary criticisms have been collected in *Il teatro italiano contemporaneo* (1872); *Studi sulla letteratura contemporanea* (1880-87); and *Libri e teatro* (1892). As a novelist he ranks among the foremost realists, his best-known work being *Giacinta* (1879). Other works include two charming volumes of fairy tales, one of which, *C'era una volta* (1882) has been translated into English (*Once upon a Time*, 1892); *Semiritmi* (1888); *Il piccolo archivio* (1886); *Passa l'amore* (1908).

**Capuchin Monkey**, kap - ū - shēn', or SAPAJOU, a name sometimes restricted to *Cebus capucinus*, sometimes applied generally to the whole genus *Cebus*, because of the cowl-like appearance of the hair on the forehead.

All the species are restricted to tropical America, and resemble other New World monkeys in the possession of prehensile tails, six cheek teeth at each side above and below, the broad division between the nostrils, and absence of cheek pouches. They vary in color from almost black to a reddish-brown. They are the most docile and easily taught of all American monkeys. *Cebus capucinus* is the monkey most often seen in travelling shows and accompanying itinerant organ players. See MONKEYS.

**Capuchins**, a branch of the Franciscan friars, founded about 1525 by Matteo da Bassi, who advocated a return to the observance of the most rigid rules of St. Francis. In 1528, Pope Clement VII. issued a bull authorizing them to wear the pyramidal hood (*capuccio*), to go barefoot, to grow beards, and to live as hermits. The order has always been a prominent one, numbering among its members many men of wealth and education. It reached its zenith in the 18th century, but suffered severely in the suppression of the monastic orders in France and Germany. It has two provinces in the United States (Detroit and Pittsburg). An order of Capuchin nuns was founded in Naples in the 16th century, but strictly speaking it is a branch of the order of St. Clare (q.v.). See also FRANCISCANS.

**Cap'ulets**, a noble family of Verona (Italian Cappelletti); which with the Montagues (Montecchi) figures in Shakespeare's *Romeo and Juliet*. The story of the feud between the families and the love of Romeo and Juliet seems to have been widely current in the 16th century, and it probably was from Arthur Brooke's versified translation (1562), through the French, of Bandello's Italian novel, that Shakespeare drew his plot.

**Capybara**, kā-pē-bā'rā, or CARPINCHO (*Hydrochærus capybara*),

Capybara

the largest living rodent, allied to the cavies and the guinea-pigs, and found only in South America. It is a heavily built animal, about four feet in length, covered with coarse, bristly, reddish-brown hair, and in general appearance meriting the

often applied name of 'water-hog.' It has short stout legs with webbed feet and hoof-like claws, a broad flat head, and practically no tail. It swims swiftly, though its movements on land are relatively slow. Its food consists chiefly of water plants, and it haunts low, swampy ground in the vicinity of rivers and lakes.

**Caraballos Occidentales**, *kā-rā-bāl'yōs ok-sē-den-tā'lās*, one of the three great mountain ranges of Luzon, Philippine Islands. It lies west of the median line of the island, and extends from Nueva Ecija to Point Mayaira, Ilocos Norte, the northernmost point of Luzon. It is divided into the Cordillera del Norte and Cordillera Central, the former being only a small part of the total chain. The ridges of Pinos and Bayabas in Benguet are west of the main range. Further north two great ridges enclose the province of Abra. The highest peak is about 8,000 feet.

**Caraballos Sur**, *kā-rā-bāl'yōs sōōr*, the third mountain range of importance in Luzon, Philippine Islands. It extends from the northern boundary of Nueva Ecija south and southeast through the great peninsula of Luzon to the strait of San Bernardino.

**Carabao**, *kā-rā-bā'ō*, the domesticated water buffalo of the Philippine Islands. It is a variety of Asiatic buffalo (q.v.), is grey or reddish grey in color, and has long horns curving backwards. It is used by the natives for drawing carts and carrying burdens as well as in ploughing and other farm-work.

**Carabidae**, *ka-rāb'i-dē*, a family of beetles, which includes all the common ground beetles, numbering some 12,000 species. The majority are carnivorous, living chiefly on other insects, especially grubs. Many of the forms have no wings, or mere rudiments of wings, and all are largely terrestrial in habit. They are to be found under stones and fallen logs, in gardens, woods, and fields.

**Carabiniers**, *kar-a-bi-nērz'*, or CARBINEERS, originally mounted French soldiers armed with carbines, one company of which was maintained in each cavalry regiment. In the late seventeenth century they were united into one body known as the Royal Carabiniers. In the British army the name is applied to the 6th Dragoon Guards; in Italy the gendarmierie are known as carabinieri.

**Carabobo**, *kā-rā-bō'bō*, state, Venezuela, in the northern part, extending from the sea inland; area 2,984 square miles. The mountain slopes are often forest covered. The southern part is

densely peopled, and produces excellent coffee, fruit, sugar, maize, rubber, and dyewoods. The capital is Valencia. Pop. (1920) 125,514.

**Caracal**, *kā-rā-kāl'*, CARACUL, or PERSIAN LYNX (*Felis caracal*),

Caracal

a small carnivore of the cat family found widely distributed throughout Southern Asia and Africa. It is a handsome animal, bright reddish brown above and paler below, with black ears and a long tail. Like the other true cats, it is actively carnivorous in habit, but is easily tamed. It is approximately the size of a fox, the body length being between 2 and 3 feet. It resembles the lynx in appearance, but its tail is longer, it has no ruff, and its fur is less close and thick. Its pelt is classified among the cheaper varieties of fur.

**Caracal**, town, Roumania, 95 miles west of Bucharest. It was named for the Emperor Caracalla. Pop. 13,000.

**Caracalla**, *kar-a-kal'a* (188-217), emperor of Rome from 211 to 217, was a son of Septimius Severus; he was named originally Bassianus, then took the name Marcus Aurelius Antoninus, but was nicknamed Caracalla from his fondness for wearing the long Gallic tunic. In 208 he accompanied his father to Britain, and on the latter's death at York, in 211, became co-emperor with his brother Geta. On their return to Rome, Caracalla's violent temper began to be manifest and after having brutally murdered Geta and all those who had favored him, he visited Gaul, Germany, Dacia, Thrace, Asia, Syria, and Egypt, marking his progress by wanton massacre. While he was preparing for another expedition beyond the Tigris, Macrinus, the praetorian prefect, instigated his murder at Edessa. Caracalla is generally said to have conferred the Roman franchise on all inhabitants of the empire in order to extract money from the provinces. He built at Rome the famous Thermæ Caracallæ, the ruins of which are still extant; also the triumphal arch of Septimius Severus.

**Caracara**, *kā-rā-kā'rā*, the

name given to various vulture-like, carrion-eating hawks of Central and South America. They are handsome birds from twenty to twenty-five inches long, dark brown or blackish, mottled with white, with long, naked legs and a somewhat crested head. Their food consists largely of carrion, and they are useful as scavengers, gathering in great flocks where food is plentiful. The nest, a large, somewhat slovenly affair, is built in trees or bushes. The best known species is *C. cheriway*, found in the Southern United States and in Guiana and Ecuador. It is a rather shy bird of terrestrial habit, strong in flight, and an exceedingly swift runner.

**Caracas**, *kā-rā'kās*, town, capital of Venezuela; 8 miles south of its port, La Guaira, with which it is connected by a narrow-gauge line crossing the coastal range by the Catia Pass, 3,100 feet high. Features of interest are the capital, a large building in semi-Moorish style; the episcopal palace; the university, museum, and library; the cathedral; school of fine arts; and residence of the president, the Yellow House. A statue of Simon Bolivar stands in the Plaza Bolivar, and on a hill west of the city are the observatory and Independencia Park, from which a fine view of the city is obtained. The immediate surroundings constitute the Federal district, 45 square miles in area. The leading industrial establishments are breweries, furniture and tobacco factories, and foundries. Exports include coffee, cocoa, and tobacco. The city was shaken by a severe earthquake in 1812, and again in October, 1900. Pop. (1920) 92,212.

**Caracci**. See CARRACCI.

**Caraciatolo**, *kā-rāt'chō-lō*, PRINCE FRANCESCO (1752-99), admiral of the 'Parthenopean Republic,' which succeeded the kingdom of Naples in 1799. He repelled every attempt at landing made by the Sicilian-English fleet, was betrayed, after the capture of Naples, tried by court-martial, and hanged.

**Caracoles**, *kā-rā-kō'lās*, town, Chile, in the province of Antofagasta, 100 miles east of Antofagasta. It has exceedingly rich silver mines. Pop. 4,500.

**Caractacus**, *ka-rak'ta-kus*, son of Cunobelinus, a king of the Silures in Britain, made a vigorous resistance to the Romans during the reign of Claudius. Betrayed to the Romans, he was taken to Rome to grace the triumph of Claudius, and appears to have ended his days in Italy.

**Caracul**. See CARACAL.

**Caraffa**, *kā-rā'fā*, a noble

Neapolitan family, three members of which, Carlo (1519-61), Antonio (1538-91), and Giovanni, were entrusted with the temporal administration of church affairs. The ablest, Carlo, served in the armies of Charles v. of Germany and Henry II. of France, and became a cardinal. Their uncle, Pope Paul IV., stripped the Colonnas of their possessions to enrich his nephews but subsequently was compelled by public opinion to banish them from Rome. His successor, Pius IV., caused them to be put to death. Another member of the family, Antonio (d. 1693), was an Austrian field-marshal. As governor of Hungary, he presided over the tribunal of Eperies, which tried the partisans of Tököly (q.v.). So great was his cruelty that his name was execrated in Hungary, and he was recalled in 1687. He was sent as commandant to Transylvania, and defeated the Turks at Munkács, in 1688.

**Caraman.** See KARRAMANIA.

**Carambola,** kar - am - bō'la (*Averrhoa carambola*), known also as the COROMANDEL GOOSEBERRY, a small evergreen tree, cultivated in India for its edible fruits. It grows to a height of about 30 feet, bearing short racemes of white or purplish flowers, followed by oval yellow fruits, about the size of an orange, smooth and thin-skinned, and having five angles or ribs. The pulp is clear and watery, pleasantly acid in some varieties, sweet in others. The carambola is also cultivated in Southern China, the Philippine Islands, Hawaii, Brazil, and occasionally in Southern Florida. The fruit is used for jelly and pickles and is preserved and exported. The Blimbing (q.v.) is a related species.

**Car'amel,** the brown or black substance produced by heating sugar over a slow fire. It can be made also by roasting sugar-containing substances, as coffee or chicory. It is soluble in water and the solution is largely used in coloring wine, beer, candy, ice cream, and other articles. The chemistry of caramel is little known. Three bodies, known as caramelin, caramelan, and caramelen, have been isolated, all of which are soluble in water.

**Caranaiba Palm.** See CARANAIBA.

**Caran d'Ache.** See POIRÉ, EMMANUEL.

**Carapa,** kar'a-pa, a genus of tropical trees, of which the best known is *C. guianensis*, a native of Guiana, where it reaches a height of fifty feet. It has pinnate leaves and bears fruit as large as oranges, with a characteristic subacid flavor; its bark is esteemed as a febrifuge, and its seeds yield a thick oil used in

lamps. From an African species (*C. procerca*) an oil is obtained with which the natives anoint the body to protect it against insects; they also burn it, and use it for making soap.

**Carapegua,** kā-rā-pā-gwā', town, Paraguay, 38 miles southeast of Asunción. It is situated in a rich cotton and sugar district. Pop. 13,000.

**Caraget,** kar-a-ke't', town, Canada, Gloucester county, New Brunswick, on Chaleur Bay and on the Canadian National Railroad; 160 miles northeast of Fredericton. It is a port of entry and has fishing industries. Pop. (1911) 2,845.

**Car'at,** (1) a unit used in weighing gems. The United States and many other countries now use the metric carat of 0.2 gram, or about 3.1 tróy grains. (2) The proportion of pure gold in an alloy, expressed as twenty-fourths of the whole. Thus, 18-carat gold is 18-24 pure gold.

**Carausius,** ka-rō'shi-us, MARCUS AURELIUS VALERIUS (?250-293 A.D.), Roman general, a native of Menapia (Belgium), who distinguished himself against the revolted Bagaudæ in Gaul, and was entrusted by the emperor Maximian with the protection of the coasts of Britain and Gaul from the inroads of Frisian pirates. But Carausius, by liberal gifts to the invaders, attached them to his interests and made himself master of Britain, assuming the title of Augustus (287). He was assassinated by one of his officers, Allectus.

**Caravaca,** kā-rā-vā'kā, town, Spain, in the province of Murcia, 40 miles northwest of Murcia. It is situated in a valley surrounded by mountains, and dominated by the ruins of a mediæval castle. The parish church contains a sacred cross famed for its healing powers, in honor of which a yearly festival is held. There are important jasper quarries in the district. Caravaca is an ancient town of the Knights Templars, remains of whose occupation still exist. Pop. (1920) 18,854.

**Caravaggio,** kā-rā-vād'jō, town Italy, in the province of Bergamo, 23 miles east of Milan. It is celebrated for the church of L'Apparizione della Madonna, a place of pilgrimage, and as the birthplace of two Italian painters both known as Caravaggio—*viz.*, Polidoro Caldara (born 1495) and Michelangelo Amerighi (born 1569). Pop. 9,000.

**Caravaggio,** MICHELANGELO AMERIGHI DA (1569-1609), Italian painter, was born in Caravaggio, near Milan, and as a boy was employed in preparing plaster for the Milanese fresco painters. Having determined to become an artist, he set himself, without any instruction, to copy

in minute detail the works of nature, and this practice he pursued to the end of his life. He spent some time in Venice, where he made a careful study of the work of Giorgione, and later was in Rome, where he enjoyed a period of great popularity. His ungovernable temper involved him in continual quarrels, and he was at various times forced to flee his place of abode. On the last of these occasions, when on his way to Rome, he fell ill in Porto Ercole and there died. Caravaggio may justly be called the founder of the Naturalistic School, but his chief claim to fame lies in his mastery of color and disposition of light and shade. Among his best works are *Christ and the Two Disciples at Emmaus*; *Death of the Virgin*; *The Fortune Teller*; *Ecce Homo*; *Martyrdom of St. Peter*; *The Entombment*.

**Caravaggio,** POLIDORO CALDARA DE (c. 1492-1543), Italian painter, was born in Caravaggio near Milan. His parents were very poor and at an early age he went to Rome to seek employment. While engaged in carrying mortar for the fresco painters of the Vatican, he attracted the attention of Raphael, whose pupil he became and under whose guidance he executed several frescoes in the Vatican. His greatest picture, *Christ bearing the Cross*, is now in the museum of Naples. Other works are *Psyche Received into Olympus*; *Cephalus and Procris*; *Passage of the Red Sea*.

**Car'avans,** the name given to travelling companies of traders or pilgrims in the Far East, especially those crossing the deserts of Asia and Africa. One of the earliest accounts of such a caravan is found in Genesis, where it is recorded that Joseph was sold by his brethren to a caravan of Midianites (Gen. xxxvii. 25-28). The rise of Islam in the seventh century led to the institution of the annual pilgrimage to Mecca, and devout Moslems make up the most celebrated caravans of the present day, while the roads from Basra, Suez and Bagdad to Mecca are among the most important caravan routes.

Caravans usually have stated times and places for assembling and departing. There is a leader, who is assisted by guides, military escort, and servants, and large consignments of merchandise are carried besides the necessary provisions and clothing. Great camel trains are a feature of the caravan. Sometimes the animals number as many as 1,000, following each other in single file, and travelling at the rate of about 2 to 2½ miles an hour, according to the load carried.

Most of the ancient caravan routes of Asia and Africa are still in use, with their recognized camping-places or 'desert stations,' usually beside a well (see CARAVANSARY). In the Sahara, where the Tuaregs are the great trading caste, there is a much travelled track from Morocco, by Tenduf, leading southeast to Wady Teli, where it meets the more northerly line from El Harib, and the main road is prolonged southward to Timbuktu. Another great road runs due north from Lake Chad to Tripoli; another stretches eastward from Taflet, in Morocco, to Cairo; while another minor track winds for 150 miles from Keneh, on the Nile, to Kosseir, on the Red Sea.

**Caravan'sary**, or CARAVANSERAI, the unfurnished inns of the East which from the earliest times have served as resting-places for caravans. They are usually built around a courtyard with a well, entered by a spacious gateway protected by strong doors and chains. Some are maintained by the government, others by private individuals or in connection with mosques. Some offer free accommodation and others make a small charge. At Cairo, Damascus, and other great caravan centres the caravansaries are large and handsome.

**Caravel**. See CARVEL.

**Car'away** (*Carum carvi*), an annual herb belonging to the

Caraway

1. Flower. 2. Fruit. 3. Section of fruit.

order Umbelliferae, about two feet high, with a much-branched stem, and umbels of white flowers in June. It is cultivated chiefly for its seeds, which are much used for flavoring. From the seeds, also, an oil is distilled which is used in medicine, as a stimulant and carminative. The caraway is easily grown in ordinary garden soil. Seed

should be sown in autumn, about nine inches being ultimately allowed from plant to plant. The fruits will be ready for gathering at the end of the following summer.

**Car'bides**, compounds of carbon with other elements, principally metals. Though several carbides were long known to exist, our knowledge of these compounds was greatly extended by the researches of Moissan with the electric furnace, by which they are most conveniently prepared. Calcium carbide,  $\text{CaC}_2$ , is manufactured on a large scale by heating coke with lime in the electric furnace. It is a crystalline compound from which acetylene ( $\text{C}_2\text{H}_2$ , hydrogen carbide, and, theoretically at least, hydrocarbic acid) is obtained, for illuminating and heating purposes, by the action of water. Similar carbides are obtained from analogous metals, but these also yield other gases, as methane, ethylene, and hydrogen, as well as acetylene. Many carbides, particularly those of copper and silver, decompose with explosive violence when heated slightly. Iron forms a carbide of a different character, probably having the formula  $\text{Fe}_3\text{C}$ ; this is one of the factors in the hardening of steel. Of the non-metals, silicon yields silicon carbide, or carborundum,  $\text{SiC}$ , prepared by heating coke and sand in the electric furnace (see CARBORUNDUM).

**Carbineers**. See CARABINIERS.

**Carbohy'drates**, a term applied to a large group of compounds containing carbon, hydrogen, and oxygen, the last two being in the proportion of two atoms of hydrogen to one of oxygen, as in water. They include (1) the aldehyde - alcohols, containing more or less than six carbon atoms, such as tetrose and arabinose; (2) glucoses, aldehyde or ketonic alcohols, containing six carbon atoms, such as dextrose or grape-sugar, lævulose or fruit-sugar, galactose, and sorbinose; (3) saccharoses, which are anhydrides formed by the union of two or more molecules of the glucose type, with loss of water, such as cane-sugar, maltose, milk-sugar, and raffinose; and (4) amyloses, of more complex constitution, such as starch, cellulose, dextrin, glycogen, and gums. Carbohydrates are important constituents of plant and animal life. They play an exceedingly important role in diet, two thirds of the energy produced in the living organism being due to their oxidation. See DIET AND DIETETICS; FOOD.

**Carbol'ic Acid**, PHENOL, or HYDROXY-BENZENE ( $\text{C}_6\text{H}_5\text{OH}$ ), is a white crystalline solid derived from coal tar and largely used as a disinfectant and germicide, as a

raw material in the manufacture of certain medicinal products, dyes and explosives, and as a constituent of synthetic plastics such as bakelite (q.v.). Small traces of it occur in certain animal secretions. The tar obtained by the destructive distillation of wood contains appreciable quantities of phenol, but its principal commercial source is the tar distilled from bituminous coal. Synthetic phenol is manufactured in large quantities.

'Natural' phenol, so called to distinguish it from the synthetic product, is recovered from the middle or carbollic oil fraction from the distillation of coal tar. This oil, distilled according to American practice at between  $170^\circ$  and  $240^\circ$  c., and in Europe between  $150^\circ$  and  $200^\circ$  c., is chilled to remove naphthalene and mixed with a solution of caustic soda, which dissolves the phenol and related bodies and thus permits their separation from other constituents. Upon acidification of this watery solution the crude phenol is separated and distilled to purify it. A ton of average bituminous coal yields an average of  $\frac{1}{2}$  pound of phenol.

Phenol is synthesized in large quantities from benzene (q.v.) by two commercially practicable methods, among many theoretically possible ones. The more important of these consists in preparing sodium benzene sulphinate by treating benzene with strong sulphuric acid and neutralizing the sulphonic acid thus formed with soda ash, and fusing this salt with caustic soda to form sodium phenate, which yields phenol on acidification with carbonic or mineral acid. The chemical reactions involved are:

Large quantities of phenol have been synthesized by treating mono-chloro-benzene (prepared by passing chlorine into benzene in the presence of aluminum chloride) with caustic soda, thus:

In addition to these two methods it has been proposed to manufacture phenol synthetically by the hydrolysis of chlorobenzene with steam ( $\text{C}_6\text{H}_5\text{Cl} + \text{HOH} = \text{C}_6\text{H}_5\text{OH} + \text{HCl}$ ) and by the catalytic oxidation of benzene by air.

Phenol is a colorless solid, crystallizing in rhombic needles, and possessing a peculiar, characteristic, penetrating odor. Its melting point is  $42.5^\circ\text{C}$ ., its boiling point  $181-182^\circ$  c., and its specific gravity, 1.09 at  $0^\circ$  c. Exposed to air and light it

gradually assumes a deep red color, due presumably to oxidation, although no definite explanation has been found for this phenomenon. It is soluble in about fifteen parts of water at ordinary temperatures, but above 67.5° C. it is miscible with water in all proportions. A mixture of nine parts of phenol with one part of water is liquid at ordinary temperatures and is the form in which phenol is ordinarily dispensed by pharmacists. It is soluble in all proportions in all the customary organic solvents. Its characteristic odor and burning taste serve to distinguish it. It is an active corrosive poison and even in dilute solutions destroys micro-organisms.

Chemically, phenol is related to the alcohols and exhibits many of their properties. Its constitution is deduced from its synthesis from benzene, which consists essentially in substituting an hydroxyl group for one of its hydrogen atoms. It may also be produced by the careful oxidation of benzene with hydrogen peroxide or nascent ozone, thus showing that it is an oxidation product of the benzene hydrocarbon. With caustic alkalis it forms phenylates (carbolates, phenolates, or phenoxides) corresponding to the alcoholates, and it is on the basis of these quasi salts, as well as its corrosive action on the skin, that phenol has been called carbolic acid, although strictly speaking it is not an acid. The phenylates are reconverted to phenol by the action of even so weak an acid as carbon dioxide. The introduction of the hydroxyl group into the benzene ring greatly increases its chemical reactivity, and phenol readily forms a variety of substitution products which are prepared only with difficulty from benzene.

A standard test for phenol is the precipitation of insoluble tribromo-phenol when bromine water is added to an aqueous solution of phenol. Ferric chloride produces a characteristic violet color when added to an aqueous phenol solution.

Many of its derivatives, as well as phenol itself, have germicidal and other valuable medicinal properties. Salicylic acid and the salicylates (qq.v.) are important medicinally. The amino phenols and their derivatives are important in photography and dyeing. Trinitrophenol (picric acid) is used both in dyeing and as a high explosive (see LYDDITE) similar in many respects to trinitrotoluene. The largest use of phenol at the present time is in the manufacture of synthetic resins by condensation with aldehydes. These resins are particularly important as the basis for insulating

material used in electrical and radio apparatus.

Phenol was formerly largely employed in aqueous solution as a disinfectant in surgical dressings, but, on account of the possibility of serious burns and poisoning if it be improperly used, other germicides have taken its place to a considerable extent. It was one of the first antiseptics used by Lister and is still considered the standard by which others are measured for germicidal power. Thus, other disinfectants are rated as having a 'phenol coefficient' of, say, 8, which means that a concentration of phenol in solution eight times that of the substance in question is required to be equally effective in killing bacteria (usually *B. aureus pyogenes* is taken as the standard bacterium).

For medicinal purposes phenol is used in glycerin, in a suppository and an ointment, also in watery mixture and oily solution as an external antiseptic, and internally in small doses (one to three grains) for antiseptis of the alimentary tract. Externally applied in a strong solution, such as one to ten, it acts as an irritant to the unbroken skin, producing a burning sensation, which, however, soon disappears, leaving a white, hardened surface, the burning being followed by temporary anaesthesia. In strong solution carbolic acid penetrates the unbroken skin, and produces carbolic acid poisoning in proportion to the amount absorbed. In the case of children its external application has been followed by albuminuria, and if absorbed, that part of it which leaves the body through the kidneys stains the urine a characteristic olive-green or gray. Internally, in small doses taken by the mouth, it stops fermentative changes in the stomach. For this purpose it is generally given as a sulphocarbonate (phenol sulphonate).

**Carbolic Acid Poisoning.**—A strong solution or pure carbolic acid taken in at the mouth acts at once on the mouth, throat, and stomach as a caustic poison. It enters the circulation and acts on the brain as a narcotic, the patient becoming comatose, cold, and cyanotic. The immediate danger is that of death through dyspnoea; but if the patient recovers from the first effects, there is still danger of suffocation owing to subsequent swelling of the injured air-passages.

The first thing, in treating poisoning by carbolic acid, is to rid the stomach of what has not already been absorbed. The stomach-pump is not safe, because of the probable condition of the mucous membrane; but the soft siphon tube should be

used, and the stomach washed out until there is no smell of carbolic acid in the washings. Sodium, magnesium, or other soluble sulphate (half an ounce to a pint of warm water) may be given, or a dram of saccharated solution of lime in a pint of water. After this olive oil (a quarter of a pint in a pint of warm water) may be given, or white of eggs in water, or large quantities of milk, keeping up the warmth of the body, and using alcoholic stimulants if necessary. It has been suggested that the soluble sulphates act by forming sulphocarbonates. After the first dangers of collapse and dyspnoea have been overcome, great care must still be taken in feeding that the throat and oesophagus do not suffer from irritation by solid food.

**Carbon** (C, 12) is an element widely distributed in nature—being found free as diamond and graphite, and in an impure state as coal; in combination it occurs in carbon dioxide, in all carbonates, as limestone and dolomite, and as an essential constituent of all living things. More than 200,000 different compounds of carbon are known, far more than of any other element. Originally it was believed that compounds of carbon could be produced only by the intervention of living matter, so closely were they bound up with the life process. For this reason the chemistry of carbon compounds was designated 'organic chemistry,' a term which persists today as a convenient classification in spite of the fact that tens of thousands of carbon compounds have been artificially produced in the laboratory.

The three naturally occurring varieties of carbon are of considerable value industrially, but a number of other varieties are also commercially useful. If material containing carbon be burned in a sufficient amount of air, the final form of the carbon is carbon dioxide (see below); if less air be admitted, carbon monoxide is formed; if still less air be present, it is easily possible to burn away the other elements having volatile oxides and leave a part of the carbon in a comparatively pure form. In this way charcoal and coke are made in large quantities from wood and soft coal, and lamp black and gas black from petroleum and natural gas. Charring of bones and ivory in a similar manner yields bone black and ivory black, both impure forms of carbon. Improved methods of manufacture of both charcoal and coke (destructive distillation) are largely practised to-day, in which the wood or coal is heated out of contact with air and valuable by-products recovered (gas,

pyroligneous acid and tar from wood, and gas, naphtha, ammonia and tar from coal). Except coke, these prepared carbons have valuable absorbent and decolorizing properties, which can be considerably increased by special methods of preparation (activated carbon).

Carbon, like several other of the elements, exists in allotropic forms—*i.e.*, in varieties which, although they have totally different properties, consist of carbon and nothing else. This is proved by the fact that not only can one form be changed into another, but also that all the kinds burn in oxygen, and from equal weights yield the same weight of carbon dioxide— $C + O_2 = CO_2$ . All the forms are solid, and volatilize without melting at the temperature of the electric arc. It is theoretically possible to melt carbon without volatilization, under pressure at high temperatures, although this has not been accomplished commercially. The various forms are insoluble in any ordinary solvent, but dissolve in melted metals, such as iron, from which they crystallize, on cooling, in the form of graphite. If the cooling is made to take place under very great pressure, some of the carbon is obtained in the form of minute diamonds. Diamonds may have been produced in a somewhat similar way in nature, as they show signs of having been subjected to great pressure during formation.

The diamond is an exceedingly hard, somewhat brittle solid, colorless, transparent, and highly refractive when pure, and crystallizing in regular octahedra (sp. gr. 3.5). Unlike other varieties of carbon, it is a non-conductor of electricity, and is converted into graphite when strongly heated, in the absence of air. Its chief industrial use depends upon the fact that it is the hardest known substance. Diamond dust is used as an abrasive and 'carbonadoes' (black or discolored diamonds) to form cutting edges for drills and for glass cutters. (See DIAMOND).

Graphite (black lead or plumbago), besides occurring naturally, is prepared by heating anthracite coal in the electric furnace. It is a soft, greasy-looking, black solid (sp. gr. 2.25) that crystallizes in six-sided plates. Its chief use is in lubricants, in contact brushes for electrical machinery, as a constituent of some metal paints formerly supposed to possess anti-corrosive properties, as the 'lead' in pencils, and as the electrodes used as conductors in certain electro-chemical and electro-metallurgical processes. (See BLACK LEAD).

The other varieties of carbon

are amorphous—*i.e.*, without crystalline form—depending for their appearance on the way in which they are prepared. Thus, charcoal is soft, black, and porous, resembling the wood from which it is obtained. It has great power of absorbing air and other gases, which become peculiarly active while in its pores. For this reason charcoal is used as a deodorant, and animal charcoal (obtained by charring bones) for decolorizing oils, juice of the sugar-cane, alkaloids, etc. Amorphous carbons prepared from gas and oil are used in rubber manufacture and as pigments in black paints and printing ink. Coke and charcoal are largely used as fuel in the recovery of iron and other metals from their ores and to some extent as smokeless domestic fuels.

Chemically, carbon is unique in forming an almost infinite series of compounds—a fact that is due to its nearly unlimited power of uniting atom to atom to form open or closed chains, other elements being attached throughout the length of the chain.

Carbon dioxide ( $CO_2$ ), also known as carbonic acid gas, is a compound of carbon and oxygen, in the proportion of twelve parts of the former to thirty-two of the latter. It occurs in the air and in natural waters, some of the latter being highly charged with it. It is formed when any material containing carbon is burned, and being produced by the oxidation of food-stuffs, is also expired by animals. Many carbonates are decomposed by heat, yielding an oxide of the metal and carbon dioxide, *e.g.*, the burning of limestone to quicklime. Similarly, the treatment of carbonates with acids yields a salt of the acid and carbonic acid, which readily decomposes into water and carbon dioxide. Commercially it is prepared in huge quantities, for carbonating beverages, by the burning of coke, and as a by-product in the manufacture of epsom salt by treating dolomite with sulphuric acid. It is interesting to note that the energy liberated by the burning of coke is sufficient to compress the carbon dioxide formed to a liquid, the form in which it is marketed. Large quantities of carbon dioxide are evolved in the fermentation of sugar to alcohol, an important commercial source.

Carbon dioxide is a colorless, odorless gas, a little more than one and one half times as heavy as air. It can be liquefied under pressure at any temperature below  $31^\circ C$ . Liquid carbon dioxide has a specific gravity of 0.83 and a boiling point of  $-78.2^\circ C$ . If allowed to boil with the release of pressure, liquid

carbon dioxide is converted into a white, snow-like solid, by the cooling effect of its evaporation. Carbon dioxide is soluble in water, forming a faintly acid solution, presumably containing carbonic acid (although this has never been isolated) from which the whole series of carbonates may be considered to be derived. It does not burn in air nor does it support combustion except of such metals as magnesium, potassium, etc., which form their own oxides and liberate carbon. It is a passive poison to animal life, acting to dilute the oxygen of the air, and is dangerous only when the oxygen content of air has been sacrificed by burning carbonaceous material in it, thus replacing the oxygen by carbon dioxide. It is the essential food of growing plants, which by a process of photosynthesis convert carbon dioxide and water into starches, sugars, and cellulose. The presence of carbon dioxide is detected by its inability to support combustion and by its formation of the insoluble carbonate when passed into lime water.

Commercially, great quantities of carbon dioxide are used in the beverage industries to impart flavor to vichy water and other soft drinks. For this purpose it is transported in a liquid state in strong steel cylinders from which it is released to be dissolved in water under pressure. Beer and sparkling wines contain carbon dioxide in solution. It is formed in the operation of most portable fire extinguishers by the action of sulphuric acid on sodium bicarbonate solution. The use of solid carbon dioxide as a commercial refrigerant has been demonstrated to be economical and is rapidly increasing.

Carbon monoxide has the formula CO, indicating that it is composed of twelve parts by weight of carbon to sixteen of oxygen. It is not ordinarily present in nature, and is formed by the combustion of an excess of carbon in oxygen; carbon dioxide being probably first formed, and then reduced to carbon monoxide,  $C + O_2 = CO_2$ , and  $CO_2 + C = 2CO$ . If required pure, it is best prepared in the laboratory by warming formic acid or a formate with concentrated sulphuric acid— $HCOOH + H_2SO_4 = CO + H_2SO_4 + H_2O$ .

Carbon monoxide is a colorless, odorless gas, that liquefies at  $-190^\circ C$ , and is almost insoluble in water. It burns in air with a blue flame (often seen on the top of a clear fire), forming carbon dioxide with the oxygen. The mixture of it with air or oxygen is explosive— $2CO + O_2 = 2CO_2$ . It is exceedingly poisonous, the inhalation of a single litre being sufficient to cause death—the

carbon monoxide combining with the red coloring matter of the blood, and preventing it from carrying the necessary oxygen to the tissues. Breathing pure oxygen is the best antidote.

Technically, carbon monoxide is extensively used as a fuel. It is present in ordinary coal gas, and is largely prepared mixed with nitrogen, under the name of 'producer gas' by drawing air through heated coal, and as 'water gas' by blowing steam through red-hot coke, when a mixture with hydrogen in equal volumes is obtained— $C + H_2O = CO + H_2$ . 'Mond' and 'Dowson' gases are similar to these. Producer gas is used for furnace-heating and for gas-engines; water gas being also employed for lighting, after admixture with sufficient oil vapors to give it luminosity.

In recent years carbon monoxide is finding extensive use as a raw material for the manufacture of certain organic compounds. A mixture of carbon monoxide and hydrogen (such as is produced by passing steam over very hot carbon, as in the manufacture of water gas, with the addition of further quantities of hydrogen) is passed at high temperatures and pressures over a catalyst for the production of methanol (wood alcohol) in commercial quantities. The catalyst used may be zinc oxide containing traces of copper or cerium aluminate containing nickel. If other catalysts be used, other compounds of hydrogen and carbon with varying amounts of oxygen may be prepared. A synthetic fuel for internal combustion engines, sold under the trade name 'synthiol', is made in large quantities by this method in Germany.

*Carbon disulphide*, or carbon bisulphide ( $CS_2$ ), is a compound of twelve parts of carbon to sixty-four of sulphur. It does not occur naturally, but is prepared by passing the vapors of sulphur over strongly heated coke or charcoal— $C + S_2 = CS_2$ . The sulphur is melted, and flows to the bottom of a vertical cast-iron or clay retort, which is heated by an external fire, or internally by electric arcs or resistances. As a result the sulphur is vaporized and combines with the hot carbon, the carbon disulphide formed being led off through cooled pipes and condensed. It is afterwards purified by distillation. Carbon disulphide is a highly refractive, colorless liquid, somewhat heavier than water, with a not unpleasant odor resembling chloroform. Usually, however, the liquid smells badly from the presence of impurities which form upon keeping it. Carbon disulphide has a specific gravity of

1.292 at 0° C., boils at 46° C., and readily evaporates to a heavy vapor. It is only slightly soluble in water, but is itself an excellent solvent for oils, fats, gutta-percha, etc. It burns with a pale blue flame, forming carbon dioxide and sulphur dioxide if there is excess of air,  $CS_2 + 3O_2 = CO_2 + 2SO_2$ ; though with a limited access of air sulphur is also set free. In oxygen or nitric oxide the vapor burns brilliantly, the combustion being explosive if the vapor is previously mixed with air or oxygen. Though neutral to litmus, carbon disulphide exhibits some acidic properties, uniting with alkaline sulphides to form thiocarbonates. Its vapor is very poisonous when breathed.

Technically, carbon disulphide is used to dissolve oils, fats, waxes, resins, etc., and as a solvent for sulphur chloride in vulcanizing rubber. It is employed as an insecticide, particularly for killing weevils in grain, but must be used with great caution. It is also used to destroy rats and other small burrowing animals in their holes.

*Carbon tetrachloride* ( $CCl_4$ ), or tetrachloromethane, is prepared by the action of chlorine on carbon disulphide. It is a colorless liquid of specific gravity 1.582 (21° C.), boiling at 77° C. Because of its non-inflammability and great solvent powers, it is used as a cleansing agent, either alone or mixed (60 pts. to 40) with gasoline, which mixture is also non-inflammable. It is also used in large quantities in the extraction of oils from seeds, as a solvent for rubber and other gums, and to an even greater extent as a fire extinguisher under the trade name, 'pyrene.' Its vapors, when concentrated, cause considerable discomfort—if not actual harm—to human beings, and for this reason it is not recommended for use in fires where subsequent ventilation is difficult.

See also CHEMISTRY; CARBIDES; CARBONATES; HYDROCARBONS.

**Carbonari**, kār-bō-nā'rē, an Italian secret political society formed early in the 19th century to resist the misgovernment of the Bourbon princes in Naples and to secure Italian freedom and unity. It has statutes and a ritual similar to those of the Freemasons. Spreading throughout Italy, it prepared the revolutions of 1820-21 in Naples and Piedmont, but collapsed before the Austrian troops. It was superseded by Mazzini's 'Young Italy' Society, though as late as 1867 there were a few Carbonari lodges in existence. Carbonarism was also well organized in France, but after the July revolution it

gradually ceased to exert any influence.

**Carbonated Waters** (Soda Water, Vichy, Seltzer, Aerated Water), a term applied to a large class of beverages which are rendered sparkling and effervescent by dissolving carbon dioxide in them under pressure. The release of the pressure permits evolution of the dissolved gas, thus causing effervescence. The carbon dioxide also improves the flavor of the beverage.

Carbon dioxide for use in beverages is obtained from three commercial sources, in the following order of importance: (1) the burning of coke in the air; (2) the fermentation of sugar into alcohol by yeasts; (3) as a by-product from certain industrial operations involving the treatment of a carbonate by an acid. It is then purified and liquefied under pressure, finding its way into commerce in heavy steel cylinders. This liquid carbon dioxide is dissolved in water in strong, tin-lined steel containers, under pressures as high as 100 pounds per square inch, at which pressure water dissolves seven times its own volume of gas. The carbonated water may be bottled in strong bottles, called siphons, from which any part of it can be withdrawn at will, or may be made up into beverages by the addition of sweetened syrups and then bottled under pressure. During 1923 more than 50 million pounds of carbon dioxide was produced in the United States and used in the manufacture of beverages.

Many mineral waters (q.v.) are naturally carbonated and others, artificially prepared, are carbonated to add 'life' to the otherwise flat taste imparted by their saline constituents.

**Car'bonates**, the salts derived from the hypothetical dibasic carbonic acid,  $H_2CO_3$ ; they are of three varieties—*normal*, *acid*, and *basic*—all of which are decomposed by most dilute acids with the evolution of carbon dioxide. The *normal carbonates*, in which both hydrogen atoms of carbonic acid have been replaced by a metal, are, as a rule, crystalline solids, and, with the exception of those of the alkali metals, are insoluble in water and are decomposed into oxides and carbon dioxide when strongly heated. Calcium carbonate (calc spar, limestone) and sodium carbonate (washing soda) are typical examples. The *acid carbonates* or *bicarbonates*, in which only one hydrogen atom is replaced, are less known. They are decomposed with evolution of carbon dioxide on heating to the temperature of boiling water. Sodium bicarbonate is an example of this class,

and is used in baking powder, seidlitz powders, etc., from the ease with which carbon dioxide is set free from it. The *basic* carbonates, which may be looked on as formed by the incomplete neutralization of the base by carbonic acid, are complex, and have been but little investigated; white lead,  $Pb(OH)_2PbCO_3$ , may be taken as typical.

**Carbondale**, city, Illinois, county seat of Jackson county, on the Illinois Central Railroad and a local electric line; 8 miles southwest of Murphysboro. The Southern Illinois Teachers' College is situated here. The city is an important shipping point for grain, coal, vegetables, and fruit and has a large railroad tie preserving plant, a garment factory, and coal mines. Commission government was adopted in 1910. Pop. (1910) 5,411; (1920) 6,247.

**Carbondale**, city, Pennsylvania, Lackawanna county, on the Lackawanna River, and on the Delaware and Hudson, the Erie, and the New York, Ontario and Western Railroads; 12 miles northeast of Scranton. It is surrounded by picturesque mountain scenery, and has a public library, parks, hospital, and Federal building. Industries include coal mining, the manufacture of paint, silk, and chemicals, bottling works, car and machine shops, and foundries. According to the Federal Census for 1919, industrial establishments number 43, with \$3,439,717 capital, and products valued at \$3,187,996. The district contains some of the oldest mines and most extensive deposits of anthracite in the country. The city has commission government. Pop. (1900) 13,536; (1910) 17,040; (1920) 18,640.

**Carbone**, kār-bō'nā, TIRTO (1863-1904), professor of pathology and anatomy in the University of Modena, acquired celebrity by his work confirming the causative organism of Mediterranean or Malta fever (*Micrococcus melitensis Bruce*). In the course of his studies he acquired the infection and died from the fever. During his illness he wrote a complete monograph, noting the progress of the disease and his observations upon it.

**Carbonic Acid Gas**. See CARBON (subhead *Carbon Dioxide*).

**Carbon Hill**, city, Alabama, Walker county, on the St. Louis-San Francisco Railroad; 60 miles northwest of Birmingham. Pop. (1910) 1,627; (1920) 2,666.

**Carboniferous**, one of the great periods or divisions of the Paleozoic Era in geology. From the Carboniferous system the world derives its principal supplies of coal, though that commodity is by no means confined

to this series of rocks. Extensive supplies of ironstone, metallic minerals, fireclay, building stone, and other valuable materials are also drawn from this formation.

The Carboniferous system overlies the Devonian and is succeeded or completed by the Permian. It falls naturally into two great subdivisions—a lower, known as the Mississippian, including great thickness of limestones, shales and sandstones, but poor in workable coal; and an upper series, known as the Pennsylvanian, and containing many valuable seams of coal. The Carboniferous series of rocks is highly developed in the Pennsylvania region, the central Mississippi Valley, and in certain districts of the Rocky Mountain region. These areas are very different in many characters, but all are capable of subdivision into an upper and a lower group as indicated above. The chief eastern formations represented in the Carboniferous are as follows:

	Upper Productive Coal Measures.
Upper or Pennsylvanian,	Lower Barren Stage.
	Lower Productive Measures.
Lower or Mississippian,	Millstone Grit. Mauch Chunk Shales. Pocono Sandstone.

In the Mississippi Valley the Lower series includes the Chester, St. Louis, Osage and Kinderhook stages, represented by great development of limestones up to 15,000 feet in thickness. The Carboniferous in the United States covers over 200,000 square miles and is extremely rich in coal in both the eastern and Mississippi Valley regions. In England there is only fresh-water Upper Carboniferous, but a similar succession and subdivision holds. The rocks of this period are heavily developed in the north of England. In France, Spain, and Belgium there is a similar succession. In Russia the Upper Carboniferous consists mainly of limestones (*Fusulina* limestone), and in Spain, Asia, and North America marine limestones are present in the Upper Carboniferous.

The Lower Carboniferous rocks are mostly sandstone, limestone, and shale; the Upper are sandstones, black shales, fireclays, coals, and ironstones. In the Appalachian region they have in part been folded into anticlines and synclines or troughs, bordered on the west by flat strata. The Mississippi Valley strata are almost horizontal. In the Alps, the Appalachians, and in Belgium the Carboniferous has been in places greatly broken, disturbed, and plicated, and may have, as the result of these movements,

taken on many of the characters of the older crystalline schists.

In the southern hemisphere a very different facies prevails in the Carboniferous. The Lower Carboniferous of Australia contains the same genera of fossils as the English Carboniferous; but the Upper or Permo-Carboniferous strata, which include many seams of coal, are distinguished by the presence of a flora, of which the most prominent member is the fern *Glossopteris*. This *glossopteris* flora occurs also in India and South Africa, and the beds which contain it are relegated to a later period than the American or English Coal Measures. In this series of rock certain conglomerates are found which have occasioned much discussion. They are full of large striated blocks, and are believed by most geologists to be of glacial origin (Talcher conglomerate of India, Dwyka conglomerate of South Africa). With this exception, all evidence points to the climate of Carboniferous times having been moist, warm, and equable. The abundance of ferns, in particular, is very suggestive.

In plants the Carboniferous is exceedingly rich; they are mostly ferns, conifers, lycopods, and Equisetacæ. Owing to the fortunate preservation of petrified stems, even the minute anatomy of these is very well known. The highest animals were reptiles and giant amphibians (Labyrinthodonts). Fishes abounded, principally ganoids and sharks; and in the limestones all kinds of marine life are abundantly represented—corals, crinoids, blastoids, brachiopods, molluscs, worms, Polyzoa and Foraminifera being the most common. The life of no other paleozoic period is so well known. See COAL, *Geology*.

**Carbon Monoxide**, or CARBONIC OXIDE. See CARBON.

**Carbon Print**. See PHOTOGRAPHY.

**Carbonyl Dichloride**. See PHOSGENE GAS.

**Carbon Paper**, tissue paper chemically treated so as to produce copies of an original manuscript. The paper is first made as absorbent as possible by removing all oil and impurities from the fabric and is then coated with a specially prepared ink, which is essentially a mixture of wax, color, and oil.

**Carborundum**, a carbide of silicon,  $SiC$ , prepared by heating sand with coke in an electric furnace. A little salt and some sawdust are usually added to the mixture to facilitate the operation of the furnace. Carborundum is a crystalline solid (sp. gr. 3.123), colorless when pure, but commercially brown or black, from the presence of impurities.

It is extremely hard and is used for abrasive purposes, making an excellent substitute for emery or corundum. Carborundum was first made in 1881, by Edward G. Acheson (q. v.). It is manufactured on a large scale at Niagara Falls.

**Carboxyl.** See ACIDS.

**Car'buncle**, a name given to almandine or crimson garnet, when cut *en cabochon*—i. e. with a rounded, smooth surface without facets. See GARNET.

**Carbuncle**, a circumscribed gangrenous inflammation of skin and subcutaneous tissue, similar to a very large boil, but far more serious because of its size. Unna thinks that it is caused by a special organism, while others say that it is due to *Staphylococcus pyogenes*, sometimes combined with *Streptococci*. A carbuncle begins with a circumscribed induration of skin and subcutaneous tissues, generally on the back of the neck, the shoulders, head, or abdomen; rarely on a limb. The hard area reddens, and then becomes purple; there is severe localized pain, throbbing, and tenderness. There may also be a rise of temperature. Later the hardness gives place to a soft, or 'boggy' feeling to the touch; the skin breaks in several spots, and oozes. Discharges may continue for a long time through several separate openings, or they may run together, the skin may come away, and a gray mass of dead tissue be exposed. The carbuncle may spread at the edges until the sufferer is exhausted, or septicæmia may occur at any time, causing death by self-poisoning.

The *treatment* of carbuncle is usually surgical; sometimes the development of the lesion can be aborted by early application of a 5 to 10 per cent. carbolic acid solution or 50 per cent. ichthylol solution. Vaccine treatment has given good results in some cases. Tonics such as strychnine, iron and arsenic are indicated to maintain the patient's strength.

**Car'bure'ter**, the apparatus in motor-car and oil engines in which oil is converted into gas, and by the admission of a regulated supply of air becomes an explosive mixture. The term is also used to denote the fire-brick-lined steel cylinder in which water gas is enriched with oil to make it luminous when burnt. The oil is sprayed in at the top of the cylinder and is 'cracked' or volatilized by the heat of the water gas and the heat remaining from the preceding 'blast' in the fire-brick lining and checkerwork in the cylinder. See GAS MANUFACTURE; OIL AND GASOLINE ENGINES; MOTOR CARS.

**Carcagente**, kâr'kâ-hân'tâ, or CARCAJENTE, town, Spain, in the province of Valencia, near the

river Jucar; 25 miles southwest of Valencia. It has large mulberry and orange groves. Pop. (1910) 13,520.

**Carcajou**, kâr'ka-jōō, the French-Canadian name of the wolverine (see GLUTTON), derived from an Indian name for the animal; sometimes improperly applied to the puma.

**Careano**, kâr-kâ'nō, GUILIO (1812-84), Italian poet and novelist, was born in Milan. In 1839 he published *Angiola Maria*, which marks the beginning of the domestic novel in Italian literature, just as Manzoni's *I Promessi Sposi* marks that of the historical novel. In 1859 he became professor in the Academy of Milan, and was afterwards nominated senator. Among his numerous works are the novels *Racconti Semplici* (1843), *Damiano* (1851), *Dodici Novelle* (1853); the collections of *Poesie edite ed inedite* (2 vols. 1861-70) and *Poesie varie* (1875); and the tragedies *Spartaco* (1857), *Ardoino* (1860), and *Valentina* (1870). One of his principal achievements was an Italian translation of Shakespeare.

**Carear**, kâr'kâr, pueblo, Cebu, Philippine Islands, on the east coast road at the head of Carcar Bay; 23 miles southwest of Cebu. An active coast trade is carried on. Pop. (1918) 37,392.

**Carcassonne**, kâr-ka-sûn', town, France, capital of the department of Aude, 55 miles southeast of Toulouse. It consists of two parts—the modern lower town, well built and prosperous, on the left bank of the Aude; and the old upper town, on the hill opposite. The old town is notable as offering a remarkably fine example of military architecture of the 11th to the 13th century. It has a double enceinte, about one mile in length, with 54 towers, and two gateways and the citadel. In the lower town is the Gothic church of St. Vincent; the cathedral of St. Michel (13th century), and a museum. Paper, cloth, soap, leather, linen, wine, and pottery are manufactured. Carcassonne dates from the time of Cæsar, and was the scene of the massacre of the Albigenes by Simon de Montfort in 1210. The Black Prince burned the town in 1355. Pop. (1921) 29,314.

**Car'cel Unit**, the flame standard officially adopted in France for gas testing; it is equal to 9.615 international candles.

**Carchemish**, kâr'ke-mish, a town of the Hittites (2 Chron. xxxv. 20), at the ferry between Haran and Syria. It is identified with the ruin Jerablus, in the north of Syria, on the west bank of the Euphrates.

**Carcinoma.** See CANCER.

**Cardale**, JOHN BATE (1802-77),

one of the founders (1835) and the first apostle of the Catholic Apostolic Church. In 1842 he compiled the liturgy then adopted, and wrote several religious works of a doctrinal and practical character, including *A Manual or Summary of Special Objects of Faith and Hope* (1843), and *The Confession of the Church* (1848).

**Car'damine**, a genus of the mustard family. Most species grow along watercourses and in wet places, but a few, like the Alpine bittercress (*C. bellidifolia*), are found on rocks and mountain summits. The flowers are cruciform, and are succeeded by pods which are straight and linear, with valves which, when the pod is ripe, curl up and separate with a spring, so that the seed is scattered to a considerable distance. The most interesting is the 'Cuckoo Flower,' or 'Lady's Smock' of both the Old and New World. Its broad lilac, or creamy white petals, borne in short racemes high above the pinnate foliage, are conspicuous in swamps. An Old World salad plant is *C. hirsuta*, the Bitter-Cress. *C. bulbosa*, also white-flowered, is among the first to bloom.

Lady's Smock (*Cardamine pratensis*)

1. Petal. 2. Pistil and stamens.

**Car'damom**, the dried capsule of a herbaceous plant known as *Elettaria cardamomum*, a native of the coast of Malabar, India, where it is found growing in clearings in forests and is also cultivated. It reaches a height of about eight feet, and bears drooping scapes of flowers. The tri-

angular capsules are gathered in the late autumn and dried in the sun. Cardamom is used in medicine as a carminative. In Europe and Asia, the cardamom is employed as a condiment in cookery.

**Cardamom Hills**, range of hills (alt. 2,000–4,000 ft.) in Travancore state, Madras, India, so-called because of the large quantity of cardamoms cultivated and gathered there.

**Cardanus**, kār-dā'nus, or **CARDAN** (1501–76), an Italian philosopher, mathematician, and astrologer, whose right name was GERÓNIMO CARDANO, was born in Pavia. He was educated at the University in his native city and taught mathematics and medicine in Milan (1534), Pavia (1547), Bologna (1562–70), and Rome (1571). During these years of teaching he was also engaged in writing, his chief works being a remarkable autobiography, *De Vita Propria* (1571–5); the *Ars Magna* (1545), which contains a formula for the solution of certain kinds of cubic equations known as Cardan's formula, although it was really the work of Tartaglia; *Practica Arithmetica Universalis* (1539); and *De Subtilitate Rerum* (1550). In spite of extravagant pretensions and superstitions, Cardan was a man of great learning and astuteness.

**Cardboard**. See PASTEBOARD.

**Cardenal**, kār-d'nal', PEIRE (d. 1306), Provençal troubadour, was born in Puyen-Velay, and flourished about the beginning of the 13th century. His songs, some seventy of which have come down to us, are, for the most part, *sirventes*, dealing with the corrupt manners of the clergy and nobles. At its best his poetry is characterized by vigor and passion. His songs have been printed by Mahn in his *Gedichte der Troubadours* (1856–73).

**Cardenas**, kār-dā-nās, seaport, Cuba, in the province of Matanzas, on the northern coast; 76 miles east of Havana, with which it has rail connection. It is a flourishing modern city celebrated for two underground rivers which furnish the water supply. There is a fine cathedral and the central square contains a statue of Columbus presented by Queen Isabella II. Cardenas is an important port for the shipment of sugar and tobacco, and there are submarine deposits of asphalt in the harbor. In Cardenas harbor occurred the battle of the Spanish-American War in which Ensign Bagley, the first American officer to lose his life, was killed. Pop. (1919) 32,753.

**Cardia**, the esophageal orifice of the stomach (q. v.).

**Cardialgia** (Gr. 'heart-pain'). See HEARTBURN.

**Car'diff**, port and largest city

in Wales, capital of Glamorganshire, is situated on the Taff River, 2 miles from its mouth. The city is well built and attractive with several fine parks, chief among which are Cathays Park, Roath Park, Cardiff Arms Park, Sophia Gardens, and Victoria Park with zoological gardens. Notable buildings are: Cardiff Castle, built about 1090, now the property of the Marquis of Bute; the group of public buildings in Cathays Park, including the law courts, city hall, and county hall; the Central Public Library; the University College of South Wales; the Welsh National Museum; and St. John's Church. Cardiff owes its prosperity chiefly to its splendid docks, consisting of five great basins with more than five miles of quays. It is the greatest coal exporting port in the world. It has enormous iron and steel works, paper and chemical manufactures, and ship-building yards. Since 1916 it has been the seat of a Roman Catholic archbishop. Pop. (1921) 200,262.

**Car'digan**, town and seaport, Wales, capital of Cardiganshire, on the right bank of the Teifi; about 75 miles northwest of Cardiff. The parish church and the priory near by are interesting buildings and about a mile distant from the town is St. Dogmael's Abbey, now partly in ruins. The castle, built in the time of Henry II., is also in ruins. Tile and brick making are the leading industries. Pop. (1921) 3,452.

**Cardigan**, JAMES THOMAS BRUDENELL, SEVENTH EARL OF (1797–1868), was born at Hambledon, Hampshire. In the Crimea he led the Light Brigade at Balaklava (1854).

**Cardigan Bay**, a large bay on the west coast of Wales, extending from Braich-y-pwll to St. David's Head and having a coast line of about 130 miles.

**Car'diganshire**, maritime county on the western coast of Wales, with an area of 443,189 acres. The surface is mountainous in the north and centre, and undulating in the south. Many small lakes are scattered over the surface, especially in the northern section. The soil is varied—fertile in the lower valleys and along the coast, poor in the mountains. The chief industry is sheep and cattle raising. Lead and zinc are obtained to a limited extent; gloves, flannel, and hats are manufactured.

Cardiganshire is rich in antiquities, including ancient British fortifications, stone circles, cromlechs, and inscribed stones. There are also remains of several mediæval castles (Aberystwith, Cardigan, etc.) and monastic buildings (Strata Florida), be-

sides interesting examples of ecclesiastical architecture. Pop. (1921) 61,292.

**Cardin**, town, Oklahoma, Ottawa county, on the Miami Mineral Belt Railroad; 3 miles from the Kansas, and 12 miles from the Missouri State line. Pop. (1920) 2,640.

**Cardinal**, one of the body of senators of the Church of Rome who act as the Pope's counsellors, constitute the Sacred College, and, in dignity and influence, are second only to the Pontiff himself. Its members are appointed by the Pope; at his death, assembled in conclave, they elect his successor, usually from among their own number, and during the period intervening one of them administers the affairs of the church (see CAMERLENGO).

The number of cardinals is not allowed to exceed seventy, of which not more than six are called 'bishops' and occupy the suburban sees of Rome, while of those described as 'priests' the maximum number is fifty, and of 'deacons' fourteen. The cardinal bishops and most of the cardinal deacons live at Rome, but only a few of the cardinal priests. In the early centuries of Christianity their number was smaller, and they took no exclusive part in the papal election till 1179 A.D. For matters of detail the Sacred College divides itself into 'congregations,' which meet separately for deliberation and decision, with the papal approval, on all the multifold affairs of the church.

There is but one episcopal seat whose occupant becomes a cardinal by virtue of his office—the patriarchate of Lisbon. It is customary, however, for the following dignitaries to be made cardinals upon giving up their offices: the Nonces of Paris, Vienna, Madrid and Lisbon, the Assessor of the Congregation of the Holy Office, the secretaries of the Sacred College, of the Congregation of the Council and of the Congregation of the Bishops and Regulars, the Major Domo, the Vice-Camerlengo, the Auditor, and the Treasurer of the Apostolic Chambers.

Cardinals wear a red dress and red cap, and have also a red cardinal's hat, which they must receive in Rome from the hands of the Pope. This hat is never worn after the Consistory at which it is bestowed.

The first American cardinal was John McCloskey, archbishop of New York, created in 1875. At present (1924) there are four American cardinals: O'Connell of Boston; Dougherty of Philadelphia; Hayes of New York; and Mundelein of Chicago, the last two appointed in 1924.

**Cardinal Bird**, RED BIRD, or VIRGINIAN NIGHTINGALE (*Car-*

Playing Cards: Early Colored Specimens

which may be considered the path of a point on the circumference of a circle which rolls on another circle of equal size.

**Carditis**, kār-dī'tis, inflammation of the heart. The term is chiefly used in the more particular expressions *pericarditis* (inflammation of the outside covering), *endocarditis* (of the lining), and *myocarditis* (of the muscular substance). See HEART.

**Cardoon'** (*Cynara cardunculus*), a thistle-like plant closely allied to the artichoke (*C. scolymus*), but taller and more prickly, sometimes reaching a height of eight or ten feet. It is a perennial, native to Southern Europe and Northern Africa and little known in the United States. It is raised from seed sown in May. In the fall the plants are blanched, and the heart is eaten as a salad or pot-herb.

Cardoon

Flower and edible central leaves.

*dinalis virginianus*). a handsome North American grosbeak. Its natural range is from Mexico to New Jersey, but of late years it has spread northward, where it remains through the winter in city parks and village gardens as far as Central New England. The male is a beautiful red marked with black and adorned with a tall crest. It has a loud, melodious, whistling song, is hardy in confinement, and is kept as a cagebird. It nests in bushes or vines, fashioning a grass-lined nest of twigs, bark, and rootlets. The eggs are white or bluish, speckled with brown.

**Cardinal Flower.** See LOBELIA.

**Cardinal Virtues**, according to Plato and other Greek philosophers, were justice, prudence, temperance, and fortitude. Upon these four all other moral virtues

were thought to hinge. Roman Catholic theology differentiates the moral and theological virtues, the former all springing from the four cardinal virtues, the latter being faith, hope and charity. See ETHICS.

**Carding**, the process of combing wool, flax, or cotton. See SPINNING.

**Cardiograph**, an instrument which records the movements of the heart by tracings, for the purpose of physiological and pathological research. One form, the electrocardiograph, is based on the fact that the electric currents produced in the human body by the activity of the heart muscle can be led off from the extremities and may be measured and recorded by a sensitive string galvanometer.

**Cardioid**, a heart-shaped curve

**Cardross**, kār'dròs, village, Scotland, in Dumbartonshire, on the Clyde, 3½ miles northwest of Dumbarton. At Cardross Castle, Robert the Bruce died, on June 7, 1329. Near it is Dalquharn House, where Smollett the novelist was born. Pop. of parish (1921) 11,609.

**Cards, PLAYING.** The earliest mention of distinct series of cards occurs in the household accounts for 1392 of Charles VI. of France. The earliest pictorial representation of a game of cards occurs in a French ms., the dates

assigned varying from 1330 to 1400. In an edict (1397) of the provost of Paris, working-people are forbidden to play certain games on working days, and among these cards are mentioned; in 1369 an ordinance of Charles V., similarly forbidding certain games, had no mention of cards. From this it is inferred that cards became popular in France between these dates. Covelluzo, a 15th-century writer, says that cards were introduced into Italy from Arabia in 1379; a statement unsupported by details. Early in the 15th century the manufacture of cards had become established in Germany, by 1425 in Italy, and before 1463 in England. In America they were brought over by the colonists.

The earliest cards used in Britain were hand-painted. The court (or, more correctly, *coat*) cards were then king, chevalier, and knave, the queen being subsequently introduced in place of the chevalier. The pips were first, in German cards, hearts, bells, leaves, acorns; next came especially on Italian cards, swords, batons, cups, money. In the 16th century the French adopted those now common in Britain—to wit, hearts, clubs, spades, and diamonds.

Besides the cards in common use, designated 'numeral' cards, there are also *tarots*, also called *atouts*, *atutti*, and *trionfmes* (trumps), because they override numeral cards in games combining the two kinds. Whether tarots were earlier than the ordinary numeral cards is still undecided. A pack of tarots consists of 78 cards, comprised of 22 emblematic and 56 ordinary cards, divided into 4 suits of 14 cards each—viz. 4 coat cards (king, queen, chevalier, and valet) and 10 point or pip cards, numbered from 1 to 10. The game played with these cards is called *tarocchi*.

As to the Eastern origin of cards, and the theories connecting them with early Eastern occult philosophy, Dr. Willshire regards them as of too recondite and shadowy a character to admit of satisfactory discussion. He inclines to the belief that Italy was the European country, and Venice the district in which they first appeared. A Swiss monk, in a ms. of 1377, says the *ludus carlarum* came to Switzerland that very year. See S. W. Singer's *Researches into the History of Playing Cards* (1816); W. A. Chatto's *Facts and Speculations on the Origin and History of Playing Cards* (1848); T. Willshire's *Descriptive Catalogue of Playing and other Cards in the British Museum* (printed by order of the trustees, 1876); Taylor's

*History of Playing Cards* (trans. from the French of D'Ambly, 1885); 'Playing Cards of various Ages and Countries,' from Lady Charlotte Schreiber's *Collection* (3 vols. 1892-5).

**Carducci**, GROSUÈ (1836-1907), Italian poet, born at Valdicastello. His boyhood was spent near the Pisan Maremma, and it is probable that the austere aspects and classic associations of this desolate region profoundly affected both the quality of his imagination and the character of his style. It was for his erudition, and not because of his achievements as a poet (for his first volume, *Rime*, 1857, and the scattered poems afterwards reprinted as *Juvenilia*, have only a relative value), that

in 1860 he was appointed to the chair of Italian literature at Bologna.

Although for some years (1861-67) immersed in his lectures, it was during this fruitful period that he wrote (in 1863—and, it is said, at a sitting) the now universally celebrated *Hymn to Satan*. In this poem, however, it is not the Mephistophcles of Goethe, nor the Lucifer of Milton, and still less the vulgar Devil of the common tradition, that is meant, but the principle of revolt, of insurgence, against effete conditions, usages, and ideas. The most famous of his poetical works are the three series of *Odi Barbare* (1877, 1882, and 1889). In style occasionally pedantic and often ultra-remote

Playing Cards: some primitive Designs.

and severe, his poetry counts at its best among the noblest in the classical tradition written by any modern poet in any country. In 1906 Carducci was awarded the Nobel prize for literature. In 1900-1 a complete edition of the poetical writings was issued in one volume. See 'Italian Poets of To-day,' in the *Quart. Rev.* (July-September, 1902), and the brief biography and translation excerpts in G. A. Greene's *Italian Lyricists* (1893).

**Carduchi**, a people who dwell in the mountains of modern Kurdistan; most likely the ancestors of the modern Kurds.

**Cardwell, EDWARD** (1787-1861), English ecclesiastical historian; became successively Camden professor of ancient history (1826-61), rector of Stoke Bruern, Northamptonshire (1828), and principal of St. Alban Hall, Oxford (1831). His published works include *Lectures on the Coinage of the Greeks and Romans* (1833); *Documentary Annals of the Reformed Church of England* (2 vols. 1839); *Hist. of Conferences* (1840; 3rd ed. 1850); *Synodalia: a Collection of Articles of Religion* (1842); *Reformatio Legum Ecclesiasticarum* (1850).

**Cardwell, EDWARD, VISCOUNT** (1813-86), English statesman, was born at Liverpool. He entered Parliament for Clitheroe in 1842 and was returned for Liverpool in 1847, but lost his seat in 1852. In the same year he was elected for Oxford city. He was successively Secretary to the Treasury (1845), President of the Board of Trade (1852-5), Chief Secretary for Ireland (1859-61), Chancellor of the Duchy of Lancaster (1861), Secretary to the Colonies (1864-6), and in 1868 was appointed Secretary of State for War, the office with which his name is most associated. In 1871-2 he carried out a great scheme of army reform. See Biddulph's *Lord Cardwell at the War Office* (1904).

**Care Sunday, CARLE SUNDAY**, or CARLING SUNDAY, the Sunday previous to Palm Sunday, is the Scottish name for Passion Sunday. 'Carlings' are fried or roasted peas.

**Carême**. See QUADRAGESIMA.  
**Carême, MARIE ANTOINE** (1784-1833), French cook, was born in Paris; became cook first to Talleyrand, afterwards to the Prince Regent (George IV.) of England, and the Empress of Russia and of Austria. His name is proverbial for artistic cookery. He was *chef* at the congresses of Aix-la-Chapelle, Vienna, and Laibach. He wrote *Le Pâtissier Pittoresque* (4th ed. 1842); *Le Maître d'Hôtel Française* (2nd ed. 1842); *L'Art de la Cuisine Française aux XIX<sup>e</sup> Siècle* (1833).

**Carew, GEORGE, BARON CAREW**

OF CLOPTON and EARL OF TOTNES (1557-1629), English statesman. He defeated Rory Oge O'More (1577), and was given command of the troops in Ireland (1579); then master of ordnance in Ireland (1588-92). After service with the expeditions to Cadiz (1596) and the Azores (1597), he was employed as envoy to France (1598).

**Carew, RICHARD** (1555-1620), English antiquary, born at Antony, East Cornwall; translated and published the first five cantos of Tasso's *Godfrey of Bolloigne, or Jerusalem Delivered* (1594), and a *Survey of Cornwall* (1602).

**Carew, THOMAS** (c. 1594-1639), English poet, of Cornish blood, but born at W. Wickham, in Kent; travelled in Italy, and The Hague; went in 1619 to France, and thereafter became gentleman of the privy chamber, and later sewer to Charles I. His poetry, of which little was published in his lifetime, consists chiefly of occasional verses and love lyrics to an unidentified Celia. It shows the influence of John Donne. Carew belonged to the poetic circle that gathered round Ben Jonson, and he had a special friend in Sir John Suckling. His works are *Celum Britannicum*, a masque (1643); *Poems* (1640); *Collected Works*, by W. C. Hazlitt (1870), J. W. Ebsworth (1893), A. Vincent (1899).

of unisexual flowers are conspicuous objects in many ponds. They are mostly easy to cultivate in moist garden soil, though a few require a pond to do themselves justice. Among the species best worth cultivating are *C. Morrowii*, whose pointed leaves are decorated with an edging of white; *C. pseudo-cyperus*, with drooping flowers; and the Indian *C. bacans*, with beautiful panicles of red berries in due season. Owing to the creeping, spreading habit of its roots, *C. arenaria* is employed to bind sand-dunes such as those which occur along the shores of the North Sea and of the Baltic Sea.

**Carey, HENRY** (?1690-1743), English poet and musician, is believed to have been the illegitimate son of George Savile, Marquis of Halifax. His first volumes of poems appeared in 1713; others in 1720 and 1729. He wrote farces, burlesques, and dramatic pieces, frequently with the accompanying music. His best-known poem is *Sally in our Alley*. A claim, later discovered to be unfounded, was advanced that he was the author and composer of *God save the King*.

**Carey, HENRY CHARLES** (1793-1879), American political economist, son of Mathew Carey, was born in Philadelphia, Pa., and took a position in his father's bookstore at the age of eight years, where he remained until he was made a partner on attaining his majority. His father retired in 1821, and he became head of the firm of Carey & Lea, at one time the largest publishing house in the country, retiring himself in 1835 to pursue his studies in political economy. Mr. Carey believed in free trade as an ideal eventually to be reached, but he vigorously advocated protection as adapted to the actual and historical situation. His first book, *An Essay on the Rate of Wages* (1835), was expanded and reissued as *The Principles of Political Economy* (3 vols., 1837-40), which was translated into several foreign languages. Some of Mr. Carey's later books were *The Credit System in France, Great Britain, and the United States* (1838), *The Past, the Present, and the Future* (1848), *Letters on the International Copyright* (1853), *Principles of Social Science* (3 vols., 1858-9), and *Miscellaneous Works* (1869). See Erders's *A Memoir of Carey* (1880).

**Carey, JAMES** (1845-83), Fenian, was born in Dublin, and was by trade a bricklayer. Joining the Fenian conspiracy (1861), he became one of the founders of the Invincibles (1881). On May 6, 1882, Lord Frederick Cavendish and Thomas Burke, permanent Irish under-secretary, were murdered by Fenians in Phoenix

*Carex arenaria*.

1, Male flower; 2, female.

**Carex**, a genus of perennial grasslike herbs frequenting the water-side, mostly in temperate climates. They are commonly known as sedges, and the spikes

Park, Dublin, the victims having been pointed out by Carey. He turned queen's evidence, but was murdered on board a vessel near Cape Town by Patrick O'Donnell.

**Carey, MATTHEW** (1760-1839), Irish-American publisher, was born in Ireland, and was the son of a Dublin baker, who gave him his choice of trades. He selected that of printer and bookseller, and at the age of seventeen published an address to Roman Catholics of so fiery a nature that he was obliged to seek refuge in France, where he was employed by Franklin. Returning to Ireland, he conducted the *Dublin Freeman's Journal* (1781) and established the *Volunteer's Journal* (1783), the latter of which papers gained a high degree of political influence. Carey's attacks on the British Government led to his temporary imprisonment, and in 1784 he removed to Philadelphia, being assisted by Lafayette. He there established the *Pennsylvania Herald*, the first American paper to give legislative reports, and was connected with other periodicals until 1791, when he started a bookselling and publishing business, with which he was associated until his retirement in 1821, being succeeded by his son, Henry Charles Carey. With Bishop White and others he founded (1796) the first American Sunday-school society. He wrote a number of pamphlets on current questions. His *Autobiography* appeared in the *New England Magazine* (1833-4).

**Carey, ROSA NOUCHETTE**, English writer of stories for girls, born in London; began her career as a novelist in 1868, and since then has produced about thirty novels, including *Barbara Heathcote's Trial* (1871), *Nellie's Memoirs* (1868), *Uncle Max* (1887), *The Mistress of Brae Farm* (1896), *My Lady Frivol* (1899), *Trivial Round* (1900), *At the Moorings* (1904).

**Carey, WILLIAM** (1761-1834), English missionary, was born at Paulerspury, Northamptonshire. Chosen as the first Baptist missionary to India (1793), he arrived in Calcutta (1794), studied the Bengali dialects, and preached in the vernacular in 1795. Having founded the Serampur mission in 1799, he was professor of Oriental languages at the college of Fort William until 1830. He published Marathi, Sanskrit, and other grammars and dictionaries, and portions of the Bible in about forty Oriental languages, besides editing the *Ramayana* (1806-10). See *Memoirs* (1856), and *Life of William Carey*, by George Smith (1885).

**Carfax**. See OXFORD.

**Cargill, DONALD or DANIEL** (1619-81), Scottish Covenanter, was born at Rattray, Perthshire.

Opposed to the restoration, he denounced those who accepted the Indulgence in 1672, and became a field preacher. He fought at Bothwell Bridge (1679), and took part with Richard Cameron in the Sanquhar declaration (June 22, 1680). For excommunicating the king and others at Torwood, near Stirling, he was captured (Sept. 12, 1680), and executed at the cross of Edinburgh.

**Cargo**. See BILL OF LADING, CHARTER-PARTY, FREIGHT, INSURANCE.

**Carhart, HENRY SMITH** (1844), American physicist, was born at Coeymans, N. Y., and graduated (1869) at Wesleyan. After several years of teaching and study, he was appointed professor of physics at Northwestern University, resigning in 1886 to accept the same chair at the University of Michigan. He was a member of the jury of awards for electricity at several world's fairs in the U. S. and abroad, and has held office in learned societies. His text-books include *Primary Batteries* (1891), *University Physics* (1894-6), and *Electrical Measurements* (1895).

**Caria**, the s.w. region of Asia Minor. The coast was largely occupied by Greek colonists: in prehistoric times the interior was held by the Leleges, a people akin to the pre-Hellenic population of Greece; later, by the Carians proper, a race akin to the Lydians. Caria was a principal source of the slave trade for Greece. In the 4th century B.C., its native princes, of whom Mausolus is the best known, rose to wealth and power, though they were then tributary to Persia. Alexander the Great conquered the country in 334 B.C. Under the later Roman republic the pirates of Caria and Cilicia were notorious; they were suppressed by Pompey in 66 B.C.

**Cariaco**, seapt., Venezuela, 30 m. E.N.E. of Cumana, near the head of the Gulf of Cariaco and on river of same name. Its docks are at Puerto Sucre on the gulf, which is well sheltered. Pop. 7,000.

**Cariama**, or SERIAMA. See SCREAMER.

**Caribbean Sea**, division of the Atlantic Ocean, from which it is separated by the West India islands, while on the s. it is enclosed by Venezuela and Columbia, and on the w. by the Central American states and Mexico. At the n.w. it connects with the Gulf of Mexico through the Yucatan Strait. A broad submarine plateau, nowhere exceeding 1,000 fathoms in depth, between British Honduras and Jamaica, divides it into two deep basins. Of these, the eastern has a general depth over 231,000 sq. m. of 2,600 fathoms, and a maximum depth of 2,844 fathoms. The western basin has about the same

mean depth, but is much less in extent, and in a narrow trough sinks to a much greater depth—viz. 3,428 fathoms. In many respects the Caribbean Sea resembles the Mediterranean, both, for instance, filling primitive depressions of the earth's crust, and both being inland seas.

**Caribbee Islands**, the name given to the chain of West India islands which begin with Saba, on the n., and end with Grenada, on the s. The chain consists of eleven conspicuous members, including Saba, St. Eustatius, St. Christopher (St. Kitts), Nevis, Montserrat, Guadeloupe, Dominica, Martinique, St. Lucia, St. Vincent, and Grenada. Saba and St. Eustatius are Dutch; St. Kitts, Dominica, Montserrat, and Nevis, English; Guadeloupe and Martinique, French; and from Martinique southward the remainder are British possessions. See WEST INDIES.

**Caribou**. The American name, derived from an Indian language, of the reindeer of North America, of which several forms exist, regarded by some as mere varieties of the European reindeer, by others as distinct species. They occur throughout the wooded districts of Canada and somewhat within the northern boundaries of the United States, in Maine and near Lake Superior, ranging the woods in bands, and particularly haunting swampy districts, where their broad, loosely connected hoofs enable them to travel. Their flesh and skins are of great value to the Indians, but except in winter their hunting is very difficult. The foregoing remarks apply to the 'woodland' caribou, ranging in a variety of slightly differing forms from Newfoundland to Alaska; but a quite different Arctic form is known as the Barren Grounds caribou, and is found on the Arctic coasts east of the Mackenzie River, and also in Greenland. These caribou assemble in the fall in enormous herds and migrate southward to the borders of the wooded lands, then return northward in the spring. During these migrations large numbers of them are killed by the Eskimos and Indians of those regions, and are their main dependence for animal food. Their characteristics and habits are essentially the same as those of the European reindeer, but they are not domesticated. See A. J. Stone in Whitney's *The Deer Family* (1903); and E. Ingersoll, *Life of Mammals* (1906).

**Caribou**, vil., Aroostook co., Me., 53 m. N. by w. of Houlton, on the Aroostook R. and on branches of the Bangor and Aroostook and the C. P. R. Rs. It has lumber and shingle mills, sash and door factories, flour

Died 1909

mills, carriage works, woollen mills, foundry, etc. Pop. (1910) 5,377. See CHESUNCOOK LAKE.

**Caribs**, S. American Indians, whose original home has been traced to the head-waters of the Xingu and other southern affluents of the Amazon in Central Brazil. Here they are still represented by the Bakaïri and other primitive tribes. Hence it is assumed that the Carib migrations spread from this region through the Guianas and Venezuela north to the W. Indies, Nicaragua, and Honduras. From the W. Indies all these tribes had disappeared before the close of the 18th century, the last survivors having been removed from St. Vincent to the Bay Is., Honduras, in 1796. But elsewhere numerous Carib communities are still found scattered over an immense area from Trinidad to Central Brazil. They possess, however, no kind of political or social coherence; their kinship rests entirely on their common speech, a highly polysynthetic stock language, represented by a great number of extremely divergent branches and dialects.

When first brought into contact with Europeans, the Caribs were a fierce, restless people, marauders on the mainland, corsairs on the high seas, and undoubted cannibals—this very word (*carnibal*) being a Spanish formation from *Canib* = *Calib* = *Carib*. The Caribs are physically a fine race, above the average height, shapely and robust, with long face, slightly oblique eyes, reddish-brown complexion, long, lank, black hair, and features of a somewhat softened Indian type. See Im Thurn's *Among the Indians of Guiana* (1883); Stoddard's *Cruising Among the Caribbees* (1895).

**Caricature**, a representation, usually pictorial, in which the salient characteristics of a person or persons are made ludicrously prominent. Fundamentally, dramatic mimicry is caricature, and caricature in its crudest form. We see it inherent in monkeys in a marked degree, as also among low races of men; and it is the first resort of the uneducated in an effort to belittle an opponent. For ages, also, in all civilized countries, caricature or burlesque has held a recognized position on the stage. In literature, moreover, its place is equally well defined. But a caricature is, before everything else, a pictorial or sculptured representation, generally satirical, sometimes offensive to the extreme of grossness, but often executed with the most perfect good-nature, a gentle railery taking the place of satire or malice. Egyptian papyri, Etruscan vases, Greek pottery, the walls of Rome, Her-

culaneum, and Pompeii, and the ruins of Yucatan all afford evidence of a love of caricature, whether displayed in mere rude *graffiti* (wall scribbings) or in much more skilful and elaborate representations. Some of these are wonderfully modern in style and feeling. In Thomas Wright's *History of Caricature* (Lond. 1865) there are ancient Greek caricatures of a 'Romeo and Juliet,' scene, and of 'Apollo at Delphi,' which would not seem out of place in the pages of *Punch*. Perhaps the *graffiti* appeal even more strongly to the modern mind, consisting as they do of pointed and personal references to contemporary citizens, glossed with a few explanatory words.

Of living nations, none is imbued more strongly than the Japanese with this love of caricature. The tendency is nowhere more powerfully and cleverly displayed than in their pictures of the aboriginal Ainos.

The discovery of printing gave an immense impetus to this phase of art. It is in the 15th century, therefore, that the real efflorescence of caricature in Europe begins, especially in connection with the names of Holbein and Cranach. And just as the early Christians were caricatured in Pompeii on account of their religion, so we find Martin Luther and his fellow-reformers satirized in this way as the preachers of new ideas, though not of a new religion. The end of the same century saw the birth of Jacques Callot, who is usually included among caricaturists on account of his keen satirical humor and the intense vivacity of his figures, which, however, are not strictly caricatures. In the 18th century genuine caricature had reached its full growth, and Hogarth was its unsurpassable exponent. In its very lowest phases the art was also then represented by the woodcuts of popular broadsheets and chapbooks, coarse in execution, and vulgar and sometimes indecent in tone—a style of art prolonged through the 19th century and even into the 20th, and exemplified by the 'comic' valentines of the early Victorian period, and by the equally comic illustrations in certain foreign journals of the baser sort.

The contemporaries Gillray (1757-1815) and T. Rowlandson (1756-1827) were caricaturists of the first rank, and not less notable were their successors, Cruikshank, Thomas Landseer, Leech, Tenniel, Richard Doyle, and Hablot K. Browne ('Phiz'), the last named chiefly known by his illustrations of Dickens's novels, and most of the others by their work in *Punch* and in Gilbert & Becketts *Comic Blackstone* (1886), *Comic*

*History of England* (1847), and *Comic History of Rome* (1852). A bright light, too early extinguished, was Randolph Caldecott (1846-86), whose style, while never becoming farcical, was always characterized by that touch of exaggeration necessary to true caricature. Linley Sambourne, E. T. Reed, Harry Furniss, the late Phil May, and F. C. Gould (*Westminster Gazette*) are all caricaturists in the strictest sense; and George du Maurier, whose name, like theirs, is chiefly associated with *Punch*, may also be grouped with them, although his *métier* was rather to depict modern London society, with a special eye to its foibles. Pellegrini ('Ape'), Leslie Ward ('Spy'), and Max Beerbohn ('Max') have respectively made the existing London weekly, *Vanity Fair*, famous for its caricature-portraits.

While the War of 1812, the various political campaigns of the first half of the 19th century, the Mexican War, and the Abolition agitation were the subjects of a great number of crude prints, American caricature, in the broadest sense, began with Thomas Nast, whose pictures in *Harper's Weekly* in 1868, 1869, and 1870 did much to bring about the destruction of the Tweed Ring. Nast's immediate successors were Keppler and Gillam. By the end of the 19th century caricature, both political and social, had become a strong feature of American journalism. Among the best-known American caricaturists of the present day are F. B. Opper, who has had success both as a political cartoonist and as a creator of whimsical pictorial characters and episodes after the style of the German, Busch, John T. McCutcheon, who is best known by his humorous drawings of life in the small towns of the Middle West, Homer Davenport, W. A. Rogers, Edward Kemble, of 'Kemble's Coons' fame, C. G. Bush, T. E. Powers, and R. F. Outcault. As a pictorial historian of the social types and customs of his time, C. D. Gibson has won a position of considerable eminence, although he can hardly be deemed a caricaturist in the full sense of the term.

**BIBLIOGRAPHY.** See Wright's *Caricature Under the Georges* (1875); Wright's *Life of Gilray*; Parton's *Caricature and other Comic Arts Album* (1877); Jean Grand Carteret's *Caricature en Allemagne*; Spellman's *History of Punch*; Punch's *Victoria Era*; Maurice and Cooper's *History of the XIXth Century in Caricature* (1901).

**Caries** is a condition in bone corresponding to ulceration of soft parts. It is peculiar to

spongy bone, and is found mostly in the spinal vertebrae, in the shaft of the long bones, and in the short bones of the wrist and ankle. The teeth also undergo caries, but this is neither syphilitic, tubercular, nor suppurative as is caries elsewhere. In *caries necrotica* the bone becomes disorganized, crumbles, and comes away in particles. Caries more generally signifies syphilis or tuberculosis (*strumous caries*.) First there is a fluctuating swelling over the bone, with pain and tenderness; and later the suppurative process which has been going on in the bone channels a way to the surface; through this sinus is discharged caseous matter containing bits of necrotic bone. In 'dry' caries, which is, sometimes at least, of tubercular origin, there is no suppuration, discharge, or swelling, but there are pain, and, if it be near a joint, stiffness, with possibly an atrophy of the surrounding soft parts. Radiography is used to show the condition of the bones where no sinus has been formed.

**Treatment.**—Specific infections must be treated and the general health must be improved as far as possible by tonics, fresh air, good feeding, and local rest. Phosphate of lime internally has lately been strongly recommended to help in healthy bone-formation. Surgical treatment consists in removing the diseased bone, or its diseased part, and scraping the cavity, with antiseptic precautions. See NECROSIS.

**Carigara**, kâ-rê-gâ'rá, pueblo, Leyte, Philippine Islands; 21 miles northwest of Tacloban. It is an important hemp port. Pop. (1918) 17,558.

**Carillon.** See BELL.

**Carimata**, kâ-rê-má'tá, or KARIMATA, group of islands (over 100 in number) in the East Indian Archipelago, lying off the west coast of Borneo; area, 58 square miles. The chief town is Palembang, on Grand Carimata, the largest of the group. The industries are iron-mining and fishing. Pop. 500.

**Carinate**, a division of birds which includes all living forms except the few running birds or Ratitæ—e.g. ostrich, emu, cassowary, etc. The name refers to the carina, or keel, on the breast-bone; but there are a few carinate birds—e.g., the extinct dodo—in which this keel is virtually absent. See BIRDS.

**Carini**, kâ-rê'nê, town, Sicily, in the province of Palermo; 17 miles west of Palermo. It was the ancient town of Hycarra, from which the Athenians carried away the famous courtesan Laïs. Pop. 14,000.

**Carinthia** (Ger. *Kärnten*), kâ-rin'thi-a, province of Austria

lying between Tyrol on the west and Styria on the east; area 3,680 square miles. It is markedly mountainous, and is drained from west to east by the Drave. Various passes, as the Predil, the Loibl, the Seeberg, and the Arlscharte, lead across the Alpine ranges, and there are beautiful lakes and mineral springs in the vicinity of Villach. The climate in the mountainous parts is severe, but in Klagenfurt, towards the east, the annual mean temperature is 45.5° F. Only 9 per cent. of the surface is unproductive, half the remainder being covered with forests, and the rest affording meadow and grazing land. Iron, lead, zinc, and lignite are mined. The most important industries are connected with these metals, but there are also manufactures of wood pulp, cement, cloth, and leather, and saw-milling. Klagenfurt and Villach are the chief commercial centres, the former being the capital. The population (1921) is 370,748. Two-thirds of the people are of German race, most of the remainder being Slovenes; 95 per cent. are Roman Catholics.

**Carinus**, MARCUS AURELIUS, emperor of Rome (283–285 A.D.), the elder of the two sons of the Emperor Carus. Soon after his accession the troops in Asia put forward Diocletian as a rival. Carinus won a decisive victory over the new claimant near Margus, in Mœsia, but immediately afterward was murdered by some of his officers.

**Carisbrooke**, kar'is-bröök, village, Isle of Wight, England; about a mile southwest of Newport. The Priory Church has a fine tower of the twelfth century and the old castle is one of the most interesting in England. In it Charles I. was imprisoned (1647–48), and here his daughter Elizabeth died in 1650. Within the castle is a remarkable well, 200 feet deep. The building dates back to a time before the Roman invasion, but the out-works were erected when the advent of the Spanish Armada was imminent.

**Carissa**, a genus of white-flowered tropical shrubs belonging to the natural order Apocynaceæ, and bearing berry-like fruits. They are easily grown in greenhouses in a peaty soil, and may be propagated by means of cuttings. They are half-hardy in the extreme Southern United States. Among the species are the evergreen Christ's thorn, *C. carandas*, which bears red fruits, used both for pickling and for dessert; the Natal plum, *C. grandiflora*; and the S. African *C. arduina*, which bears red fruits, not unlike raspberries in flavor and excellent for preserves.

**Carissimi**, kâ-rês'sê-mê, GIACOMO (1604–74), Italian musical composer, was born in Marino, near Rome. In 1624 he was appointed conductor of the choir at Assisi, and in 1628 removed to Rome, where he had obtained a similar appointment at St. Apollinaris. Carissimi's most important work was done in the direction of developing and perfecting the sacred cantata and recitative, and in improving instrumental accompaniments. His principal oratorios—*Jephtha* (considered to be his best), *Judicium Salomonis*, *Baltazar*, and *Jonas*—have been published by Chrysander in the second volume of the *Denkmäler der Tonkunst* (1882).

**Caritat.** See CONDORCET.

**Carit Etlar**, the pen-name of the Danish novelist and dramatist, JOHAN KARL CHRISTIAN BROSBÖLL (1816–1900), who was born at Fredericia. He was one of the most popular writers of Denmark in the 19th century, excelling especially in historical romances and tales of Jutland life. He also wrote plays, but in point of artistic merit these cannot rank with his novels.

**Carlaverock**, kâr-lav'er-uk, parish, Scotland, in Dumfriesshire, on the coast, 5½ miles southeast of Dumfries. In the parish churchyard is the grave of Richard Paterson, the original of Scott's *Old Mortality*. The castle (Scott's Ellangowan) was built about 1220, and was captured by Edward I. in 1300. Pop. (1921) 799.

**Carlen**, EMILIA (1807–92), Swedish novelist, better known as FLYGARE-CARLÉN, was born at Strömstad. Her many works portray popular life and customs, especially on the Kattegat coast, and are characterized by a deep feeling for natural beauty and a vivid style. Of her novels, many of which have been translated into English, the most notable are *The Professor and his Favorites* (1840; Eng. trans. 1843); *The Rose of Tistelön* (1842; Eng. trans. 1844); *The Hermit* (1846; Eng. trans. 1853); *Gustavus Lindorm* (1839; Eng. trans. 1853); *En Natt vid Bullan Sjön* (1847); and, probably her best, *Ett Köpmanshus i Skårgården* (1859).

**Carleton**, kâr'l'tun, HENRY GUY (1856–1910), American dramatist, was born in Fort Union, N. M., the son of Gen. James H. Carleton (q.v.). He received his education at Santa Clara College, Cal., was appointed second-lieutenant in the 8th U. S. cavalry (1873), served with Miles in Texas, and resigned in 1876. He then entered journalism, was associate editor of the *New Orleans Times*, literary editor of *Life*, and a special writer for the *New York World*

and other papers. At different periods of his life he devoted much attention to the study of electricity, and invented numerous electrical appliances. He began his dramatic work in 1881. His plays include *Memnon*, blank verse (1881); *Victor Durand* (1885); *The Pembertons* (1889); *The Lion's Mouth* (1890); *Ye Earlie Trouble* (1891); *A Princess of Erie* (1892); *A Gilded Fool* (1892); *The Butterflies* (1894); *That Impudent Young Couple* (1896); *Ambition* (1896); *Colinette* (1898); *Jack's Honeymoon* (1898).

**Carleton, JAMES HENRY** (1819-73), American soldier, was born in Maine. He entered the U. S. army as a second-lieutenant of dragoons in 1839 and served in the Mexican War (1846-7), winning the brevet of major at Buena Vista. He was a Federal officer in the Civil War, becoming a brigadier-general of volunteers in April 1862, and in March 1865 receiving the brevet of brigadier-general in the regular army for his services in New Mexico and the brevet of major-general, both in the volunteer and regular service, for 'meritorious service during the war.'

**Carleton, WILL** (1845-1912), American poet, was born in Hudson, Lenawee county, Mich., and was graduated (1869) from Hillsdale College. He engaged in journalism in Chicago and Hillsdale, but soon devoted himself to the writing of poems of domestic life, some of which, notably 'Betsy and I are Out' and 'Over the Hill to the Poor House,' attained great popularity. They were singularly adapted for recitation, and Mr. Carleton for many years gave readings of his works in the United States, Canada, and Great Britain. His published volumes include *Poems* (1871); *Farm Ballads* (1873); *Farm Legends* (1875); *Farm Festivals* (1881); *City Ballads* (1885); *City Legends* (1889); *City Festivals* (1892); *Songs of Two Centuries* (1902); *Poems for Young Americans* (1906); *A Thousand Thoughts* (1908).

**Carleton, WILLIAM** (1794-1869), Irish novelist, was born in Prillisk, county Tyrone. He was for a time a tutor in the village school but in 1830 went to Dublin where he published *Traits and Stories of the Irish Peasantry* (2d. series, 1883); *Tales of Ireland* appeared in 1834, and in 1839 *Fardorougha the Miser*, a remarkable work which was dramatized, followed by the *Misfortunes of Barney Branagan* (1841), *Valentine M'Clutchy* (1845), and others. Carleton's tales are characterized by pathos and vigor and furnish an accurate picture of Irish peasant life.

**Carleton College**, a co-educational institution of higher learning situated in Northfield, Minn. It was founded in 1866, and is named in honor of William Carleton of Charlestown, Massachusetts, an early donor. It is non-sectarian in control, but maintains relations of co-operation with the Congregational, Baptist, and Episcopal denominations. Four-year courses in the liberal arts are offered. The campus, including the Lyman Memorial Lakes and athletic fields, comprises about one hundred acres. Adjoining is the college farm of three hundred acres. Attendance is limited to eight hundred and fifty. For recent statistics see Table under the heading COLLEGE.

**Carleton Place**, town, Ontario, Lanark county, on the Canadian Pacific Railway and on Mississippi Lake, at the head of its outlet which is navigable from the St. Lawrence; 30 miles southwest of Ottawa. Its manufactures include lumber, woollen and iron goods, and it has machine shops and foundries. Pop. (1911) 3,621; (1921) 3,841.

**Carli, GIOVANNI RINALDO, COUNT** (1720-95), Italian antiquary, was born in Capo d'Istria; became professor of astronomy and navigation at Padua; and was later appointed president of the new council of finance and public instruction at Milan (1771), where he induced Joseph II. to abolish the Inquisition. He is said to have originated index numbers (q.v.). His works include a three-volume treatise on Italian coins, *Della monete e dell' istituzione delle zeche d'Italia* (1754-60), *Antichità italiane* (5 vols. 1788-91), *L'Uomo libero* (1772) against Rousseau's social theories, and *Lettere Americane* (1780-81).

**Carling, SIR JOHN** (1828-1911), Canadian public official, was born in London, Ontario. He represented London in the General Assembly from 1857 until the confederation of the Dominion, and held the posts of receiver-general of Canada (1862), minister of agriculture and public works for Ontario (1867-71), postmaster-general for the Dominion (1882-5), Dominion minister of agriculture (1885-92). From 1892 to 1895 he was a cabinet minister without portfolio, and in 1896 became a senator. He was knighted in 1893.

**Carlingford**, seaport town, Ireland, in County Louth, on the south side of Carlingford Lough; 13 miles northeast of Dundalk. It is a charmingly situated and popular seaside resort, and has valuable fisheries, especially of oysters. There are ruins of King John's castle and of a monastery of the 14th

century. The town claims to be the landing place of St. Patrick in 432. Pop. 600.

**Carlingford Lough**, an inlet 10 miles long by 2 miles wide, between counties Down and Louth, 9 miles northeast of Dundalk. The Newry Canal connects it with Lough Neagh. The entrance, which is rocky and shoaly, is guarded by five light-houses.

**Carlisle, city**, Illinois, county seat of Macoupin county, on the Chicago and Alton Railroad; 48 miles northeast of East St. Louis. Coal is mined in the vicinity, and there are flour mills and brick yards. Pop. (1910) 3,616; (1920) 5,212.

**Carling Sunday**. See CARE SUNDAY.

**Carlisle, kär-lil'**, city, England, in Cumberlandshire, on the River Eden; 300 miles northwest of London. Its port is Silloth, 21 miles distant, and it is an important railway centre. Features of interest are the cathedral, founded as a priory church in 1092, and converted into a cathedral in 1133, and the castle, situated on a promontory overlooking the Eden, with massive Norman keep with double gates and portcullis. The citadel, at the southeast entrance to the city, consists of two large drum towers, rebuilt in 1810; it is now used for the court of assize and jail. Other public buildings are the town hall and the guildhall (both ancient), city hall, county infirmary, general and fever hospitals, museums, art gallery, library, and science and art schools (installed in a 17th-century mansion and adjacent new buildings), and city cross (1682). Industries include cotton manufactures and dye-works, ironfounding, and brewing, and there are large railway shops.

Carlisle was a Roman station near the Roman wall. The place was destroyed by the Danes (875). William Rufus built the castle and commenced the fortifications (1092), but the latter were not completed till the time of David, king of Scotland (1084-1153). During the civil war it was occupied alternately by the Royalists and the Parliamentarians, the latter gaining possession after a rigorous siege (1647). It also shared in the troubles of 1745, when several persons were hanged on Gallows' Hill. Pop. (1921) 52,600.

**Carlisle**, borough, Pennsylvania, county seat of Cumberland county, on the Cumberland Valley and the Gettysburg and Harrisburg Railroads; 17 miles southwest of Harrisburg. It is the seat of the U. S. Indian Training and Industrial School, of Dickinson Col-

lege and of the Metzger Institute for Girls. Its manufactures include cars, carriages, axles, carpets, shoes, and flour. Carlisle mineral springs are in the vicinity. The site was settled in 1751. In July, 1863, the town was shelled by the Confederates. Pop. (1910) 10,303.

**Carlisle, FREDERICK HOWARD, FIFTH EARL OF (1748-1825)**, English politician; was president of the Board of Trade (1779), and viceroy of Ireland (1780-2). In 1778 he was sent to America by Lord North as chief of the commission to treat with the American colonies. He wrote a tragedy, *The Father's Revenge* (1783), which was warmly praised by Johnson and Walpole. He published *Tragedies and Poems* (1801). He was guardian in Chancery to Lord Byron, and was attacked in the latter's *English Bards and Scotch Reviewers*.

**Carlisle, GEORGE WILLIAM FREDERICK HOWARD, SEVENTH EARL OF (1802-64)**, English politician, born in London; was a supporter of the Reform Bill, and represented (1831-41) the West Riding in the first reformed Parliament. He became Chief Secretary for Ireland (1835-41), and passed the Irish Tithe, Irish Municipal Reform, and Poor Law Bills. He visited the United States in 1841-2. In 1848 he succeeded to the earldom, and took his seat in the House of Lords (1849). He was twice appointed lord-lieutenant of Ireland (1855-8 and 1859-64), and devoted himself during his terms of office to the improvement of Irish agriculture and manufactures.

**Carlisle, JOHN GRIFFIN (1835-1910)**, American lawyer and legislator, was born in Campbell County, Ky. He received a meagre common school education, most of his youth being spent in assisting his father, a farmer. In 1858 he was admitted to the bar, and, though he soon became a successful lawyer, he devoted his attention chiefly to politics. He was a member of the lower house of the Kentucky legislature (1859-61) and of the State senate (1866-71); and was lieutenant-governor of Kentucky (1871-5). After twenty years of political influence in his native State, he was elected a Democratic Representative in Congress, a position which he held until 1890, being for six years (1883-9) Speaker of the House of Representatives. He was a prominent advocate of the repeal of the Silver Purchase Act and of the reduction of the tariff; and, as Speaker, was noted for the judicial fairness of his decisions on parliamentary law. He was a member of the U. S. Senate (1890-3), and Secretary of the Treasury in the Cabinet of President Cleveland (1893-7). During these years he succeeded in averting grave dangers that threatened as the

result of the Silver Purchase Act and the depletion of the Treasury in the previous administration. In the 'free-silver campaign' of 1896 a movement was started to nominate Carlisle for President, but he declined to be considered a candidate, and supported the candidates of the 'Gold Democrats.' He also refused an appointment from Cleveland as Chief Justice of the Supreme Court. In 1897 he retired from public life, and removed to New York City to engage in the practice of law.

**Carlists**, the supporters of the Legitimist pretender to the throne of Spain. In 1713 Philip v., the first of the Bourbon dynasty, settled the royal succession by a statute in favor of male heirs. His successor, Ferdinand VII., in 1830, was persuaded by his fourth wife, Christina of Naples, to issue a decree abrogating this statute. A daughter was born the same year, who thus became the heir to the throne in place of the King's brother, Don Carlos. The latter had many ardent supporters, especially in the Basque provinces, and on Ferdinand's death (1833) he quickly secured all the north of Spain by force of arms, and his success was only cut short when Christina obtained the aid of Great Britain and France. Don Carlos finally resigned his pretensions to his son, Don Carlos 2d, in 1845; the latter, in 1861, to his brother, Don Juan; and the last named, in 1868, to his son, Don Carlos 3d, who was afterward accepted by the extreme French Legitimists also as their recognized head. In 1867 he married Princess Margaret of Bourbon, daughter of Duke Carlos III. of Parma, and in 1894 Marie Berthe, Princess de Rohan. He died in July, 1909.

After the first Carlist war, many risings took place, but the most formidable occurred in 1873, when the abdication of King Amadeo and the proclamation of a republic afforded an opportunity. This, the second Carlist war, was only suppressed in 1876, after which the Basque provinces were deprived of the last of their autonomous privileges.

Don Carlos 3d's eldest son, DON JAMÉ, born in 1870, is an officer in the Russian Army. He announced at the time of the Moroccan trouble, in 1909, that he would not attempt to gain the Spanish throne by force. In 1910, however, he offered to aid the Pope in the dispute between the Government and the Vatican, and another uprising may occur at any moment. See SPAIN.

**Carlos I. (1863-1908)**, king of Portugal, son of Luiz I., was born in Lisbon, and ascended the throne in 1889. During his reign Portugal rose in international importance through the activity of colonization

in Africa. But the country was in financial difficulties, accumulated from the beginning of the century; and despite the fact that the king and his family surrendered a fifth of their income to meet public needs, the financial situation caused the growth of a strong radical sentiment among the people. In 1893 an attempt was made on the king's life, and in 1908 he and Crown Prince Luiz were assassinated while driving in the capital. See PORTUGAL.

**Carlos, Don (1545-68)**, the son of Philip II. of Spain, was of vicious character and feeble intellect, and was deprived by his father of the right of succession in favor of the Archduke Rudolf. His betrothal to Elizabeth of Valois, daughter of Henry II. of France, was abruptly annulled by his father intervening and himself marrying Elizabeth. In 1567 he was accused, on a statement made under confession, of plotting his father's murder, though it is more probable that the intended victim, who had not been named, was the Duke of Alva. The death of Don Carlos in the following year was attributed by William of Orange to his father's orders. The true cause is uncertain, but the version of the story given in Schiller's famous tragedy, *Don Carlos*, must be rejected as fiction. In addition to Schiller, Chénier, Alfieri, and Otway have made him the subject of dramas. See Gachard's *Don Carlos et Philippe II.* (1863); Prescott's *Philip II.* (1856).

**Carlota**, inland town of Occidental Negros, Philippine Islands. It is a telegraph and military station and an important road centre between interior points and the coast. Pop. 13,500.

**Carlotta (MARIE CHARLOTTE AMÉLIE) (1840)**, ex-empress of Mexico, the wife of Archduke Maximilian of Austria, and the only daughter of Leopold I. of Belgium, was born in Laeken, Belgium. She was married to Maximilian in 1857, and accompanied her husband to Mexico in 1864, whither they went on invitation from the Assembly of Notables, at the suggestion of Napoleon III. In 1866 she returned to Europe to secure aid for her husband from Napoleon III. of France. Failing in this, she appealed without result to the Pope. Her health was much affected; and after the complete failure of the Mexican enterprise, and the execution of Maximilian, her mind gave way. She was placed in the care of her family, first at the royal Belgian palace at Laeken, and afterward at a royal château near Brussels. See MAXIMILIAN.

**Carlovingians**, more correctly CAROLINGS, the second reigning dynasty of France. The family dates from ARNULPH, bishop of

Metz, in the seventh century. Arnulph's grandson, PEPIN, or PIPPIN, Duke of Austrasia, became mayor of the palace under the Merovingian kings. On Pepin's death (714), CHARLES MARTEL (q.v.), natural son of Pepin, usurped the position, and by the victory of Poitiers (732) over the Saracens, which saved France from the fate of Spain, and by wise administration strengthened his position so much that he became actual ruler, though content with the title of Duke of France. Charles's son, PEPIN (LE BREF), in league with Pope Zachary, deposed Childeric, last of the Merovingians, and was crowned in 752. He was succeeded in 768 by his son, CHARLEMAGNE (q.v.), who widely extended the empire. On the death of Charlemagne's son, LOUIS (814-840), the empire was divided among his three sons—viz., LOUIS (Germany), LOTHARE (Italy, Lorraine, and Burgundy), and CHARLES II., THE BALD (France). Charles II. died in 877, and was followed by a succession of feeble princes, the Carolingian dynasty ending with Louis V. in 987, when the Capets began their reign. Consult Warnkōning and Gerard's *Histoire des Carolingiens* (2 vols., 1862); and for the copious literature of the period, Monod's *Bibliographie de l'Histoire de France* (1888). See FRANCE, HISTORY; HOLY ROMAN EMPIRE.

**Carlow**, county, province of Leinster, Ireland. The Leinster (2,604 sq. ft.) and other mountains border it on the southeast, but the greater part of the surface is level or undulating. The principal rivers are the Barrow and the Slaney. The soil is generally fertile, and agriculture is the chief industry. Area, 221,224 ac. Pop. 38,000.

**Carlow**, chief town of above county. St. Patrick's College was founded in 1795. Slight vestiges remain of the ancient castle, which dates from 1180. Pop. 6,500.

**Carlsbad**, town, capital of Eddy co., New Mexico, on the Pecos River, and on the Pecos Valley and Northeastern and the Pecos and North Texas RRs. It manufactures beer and ice, and acts as a distributing centre for live stock and wool. Pop. (1910) 3,000.

**Carlsbad**, CARLSRUHE, KARLSSTADT, etc. See KARLSBAD, CARLSRUHE, KARLSSTADT, etc.

**Carlstadt**, town in Bergen co., New Jersey, on the Erie RR.; 9 m. northwest of Jersey City. Its industries include silk mills and white goods factories, and marble works. Pop. (1910) 3,807.

**Carlstadt**, ANDREAS RUDOLF BODENSTEIN AF (1483-1541), German theologian, born at Karlstadt in Franconia; studied theology at Wittenberg, where he became pastor (1508) and pro-

fessor (1515). He was a reformer of the most extreme stamp, outstripping Luther, with whom he held controversy. He denied the real Presence, and was a bitter opponent of images. Compelled to flee (1528) from Saxony, he found shelter in Switzerland, where he remained until his death, being appointed (1534) professor of theology at Basel.

**Carlyle**, JANE BAILLIE WELSH (1801-66), wife of Thomas Carlyle, was born at Haddington and claimed descent from John Knox and Sir William Wallace. Her earliest teacher was Edward Irving, by whom she was introduced to Carlyle in 1821; and the friendship with the new acquaintance ripened gradually into affection. The marriage took place on Oct. 17, 1826. The Carlyles first resided at Comely Bank, Edinburgh, removing in 1829 to Craigenputtock, and in 1834 to Chelsea. (See CARLYLE, THOMAS.) Much has been made of the unhappiness of her married life, and it is evident that her husband might have made it easier if he had recognized her intellectual powers by consulting her more in regard to his work. Part of her unhappiness was also due to jealousy of Lady Ashburton's friendship with her husband (from about 1847 to 1857). But it is difficult to see how two people of such exaggerated nervous sensibility could ever have been happy in the ordinary sense; although the later letters of the two show the warmest affection on both sides. From about 1842 (the year of her mother's death) Mrs. Carlyle was really a perpetual invalid, being tortured with unceasing attacks of neuralgia. In 1863 she had a bad fall in saving herself from being run over by a cab in the street, and was seriously injured. She rallied, however, and the pain of her disease even lessened; but on April 21, 1866, she was found dead in her carriage as she was driving in Hyde Park. Mrs. Carlyle wrote some poetry of more than ordinary merit, and her posthumously-published letters mark her out as among the first letter-writers in the language. See *Letters and Memorials of Jane Welsh Carlyle*, ed. by J. A. Froude (1883); *Early Letters of Jane Welsh Carlyle*, ed. by D. G. Ritchie (1889); *Life of Jane Welsh Carlyle*, by Mrs. Alexander Ireland (1891). The recently re-opened Carlyle controversy may be sufficiently studied in the *New Letters and Memorials of Jane Welsh Carlyle*, ed. by Alexander Carlyle, with an introduction by Sir James Crichton-Browne (1903); *My Relations with Carlyle*, by J. A. Froude (1903); and Sir J. Crichton-Browne's article, 'Car-

lyle and Froude,' in the *Contemporary Review* for July, 1903.

**Carlyle**, JOHN AITKEN (1801-79), younger brother of Thomas Carlyle, was born at Ecclefechan, Dumfriesshire, Scotland. Failing to build up a medical practice in London, he became a travelling physician. He executed an admirable translation of Dante's *Divine Comedy*, published in 1849 (2nd ed. 1867). In 1861 he edited Dr. Irving's *Hist. of Scottish Poetry*. He died at Dumfries. See Carlyle's *Reminiscences* (1881), and *Letters, etc., of Jane Welsh Carlyle* (1883).

**Carlyle**, THOMAS (1795-1881), Scottish historian and moral teacher, was born (Dec. 4) at Ecclefechan, Dumfriesshire. His father, James Carlyle (1757-1832), a stonemason, was twice married, and Thomas was the first-born of his second wife, Janet Aitken (1769-1853). From Annan Academy he proceeded to Edinburgh University, where he matriculated in November, 1809. Carlyle had been intended for the ministry of the Church of Scotland, but after much hesitation he finally abandoned the purpose in March 1817. Previous to this (1814) he had become mathematical master at Annan Academy, and had removed in 1816 to Kirkcaldy. His opponent here was Edward Irving, but the intercourse between the two was, thanks mainly to Irving's frankness, of the most cordial description; and through him Carlyle made the acquaintance of Margaret Gordon (the Blumine of *Sartor Resartus*), who afterwards became Lady Bannerman. He left Kirkcaldy in November, 1818, and removed to Edinburgh, where he subsisted by private teaching, translating scientific articles, and doing biographical and geographical work for Brewster's *Edinburgh Encyclopaedia*. Life was made miserable for him by his lifelong foe dyspepsia, and also by doubt in religious matters. From this latter trouble he was relieved by his sudden 'spiritual new birth' which, he tells us, happened in June, 1821, as he was passing down Leith Walk; and an engagement as tutor to the sons of Mr. Buller, a retired Anglo-Indian, relieved him from pecuniary cares.

In 1824 he published a translation of Goethe's *Wilhelm Meister*; and this, with his *Life of Schiller*, which first appeared (1823-4) in the *London Magazine*, and was published in book form in 1825, led to his long correspondence with Goethe. His tutorship with the Bullers was resigned in 1824, during a visit to London. In 1826 he married Jane Baillie Welsh (see CARLYLE, JANE BAILLIE WELSH), and settled down at 21 Comely Bank, Edinburgh. Next

year he published four volumes of translations entitled *German Romance*; and he began to write for the *Edinburgh Review*, having obtained an introduction to Jeffrey through Barry Cornwall. His connection with the *Edinburgh* led to the production of that great series of essays beginning with the one on Richter—essays more marked by psychological than by critical insight. At the same time Carlyle also wrote in the newly-established *Foreign Review*, and a connection with *Fraser's Magazine* followed in 1830. He now formed a new plan of removing to his wife's property at Craigenputtock, which his brother Alexander was to farm; and this plan was carried out in 1829, much to Mrs. Carlyle's discomfort. In the solitude of Craigenputtock Carlyle first found himself. Here his most characteristic work, *Sartor Resartus*, was written, and the *French Revolution* planned. And here, in 1833, he received a visit from Ralph Waldo Emerson. A *History of German Literature* was also embarked on, but never completed. But in 1830, his brother's farming of Craigenputtock having proved a failure, the little household was in sore financial straits. *Sartor* was now at length (1833-34) appearing in *Fraser's*, and in June, 1834, the Carlyle household moved to London, establishing themselves at No. 5 (later 24) Cheyne Row, Chelsea. By May, 1836, the first volume of the *French Revolution* was complete in ms.; but having been lent to John Stuart Mill it was burnt by his housemaid. However, the volume was recreated by September; and the complete work appeared in 1837, being received with enthusiasm. On the suggestion of Miss Martineau, Carlyle delivered a course of lectures on German Literature (May, 1837), followed by courses on European Culture, Revolution of Modern Europe, and Heroes and Hero-worship (1838-40). *Sartor Resartus* appeared in book form in the U. S. (1836), under the protection of Emerson, and now reappeared in England (1838). New works also were produced in fairly rapid succession. *Critical and Miscellaneous Essays* and the pamphlet *Chartism* came out in 1839, followed by the printed lectures on *Hero-worship* (1841), *Past and Present* (1843), *The Letters and Speeches of Oliver Cromwell* (1845), *Latter-day Pamphlets* (1850), and the life of his friend *John Sterling* (1851), a work which contains much of his most vivid descriptions of men and scenes. His last great work, the *History of Frederick the Great*, was begun in 1852, and occupied him for thirteen years, during which he

made two visits to Germany (1852 and 1858). It appeared in instalments of two volumes in 1858, 1862, and 1865. One of the most regrettable incidents of his life was the writing in 1863 of the paper, entitled *The American Iliad in a Nutshell*, a violent attack on the anti-slavery side in the American civil war; and the bequest to Harvard University after his death of the books used in the composition of *Frederick* and

*millan's Magazine*. His latest works of any length, *Early Kings of Norway* and *Portraits of John Knox*, appeared in *Fraser's Magazine* for January, and March, 1875. He was buried at Ecclefechan.

Carlyle was in perpetual opposition to the main tendencies of his own age. He preached the benefits of benevolent despotism to a generation whose main political work was the development

Thomas Carlyle.

(From the unfinished portrait by Millais in the National Portrait Gallery, London.)

*Cromwell* was undoubtedly designed as a reparation for the wrong done on this occasion. On the 21st of April, 1866, his wife died; and his whole after-life was saddened by the discovery, from her letters and journals, how unhappy her life had been. He visited Mentone in 1867, and began the writing of his *Reminiscences* (published by his literary executor, Froude, in 1881). The franchise legislation of 1867 produced his *Shooting Niagara*, which appeared (August, 1867) in *Mac-*

of democratic principles; and to an age of easy optimism, bred of unparalleled commercial activity, he proclaimed the doctrine that wealth is not prosperity, and only brings new dangers instead of removing the old. This perpetual opposition, which made him such a healthy stimulus to his first readers, however, is apt to militate against him with their successors. The defects of his method—his habitual exaggeration, his exaltation of the individual at the expense of the

people, and the great preponderance of destructive criticism in his works—rather rebel readers of to-day. But his doctrine of the sacredness of work and the sacredness of truth, have already passed into the current thought of our time. As a literary artist, as a painter of individuals and individual scenes in biography and history, he is unrivalled among the prose writers of the world. The style of his earliest works is little different from that of ordinary compositions of the preceding generation; but as his genius developed he forged for himself a new style, unfettered by any of the ordinary conventions, and, for the most part, running counter to them. In Carlyle's hands it became the most perfect example literature offers of the unconscious self-revelation of a great personality.

See J. A. Froude's *Thomas Carlyle: a History of the First Forty Years of his Life* (1882), and his *Thomas Carlyle: a History of his Life in London* (1884); also *Carlyle's Reminiscences*, edited by Froude (1881) and by Professor Norton (1887). Norton has also edited *The Correspondence of Thomas Carlyle and Ralph Waldo Emerson* (1883; revised edition, 1886), *Early Letters of Thomas Carlyle* (1886), and *Correspondence between Goethe and Carlyle* (1887). Of other books dealing with Carlyle's life, we may mention Moncure D. Conway's *Thomas Carlyle* (1881); R. H. Shepherd's *Memoirs of the Life and Writings of Thomas Carlyle* (1881), and *The Bibliography of Carlyle* (1881); W. H. Wyllie's *Thomas Carlyle, the Man and his Books* (1881); Professor Masson's *Carlyle Personally and in his Works* (1885); H. Larkin's *Carlyle and the Open Secret of his Life* (1886); and *Lives by R. Garnett* (1887), Paxton Hood (1875), H. J. Nicoll (new ed. 1894), and Wilson's *Froude and Carlyle* (1898). Interesting critical notices may also be found in Morley's *Critical Miscellanies*, vol. i.; W. Minto's *Manual of English Prose Literature* (3rd ed. 1886); *The Life and Writings of Joseph Mazzini* (1864-70; see vol. iv.); Matthew Arnold's *Discourses in America* (new ed. 1896); and Augustine Birrell's *Obiter Dicta* (new ed. 1896).

**Carmagnola**, tn., prov. Turin, Italy, 18 m. by rail s. of Turin; has silk industries. Pop. (1901) 11,721.

**Carmagnola**, FRANCESCO DI BARTOLOMEO BUSSONE (c. 1390-1432), Italian condottiere, was the son of a peasant of Carmagnola (Piedmont), whence his surname. He entered in 1412 the service of Visconti, Duke of Milan, and not only established the power of

Visconti in Milan, but also conquered Bergamo, Brescia, Parma, Novara, Piacenza, Genoa, etc. But losing the confidence of his prince through court intrigues, he transferred his services (1425) to Venice, which entrusted him with the command of the expedition against the Duke of Milan. Having won a victory at Maclodio in 1427, he conquered (1428) Bergamo and a part of Cremona, and forced Visconti to make an unfavorable peace. Being suspected of treachery by the Venetian senate, he was enticed into the Doge's palace, separated from his suite, tortured, and executed in the Piazza, in 1432. The fate of Carmagnola, a typical mercenary leader of the 15th century, forms the subject of several dramas and novels, the best being Manzoni's tragedy *Il Conte di Carmagnola* (1820). See Daru's *Histoire de Venise* (1821); Battistella's *Il Conte Carmagnola* (1889).

**Carmagnole**. (1.) A vest adorned with several rows of buttons, popular in the south of France, and much worn by ardent revolutionists during the troublous times. (2.) A revolutionary song and dance which was the rage in Paris in 1792 and following years. Each verse ended with this refrain—

'Dansons la Carmagnole, vive le son,  
vive le son,  
Dansons la Carmagnole, vive le son  
du canon!'

**Carman** (WILLIAM) BLISS (1861), Canadian poet, was born at Fredericton, New Brunswick, and graduated (1881) at the University of New Brunswick. He continued his studies in Edinburgh and at Harvard, studied for the law, practiced engineering, and engaged in various journalistic enterprises. He was office-editor of the *Independent*, 1890-2, and was for some time editor of the *Literary World*. His first book, *Low Tide on Grand Pré* (1893) showed that dreamy appreciation of the spirit of Canadian woods and waters that is characteristic of his best verse. It was followed by *A Sea Mark* (1895), *Behind the Arras* (1895), *Ballads of Lost Haven* (1897), *By the Aurelian Wall* (1898), *Pipes of Pan* (5 vols., 1902-5), *Collected Poems* (1905); and two volumes of essays—*The Kinship of Nature* (1903) and *The Friendship of Art* (1904). *Songs from Vagabondia* (3 vols., 1894-1900) were written in collaboration with Richard Hovey.

**Carmarthen**, co. tn. and bor. on the river Towy, 8 m. from the sea, Carmarthenshire, Wales; has important fairs, and iron-founding, woollen manufacture, tanning, and rope-making industries. It has a theological college and training college. Pop. (1911) 10,221.

**Carmarthenshire**, a maritime co. of S. Wales, on the Bristol Channel. The surface is generally hilly, intersected by narrow valleys. The principal level tract is that of the Vale of Towy, extending inland for about 30 m. The soil is generally fertile in the valleys, more particularly those of the three chief rivers, the Towy, the Taf, and the Teifi, but throughout a great part of the hilly and mountainous districts it is poor. Sheep are reared in considerable numbers, besides cattle and horses. The mineral resources are important: coal takes the lead, with an annual output exceeding 1,000,000 tons; limestone and sandstone are extensively quarried; fire and other clays, slate, and lead are also worked. Chief town, Carmarthen. Near Llandilo was fought, about 1277, one of the last battles in which Edward I. destroyed the independence of Wales. In 1843 the inhabitants took a very active share in the Rebecca riots. The county is very rich in antiquarian remains. Area of county (ancient and admin.), 918 sq. m. Pop. (1911) 160,430.

**Carmaux**, tn., dep. Tarn, France, 9 m. by rail n. of Albi, is the centre of a coal-mining district. There are glass works and brick works. Pop. (1901) 10,956.

**Carmel**. (1.) a town of Palestine, in Judah, 10 m. s.e. of Hebron; now Kurmul. (2.) Mt. Carmel, a long hill (1,700 ft.) in N.W. Palestine, terminating in a bold headland (500 ft.) on the Mediterranean; now Jebel Mar Elyas (*i.e.* Elijah) or Kurmul. Mt. Carmel is immemorably famous as a place of great sacredness, and here Elijah triumphed over the priests of Baal (1 Kings 18: 17 f.); the Druses also have a sanctuary on the supposed site of his altar. In Roman times it was noted as the place of an oracle; and the Carmelite Friars, who derive their name from it, have a convent upon the promontory. At its foot is the prosperous German Templar colony of Haifa. (3.) Tn., N. Y., co. seat of Putnam co., 50 m. n.n.e. of New York, on the N. Y. C. and H. R. R. R. It is the seat of Drew Seminary and Female College. Gleneida Lake is situated here, and Lake Mahopac, a summer resort, is 4 m. to the s.w. Pop. of the town (1910) 2,610.

**Carmelites**, or ORDER OF OUR LADY OF MOUNT CARMEL, popularly known in former times as 'White Friars.' Although this order was practically founded in 1156 by an Italian monk and excrusader, Berthold, on Mt. Carmel, it was nevertheless believed by many that a succession of holy men had lived the anchoritic life there from the time of Elijah; and

these conflicting beliefs culminated in the seventeenth century in a bitter controversy, eventually silenced by a Papal edict of 1698. After 1238 the Mohammedans caused the Carmelites to leave Mount Carmel, and they settled in various European countries. The ascetic rule prescribed to the twelfth-century hermits of Mount Carmel underwent much modification after the migration to Europe, notably under Innocent iv. (1245) and Eugenius iv. (1431), and the Carmelites became altered from hermits into mendicant friars. At the same time they flourished greatly, possessing no less than fifty-two houses in England at the date of the dissolution of the monasteries. To-day, there are Carmelite houses in America, England, Ireland, and Spain.

The order of *Carmelites*, or *Carmelite Nuns*, was instituted by the Carmelite general Soreth in 1452.

**Carmen**, seaport, Campeche state, Mexico, capital of the district, and situated on the island of the same name which encloses one side of Laguna de Términos. Dyewood is exported. Pop. 6,000.

**Carmen**, town, Antioquia, Colombia, 60 miles southeast of Cartagena; noted for its tobacco. Pop. 10,000.

**Carmen Sylva**. See ELIZABETH, QUEEN OF ROUMANIA.

**Carmi**, city, Illinois, county seat of White county, at the head of navigation on the Little Wabash River, and on the Cairo branch of the Cleveland, Cincinnati, Chicago, and St. Louis, and the Louisville and Nashville Railroads. Its manufactures include bricks, tiles, and flour. Fruit and grain from the surrounding agricultural region are exported. Pop. (1900) 2,939; (1910) 2,833.

**Carmignano**, market town, Tuscany, Italy, 13 miles northwest of Florence. It exports wines (Montalbati) and manufactures straw hats. Pop. 14,000.

**Carmina Burana**, songs, mostly Latin, some also German, written in the twelfth and thirteenth centuries by wandering students (Goliards). They are similar in form to the church hymns, and their subjects, though mostly of a religious character, sometimes turn also on profane and even immoral matters. A complete collection has been edited by Schmeidler. Compare MACARONIC VERSE.

**Carminatives**, a class of remedies used in medicine for the relief of gastric and intestinal discomfort, caused by the collection of gases formed during imperfect digestion. Carminatives also stimulate the nervous system generally, and through it

the heart and circulation. Anise, caraway, cardamom, cajuput, chalk, cinnamon, cloves, coriander, dill, fennel, ginger, juniper, lavender, lime water, nutmeg, peppermint, spearmint, and sodium carbonate are the most familiar examples.

**Carmine**, a beautiful red coloring substance obtained from the cochineal insect. The powdered cochineal is boiled with water (as pure as possible) in the proportion of from four to eight gallons of water to each pound of powder. To the solution is added alum, which precipitates the coloring matter as a lake. See COCHINEAL; DYEING.

**Carmo**. See KARMÓ.

**Carmona**, town, province of Seville, Spain; 18 miles northeast of Seville. It is a very ancient Iberian, Roman, and Moorish town, picturesquely situated commanding an imposing view of the valley of the Guadalquivir. It has many Roman and Moorish remains including a Roman necropolis of great interest, and considerable portions of the Moorish wall and alcazar. Pop. 20,000.

**Carnac**, a Breton village, department of Morbihan, France, on the Quiberon peninsula; 17 miles southeast of Lorient. It is famous for the number and variety of its Celtic monuments and Gallo-Roman ruins, consisting of menhirs, dolmens, and tumuli, with which the neighborhood is studded. The principal group of menhirs is situated on a sterile moor near the seashore, and consists of 1991 rude monoliths of granite. They are arranged in eleven roughly parallel rows, with two slight breaks, extend from east to west, about a mile and a quarter in length, and have at one end a curved row of eighteen stones, the extremities of which touch the outer horizontal rows. The bossenno, a group of mounds, about a mile and a half from Carnac, otherwise called 'Cæsar's Camp,' contains the principal Roman remains, and was first explored systematically by James Miln of Scotland. Consult Miln's *Excavations at Carnac* (1874-80).

**Carnallite** (KClMgCl<sub>6</sub>H<sub>2</sub>O) is a double chloride of potassium and magnesium, forming a valuable source of these metals, and found in considerable quantities at Stassfurt in Prussia. See POTASSIUM.

**Carnarvon**, or CAERNARVON, seaport town, capital of Carnarvonshire, Wales, is situated near the southern end of Menai Strait; 69 miles west of Chester. There are remains of the ancient walls, and the castle, commenced by Edward I. in 1283, is one of the noblest ruins in Great Britain, its walls, which are 7 to 9

feet thick, being still entire. Industries are shipbuilding, fishing, and tanning. There are also iron and brass foundries; and slates, stones and ores are exported. The town is popular as a bathing resort and is much frequented by tourists. Carnarvon was an old Roman station, and a residence of early Welsh princes; Edward II. was born in the castle (April 25, 1284). Pop. (1911) 9,119.

**Carnarvon**, district and town, Cape of Good Hope; 102 miles northwest of Beaufort West. It is famed for the vast reservoir known as Van Wyk's Vlee. Pop. of district, 7,000; of town, 1,000.

**Carnarvon**, HENRY HOWARD MOLYNEUX HERBERT, FOURTH EARL OF (1831-90), English public official, was born in London. He became Colonial Secretary in the Conservative Cabinet of 1866, but resigned because of his opposition to the Reform Bill of 1867. In Disraeli's government (1874) he resumed the portfolio of Colonial Secretary, which he held till 1878. In 1885 he became Lord-Lieutenant of Ireland. He wrote *The Druses of Mount Lebanon* (1860), *Reminiscences of Athens and the Morea* (1869), and translated the *Agamemnon* (1879), the *Odyssey* (1886), and the *Prometheus Vinculus* (1893).

**Carnarvonshire**, the most northwesterly county in the mainland of Wales, is separated from Anglesey by the Menai Strait. It comprises two natural divisions, the north mountainous region, or Snowdonia, and the south peninsula, or Lleyn promontory, mostly level or undulating. The coast of the north forms the fine rocky headlands of Green Gorge's Head and Penmaenmawr; on the Menai Strait it is rugged, and in the south generally low. Snowdon proper, with Yr Wyddfa or the Peak, 3,560 ft., is the highest summit of England and Wales (see SNOWDON). The principal rivers are the Conway, with its tributary the Llugwy; Ogwen, with Nant Francon and Seiont, and Glaslyn. Much of the surface is unfit for cultivation. The rearing of sheep and other stock and dairying are the principal branches of farming industry. Of minerals, slate is the most valuable, drawn mostly from the quarries of Penrhyn; copper is worked at Beddgelert. Area, 563 square miles. Pop. (1911) 141,776.

**Carnassial** or SECTORIAL TEETH are teeth specially adapted for tearing flesh, and are peculiar to the terrestrial carnivora. In the typical carnivores there is one carnassial tooth at each side in each jaw. In the upper jaw it is the last premolar which

forms the carnassial; in the lower, the first molar. In shape the upper and lower carnassials differ from each other, but both have compressed blades, divided into sharp-edged cusps, and are large relatively to the other teeth.

**Carnatic**, a region on the eastern or Coromandel coast of India, now included in the presidency of Madras.

**Carnation** (*Dianthus caryophyllus*), a double flowering variety of the clove pink, is a half hardy herbaceous, perennial plant, a native of Southern Europe, having been cultivated by the ancient Greeks and Romans.

The plant is from two to three feet high, with a branching stem,

Carnations.

opposite linear leaves, and terminal flowers which bloom naturally in summer, and are cultivated under glass throughout the year. Until the sixteenth century only one variety, pale pink in color, was known, but carnations of many forms and colors are now cultivated, the most common being white, pink, and red. The carnation is best grown from cuttings taken from blooming stock, the finest ones being those taken from the middle of the plant. These cuttings are placed in moist sand and protected from sun and drafts; in about four weeks they are ready for potting, and in late April or early May they are planted out of doors. The soil

should be a sandy loam; sheep manure, dried blood, and wood ashes are good fertilizers. Abundant fresh air and a cool steady temperature are essential to successful cultivation.

The tree or perpetual-blooming carnations which have been brought to a high state of perfection by American growers are widely used for providing flowers in the depth of winter. Cuttings are taken in August, potted, and wintered under glass. They are not allowed to flower during the following summer, but are gradually moved on into bigger pots. In September they are placed under glass, and kept at a temperature of from 50° to 65° F.

The chief diseases to guard against are stem rot, caused by a fungus in the soil; carnation-rust, also caused by a fungus, and fairy ring, due to a humid or foul atmosphere. Spraying with Bordeaux mixture is effective in all cases.

**Carnauba** (*Copernicia cerifera*), a Brazilian palm, the under surface of the leaves of which yields a wax used to adulterate beeswax, in the manufacture of candles, etc. The timber is used for veneering, the fruit is edible, and the leaf is woven into mats, hats, baskets, etc.

**Carneades** (c. 213-129 B.C.) of Cyrene, in Africa, Greek philosopher. He studied logic at Athens under Diogenes, but became a partisan of the New Academy, and an enemy of the Stoics, whose stern and almost dogmatic ethics did not suit his skeptical predilections.

**Carnedd Dafydd** and **Carnedd Llewelyn**. See SNOWDON.

**Carnegie**, borough, Allegheny county, Pennsylvania, on the Pittsburgh, Cincinnati, Chicago, and St. Louis, and the Pittsburgh, Chartiers, and Youghiogheny Railroads; 5 miles southwest of Pittsburgh. It has large iron and steel works, and manufactures of tin, lead, and agricultural implements. Pop.(1900) 7,330; (1910) 10,009.

**Carnegie**, ANDREW (1835-1919), American manufacturer and philanthropist, was born in Dunfermline, Scotland, on Nov. 25, 1835. In 1848 his parents came to America, and settled in Allegheny City. Andrew was employed first as a 'bobbin boy' at a dollar and twenty cents a week, and then entered the service of the Ohio Telegraph Company as a messenger boy, learned telegraphy, and became an operator on the Pennsylvania Railroad. He was promoted to the office of secretary to the superintendent, and in 1860 became superintendent of the Pittsburg division of the railroad, a position he held until shortly after

the Civil War. When war seemed imminent, he was called to Washington and organized the Military Telegraph Corps. During the war he performed important duties as superintendent of military railways and government telegraph lines in the East.

Meanwhile, his business activities were not confined to his salaried positions. In 1854 he made his first investment—ten shares of Adams Express Company Stock—with money borrowed from his uncle. He also saw the advantages of the sleeping car, then newly invented; invested money in the Woodruff Sleeping Car Company, and obtained the adoption of the system on the Pennsylvania. On the discovery of oil in Pennsylvania, in 1861, he invested his dividends and savings in oil lands, which yielded a large profit. He also became interested in the Iron City Forge Company and the Keystone Bridge Company. In 1868 he visited England and investigated the Bessemer steel processes, and on his return broke new ground by founding the Union Mills, Pittsburgh, for the manufacture of steel rails. The subsequent boom in railroad building brought great success to his iron and steel enterprises, and he built the Edgar Thomson Steel Works.

In 1875 all the concerns in which Carnegie was interested were amalgamated under the title of 'Carnegie Brothers & Co.' In 1883 the Homestead Steel Works were acquired, and along with several other works were formed into one concern under the title, 'The Carnegie Steel Company Limited'; capital (paid up), \$25,000,000. In 1892 the Frick Coke Company was amalgamated with it, and the company's capital raised to \$60,000,000, to be still further increased to \$140,000,000 in 1900; while in 1901 the entire Carnegie enterprise was taken over by the United States Steel Corporation, Mr. Carnegie retiring from active business with an interest in the company amounting to \$250,000,000.

Besides his beautiful Fifth Avenue residence in New York City, Mr. Carnegie had a magnificent home in Scotland—Skibo Castle—where he spent a large portion of the later years of his life. He died suddenly after a short illness with pneumonia, at his summer home at Lenox, Mass., on August 11, 1919.

The philanthropic works of Andrew Carnegie are famed throughout the world, his numerous benefactions being estimated at over \$350,695,000. He expended on 2,811 libraries, located

in all parts of the world, the sum of \$60,364,808. To the Scottish universities, for the payment of class fees for the students, he in 1901 gave \$10,000,000. He presented a technical school and large public park to Dunfermline, and was a generous helper of the University of Pennsylvania, the Pittsburgh Technical School, the Mechanic's and Tradesman's School of New York, the Cooper Union technical classes, and other institutions. He contributed large sums to the Carnegie Institution, the Carnegie Institute, the Carnegie Hero Funds, and the Carnegie Endowment for International Peace (q. v.). He gave also \$1,500,000 for the erection of the Peace Palace at The Hague (q. v.). In April, 1907, he presided at the Peace Conference held in New York, and the same year gave \$750,000 to house the Bureau of American Republics in Washington. In 1912 he gave \$125,000,000 to the Carnegie Corporation of New York, which was organized to carry on work in which he was interested. To the Allied Engineers' Societies he gave \$1,500,000; while his gifts to small colleges in the United States amounted to some \$18,000,000 and his war benefactions, including gifts to the Red Cross, totalled over \$2,790,000. At his death his estate was valued at between \$25,000,000 and \$30,000,000, of which \$20,000,000 was left to the Carnegie Corporation.

Mr. Carnegie's writings include *An American Four-in-Hand in Britain* (1883); *Round the World* (1884); *Triumphant Democracy* (1886); *The Gospel of Wealth* (1900); *The Empire of Business* (1902); *Life of James Watt* (1905); *Problems of Today* (1908).

**Carnegie Endowment for International Peace**, a foundation of \$10,000,000 given by Andrew Carnegie (q. v.) in 1910 for the promotion of international peace. Its object, as outlined by the trustees (twenty-eight in number) at their first meeting, in March, 1911, is to advance the cause of peace among nations, to hasten the abolition of international war, and to encourage and promote a peaceful settlement of international differences. These objects are to be attained by promoting investigations as to the cause of war and practical methods of avoiding and preventing it; by diffusing information; by educating public opinion; by establishing a better understanding of international rights and duties; by cultivating friendly knowledge and understanding between different countries, and

by maintaining, promoting, and assisting all associations and agencies that shall be deemed necessary and useful in attaining the purposes of the corporation. The work of the Endowment is divided into three parts: the division of Intercourse and Education, the division of International Law, and the division of Economics and History.

The outbreak of the European War in 1914 necessarily caused many changes in the plans of the Foundation. A resolution was passed in support of vigorous prosecution of the war as the most effectual means of promoting durable international peace; and the Trustees voted to tender the services of its officers and personnel to the Secretary of State during the continuance of the war. This offer was accepted, special appropriations were made for the purpose, and a large volume of work undertaken at the request of the Secretary of State was sent to the Paris Peace Conference, for use in the preparation of the Peace Treaty.

Senator Elihu Root is president of the Board of Trustees. Headquarters are in Washington and meetings of the trustees are held annually in April.

**Carnegie Foundation for the Advancement of Teaching**, a fund of \$15,000,000 created in 1905 by Andrew Carnegie, the income of which is used for retiring allowances to officers and teachers in institutions of higher learning in English-speaking North America, and for pensions for the widows of such officers and teachers. In 1908, \$5,000,000 was added to the original gift of \$10,000,000, so that tax-supported colleges, universities, and technical schools, not included in the fund up to that time, might be admitted to its benefits. In 1911, Mr. Carnegie endowed the Educational Enquiry of the Foundation with \$1,250,000. By 1918 798 allowances and pensions had been granted at a cost of \$6,620,000. In this year the Foundation received from the Carnegie Corporation the sum of \$13,000,000 to be used in the termination of its present system and the inauguration of a contributory system of pensions.

In order that the Foundation shall be an integral part of higher education in America, the trustees have dealt, so far as possible, with institutions rather than with individuals. For this reason, they created what is called the accepted list of institutions. To be placed on this, an institution must conform to definite regulations with regard to educational standards, form of gov-

ernment, and amount of endowment. Once an institution is placed on this list, its teachers and officers receive retiring allowances as a matter of right and under fixed rules as to age and length of service. Pensions to widows of teachers and officers are also granted under definite rules.

The fund is in the hands of a board of 25 trustees, who meet in November of each year. The administrative offices of the Foundation are in New York City. Consult *Bulletins* and *Reports* issued by the Foundation.

**Carnegie Hero Funds**. In 1904 a fund of \$5,000,000 was created by Andrew Carnegie (q. v.), for the purpose of rewarding heroic efforts, to save human life in the United States, Newfoundland, and Canada, to relieve those injured in making such efforts, and to provide for those dependent upon them where life was sacrificed. The fund is managed by a commission of twenty-one members, who meet three times each year. Heroic acts are brought to the attention of this Commission either through direct application or through the public press. In each acceptable case a medal of gold, silver, or bronze is awarded; and in appropriate cases an additional award of money is granted. From the establishment of the fund in 1904 until January 22, 1919, 1461 medals (18 gold, 449 silver, and 994 bronze) and \$1,709,898 were awarded. The offices in the Commission are in Pittsburgh, Pa.

The success of the American fund led Carnegie to establish a similar fund in Great Britain, in 1908, \$1,250,000 for the purpose being placed in the hands of trustees in Carnegie's native place, Dunfermline, Scotland. A foundation for heroes was established in France (1909) by a gift of \$1,000,000, and one in Germany (1910) by a gift of \$1,500,000. Hero Funds have also been established in Denmark, Norway, Sweden, Holland, Italy, Switzerland, and Belgium.

**Carnegie Institute**, an institution for technical education given by Andrew Carnegie to the city of Pittsburgh in 1900. His original gift was \$1,000,000, which was later increased until it reached a total of \$4,000,000 for equipment and building, and \$7,000,000 for endowment. There are four separate schools, each with its own faculty and student body, i. e., The School of Applied Science, School of Applied Design, School of Applied Industries, and Margaret Morrison School for Women. In 1918 there were 241 teachers and 3,149 students.

**Carnegie Institution of Washington**, an organization founded by Andrew Carnegie (q. v.) on Jan. 28, 1902, with a gift of \$10,000,000, which he increased by \$2,000,000 on Dec. 10, 1907, and by \$10,000,000 on Jan. 19, 1911. The Institution was incorporated by act of Congress, approved April 28, 1904, the articles of incorporation declaring in general 'that the objects of the corporation shall be to encourage in the broadest and most liberal manner investigation, research, and discovery, and the application of knowledge to the improvement of mankind.' It is controlled by a board of 24 trustees.

The work may be conveniently classed under three heads: (1) Large projects or departments of work whose execution requires continuous research by a corps of investigators during a series of years. Ten such departments have been established, as follows: Botanical Research, Experimental Evolution, Economics and Sociology, Geophysical Laboratory, Marine Biology, Meridian Astrometry, Historical Research, Mt. Wilson Solar Observatory (q. v.), Nutrition Laboratory, and Terrestrial Magnetism. To these may be added the Eugenics Record Office recently taken over as the result of a gift from Mrs. E. H. Harriman. (2) Minor projects which may be carried out by individual experts in a limited period of time, or by investigators possessing exceptional abilities and opportunities for research work. Many grants in aid of this class of projects have been made. (3) The publication of the results of investigation made under the auspices of the Institution.

The Administration Building of the Institution is located on the southeast corner of Sixteenth and P Streets, Washington, D. C. The President is Robert S. Woodward. To date (1919), about 400 volumes of publications, with an aggregate of more than 105,000 pages of printed matter, have been issued directly by the Institution.

During the Great War of Europe (q. v.) the services of associates and members of departmental and divisional staffs and the departmental organization of the Institution, with laboratory facilities and equipment, were freely offered to the U. S. Government, and valuable service was thereby rendered.

**Carnelian**, or CORNELIAN, in mineralogy, a variety of chalcedony (q. v.) of a bright red color, which takes on a fine polish and is used as a ring stone, and for brooches, seals, and ornaments. An oxide of iron is the coloring

matter. It is the most precious of all forms of chalcedony, and is found, like agate and other secondary forms of silica, in nodular masses occupying cavities in rocks, from which it may be set free when the surrounding rock decomposes into earth. Fine specimens have been obtained in the United States (Florida), Nova Scotia, South America, India, Queensland, and elsewhere.

**Carnic Alps**, See SOUTHEASTERN ALPS.

**Carniola** (German *Krain*; Russian *Ukrain*), former crown land of Austria; under the terms of the Austrian Peace Treaty (1919) included in the new Jugo-Slav state (see JUGO-SLAVS). It is bounded by Trieste on the west, Croatia and Slavonia on the south and southeast, and Carinthia and Styria on the north and northwest. Area 3,856 square miles.

It is traversed in the north by a continuation of the Carinthian Alps, and in the south by the Julian Alps, the loftiest summit being the Terglou (9,393 feet). The scenery of the country abounds in interesting and singular features, amongst which are Lake Zirknitz, the Adelsberg Grotto, and the rock-bridge of St. Kanzian. The climate is in general mild, except in the high mountainous parts. Agriculture is backward, but some districts yield excellent wines and much fine fruit. Flax, silk, maize, and honey are produced. The chief minerals are iron, quicksilver, and brown coal. Manufacturing is limited, but linen-weaving and coarse lace making are practiced.

The people are mostly Slavonic. The capital is Laibach. Carniola was added to the Empire by Charlemagne, and until the close of the Great War was an integral part of the Austrian monarchy from 1335, except for the few years from 1809 to 1813. Pop. 525,000.

**Carnival**, a period of rejoicing and festivity, observed in many parts of Europe and America—usually between Epiphany and Shrove Tuesday. The forms and customs observed in the celebration originated without doubt in the pagan festivals of spring.

At the present day, the carnival is observed in Italy, and parts of Germany, France, and the United States, while it is found in very primitive form in remote regions of Thrace. In Rome the advent of carnival is announced on Twelfth Night by youths attired as monks and wearing masks, who perambulate the streets, shouting their news to the passersby; and during the succeeding days, masks, monks, *pierrots*, harlequins, columbines, and fantastic figures of every description are seen in the

light of day as well as in ball-rooms; while there are races of riderless horses, masked balls, and other sports and festivities. The carnival ends at midnight on Shrove Tuesday.

The carnival in New Orleans is the most famous of these revels in the United States.

**Carnivora**, an order of mammals. The large majority feed upon flesh of some kind, typically upon recently killed warm-blooded animals; but the bears, for example, are largely vegetable eaters. They are characterized by the fact that never less than four toes are present on each foot, by the nature of the teeth, and by certain internal peculiarities. The teeth afford an admirable illustration of the carnivorous or flesh-eating type of dentition: the incisors are small and pointed; the canines are strong, conical, and recurved, and are used to transfix the prey; while certain of the cheek teeth in both jaws in the more typical forms are compressed, sharp-edged, and constitute scissor-blades that are used to pare off the flesh from the bones (see CARNASSIAL).

The living carnivores are divided into two forms—the *fissiped*, in which the limbs are adapted for terrestrial progression; and the *pinniped*, which habitually live in water, and which have their limbs converted into flippers.

The classification of the fissiped carnivores is a matter of some difficulty, but the living forms are conveniently divided into (1) the cat section (*Æluriodea*), (2) the dog section (*Cynoidea*), and (3) the bear section (*Arctoidea*).

In the pinniped carnivores there is no sectorial or carnassial tooth, and the cheek teeth are very uniform. They include the eared or fur seals, the walrus, and the true seals—all aquatic animals, but differing from whales and their allies in coming on shore for breeding purposes.

**Carnivorous Plants**. See INSECTIVOROUS PLANTS.

**Carnot**, LAZARE NICOLAS MARGUERITE (1753 - 1823), French republican statesman, general, and mathematician, was born in Nolay in Burgundy. He was elected a member of the Legislative Assembly (1791), became a member of the National Convention (1792), and was appointed minister of war (1793). He reorganized the army, enforced a general conscription, and drew up plans of campaign. Although he opposed the establishment of the Directory, he was elected one of the directors in 1795, and again acted as minister of war, when he supported Bonaparte, and arranged with him the plan of

the Italian campaign. Proscribed by Barras (1797), he escaped to Germany, and later joined the Tribunat, and opposed Bonaparte's assumption of imperial power. He was Minister of the Interior during the 'Hundred Days,' and a member of the provisional government of June 1815. Following the restoration of Louis XVIII., he retired to Germany, where he died. He published a number of valuable mathematical works.

**Carnot, LAZARE HIPPOLYTE** (1801-88), French public official, son of Lazare N. M. Carnot (q. v.), was born in St. Omer. He studied law, but because of his refusal to swear allegiance to the Bourbons was not allowed to practise. After spending some time in journalism, he was in 1839 elected to the Chamber of Deputies, where he remained, a strong radical, until 1848, when he became Minister of Public Instruction. He was again elected deputy for Paris in 1850, but refused to take the oath of allegiance to Napoleon III. and was not seated until 1864. In 1875 he was made a life member of the Senate. His publications include *Mémoires sur Carnot* (1861-4); *La révolution française* (1869-72); *Lazare Hoche* (1874).

**Carnot, MARIE FRANÇOIS SADI** (1837-94), president of the French republic, eldest son of Lazare Hippolyte Carnot (q. v.), was born in Limoges. He was educated as an engineer and had acquired a considerable reputation in his profession when in 1880 he was made Minister of Public Works. He occupied the same position again in 1885, and shortly afterward was made Minister of Finance. He was elected President of France in 1887 and was assassinated at Lyons shortly before the end of his term. The opening of the Paris Exhibition occurred during his presidency; the Panama scandals of 1892, while discrediting the state, in no wise reflected upon its head.

**Carnot, NICHOLAS LÉONARD SADI** (1796-1832), French physicist, son of Lazare Nicolas Marguerite Carnot (q. v.), was born in Paris. He was educated in the Polytechnic School and served on the corps of engineers in that institution, devoting his spare time to study and research. He is best known as the founder of the science of thermo-dynamics. His great work, *Réflexions sur la puissance motrice du feu*, published in 1824, describes his cycle and reversible engine. Professor Thurston's English translation (1890) includes an account of Carnot's theory by Lord Kelvin.

**Carnuntum, cār-nun'tum**, or CARNUTUM, ancient town of Pannonia, on the Danube, 16 miles southeast of modern Vienna.

It was the headquarters of the Romans in their military operations against the Germans, and for three years the residence of Marcus Aurelius during his campaign against the Marcomanni. In the ninth century the town was destroyed by the Magyars. There are extensive ruins.

**Carnutes, car-nū'tēz**, a tribe of Gauls who lived in the centre of ancient Gaul, between the Liger (Loire) and the Sequana (Seine); their capital was Genabum (Orleans).

**Car'o, village, Michigan**, the county seat of Tuscola county, on the Cass River, and on the Detroit, Bay City and Western, and the Michigan Central Railroads; 30 miles east of Saginaw. Its manufactures include beet sugar, lumber, shoes, telephones, brick, flour, and marble works. It has, also, a canning factory. Pop. (1910) 2,272; (1920) 2,704.

**Caro, kā'rō, ANNIBALE** (1507-66), Italian poet, was born in Civitanova (March of Ancona). He became tutor in the family of Lodovico Gaddi in Florence and subsequently (1543) entered the service of the Farnesi at Parma and Rome. His most valuable work is his translation of the *Æneid* (1581); he also made a beautiful translation of Longus' *Amore Pastoralis*, and his *Lettere familiari*, apart from the interest of their contents, are admirable by reason of their style. His bitter quarrel with Castelvetro because of the latter's criticism of his panegyric on the royal house of France has somewhat detracted from his good fame. Collected editions of Caro's works were published in Venice in 1757 (6 vols.) and in Milan in 1807-12 (8 vols.).

**Caro, kā-rō, ELME MARIE** (1826-87), French philosopher, was born in Poitiers. After being elected professor of philosophy at the Sorbonne (1864), he was, in 1871, enrolled a member of the French Academy. Such was his popularity at the Sorbonne that, as 'philosophe des dames,' he was satirized in the comedy *Le monde ou l'on s'ennuie*. His works include *Philosophie de Goethe* (1866); *Le matérialisme et la science* (1868).

**Car'ob (Ceratonia siliqua)**, or LOCUST TREE, a handsome evergreen tree native to the Mediterranean region. It reaches a height of from 40 to 50 feet, and bears shining pinnate leaves, racemes of red flowers, and brown leathery pods containing a sweet gummy substance and small brown beans. In eastern countries the pods form an important forage crop and are even eaten by the poorer classes of the population in times of food scarcity. It is said that the seeds and pulp are the locusts and wild

honey eaten by John the Baptist in the wilderness, and that the pods are the husks referred to in the parable of the prodigal son. Carob trees are grown in Florida and California. They are propagated by cuttings.

Carob (*Ceratonia siliqua*)

1. Single flower

**Caroba.** See JACARANDA.

**Car'ol**, originally a term for a dance, or for songs intermingled with dancing, later used to signify festive songs, particularly such as were sung at Christmas. The first printed collection of English carols came from the press of Wynkyn de Worde in 1521. A unique fragment of it is extant, containing the famous 'Boar's Head Carol,' which is still sung at Queen's College, Oxford, on Christmas day. The Puritans did their best to discourage carol-singing; but the practice was revived at the Restoration.

In France the singing of Christmas carols, called *noëls*, was common at an early date, and collections of *noëls* were published early in the sixteenth century. Russian literature is very rich in carols and religious songs generally. The best collection of them is by Bezzonov, under the title, *Kaliki Perekhozhie*, or 'The Wandering Cripples,' the singers being beggars and lame people who go about for charity. There is a large store of Manx carols, or *caroal*, but only a very few have been printed.

Consult Sandys' *Christmas Carols Ancient and Modern* and Bramley and Stainer's *Christmas Carols, Old and New*.

**Caroli'na, AMELIA ELIZABETH** (1768-1821), queen of George IV. of England, was the second daughter of Charles William Ferdinand, Duke of Brunswick. She was married in 1795 to the Prince of Wales, who forsook her immediately after the birth of their only child, the Princess

Charlotte (1796). Charges of grave impropriety having been brought against her, a commission of investigation was appointed in 1806, which cleared her of all guilt, though it could not acquit her of imprudence. After the death of George III., divorce proceedings were initiated against her; but so brilliant was the defence that the case was abandoned. At the king's coronation the queen was peremptorily refused admission to Westminster, a slight which she took much to heart. She died about three weeks later (Aug. 7, 1821). Consult Nightingale's *Memoirs of Queen Caroline*.

**Carolina Allspice.** See CALYCANTHUS.

**Carolina Tea.** See YAPON.

**Caroline Affair,** a diplomatic difficulty between the United States and Great Britain arising in 1837. During the Canadian rebellion, certain insurrectionists seized Navy Island (British) in the Niagara River, to which men and supplies were subsequently conveyed in the American steamboat *Caroline*. A loyal Canadian party was sent to capture this vessel, and though they found her moored on the American shore, nevertheless seized and burned her, an American named Dufree being killed. The United States Government demanded reparation for this violation of neutrality, and the situation reached a crisis when in 1840 one Alexander McLeod, a deputy sheriff in Upper Canada, who had boastingly asserted that he was the slayer of Dufree, was arrested and tried for murder in New York. Great Britain immediately avowed responsibility for the death of Dufree, and demanded of the United States the release of McLeod. New York refused to surrender her jurisdiction to the National Government, but McLeod, defended, at Secretary of State Webster's instance, by the Federal district-attorney, was eventually acquitted, proving an *alibi*, and the threatened rupture between the two nations was averted. In 1842 Congress passed a law giving the Federal courts power to issue a writ of *habeas corpus* in the case of a prisoner committed by a State court for an act for which a foreign government assumed the responsibility.

**Caroline Islands,** an archipelago of about 600 islets and islands in the Pacific Ocean, between 1° and 10° N. lat. and 131° and 163° E. long. It is divided, for administrative purposes, into two groups, the Eastern and the Western, with a total area of about 380 square miles. Most of the islands are only small atolls, but there are about fifty

of other formation and size, the most important being Ponape, Yap, Truk, and Kusaie. The climate, though rainy, is temperate and healthful, and the soil is fairly fertile. The products include copra, bêche de mer, vegetable ivory, nuts, pearl and turtle shell. Archaeologically the islands are interesting on account of their cyclopean stone structures. Pop. about 45,000, mostly Malays, with some Chinese and Japanese.

The Caroline Islands were discovered by the Portuguese Diego da Rocha in 1527; they were given their present name in 1688, in honor of Charles II. of Spain. In 1899, by an agreement with Spain, they became a German possession. In 1914, soon after the Great War, they were occupied by the Japanese and are now administered by Japan under a mandate. A treaty between Japan and the United States, ratified March 1, 1922, assures the United States of free access to the island of Yap in all that relates to the operation of the Yap-Guam cable or any other cable which may be laid hereafter by the United States or its nationals. Consult Christian's *Caroline Islands*.

**Caroline Matilda** (1751–75), daughter of Frederick, Prince of Wales, was married in 1766 to Christian VII. of Denmark, to whom she bore the future Frederick VI. in 1768. Seduced by Struensee, she was involved in his fall (Jan. 17, 1772), was divorced from her husband after confessing her guilt, and banished to Celle, Hanover, where she died. Her sad story has been made the subject of several dramas. Consult Wraxall's *Life and Times of Caroline Matilda*.

**Carolings.** See CARLOVINGIANS.

**Carolus,** a gold coin first struck in the reign of Charles I., originally equal to £1, but later valued at 23 shillings. The name has been given to other coins of the period bearing 'Carolus' as the name of the monarch—e. g. a Carolus dollar.

**Carolus-Duran,** kar'ō-lus-dū-rān', EMILE AUGUSTE (1837–1917), French artist, originally known as CHARLES EMILE AUGUSTE DURAND, was born in Lille. He studied in Lille and Paris, and having won the Wicar prize in the latter city, was able to travel and study in Italy. He first attracted attention by his dramatic painting *L'Assassiné*, exhibited in the Salon of 1860. Following this success he travelled in Spain, was greatly influenced in technique by Velasquez, and painted *St. Francis of Assisi* (1868). His other works include *The Glory of Marie de Medici* for the Luxembourg ceiling; *Lady*

*with the Glove*, probably his masterpiece; *The Triumph of Bacchus*, and many portraits displaying great distinction of style. With Duran the pictorial element is secondary, the expression of vitality and an extraordinary talent in painting textures being his chief characteristics. Many American artists, among them John Sargent and Will Low, studied under him. He was a grand officer of the Legion of Honor, a member of the Academy of Beaux-Arts, and from 1904 to 1913 director of the French Academy in Rome.

**Carot'id Artery,** the great artery which divides into two branches, one on either side of the neck, and supplies blood to the head and neck. Each branch again divides into an internal and an external carotid, the former supplying the parts within the cranial and orbital cavities, and the latter, the exterior of the head, the face, and most of the neck. Wounds of the carotid are usually rapidly fatal. Compression of both causes fainting. See CIRCULATION.

**Carotin,** the coloring matter found in the carrot and in the tomato. It is present, also, in maize, squash, orange peel, mustard seed, and other vegetable matters and occurs as the coloring matter of milk-fat. It crystallizes in copper-colored leaflets, is insoluble in water but readily soluble in benzine and sparingly so in alcohol, ether, and chloroform.

**Carp** (*Cyprinus carpio*), a fresh-water fish, native of the East, especially China, but abundant as an introduced form throughout Europe and North America. The body is compressed and covered with large scales, the mouth rather small and furnished with four barbels; the dorsal fins are much longer than the anal. The carp is generally dark brown in color, from

Carp

12 to 17 inches long, and weighs about 20 pounds, though it sometimes attains a much greater weight. Its diet is varied, consisting of vegetable matter, worms, insects, and small crustacea. It is exceedingly hardy and long-lived, some specimens being said to attain an age of 200 years. As a food fish, the carp is esteemed in Europe, particularly in Germany; in America it has not found much favor. Allied is the crucian carp (*Carassius vulgaris*), widely dis-

tributed throughout Europe, and the gold-fish (*C. auratus*), all belonging to the family Cyprinidae.

**Carp**, PETRACHE (1837), Roumanian statesman, born at Jassy (Iasi). After entering politics as a Conservative, he separated from that party on the education question, and founded the Junimist or Young Roumanian party (1876). Carpath office in 1890 and 1892-5, and became premier in 1900 in order to reduce the financial deficit by taxation reform, but was defeated. For the east of Europe, Carp is an example of political integrity. He is the author of several useful economic laws—e.g. mining laws.

**Carpaccio**, VITTORE (c. 1450-c. 1522), Venetian painter, of whose life little is known. He was employed in the school of St. Girolamo with Vivarini and Giovanni Bellini, and it is surmised that he may have accompanied Gentile Bellini to Constantinople. His fine qualities as a religious painter are shown in his masterpiece, *The Presentation in the Temple* (1510, Venetian Academy)—intricate composition, graceful figures, and rich but restrained color. His St. Ursula series of paintings (Venetian Academy), and the nine canvases in San Giorgio degli Schiavoni illustrating the lives of Saints Tryphon, Jerome, and George, show great dramatic qualities. His finest works are in Venice, but good examples are in Ferrara, Vienna, Berlin, Stuttgart; and an early *Virgin and Child* is in the National Gallery, London. For the modern appreciation of Carpaccio we are indebted to Ruskin.

**Carpathians**, one of the principal mountain ranges of Europe, sweeping in an irregular semicircle round the N.W., N., N.E., E., and S.E. of Hungary, which it barricades against Moravia, Galicia, and Roumania. Length from the Danube, in the w., to the Iron Gates, in the e., nearly 1,000 m., with a breadth varying from 10 to 200 m. The system consists of the following series of ranges, following one after another: Little Carpathians (2,400 to 3,200 ft.), White Mts., W. Beskids (Phlisko, 5,110 ft.; and Babia Gora, 5,660 ft.), E. Beskids, Carpathian Forest Mts. (Guimaleu, 6,100 ft.; Czerna Gora, 6,750 ft.), Transylvanian Highlands, and Alps; together with a number of semi-independent subsidiary mountain groups or spurs jutting out into the Hungarian plain. Between the E. and W. Beskids are the "dropped links," much farther to the s., of the (Hohe) Tatra (5,000 to 6,000 ft. above the plain; absolute elevation, 8,000 to 8,700 ft.) and the Niedrige (Nizna) Tatra, which contain the most imposing scenery of the W. Carpa-

thians, and are much visited by tourists. On the n. and n.e., but still more on the s. of Transylvania, are the most imposing altitudes of the system—Pietrosza (7,440 ft.), Pietroszul (6,900 ft.), Königstein (7,355 ft.), Bucsecs (8,265 ft.), Vunetara (8,255 ft.), Negoi (8,320 ft.), the culminating point. The Carpathians contain the rich petroleum stores of Galicia, salt, gold, silver, copper, coal, and other minerals, together with mineral springs. Although many of the peaks of the Carpathians rise above the snow-line and the normal limit of forest growth, yet, owing to their steepness and to the scanty precipitation (24 to 35 in. annually), there are no real glaciers in the system. Although the middle parts of the system are, generally speaking, inaccessible, there are several convenient passes, such as the Jablunka (1,810 ft.), over which runs the Cracow-Pressburg Ry.; the Jordanow (2,630 ft.), Tarnow-Kaschau Ry.; and the Dukla (1,650 ft.). Farther e. the Lemberg Munkacz line crosses by the Rodna Pass (4,128 ft.) and the Borgo Pass (3,940 ft.), both leading into Bukowina. Transylvania is connected with Moldavia by the Tolygyes (2,135 ft.), Gyimes (2,955 ft.), Oitoz (1,410 ft.), and other passes; and with Walachia by Tömös or Predeal (3,375 ft.), the famous gorge of the Rother Thurm (1,155 ft.), and the defile of the Iron Gates close beside the Danube.

**Carpeaux**, JEAN BAPTISTE (1827-75), born at Valenciennes, was one of the most characteristic French sculptors of the second half of the 19th century. His ideal was the expression of life in all its attitudes. Among his works are *La Palombella* (1858), a bust of an Italian girl; the bronze group of *Ugolino and his Children* (1863), in the Tuileries Gardens at Paris; the bust of the *Princesse Mathilde* (1863); the bust of *Alexandre Dumas fils* (1874); the group of the *Four Parts of the World*, adorning a fountain in the Luxembourg Gardens at Paris. He executed also the bas-reliefs for the Flora pavilion of the Louvre, the principal subject being *France Shedding Light through the World and Protecting Science* (1866). But one work, *The Dance* (1869), adorning the façade of the New Opera House at Paris, created a great controversy by reason of the novelty of its naturalistic tendencies, and even led to an attempt to ruin its effect. See Chesneau's *Le Statuaire J. B. Carpeaux* (1880); W. C. Brownell's *French Art* (1902).

**Carpel**. The central part of a flower is the pistil or gynoecium, and its several parts of floral

leaves the carpels. Each carpel consists of a swollen hollow part called the ovary, enveloping the ovule or ovules, which when fertilized become seeds; of an expanded superior surface called the stigma, to which adhere the pollen grains destined to fertilize the ovules below; and generally, also, of a stalk or column between the ovary and the stigma. When the carpels are joined so as to form a united pistil, or when the ovaries are joined, and the styles and stigmas are not united, the pistil is spoken of as syncarpous; otherwise, it is said to be apocarpous.

Types of Carpel.

1. Apocarpous (buttercup); 2. monocarpellary (peach); 3. bicarpellary and section (erythraea); 4. tricarpellary and section (lily); 5. polycarpellary and section (linum).

**Carpentaria**, GULF OF, N. of Australia, about 300 m. from w. to e., between Capes Arnhem and York, and 400 m. from n. to s. Into it flow the rivers Mitchell and Van Diemen on the e.; Flinders, Leichhardt, and Albert on the s.; and Roper on the w. It is deeply indented, and contains several islands (Groote Eylandt, Wellesley). Its e. coast was discovered by the Dutch in 1606.

**Carpenter**, LOUIS GEORGE (1861), American irrigation engineer and teacher, born at Orion, Mich. He graduated at the Michigan Agricultural College in 1879 and studied at the University of Michigan and at Johns Hopkins University. He taught mathematics at his alma mater in 1881-88, was professor of engineering and physics at the Colorado Agricultural College, became well-known as an irrigation engineer, and was state engineer of Colorado (1903-4).

**Carpenter**, MARY (1807-77), English philanthropist, was born at Exeter. Dr. Tuckerman, the Boston philanthropist, stimu-

lated her to work for destitute children. The passing of the Youthful Offenders Bill (1854) was largely due to her exertions. She visited the U.S. in 1873, and lectured there and in Canada on prison reform. Author of *Reformatory Schools* (1851), *Juvenile Delinquents* (1853), *Memoir of Joseph Tuckerman* (1848), reprinted in *American Unitarian Biography*, vol. ii. (1851), *Our Convicts* (1864), *Last Days in England of the Rajah Rammohun Roy* (1866), *Six Months in India* (1868), and *Reformatory Prison Discipline* (1872). See *Life* by J. E. Carpenter (1879).

**Carpenter, MATTHEW HALE** (1824-81), American senator, was

in 1879, holding office until his death. Senator Carpenter was an opponent of slavery at the outbreak of the war and was in favor of the franchise for the freedmen. He made many brilliant speeches in the Senate. See *Flower's Life* (1883).

**Carpenter, ROLLO CLINTON** (1852), American engineer and educator, born at Orion, Mich. He was educated at the Mich. Agricultural College, at the University of Michigan, where he graduated c. e. in 1875, and at Cornell University; and was a professor in the Michigan Agriculture College from 1878 to 1890, when he became professor of experimental engineering in Cornell

named on account of its habit of forming a nest in dry wood, in which it excavates parallel galleries. Within these galleries cells are formed of wood pulp moistened by salivary juice. (See BEES). Numerous species occur in the United States, of which *Xylocopa virginica* is the largest and best known species of the Northern states. It is numerous and widely distributed; and as it very often cuts its tunnels into the timbers of porches and outhouses its interesting habits may be easily observed. Consult Packard *Text-book of Entomology* (1898).

**Carpentras, tn.**, dep. Vaucluse, on the riv. Auzon, 17 m. N.E. of Avignon by rail. It is a walled town with four gates, the Porte d'Orange being one. The cathedral is Gothic, and there is also a Roman triumphal arch. From the 5th century to 1805 Carpentras was an episcopal see. There are felt-hat and silk factories, tanneries, dye-works, and flour mills. Pop. (1901) 10,443.

**Carpentry** is the art of working timber with cutting and other tools. A knowledge of the laws of mechanics is required in order to design successfully roofs, floors, bridges, the centering for arches, and those other structures in which a correct proportion and disposition of the component parts is essential.

**Joints.**—The first requisite is a knowledge of the different methods of joining pieces of timber so as to bear the strains which come upon them under varying conditions. The mortise-and-tenon joint (Fig. 1) is used in all varieties of framing, where one piece of timber meets another without crossing it. The tenon, or projecting portion left on the end of the first timber, fits tightly into the mortise, or hole, cut in the second, and is secured to it by glue or by wedges driven into it on the farther side. Modifications of this are shown in Figs. 2 and 3, and are adapted for cases where the entering timber is at an acute angle with the receiving piece, and presses against it in the direction of its length. The joints of rafters and tie-beams, also those of bridge struts and piers or longitudinals, afford example of these and similar joints, in which great care is necessary to provide a bearing surface at right angles to the direction of the thrust. In rougher work, instead of the mortise-and-tenon joint, the plan is often adopted of 'halving' the portions of timber in contact, so that when joined they present a flush face, afterward uniting them firmly by one or more bolts. Notching, cogging, and housing are somewhat similar operations, performed to join timbers which cross each other—no strength of

Carpentry: Joints.

born at Moretown, Vt., and entered, but did not stay to graduate from, West Point. He was admitted to the bar of Vermont in 1847, and the following year established himself at Beloit, Wis., soon building up a brilliant reputation as a lawyer and removing to Milwaukee. He supported the Union as a war Democrat during the Civil War, and afterward, in 1868, with Lyman Trumbull successfully maintained the validity of the reconstruction act of 1867 before the U. S. Supreme Court. For this and other services Grant and Stanton recommended his election to the U. S. Senate, and he was elected by the Republicans of Wisconsin, holding office from 1869 to 1875. Returning to his practice he defended Secretary Belknap from charges made by the U. S. House of Representatives, and was counsel for Samuel J. Tilden before the electoral commission of 1877. He was again elected to the U. S. Senate

University. He also gained a wide reputation as a consulting engineer. His publications include *Experimental Engineering* (1890; 6th ed., 1902), and *Heating and Ventilating Engineering* (1898; 5th ed. 1902).

**Carpenter, WILLIAM BENJAMIN** (1813-85), English naturalist and physiologist, brother of Mary Carpenter; born at Exeter; studied medicine in London and in Edinburgh. He is the author of *Principles of General and Comparative Physiology* (4th ed. 1854), *Principles of Mental Physiology* (7th ed. 1896), and *The Microscope and its Revelations* (8th ed., by Dallinger, 1901). Carpenter was lecturer on medical jurisprudence at Bristol, and Fullerton professor of physiology at the Royal Institution, London. He obtained the Royal Society medal (1861), and was president of the British Association for the Advancement of Science (1872).

**Carpenter Bee**, a bee so

union; however, being obtained without the use of bolts and straps. Dovetailing, which plays so large a part in joinery, is of but little use in carpentry, owing to the fact that the shrinkage inseparable from timber of any size renders the joint useless for purposes of strength. Scarf joints (Figs. 4, 5, 6, 7) are employed in joining longitudinal timbers so as to form a beam of greater length than a single piece of wood would naturally afford. The methods of scarfing shown in Figs. 4 and 5 are especially adapted for cases where the timber is in tension or compression. Figs. 6 and 7 exemplify patterns more useful for resisting a bending strain, when strengthened with bolts—which are also largely employed for securing the other forms of joint. Hard-wood keys are previously driven through the holes in the joint, to make the parts of it fit closely to each other; and while these must be driven in sufficiently tight to close up the joint, care must be taken to avoid any strain being put on the fibres of the wood by forcing the parts together too much. All kinds of joints may be strengthened by iron straps, forged to the exact shape required, and bolted to the wood. Figs. 8 and 9 show the rafters of a roof firmly connected to the king and queen posts respectively by straps laid on the sides of the different members.

**Roofs.**—The simplest form of roof, employed only for spans under 20 ft., consists of common rafters meeting at a ridge-pole, and held together by a light tie or 'collar-beam' at about the centre of each. The lower ends of the rafters rest on a wooden wall-plate, which they are notched to receive. For larger spans trussed 'principals' are adopted. The simplest form of these is the king-post roof, in which a tie-beam holds together the feet of the principal rafters. The weight of the tie-beam is held by a vertical king-post attached to the rafters at their apex, and supporting on 'shoulders' near its base two diagonal struts which stiffen the rafters. For spans over 30 ft. the king-post is usually replaced by two queen-posts, in order to avoid leaving the rafters unsupported for so much as half their length. Figs. 10 and 11 show these two types of roof principals, of which all others up to the largest spans are modifications or combinations, with the exception of those special designs for churches and public buildings in which a tie-beam is omitted for the sake of architectural effect. In these cases stability is assured by the walls being sufficiently strong to withstand the resultant horizontal

pressure or by the roof principals being of a form approximating to that of an arch.

The roof principals are usually placed at a distance of about ten feet apart. They are connected by longitudinal timbers called 'purlins,' which in their turn support the 'common' rafters on which the roof itself is laid. In roofs of large span, where the principals are necessarily heavy and costly, an economy may be effected by spacing them farther apart and strengthening the purlins (which have to bear a cross strain) by means of trussing—a method not infrequently applied also to long beams in bridges and other temporary works. Trussing consists in supporting the beam by two or more iron struts near the centre, their weight being carried by iron tension rods which have a bearing on the fixed ends of the beam. The chief objection to this is the high crushing stress which is brought on

ing is afforded on a cross-piece, or 'trimmer,' which is mortised into the full-length joist on each side. (2.) Double floors have three tiers of joists—(a) the binding joists, which are the chief supports, and which rest on the walls (as before); (b) the bridging joists above and (c) the ceiling joists below, which cross the main series and are notched into them, holding respectively the floor boards and the ceiling. (3.) Framed floors have in addition main beams, into which the binding joists are framed at intervals, instead of crossing the whole width of the room. Each variety of floor has its own use—framed floors being adapted for large spans, double floors where an even ceiling is essential, single floors for moderate-sized rooms, where strength and lightness are first considerations. The joists of single floors should, for all spans above 8 ft., be strutted together at intervals, to prevent them turning or twist-

FIG. 10.—KING-POST PRINCIPAL.

FIG. 11.—QUEEN-POST PRINCIPAL.

## Carpentry: Roofs.

the wood where the tension rods are fixed. For temporary work, and for such particular uses as that of lengthy purlins in a large-span roof, the truss is advantageous; otherwise, it is preferable to use an iron girder for a long beam under a bending load.

**Floors.**—The timber framing which supports the flooring boards of the room above and the ceiling of the room beneath is constructed on one of three general designs. (1.) Single-joisted floors consist of only one series of joists, which rest on the wall-plate at either end. If an obstacle, such as a fireplace, intervenes, a bear-

ing. A system of diagonal or 'herring-bone' strutting is the most efficient.

**Partitions** are frames of timber used for dividing the upper stories of a house into rooms. They are usually faced on each side with lath and plaster; or the spaces between the timber may be filled in with concrete or brickwork.

**Centres** are curved frames for supporting the arch stones of bridges or vaults during the construction of the arch. The vertical frames or 'ribs' of which centres are composed are placed from 4 to 6 ft. apart, and are connected by horizontal ties and

by diagonal bracing. On them is laid the 'lagging' of narrow boards which carries the stones of the arch. The ribs are built up of a series of short timbers shaped on the outside to the curve of the arch, and supported at their junctions by radial struts. For a small span these struts converge to one or more points on the tie-beam, which is, if possible, there supported by vertical posts from the ground. In the centres for a large bridge a system of trussing must be adopted by which for each rib the load of the arch is transmitted to two points at the extremities of the chord. These points rest on some fixed support, with the intervention of two or more wedges, which are driven in when the centre is first adjusted. When the arch is finally keyed in, and it is desired to strike the centres, the wedges are gradually knocked back and out, so as to let the rib down by degrees and allow the arch to take its proper bearing slowly.

**Staging and Gantries.**—The design of permanent bridges of large span, in which wooden trusses may be made to take the place of the voussiors of a masonry arch, or the members of an iron lattice girder, comes more under the province of the engineer.

Staging consists of two rows of standards (squared timbers of large scantling) stiffened and braced by diagonals, and connected at the tops by longitudinal beams which serve to carry a platform or a line of rails. The bases of the standards are usually set on a sill of horizontal timber resting on the ground. Short cross pieces are fixed to their heads, so as to give a better bearing for the longitudinal 'runners,' which are also supported by diagonal struts, butting on cleats fixed to the sides of the standards. The different members of such a structure are joined together by bolts. A gantry is a staging of considerable length used to carry a travelling crane. See *Holly's Carpenters' and Joiners' Handbook* (1863).

**Carpet-Baggers**, a name derisively applied to those Northern men who went South after the Civil War and took an active part in Reconstruction politics, as leaders of the negroes and often as office-holders in the Reconstruction governments of the various Southern states. The name arose through the assertion that these men, mere political adventurers as Southerners believed, and actuated chiefly by the desire for gain, which they would not hesitate to secure through corrupt means, went to the South with only so much property as might be carried in a carpet-bag.

**Carpet Bug**, a small spotted

beetle of the destructive family Dermestidæ, which, when adult, feeds upon the pollen of flowers. It has, since about 1870, learned to enter houses and lay its eggs in the dust of floor-corners, where the larvæ, as soon as they hatch, begin to feed on the wool of the carpet, and later form from the shreds cocoons in which to pass the pupa stage. Where carpets are nailed down, and not frequently shaken, they may thus do great damage. The better practice of using loose rugs, assiduous cleanliness and the use of pyrethrum powder will prevent or remedy this harmfulness. This beetle is *Anthemus scrophulariæ*, and is an accidental importation from the Old World.

**Carpet Moths**, a name given by British collectors to many of the Geometridæ, whose larvæ are called 'loopers,' and which have beautifully patterned wings. In the United States the same name is carelessly given to the larva of the carpet beetle, on the ignorant supposition that it is a kind of clothes moth.

**Carpet Snake**, a large, harmless, highly variegated and extremely common Australian serpent (*Morelia variegata*).

**Carpets** came to us originally from the East, where the rug or carpet is the most important—often, indeed, almost the only—furnishing of the house: the Moslem always spreads his carpet for prayer. Turkey, Persia, and India still send us the most beautiful examples of the art, though the perfect designs of old time are being vulgarized by the disastrous influence of the West. But it is with the modern industry, as carried on in large factories, that we have here to do. France was the first to develop carpet-making (at the Louvre in 1607); but the revocation in 1685 of the Edict of Nantes drove many French craftsmen across the Channel, to settle at Bristol, Axminster, and other places in the s.w. of England. At this date the carpet had not replaced the floor covering of strewn rushes in Britain. The industry soon spread to Glasgow, Kidderminster, and the Yorkshire towns. It was started at Philadelphia, in 1791, and was greatly developed there and in other American cities; and since then the U. S. has played the most important part in the designing of carpet looms, though no new structure of carpet has been invented.

There are two distinct classes of carpets—*vis.* ordinary woven fabrics and pile fabrics.

**Ordinary Woven Fabrics.**—These are variously known as Ingrain or Kidderminster carpets. The earliest known example of this double-cloth structure dates

from about the 16th century. The industry was introduced to Kidderminster from Bristol in 1735, though the first power-loom for the purpose was invented in Scotland in 1830. These carpets have a flat surface, and are reversible; but the relation of colors on one side is opposite to that on the other, so that if there is a black design on a red ground on one side, there is a red design on a black ground on the other.

Of *Pile Fabrics* there are three principal kinds—*vis.* (1) Chenille Piles, known as Chenille Axminsters; (2) ordinary wired Piles, known as Tapestry, Brussels, Wilton, or Velvet carpets, and (3) Tuft-woven Piles, known as Victoria, Royal, etc., Axminsters.

**Preparation for Chenille Carpet.**  
Cut into strips at dotted lines A to form B.

**Chenille Axminsters.**—Chenille (Fr. 'caterpillar') denotes a thick, loose, fluffy thread. The figure on this carpet is of a colored pile formed by a series of woven pile-thread, or, as they are technically called, 'chenille-picks.' Each pick is of one of the colors of the design, and the weaving operation consists in laying these picks in their right relative positions in the cloth. The picks themselves are first woven in the required colors on a kind of gauze foundation, which holds the fluffy pile very firmly.

**Section of Brussels Carpet.**  
Loops woven over wires A; B, wires removed.

The *Brussels* is a wired-pile carpet. Its pile consists of loose loops of worsted thread formed over wires, and held down at their bases by a firm fabric of linen threads, into which the colored worsted loops are woven. The Flemish origin of this carpet is shown by the width of the piece being still the Flemish *el*; and the first Brussels carpet loom introduced into England came from Touray in 1749. When the wires, after forming the loops, cut through them at their highest point, the *Wilton* or *Velvet* carpet is produced; the pile in this case forms a kind of plush. The *Tapestry* carpet is the simplest form of the wired-pile car-

pet, and resembles a Brussels carpet. The pattern is, however, not produced by the weaving together of threads of different colors, but is printed on the warp in an elongated form. The looping of the warp by the wires in the weaving process reduces the pattern to its proper proportions. The tapestry carpet usually has a wadded ground texture, to give the necessary elasticity. The warp is printed, thread by thread—a method which allows of a large number of colors.

*Velvet Pile and Wilton Carpet.*

A, Loops on wires; B, loops cut to form pile.

Carpets of the tuft-woven pile or moquette type were first made at Nîmes, France, on hand looms. The power loom which produces the tufted pile was invented in the United States in 1856. The essential feature of these carpets is the introduction into a simple framework of warp and weft of a series of tufts sufficiently long to form a pile. Woollen yarns corresponding in color to the colors in the design are wound side by side on spools—one for each row of tufts. These are then fixed in the loom in an endless chain, and the yarns are fed through a series of small tubes attached to the spools into the body of the carpet, and are cut by machinery.

Special varieties of carpets are woven from strips of brightly colored rags, common in the United States from colonial times, and from grass and vegetable fibres.

**Statistics.**—In the United States, according to the U. S. Census of Manufactures for 1914, there were 97 establishments devoted to the manufacture of carpets and rugs, exclusive of jute carpet, with a capital of \$85,153,828 and products valued at \$69,128,185. The amount and value of the principal varieties of carpets and rugs were as follows: Axminster and moquette, 15,742,835 square yards, \$18,578,693; Wilton, 5,616,263 square yards, \$11,929,605; body Brussels, 2,698,840 square yards, \$3,995,626; tapestry velvet, 13,227,819 square yards, \$12,867,635; tapestry Brussels, 13,614,354 square yards, \$9,852,647; ingrain, 8,973,270 square yards, \$3,406,381. The industry is confined to six States—New York, Pennsylvania, Massachusetts, Connecticut, New Jersey, and Indiana.

See RUGS. Consult F. Bradbury's *Carpet Manufacture*; W. S. Murphy's *The Textile Industries* (vols. vi., vii., 1912).

**Carpet Sweeper**, a dust-saving device for sweeping carpets and rugs, the principle of which is that of a brush revolving inside

a dustpan, thus picking up the dust and confining it at the same time. The vacuum cleaner, by which dust is extracted by means of air suction, is now largely replacing the sweeper, especially in hotels and large establishments. See VACUUM CLEANERS.

**Carpi**, kâr'pē, town and episcopal see, province Modena, Italy; 9 miles north of Modena. It has two cathedrals and a fine Renaissance church of the fifteenth century, and carries on silk industries. Pop. (commune) 23,000.

**Carpi**, village, Italy, 28 miles southeast of Verona, celebrated for the victory obtained here by Prince Eugene over the French in 1701.

**Carpocrates**, an Alexandrian Gnostic of the second century, who taught the pre-existence of souls, and founded the Gnostic sect of Carpocratians. According to him, those who can recall their pre-existing state may regain the harmony of complete union with God. The essence of true religion consists in the union of the soul with the Monas or highest God, by means of contemplation, which liberates it from the necessity of submitting to the common laws of society. Among those who have attained to this are Jesus, Pythagoras, Plato, and Aristotle. See Gnostics.

**Car'polites**, or CARPOLITH, the fossil fruits of certain carboniferous trees. Some of these are heart-shaped bodies; some are ellipsoidal and usually three-angled; others are ellipsoidal with a wrinkled and finely granulated surface.

**Car'pophore**, in botany, is a continuation of the flower stalk, which passes in certain flowers, notably those of the order Umbelliferae, between the carpels, until it reaches their highest points. Often when the carpels are ripe, and separate from one another, they remain attached to the carpophore at its summit.

**Car'pospore**, one of the spores in the life history of the red alga (*Rhodophyceae*).

**Carpus**, **Carpal Bones**. See HAND; SKELETON.

**Carquinez**, kâr-kē'nās, or KARQUINES, a strait, 7 miles in length, connecting Suisun and San Pablo Bays in California, and dividing Contra Costa and Solano counties. Benicia, Martinez, and Port Costa are situated on its shores.

**Carr**, EUGENE ASA (1830-1910), American soldier, was born in Concord, N. Y., and was graduated from West Point (1850). He joined the cavalry, served on the frontier, and was wounded in Texas (1854). He fought throughout the Civil War in the Union Army, taking part in the Battles of Wilson Creek, Pea Ridge, and Champion Hills, and in the cap-

ture of Vicksburg and Mobile. He was brevetted major-general for his services, and received a medal of honor from Congress. After the war, as lieutenant-colonel and colonel, he served with distinction against the Sioux, Cheyenne, and Apache Indians in the West, being in command against the Apaches in Arizona and New Mexico (1880-1). In 1892 he became a brigadier-general, and in 1893 retired.

**Carr**, JOSEPH BRADFORD (1828-95), American soldier, was born in Albany, N. Y. At the outbreak of the Civil War he was commissioned as colonel of volunteers in the Union Army; became brigadier-general (1862), taking part in the Peninsular Campaign and in the Battles of Bristoe Station, Fredericksburg, Chancellorsville, and Gettysburg; and retired with the brevet of major-general of volunteers (1865). Subsequently he served as secretary of state of New York (1879-85).

**Carr**, ROBERT. See SOMERSET, EARL OF.

**Carracci**, kâr-rât'chē, or CARRACCI, a celebrated family of Italian painters, the founders of the Bolognese or Eclectic school of painting. The best Italian masters of the seventeenth century—Domenichino, Guido Reni, Albani, and others—proceeded from the school of the Carracci.

LUDOVICO CARRACCI (1555-1619) was born at Bologna. He studied under Tintoretto; went to Venice and Parma, making acquaintance with the works of the great masters there; and returned to Bologna imbued with art principles quite opposed to the superficial mannerism then prevailing in his native city. In conjunction with two of his cousins, Agostino and Annibale, he founded (1589), in spite of great opposition, the Eclectic school which afterward became so famous in the history of painting. The first principle of this new school was that 'observation of nature ought to be combined with imitation of the best masters.' So great was their success that in the course of a short time all other schools of painting were closed in Bologna. Some of the finest works of this master are preserved at Bologna—among others, the *Madonna and Child Throned*, *Madonna and Child Standing*, *The Transfiguration*, and the *Nativity of St. John the Baptist*.

AGOSTINO CARRACCI (1558-1602), cousin of Ludovico, was born at Bologna. He became a disciple of his cousin, but he also achieved a name for himself as an engraver. He accompanied his younger brother Annibale to Rome, and there assisted in some of the paintings in the Farnese Gallery. He afterward settled in Parma, and is remembered for his

*Communion of St. Jerome, and Love: Celestial, Terrestrial, and Venal.*

**ANNIBALE CARRACCI** (1560-1609), brother of Agostino, was born at Bologna. He was one of the greatest followers of Correggio, and in composition approached most nearly to the style of Raphael. Ludovico had a greater talent in teaching, and Agostino had a more versatile invention, but Annibale was unquestionably the greatest artist of the three Carracci. His best work are his mythological frescoes in Rome, which have been frequently engraved.

The work of the Carracci is characterized by correct technique, large design, and fine figure drawing, but it lacks spontaneity and creative impulse. Their great merit is to have arrested the decline of Italian art for a period, to have encouraged the production of easel pictures, and to have liberated Italian landscape art from its dependence on figure subjects.

**Carrageen**, kar'a-gēn, CARRAGEEN MOSS, or IRISH MOSS, the Irish name of *Chondrus crispus*, and some other allied species of seaweeds, long of local importance as an article of food, but now widely diffused. The true carrageen occurs commonly on rocky shores, particularly in Northern Europe, presenting many local varieties. It is sometimes as much as twelve inches long, branched by repeated forking, tough and flexible, and of variable color, from yellowish green through shades of red to purple. After being collected and washed in fresh water, it is bleached and dried in the open air; and is then white or yellowish, dry, shrunken, horny, and translucent.

When treated for ten minutes with cold water, in the proportion of half an ounce of carrageen to three pints of water, and then boiled and strained, it yields, with or without spices, a pleasant drink. With a larger proportion of carrageen, a thickish liquid or *mulilage* is obtained; and on boiling down this strong decoction, and cooling, a stiff *jelly* is procured. Milk may be employed instead of water.

**Carran'za**, VENUSTIANO (1859), Mexican general, constitutionalist leader, and president, was born in Cuatro Ciénegas, in the state of Coahuila. He studied law in Mexico City, and returned to Coahuila to conduct his farm, devoting his leisure to the study of history and political economy. In 1893 he led a successful rebellion against Garza Galan, governor of Coahuila, and in 1910 joined the revolutionary forces of Madero. On the establishment of peace he returned to Coahuila, and was elected governor. In

February, 1913, after the arrest of President Madero (q. v.) and Suarez by Huerta (q. v.), Carranza obtained from the legislature extraordinary powers to sustain the constitutionalist orders of the Republic by force of arms, and in March published the Plan of Guadalupe, in which he is named First Chief of the Constitutional Army. He travelled through Northern Mexico, organizing the local and federal governments, and in September reached Hermosillo (Sonora), where as provisional president he established his capital. He eventually entered Mexico City on Aug. 20, 1914, but subsequently moved his government to Vera Cruz. On Oct. 9, 1915, the Pan-American Conference, representing seven American republics, including the United States, recognized him as president of Mexico. On Sept. 30, 1916, he issued a decree abolishing the office of vice-president, and reducing the presidential term from six to four years. See MEXICO, *History*.

**Carrara**, kār-rā'rā, town, province Massa Carrara, Italy; 18 miles by rail southeast of Spezia. It lies in a valley of the Apennine Alps, and is famous for its quarries of fine-grained marble, mostly white, but also black, yellow, and green. There are hundreds of quarries in the neighborhood, giving employment to over 10,000 men, and over \$1,000,000 worth of marble is exported annually from the port of Avenza, 3 miles distant, on the Mediterranean. There are an academy of fine art, a school of sculpture, and many artists' ateliers in the town. The Carraran marble was known to the Romans, who called it *marmor lunense* (from the port of Luna). Between the downfall of the empire and the end of the fifteenth century it was not worked; it is now, however, in great request. The marble is a white saccharoid limestone, which derives its value to the sculptor from its texture and purity. The quarries are on the side of the mountains, a branch of the Apennines, at heights varying from 500 to 3,500 feet. Pop., including Avenza, 42,000.

**Carrel**, kā-rel', ALEXIS (1873), French-American surgeon and biologist, was born in Lyons, France. He was graduated from the University of Lyons in 1890 (B.S. 1891), became an interne in the Lyons Hospital, and received the degree of M.D. in 1900. In 1905 he came to the United States, where he first attracted attention by his articles (with Dr. C. G. Guthrie) on *Anastomosis and Transplantation of Blood Vessels and Amputation of the Thigh and Its Replantation*. He has been associate member (1909-12) and member (since 1912) of the Rock-

efeller Institute for Medical Research, and in 1912 was awarded the Nobel Prize for Medicine. He has made highly valuable discoveries in the surgery of the blood vessels, and has carried out researches of far-reaching importance on the transplantation of tissues and organs, the cultivation of living tissues apart from the body, and the preservation of life in cold storage. During the European War he assumed charge of the Military Hospital at Compiègne, where he introduced an efficient treatment for septic wounds. He has published numerous monographs of his surgical operations.

**Carrel**, NICOLAS ARMAND (1800-36), French publicist, born at Rouen. After a short military career he became Thierry's secretary and collaborator. In 1830 he joined Thiers and Mignet in editing the *National*. When, after the Revolution of 1830, his colleagues entered the government, and Carrel was left editor-in-chief, his bold and spirited attacks on the monarchy enhanced the *National's* popularity, which government prosecutions and fines only stimulated. A newspaper war with the editor of *La Presse* led to a duel, in which Carrel was mortally wounded. His *Œuvres Politiques et Littéraires* were edited by Littré.

**Carreño**, kār-rān'yō, TERESA (1853), Venezuelan pianist, was born in Caracas. She received her first lessons in music from her father, and subsequently studied the piano under Gottschalk in New York, Mathias in Paris, and Rubinstein, and at an early age achieved distinction as a pianist. Before finally adopting the career of a piano virtuoso she sang in opera under Mapleson and Maurice Strakosch. She has made frequent tours of Europe and America with unqualified success. In addition to interpretative gifts of a high order, she is noted for the vigor and brilliancy of her playing. She has published numerous pieces for piano, and is the composer of the Venezuelan national anthem.

**Carrer**, kār-rār', LUIGI (1801-50), Italian poet and scholar, was born at Venice. He held the professorship of philosophy at Padua (1830) and at Venice (1844), and was subsequently appointed custodian of the Museo Correr in the latter city, a post which he held till his death. He published several volumes of poetry, his lyrical pieces showing the influence of Foscolo (whose life he wrote); and introduced the ballad from Germany with much success, his *L'Anello di Sette Gemme* (1838), which relates the picturesque story of Venice and her customs, being still popular. As an editor of various Italian classics—Petrar-

Boiardo, Della Casa, Bembo, Michelangelo—Carrer did valuable work. From 1836 to 1838 he superintended the publication of *Il Novellista Contemporaneo Italiano e Straniero*. Consult Sartorio's *Luigi Carrer*.

**Carrera**, kâr-râ'rá, JOSÉ MIGUEL DE (1785–1821), Chilean soldier, was born in Santiago de Chile, studied in Madrid, and served in the Spanish army against the French, rising to the rank of major. At the outbreak of the Chilean revolution he returned to that country (1810), and became a member of the junta. In December, 1911, he deposed the newly formed congress and proclaimed himself president and dictator of Chile; but two years later was himself deposed in favor of Bernardo O'Higgins (q. v.). After the Chilean defeat at the Battle of Rancagua (1814) Carrera sought refuge in Buenos Ayres, and from there made his way to the United States. Returning to Buenos Ayres in 1816, he organized a guerilla force, and engaged in petty warfare until he and his two brothers, Juan and Luis, were captured and executed by the Spaniards at Mendoza in 1821.

**Carrère**, ka-râr', JOHN MERVEN (1858–1911), American architect, was born in Rio de Janeiro of American parentage, and studied architecture at the Ecole des Beaux-Arts, Paris. In 1884, with Thomas Hastings, he formed the distinguished architectural firm of Carrère & Hastings in New York City. This firm built the Ponce de Leon and Alcazar Hotels at St. Augustine, the New York Public Library, the Harvard Club in New York, the Memorial Buildings at Yale, the Carnegie Institution at Washington; and were the consulting architects for the Office Buildings of Congress at Washington. Carrère was killed in an automobile accident.

**Carrhæ**, kar'ê, called Haran in the Bible, a city of Osroene, in Mesopotamia, where Crassus died, after having been decisively defeated by the Parthians, in 53 B.C.

**Carriage Dog**. See DALMATIAN DOG.

**Carriages**, wheeled vehicles of various types, intended for the conveyance of passengers. As generally used in the United States, the term does not include motor driven vehicles (see MOTOR CARS) or railway coaches. The earliest carriages were probably constructed for warlike purposes; but at the period as remote as the time of Joseph, carriages were used also for royal pageants (Gen. xli. 43). Among the Greeks, chariot races formed an important feature in the Olympic Games; the Romans had two,

three, and four horse chariots; and according to Herodotus, the Scythians had a covered chariot the top of which was removable, and capable of being used as a tent.

In modern times, the earliest record belongs to about the year 1280, when Charles of Anjou entered Naples, and his queen rode in a caretta or a small decorated car. Soon thereafter, in 1294, Philip of France issued an edict prohibiting the wives of citizens from using cars or chars, and later Pius IV. (1559–66) exhorted his ecclesiastics to discountenance the womanly fashion of riding in coaches.

In Great Britain carriages came into general use much later than on the Continent, the litter being the chief state vehicle until the sixteenth century. One of the first carriages was built in 1555 by Walter Rippon for the Earl of Rutland, and subsequently the same builder made carriages for Queen Mary (1556) and Queen Elizabeth (1564). By the beginning of the seventeenth century the use of the pleasure carriage in England was well established; coaches were introduced in 1605; and the stage coach made its appearance in 1640. The early carriages were heavy, lumbering structures, necessarily of considerable strength and solidity because of the wretched roads. Later the coach body was suspended by leather straps to insure ease of motion, and still later these straps were attached to C springs, an arrangement even now used in coaches proper.

In the *United States* the earliest carriages were brought from England, and were practically all intended for public conveyances. The carriage built for General Washington by Clarke of Philadelphia, which is still extant in that city, is an excellent specimen of the later and more elegant private carriage of the eighteenth century. It had a well-hung body, with two lamps in front, green Venetian blinds, a box below the coachman's seat for holding tools, and a footboard behind, on which the lackeys stood. The era of turnpike building and the opening up of the West and South, from about 1825 onward, furnished a great stimulus to carriage building. New shapes and designs were introduced; lighter and cheaper vehicles came into use; and the construction of bodies, wheels, and other parts gradually became specialized.

**Manufacture**.—A plentiful supply of well-seasoned timber is the first essential for carriage building. A strong, tough, elastic wood, as ash, is used for the framework of the body, mahogany for panels, white pine for roof, oak or hickory for the spokes

of wheels and elm for the hubs, lancewood for shafts, and elm, birch, and whitewood for footboards, seats, and varnished work. The wood is stored in a warm, dry place, and care is taken to avoid warping. Springs are made from the best steel, specially prepared for the purpose; axles from wrought iron, composed of a number of thin rods twisted and welded together into one bar.

In the manufacture of a carriage there are seven distinct branches, besides such subsidiary trades as supply the axles and springs, lamps, paint, and varnish: (1) body makers concern themselves only with the body, the most conspicuous and costly part of the vehicle; (2) carriage makers construct and erect the under-frames, springs, and shafts; (3) wheel makers construct the wheels; (4) smiths shape the iron joint plates; (5) visemen fix and adjust these plates; (6) painters are responsible for the decoration of the outside of the carriage, and (7) trimmers for its inner appointments.

The body of the carriage is first drawn to full size in elevation, usually on a canvas stretched along the side of the workshop; from this the 'cant boards' are prepared, showing the curves of the body as presented in end elevation and plan; and finally a complete series of working drawings, showing all details and dimensions, are made for the guidance of the body makers. The carriage makers have details similarly worked out for them from one general design, thereby insuring the harmony of the whole structure.

Wheels are made almost entirely by machinery, the only hand operations being the shrinking on the red-hot iron tire, and the fitting of bushes or 'boxes' to the extremities of the axles. The spokes are mechanically shaped and polished, and fitted radially into the machine-turned hub.

The painting of a carriage is a most important operation. The best coaches receive as many as twenty to thirty coats of oil paint; and the polishing processes are numerous and carefully conducted. The carving, gilding, decorative painting, lace and fringe work, metal ornamentation, etc., are among the best examples of their respective handicrafts.

Carriages vary in a great number of ways, the most important being in the number of wheels, the method of entering, the seating of the vehicle, the nature of the covering whether enclosed or partially enclosed, the number of persons it is designed to accommodate, and the arrangements for horsing. Important types are the coach, landau, landaulet, vic-

toria, barouche, brougham, wagonette, phaeton, buggy, surrey, sulky, dogcart, and gig.

**Statistics.**—According to the Federal Census of Manufactures for 1909, there were in the United States 5,492 establishments engaged in the manufacture of carriages, wagons, sleighs, and sleds, with a capital of \$175,473,728, and products valued at \$164,420,558, of which \$159,892,547 represented carriages and wagons. Pleasure carriages numbered 828,411, valued at \$47,754,118.

See COACHING; DRIVING. Consult R. Strauss' *Carriages and Coaches* (1912).

**Carriages, Gun.** See GUNS.

**Carrick**, borough, Allegheny county, Pennsylvania; 3 miles from Pittsburgh. It is in a bituminous coal mining district. It was incorporated from part of Baldwin town in 1904. Pop. (1910) 6,117.

**Car'rickfer'gus**, seaport, county Antrim, Ireland, on the north side of Belfast Lough; 10 miles northeast of Belfast. Its chief feature is its picturesque castle, which stands on a rock 30 feet high, and is now occupied as an arsenal. Here William III. landed seventeen days before the Battle of the Boyne. Flax spinning, cotton and linen manufacture, and oyster fishing are the chief industries. Pop. (1901) 4,208; (1911) 4,608.

**Car'rickmacross'**, market town, county Monaghan, Ireland; 25 miles southeast of Monaghan. Lace making is the chief industry. Pop. 5,300.

**Carrick-on-Suir**, shōōr, town, Tipperary, Ireland, on the Suir; 14 miles east of Clonmel. There are manufactures of linen and wool and slate quarries. A stone bridge connects with Carrickbeg, which has an abbey dating from 1336. Pop. (1911) 5,235.

**Carrier**, or COMMON CARRIER, in the legal sense, is one who offers to convey passengers or goods for hire. Unless all the available space in his conveyance is already taken up, he is not entitled to refuse any one who offers himself as a passenger, or his property as goods for transit. Exception is made, however, where the intending passenger is in a filthy or intoxicated condition, so as to render himself objectionable to other passengers or spoil the furnishings of the conveyance, or where the goods offered are dangerous in their nature or improperly packed and secured. The carrier has a right to demand prepayment of the hire, and has a lien on goods for such charges as have not already been met.

All modern systems of law, following that of Rome, impose special responsibilities on carriers. At common law a carrier is absolutely liable for any loss or injury

that may occur in the course of transit, otherwise than by act of God—e.g., storms and earthquakes—or of the public enemies. In most jurisdictions special statutes prevent him from contracting out of this liability, but allow special conditions to be laid down for the carriage of valuable property and live stock; if these conditions are not complied with, the carrier's liability is restricted. Responsibility as a carrier usually begins when the goods are delivered to him, and continues until a reasonable time after their arrival at the destination agreed upon.

The responsibility attaching to persons who engage privately to convey persons or goods, gratuitously or for hire, is much less than in the case of those who hold themselves out as common carriers. A gratuitous carrier is not liable except for intentional misconduct or gross negligence, while a private carrier for reward is only liable when it is proved that he has not acted up to the standard of duty and care which may reasonably be expected of an ordinarily prudent man.

In recent times the great growth of commerce and the formation of trusts (q. v.) which aim at securing monopolies (q. v.) have necessitated legislation prohibiting carriers from unduly favoring certain traders or districts, to the prejudice of others. Otherwise a trust or combination might induce or compel, by means of subsidies or threats, railroad and steamship companies to impose prohibitory rates on their competitors. Accordingly, by the Interstate Commerce Acts Congress has forbidden carriers to discriminate between persons or localities in the conveyance of passengers or goods from State to State, and has compelled them to charge only such rates as are fair and reasonable; and the Interstate Commerce Commission has power to hear complaints affecting interstate transit, and provide remedies for the same (see INTERSTATE COMMERCE COMMISSION). Each State has full control of the means of conveyance within its own jurisdiction, including the power to check abuses of the nature just mentioned. Oversea transit is subject to the jurisdiction of the Federal Government. See BILL OF LADING.

**Carrier**, kār-yā', JEAN BAPTISTE (1756-94), member of the French National Convention, was born at Yolet, Auvergne. Entering the Convention in 1792, he took an active part in the formation of the Revolutionary Tribunal, voted for the death of the King, demanded the arrest of the Duke of Orleans, and assisted in the overthrow of the Girondists. At Nantes, whither he was sent

on a mission against the moderates in 1793, he found ample means for indulging his insatiable thirst for human blood. The utter defeat of the Vendéans had filled the prisons with captives, and Carrier proposed and carried a resolution for murdering the unhappy prisoners *en masse*. In these massacres the form of trial was discontinued; and in four months 16,000 persons perished. Even Robespierre was offended by the enormities committed, and recalled Carrier, who boldly justified his own conduct before the Convention. The fall of Robespierre, was soon followed by outcries against Carrier; and he perished under the guillotine.

**Carrière**, kār-yār', EUGÈNE ANATOLE (1849-1906), French painter, born at Gournay (Seine-Inférieure). He was a great painter of maternity—not of the Madonna, but of the mother absorbed in the care of her children. He worked at Vaugirard through many years of non-recognition. A consummate draughtsman, he painted as a sculptor works; and in order to emphasize the inner life, he isolated the figure by enveloping it in a soft haze. His famous *Maternity* (1892) is in the Luxembourg at Paris, *The Young Mother* (1878) at Avignon, and *The Sick Child* (1886) at Montargis. Among other remarkable pictures are *Théâtre de Belleville* (where he discloses the mind of the audience); his portraits of Daudet, De Goncourt, Verlaine, Anatole France, Reclus, Henri Rochefort, and Metchnikoff; *Christ on the Cross* (1897); and a decorative panel at the Sorbonne.

**Carriere**, MORIZ (1817-95), German philosopher, born at Griedel, near Butzbach, in Hesse-Darmstadt. In 1853 he was appointed professor of esthetics at Munich. His philosophy is an attempt to reconcile deism and pantheism, and maintains the ultimate triumph of the beautiful and the good. His works embrace: *Aesthetik* (3d ed. 1884); *Die Kunst . . . und die Ideale der Menschheit* (3d ed. 1876-86); *Jesus Christus und die Wissenschaft der Gegenwart* (2d ed. 1889); *Die Sittliche Weltordnung* (2d ed. 1891); *Die Philosophische Weltanschauung der Reformationszeit* (2d ed. 1887).

**Carrier Pigeon.** See PIGEON.

**Carrington**, CHARLES ROBERT WYNN-CARRINGTON, FIRST EARL OF (1843), was educated at Cambridge, and sat in the House of Commons as Liberal member for High Wycombe (1865-8), until he became third Baron Carrington, in succession to his father. He was governor of New South Wales (1885-90), and lord chamberlain (1892-5); and was appointed president of the Board of Agriculture in the Campbell-

CARRIAGE BUILDING: MODERN TYPES OF CARRIAGE.

Bannerman ministry formed in Dec., 1905.

**Carrington, HENRY BEEBEE** (1824), American soldier and author, born at Wallingford, Conn. He graduated at Yale in 1845 and at the Yale Law School in 1847; practised law at Columbus, O. (1848-61); served on the Federal side in the Civil War, rising to the rank of brigadier-general of volunteers (commissioned Nov., 1862); later took part in operations against the Sioux Indians, and in 1870 retired from the army. Among his publications are: *Russia as a Nation* (1849), *American Classics, Battles of the American Revolution* (1876; last ed. 1903), the best work on the subject; *The Six Nations of New York* (1892), a census bulletin of the Eleventh U. S. Census, *Washington the Soldier* (1898), *Lafayette and American Independence*, etc.

**Carrington, RICHARD CHRISTOPHER** (1826-75), English astronomer, born at Chelsea; equipped an observatory at Redhill, Surrey, in 1853, and completed in 1857 a *Catalogue of 3,735 Circumpolar Stars*. His observations of sun spots, and discovery of the composite law of solar rotation, were published in 1863.

**Carrion Crow** (*Corvus corone*), a European crow, a close ally of the hooded crow (*Corvus cornix*), with which it is stated to interbreed. It differs from the latter in the uniform shimmering black plumage. In the United States the name is given to a black vulture (*Catharista atrata*), smaller than the turkey buzzard, which performs scavenging work in the towns along the Gulf of Mexico.

**Carrion Flowers**, or STAPELIAS, are members of a genus of S. African succulent plants belonging to the order Asclepiadæ. They derive their popular name from the odor of their flowers, which are usually showy and frequently beautiful. The plants are leafless, and the stems are quadrangular, with teeth projecting from each edge. They are grown in a mixture of light loam, sand, and broken brick in equal proportions, and are easily propagated by means of cuttings. The species are very numerous, a few of the best being the following: *S. gigantea* has yellow flowers, covered with silky purplish hairs; *S. grandiflora* has dark purple blossoms, streaked with white, and is hairy. The carrion flowers are sometimes spoken of as the African toad-flowers. In the United States the name is given to a species of Smilax (*Smilax herbacea*). It is a climbing, thornless plant, with evil-smelling, globular heads of greenish flowers.

**Carrizal Bajo**, seapt., Atac-

ama prov., Chile, 130 m. N. of La Serena. The chief industry is copper smelting. Pop. about 2,500.

**Carroccio**, a large chariot or van on which, in the middle ages, the banner of an Italian town was carried into battle. It was painted red, and had in the middle a red pole with a golden apple at the top, into which the flag was fixed. This was regarded as the palladium of the city. The originator of the practice is reputed to have been Aribert, archbishop of Milan, when his city was being besieged in 1038 by order of the Emperor Conrad II. The carroccio of Milan was lost in the battle of Corte Nuova (1237) against the Emperor Frederick II. The battle of the Standard, near Northallerton in England (1138), owed its name to a standard planted by the Scots on a carroccio or wagon, after the Italian fashion.

**Carroll**, city, Ia., co. seat of Carroll co., 73 m. N.W. by w. of Des Moines, on the Middle Coon R. and on the Chi. and N.W. and the Chi. Gt. W. R. Rs. It is an agricultural centre and shipping point with some manufacturing interests. Pop. (1910) 3,546.

**Carroll, CHARLES**, of Carrollton (1737-1832), American patriot, born at Annapolis, Md., of Irish-Catholic descent. He was educated in Europe, partly in Jesuit colleges at St. Omer, Rheims, and Paris, and partly at the Temple, London; returned to Md. in 1765, and in the pre-Revolutionary controversies between the British government and the American colonists became one of the leaders of the latter, attracting particular attention by a series of articles signed 'First Citizen,' which in 1773 he contributed to the *Maryland Gazette*, and in which he vigorously opposed arbitrary taxation. His course was the more noteworthy because he was at that time probably the wealthiest man in America, and a majority of the men of especial wealth were naturally conservative and ultimately joined the Loyalists rather than the Whigs. During the Revolutionary War he was a member of the Continental Congress (1776-79), signing the Declaration of Independence (Aug. 2, 1776); and in 1776, with Benjamin Franklin and Samuel Chase, was sent by the Continental Congress to gain the good-will and, if possible, the cooperation of Canada, the mission, however, accomplishing nothing. He was a member of the Md. Constitutional Convention (1776) and of the Md. Senate (1777-1800). From 1789 to 1791 he was a Federalist member of the U. S. Senate. He was the last survivor of the signers of the Declaration of

Independence. The phrase 'of Carrollton' generally attached to his name was adopted by Carroll himself after coming into possession, about 1765, of the estate known as Carrollton in Md., the statement frequently made that he added the phrase to his name for the first time (to distinguish himself from other Charles Carrolls) when signing the Declaration being almost certainly erroneous. See Rowland's *Life of Charles Carroll of Carrollton, with his Correspondence and Public Papers* (2 vols., 1898).

**Carroll, HENRY KING** (1848), American journalist and author, was born at Dennisville, N. J. From 1876 to 1898 he was religious and political editor of the *Independent*, and he conducted the census of churches for the 11th U. S. Census (1890). He was a special U. S. Commissioner to Porto Rico, 1898-9, and in 1900 became corresponding secretary of the Methodist Episcopal Church Missionary Society. He published *The Religious Forces of the United States*, and various government reports and other papers.

**Carroll, JOHN** (1735-1817), American R. C. prelate, a cousin of Charles Carroll of Carrollton, was born at Upper Marlborough, Md., and, affiliating himself with the Society of Jesus, studied in Flemish and French Jesuit colleges. He was ordained a priest at Liège in 1759, and was professor of moral philosophy at St. Omer and Liège until 1771. On the suppression of his order by the Pope in 1773, he removed to England, whence he returned (1774) to America to take part with his Roman Catholic kinsmen, the Carrolls of Maryland, in that colony's struggle against the Crown. He took an active part in the Revolution, was commissioner to the Canadian Roman Catholics (though not successful in this mission), and after the declaration of peace was, in 1784, made superior of the Roman Catholic clergy in the U. S. On the establishment of the bishopric of Baltimore, he was chosen first Bishop of the diocese, and was consecrated in England (1790). He was sole bishop in the U. S. for many years, and in 1808 he was created archbishop, with jurisdiction over four sees, including Maryland, Virginia and other Southern States to the Gulf of Mexico. He founded Georgetown College (1781) and a great number of other R. C. institutions, and built the Cathedral of Baltimore. His writings were chiefly of a controversial character. See *Shea's Life* (1888).

**Carroll, LEWIS**—pseudonym of CHARLES LUTWIDGE DODGSON (1832-98)—English mathematician and writer of fairy tales, born at Daresbury, Cheshire; edu-

Died 1912

cated at Christ Church, Oxford, of which he became a mathematical lecturer (1855-81). His Oxford life was almost that of a recluse, but he delighted in the society of little girls. In the affairs of the university he interested himself to the extent of an occasional witty pamphlet. Six of these were published between 1865 and 1874, and are collectively known as *Notes by an Oxford Chiel*. His mathematical speculations were ingenious rather than profound. He delighted in the invention of games and puzzles. He published *Alice's Adventures in Wonderland* in 1865. The verbal felicities and whimsical logic of this, aided by Tenniel's clever drawings, proved attractive both to children and to their elders. It was followed by *Through the Looking-glass, and what Alice found there* (1871), and by some other attempts of less account. Lewis Carroll was also responsible for a good deal of humorous verse, of which *The Hunting of the Snark* (1876) is the best. Other works: *Curiosa Mathematica* (1883-93), *Principles of Parliamentary Representation* (1884), *Symbolic Logic* (1896), *Sylvie and Bruno* (1889), *Sylvie and Bruno Concluded* (1893). See S. D. Collingwood's *The Life and Letters of Lewis Carroll* (1898); Isa Bowman's *The Story of Lewis Carroll* (1899).

**Carrollton.** (1.) City, Mo., co. seat of Carroll co., 61 m. E.N.E. of Kansas City, on the A., T. and S. Fe, the Chi., Burl. and Quincy, and the Wabash R. Rs. Its manufactures include furniture, wagons, textiles, flour, cigars and tiles. Pop. (1910) 3,452. (2.) City, Ill., co. seat of Carroll co., 50 m. N. by w. of St. Louis, Mo., on the Chi. and Alt. and the Quin., Carroll. and St. Louis R. Rs. It has a foundry, machine shops, canneries, and flour mills. Pop. (1910) 2,323. (3.) City, Ky., co. seat of Carroll co., 44 m. N.E. of Louisville, on the Ohio at the mouth of the Ky. R., on several lines of river packets and accessible to the Louis. and Nash. R. R. at Worthville. It is a shipping point for tobacco and manufactures lumber, furniture, flour, textiles, etc. Pop. (1910) 1,906. (4.) A suburb, now incorporated in New Orleans, La.

**Carron,** vil., Stirlingshire, Scotland, on riv. Carron, 1½ m. N.W. of Falkirk; noted for its extensive iron works, founded by Dr. Roebuck of Sheffield in 1760. At one time it was famous for the manufacture of cannon and shot, hence the name 'carronades.' Pop. (1901) 1,942.

**Carronade** (from Carron—see above—where the weapon was first made), originally called 'smasher,' a short piece of ord-

nance in use at sea in the latter days of wooden ships. It was adopted in the British service in June, 1779. Carronades were made in several sizes, varying from the 12-pounder of 2 ft. 2 in. long to the 32-pounder of 4 ft. 0½ in. long. Large carronades, 68-pounders, were ultimately adopted, and were 5 ft. 2 in. long, and weighed 36 cwt., with a calibre of 7.702 in.

Carronade.

**Carron Oil,** a mixture of equal parts of lime-water and linseed oil, is used as an application for burns, and takes its name from the Carron Iron Works, where it was formerly much in favor among the workmen. See BURNS.

**Carrot.** The carrot derives its origin from the wild species *Daucus Carota*. It is a member of the order Umbelliferae. In order to grow well, carrots should be provided with a light, moderately rich, deeply cultivated soil. Manure should not be added at or immediately before the time of sowing, but a heavy dressing should have been applied for the previous crop. Plant in early spring as soon as weather conditions permit. The seeds should be sown in drills about 12 inches apart, the carrots being afterwards thinned out so that four inches are allowed to each root in the row. The main field crop may be sown in May or up to the middle of June, eighteen inches being allowed between the drills and four inches between the plants in the row. Cover the seed about 1 inch deep. The plant makes its best growth in cool fall weather. The roots should be pulled before the ground freezes, the tops cut off and the crop stored like potatoes either in the cellar or in pits out of doors. Some of the small half long sorts are best for early use. The long White Belgian and Orange are good field sorts. Carrots make excellent stock feed, especially for horses and dairy cows, but the cost of growing is considerably greater than for mangles.

**Carruthers, ROBERT** (1799-1878), Scottish journalist, born at Dumfries. In 1828 he became editor of the *Inverness Courier*, and conducted it until his death. Carruthers's publications include *Hist. of Huntingdon* (1824); *Poetry of Milton's Prose* (1827); Boswell's *Tour to*

*the Hebrides*, with notes (1851); editions of Pope's poems (1853 and 1858); *The Life of Alexander Pope, with Extracts from his Correspondence* (1857). He collaborated with Robert Chambers on his *Cyclopaedia of Eng. Lit.* (1843-4) and with William Chambers on his Bowdlerized *Household Edition of Shakespeare* (1861-3), and to the eighth edition of the *Encyc. Brit.* contributed several biographies. See *Memoir of William and Robert Chambers* (13th ed. 1884); *Memoir prefixed to Thomas Aird's Poetical Works*, edited by Rev. Jardine Wallace (1878).

**Carruthers, WILLIAM A.** (c. 1800-c. 50), American novelist, was born in Virginia, and studied at Washington College, Va. He became a physician, and practised at Savannah, Ga. His description of an ascent of the natural bridge in Virginia, in the *Knickerbocker Magazine* for 1838, was long a favorite piece for recitation by schoolboys. His works of fiction include *The Cavaliers of Virginia* (1832) and *The Knights of the Horse-Shoe* (1845).

**Carson, CHRISTOPHER** (1809-68), American hunter, scout, and frontiersman, generally known as Kit Carson, born in Madison co., Ky. In 1810 he was taken by his parents to Howard co., Mo., then sparsely settled, and at the age of seventeen he became a hunter, trapper, and professional guide. He acted as guide to Frémont in his exploration in the Rocky Mts. (1842-4), served under him during the conquest of California (1846-7), conducted parties overland to California during the rush of 1849-50 to the newly-discovered gold fields, and settling in New Mexico in 1854, became U. S. Indian agent at Taos, and was breveted brigadier-general for services rendered there, chiefly as a scout, during the Civil War. He died at Fort Lynn, Col. See *Lives* by Burdett (1859) and Peters (1874).

**Carson City,** cap. of Nev., co. seat of Ormsby co., 12 m. E. of Lake Tahoe at the base of the Sierra Nevada, on the Virginia and Truckee R. R. Here are the famous Comstock Lode and other mines of gold and silver. It is the seat of an Indian school and a U. S. mint. Lumbering is an important industry. Hot springs occur in the vicinity. There is a splendid view of the snow clad mountain peaks. Pop. (1910) 2,466.

**Carson River,** river in Nevada. It rises in the Sierra Nevada, traverses parts of Ormsby, Lyon and Churchill cos. and terminates in Carson Lake after following a general N.E. course of 170 m.

**Carstares**, kār'stārz, WILLIAM (1649–1715), Scottish statesman and divine, was born near Glasgow. He studied at Edinburgh and subsequently at Utrecht, where he came to the notice of William of Orange. In 1674 he was arrested in England, for supposed complicity in the authorship of a pamphlet on *Scotland's Grievances*, was thrown into Edinburgh Castle, and there he lay untried until his release in 1679. From that time onward he was one of the principal agents in bringing about the advent of the Prince of Orange. He took a leading part in the

established the Scottish Presbyterian Church was chiefly the result of his efforts, but patronage was abolished against his advice. In 1703 he was appointed principal of Edinburgh University, and in the same year he became minister of the Greyfriars' Church, Edinburgh. He continued in the office of royal chaplain under Anne and George I., and was four times elected moderator of the General Assembly (1705, 1708, 1711, 1715). He was an active promoter of the union. Consult R. H. Story's *Life of Carstares*, and *The Carstares State Papers*.

all classical in subject, he laid stress on beauty of line, practically to the disregard of color. The ducal collection at Weimar is rich in his drawings, and there are many also at Copenhagen and Berlin. His *Argonaut* cycle has been engraved in twenty-four plates.

**Cartagena**, kār-tha-jē'na; Sp. kār-tā-hā'nā, city, Spain, in the province of Murcia; 240 miles southeast of Madrid. It is a strongly fortified town, the chief naval harbor of Spain. Two forts, crowning high cliffs, protect the harbor, which is sheltered on the southeast by the island of Escom-

*Cartagena, Colombia: Columbus Square, a Typical Street, with Living Quarters Above and Stores on the Street Level*

organization of the proposed rising in which Shaftesbury, Russell, and Argyll were the chief actors, but did not approve of the Rye House plot, on the discovery of which he was captured at Tenterden, Kent (1683), and was once more sent to prison. Returning to Holland, Carstares was appointed second minister of the Scottish congregation at Leyden and chaplain to William. He accompanied the Prince to England in 1688, and William thenceforward relied implicitly on him so far as the government of Scotland was concerned. The revolution settlement which es-

**Carstens**, kār'stens, ASMUS JACOB (1754–98), Danish painter, the initiator of the classical reaction in Germany, was born near Schleswig. Influenced by Winkelmann, he conceived an admiration for Hellenic ideals, and rebelled against the rococo school and academic traditions. His ideas were met by violent opposition, and, hampered by poverty, he supported himself by portraiture, until, in 1787, he obtained a professorship at the Academy, Berlin; this enabled him to go to Rome, where he studied Michelangelo and Raphael. In his pictures, almost

bera. Features of interest in the city are the ruins of the old mediæval cathedral, the church of Santa Maria de Gracia, and the arsenal. The chief industries are shipping and lead smelting and desilverizing. Pop. (1920) 101,613.

Cartagena was founded by Hasdrubal in 221 B.C., on the site of an ancient Iberian settlement. It was conquered by Scipio in 209 B.C., and for centuries was an important commercial port. It came into Spanish possession in the thirteenth century. In the war of the Spanish Succession it was

taken by an English-Dutch fleet (1706). During the political troubles in the latter part of the reign of Isabel II., Cartagena was one of the most stubborn of the revolting cities; it was forced to surrender, after a long siege, in 1874.

**Cartagena**, seaport town, Colombia, capital of the department of Bolivar, is situated on an island in Cartagena Bay. It is one of the oldest settlements in Spanish South America and still retains much of its old-time appearance. Notable features are the magnificent cathedral, archiepiscopal palace, several modern hospitals, and a fine theatre. It is the seat, also, of a university and the national normal school. Industrial establishments include textile works, sugar, chocolate, soap, hat, shoe, and straw factories, and flour mills. Pop. (1918) 51,382. (For illustration see page 555.)

Cartagena was founded by Pedro de Heredia in 1533. It was frequently sacked and plundered, notably by Drake in 1585, and by the French in 1697. In 1815 it was the headquarters of the South American Inquisition.

**Cartago**, kār-tā'gō, town, Colombia, capital of the province of Cartago, near the Rio Vieja; 130 miles west of Bogota. It is in an agricultural region and produces coffee, tobacco, and cocoa. Pop. 18,000.

**Cartago**, town, Costa Rica, Central America, in the province of Cartago, on the railroad which connects the Atlantic and Pacific coasts; 12 miles southeast of San José. It lies dangerously near the base of the active volcano of Irazu or Cartago (11,200 ft.). The chief products are coffee and tropical fruits. Cartago is the seat of a college and was the capital of the country until 1823. It has suffered seriously from earthquakes, being practically destroyed in 1823 and again in 1910. Pop 18,599.

**Carte**, a position in fencing, in which the inside of the hand is turned upward and the point of the foil is toward the adversary's right breast.

**Carte**, RICHARD D'OYLY (1845-1901), British theatrical manager, notable for his intimate connection with Sir Arthur Sullivan. He turned his attention to comic opera in 1870, and in 1877 made his fame by the production of *The Sorcerer* at the Opéra Comique, London. With the profits from this and other Sullivan operas he built the Savoy Theatre, London. His attempt to establish a Grand English Opera House (now the Palace Theatre) in London proved disastrous.

**Carte**, THOMAS (1686-1754), English historian, was born in

Clifton-upon-Dunsmore. He was educated at Oxford (B.A. 1702), and at Cambridge (M.A. 1706), and having taken holy orders, became reader in Bath in 1707. He was an ardent Jacobite and on that account was often in trouble with the government. Having refused to take oaths of allegiance to George I., and being suspected of complicity in the Atterbury conspiracy in 1722, he was forced to escape to France, where he lived under the name of Phillips. He returned to England in 1728 and devoted himself to writing. His published works include *Life of James, Duke of Ormonde* (2 vols., 1736), *History of England to 1654* (4 vols., 1747-55), and many pamphlets and translations. He also left a valuable collection of historical material brought together during his lifetime.

**Carte Blanche**, kárt blōnsh, an expression meaning unlimited authority. Literally, it is a blank paper, duly signed, intrusted to a person to fill out at his discretion.

**Cartel**, a ship commissioned in time of war to exchange the prisoners of any two hostile powers, or to carry proposals from one to another. With the exception of a single gun for making signals, no arms, ammunition, or materials of war are carried on board.

In Germany and Austria the term cartel signifies a combination among producers, as of sugar, coal, and iron, relative to prices and output. The producers who enter into a cartel usually bind themselves to limit their sales to a particular locality; frequently also they agree upon minimum prices and upon the amount of product to be placed upon the domestic market. When the domestic prices seem to be forced down by overproduction, the members of a cartel may form a fund to meet the loss caused by selling part of the supply in foreign markets at whatever price may be obtainable.

Unlike the analogous American combination (see TRUSTS), cartels are upheld by the laws of Germany and Austria. Agreements to limit production and to fix prices are enforced by the courts, so long as extortionate prices do not result. Consult Hirst's *Monopolies, Trusts and Cartels*.

**Carter**, ELIZABETH (1717-1806), English poet and scholar, was born in Deal. She mastered Greek and Latin, Hebrew, French, German, Italian, Spanish, and Portuguese, and made some study of Arabic. She translated *Epictetus*, and published two volumes of *Poems*. Samuel Johnson, Horace Walpole, Ed-

mund Burke, and other notables were among her friends.

**Carter**, FRANKLIN (1837-1919), American educator, was born in Waterbury, Conn. He studied at Yale, Williams, and the University of Berlin, was professor of French and Latin (1865-8) and of Latin alone (1868-72) at Williams, and of German at Yale (1872-81). In 1881 he was elected president of Williams College, a position which he occupied until 1901. He was also president of the Clark School for the Deaf (1896-1919). His publications include *Life of Mark Hopkins* (1892) and an edition of Goethe's *Iphigenie auf Tauris* (1879).

**Carter**, HENRY, the real name of Frank Leslie (q. v.).

**Carter**, HENRY ROSE (1852-1925), American public health official, was born in Caroline county, Va. He was educated at the University of Virginia and at the Medical School of the University of Maryland, and in 1879 entered the U. S. Public Health Service as assistant surgeon, becoming assistant surgeon general in 1915. He has devoted himself particularly to sanitation in connection with yellow fever and malaria. He inaugurated a quarantine system in Cuba in 1899-1900, was director of hospitals in the Panama Canal Zone (1904-09), a member of the Rockefeller Yellow Fever Commission to Central and South America (1916), and sanitary advisor of the Peruvian Government (1920-21). He is a member of the Yellow Fever Council, International Health Board of the Rockefeller Foundation. His publications include many reports and articles for medical journals and other publications.

**Carter**, HOWARD (1873- ), British archaeologist and Egyptologist, was born in Swaffham, Norfolk. He was educated privately, studied art, and in 1891 began his work as an archaeologist under Professor Petrie in Egypt, assisting in the Tel-el-Amara excavations. From 1900 to 1905 he was government inspector-in-chief of Egyptian antiquities in Upper Egypt. He conducted extensive explorations in the Valley of the Kings, making many valuable discoveries, and in 1917 joined Lord Carnarvon in his Theban explorations which led to the finding (1923) of the tomb of Tut-ankh-amen (q. v.). In 1924 he visited the United States, giving a series of illustrated lectures on his discoveries.

**Carter**, JAMES COOLIDGE (1827-1905), American lawyer, was born in Lancaster, Mass. He was graduated from Harvard (1850) and from the Harvard Law

School (1853), and was admitted to the New York bar. Governor Tilden appointed him a member of the commission to devise a form of municipal administration for cities in New York (1875), and Governor Hill made him a member of the constitutional commission of 1888. In 1892 he was named by President Harrison, with Edward J. Phelps and Henry W. Blodgett, counsel to present the claims of the United States before the Bering Sea tribunal which met in Paris the following year. He published several addresses and a pamphlet on *The Codification of Our Common Law* (1883).

**Carter, JESSE BENEDICT** (1872-1917), American educator, was born in New York City. He was educated at New York University, Princeton, and the Universities of Leipzig, Berlin, Göttingen, and Halle, and was successively instructor, assistant professor, and professor of Latin at Princeton (1895-1907). He was director of the American School of Classical Studies at Rome (1907-12) and director of the American Academy at Rome from 1913 until his death. His publications include *De Deorum Cognominibus* (1898); *The Roman Elegaic Poets* (1900); *Epitheta Deorum* (1902); *Virgil's Æneid* (1903); *The Religion of Numa* (1906); *The Religious Life of Ancient Rome* (1911).

**Carter (Mrs.) LOUISE LESLIE** (1862- ), American actress, was born in Lexington, Ky. Her first professional appearance was in *The Ugly Duckling*, in New York, in 1890. She next appeared in the musical comedy, *Miss Helyett*, and after two years' study under David Belasco won marked success in *The Heart of Maryland* (1895), *Zaza* (1898), *Du Barry* (1901), and *Adrea* (1904). In 1907 she made a tour under her own management, adding *La Tosca*, *Vasta Herne*, *Camille*, *The Second Mrs. Tanqueray*, and other plays to her repertoire. She was absent from the stage from 1917 to 1921, when she reappeared with John Drew in *The Circle*.

**Carter, SAMUEL POWHATAN** (1819-91), American naval officer and soldier, was born in Carter county, Tenn. He entered the U. S. Navy in 1840, and as lieutenant, serving on the *San Jacinto*, took part in the attack on the Barrier Forts, Canton River, China, in 1856. Following the outbreak of the Civil War, he was permitted to report to the Secretary of War for special duty (July 1861), and soon afterward organized in East Tennessee a brigade which he commanded. He was commissioned brigadier-general of volunteers in May 1862, and

lieutenant-commander in the navy in July 1862. In 1865, he was brevetted major-general of volunteers, and in 1866 was mustered out of the volunteer service. He then rejoined the navy, having been commissioned commander in June 1865. He was commandant of the U. S. Naval Academy from 1869 to 1872, retired in 1881, and was made a rear-admiral on the retired list in 1882.

**Carter, THOMAS HENRY** (1854-1911), American legislator, was born in Scioto county, Ohio. After some time spent in farming and teaching, he studied law and settled in Helena, Mont. (1882). He was delegate to Congress in 1889-91, representative in 1891-2, and U. S. Senator (Rep.) for the terms 1895-1901 and 1905-11. He was president of the U. S. commissioners of the Louisiana Purchase Exposition at St. Louis and was a member of the International Boundary Commission of the United States and Canada (1911).

**Carteret, kār'ter-et, SIR GEORGE** (c. 1613-80), English royalist, governor of the island of Jersey, was bred to the sea, and by 1632 was lieutenant of the *Convertelle*. He took the side of King Charles in the Cromwellian wars, and maintained his position as lieutenant-governor of Jersey until forced to surrender in 1651. After the Restoration he held several offices under Charles II., of which the most important was that of treasurer of the navy (1661-7). For his loyalty and services to the crown he was, in 1650, granted 'a certain island and adjacent islets in America in perpetual inheritance, to be called New Jersey, and held at an annual rental of £6 a year to the crown'; and in 1663 he appears as one of the original proprietors of Carolina. In 1664, the Duke of York assigned to him, in conjunction with Lord Berkeley, the land between the Hudson and the Delaware, to be called, in honor of Carteret, New Jersey. The district was divided in 1676, Carteret retaining the part known as East Jersey, which was bought from his widow in 1682 by William Penn and eleven other Quakers.

**Carteret, JOHN, EARL GRANVILLE** (1690-1763), British statesman, succeeded to the peerage on the death of his father in 1695. He was educated at Oxford, and in 1711 took his seat in the House of Lords, becoming a staunch supporter of the Protestant succession. In 1719 he was appointed ambassador-extraordinary to Sweden and was instrumental in concluding peace between Sweden, Prussia, and Hanover. He was made a secretary of state in 1721, but after

an unsuccessful attempt to combat the influence of Walpole and Townshend in the same cabinet, he resigned, and in 1724 became lord-lieutenant of Ireland, a position he held with considerable popularity for six years. From 1730 until Walpole's resignation in 1742, Carteret did not cease to oppose him, and upon his resignation the latter was again made a secretary of state. He became Earl Granville on the death of his mother in 1744, and soon afterward resigned his secretaryship. Two years later he and Lord Bath were appointed to form a ministry, but resigned, after a vain attempt, at the end of four days. He still enjoyed the King's favor, however, and in 1750 was elected a Knight of the Garter. Carteret was a man of undoubted ability, quickness, and precision, a fine speaker, and endowed with many social graces, but his haughty contempt for his opponents' opinions unfitted him for successful parliamentary leadership.

**Carteret, PHILIP** (? - 1796), British rear admiral and explorer, attained the rank of commander in 1766. In that year he was sent to the southern hemisphere to complete the work begun by Byron's expedition two years earlier. He discovered Pitcairn Island, Queen Charlotte Islands, New Ireland, St. George's Channel, Sandwich, Byron, New Hanover, and many other small islands, all in the South Pacific. In 1794 he retired from active service. His 'Journal' was published in Hawkesworth's *Voyages* (1773).

**Carteret, PHILIP** (?-1682), brother of Sir George Carteret (q. v.), was appointed by his brother and by Sir John Berkeley, lords proprietors of New Jersey, first governor of that province. He sailed for America in 1665, and founded Elizabethtown, which he named in honor of his sister-in-law. He was governor of the province until his division in 1676, after which he was governor of East Jersey until his death. He had serious difficulties with Sir Edmund Andros, governor of New York, who claimed jurisdiction over his territory, and with James Carteret, second son of Sir George, who usurped his position in 1672, but he was able finally to maintain his rights in both cases.

**Cartersville**, city, Georgia, county seat of Bartow county, on the Louisville and Nashville, the Nashville, Chattanooga and St. Louis, and the Seaboard Air Line Railroads; 48 miles northwest of Atlanta. The surrounding region is rich in minerals, including iron, manganese, ochre, and barytes. Cattle are raised, and cotton, wheat, and other

A Third Punic War, declared by the Romans in 149 B.C., on a flimsy excuse, resulted in the ultimate destruction of Carthage by Scipio Æmilianus in 146 B.C., and her territory became the Roman province of Africa. In her struggle with Rome, Carthage had the advantage of wealth (she was the wealthiest city of antiquity) and of generals; but her mercenary troops—a motley horde of Phœnicians, Libyans, Numidians, Spaniards, Ligurians, and Gauls—were inferior to the homogeneous Italian army of Rome.

In later time a Roman colony founded at Carthage by Julius Cæsar, and developed by Augustus, became once more the chief city of Roman Africa, and was the seat of several ecclesiastical (Christian) synods and councils. The Vandals captured it in 439 A.D., and held it until Belisarius took it and destroyed their power in 533. The Arabian conquerors finally destroyed the city in 698 A.D.

The first important excavations at Carthage were undertaken in 1837 by de la Mollé. He was followed by other explorers, of whom the most notable was Father Delattre, but the work was for the most part conducted with little systematic plan. In 1921 Count de Porok, a French archæologist, began work in Carthage, and this work has been carried on by him and by American archæologists. Among the most important recent discoveries is the Temple of the goddess Tanit, dedicated to her worship and that of the god Baal Ammon. Sacrificial urns found on the site containing the bones of children indicate that human sacrifices formed an important part of Carthaginian worship. A number of Punic tombs of about 700 B.C. were also excavated, and a large deposit of Punic incense burners of about 400 B.C. was laid bare. Extensive Roman remains have also been discovered, including beautiful mosaics, numerous Latin inscriptions, coins, pottery, jewels, and glass, a Roman theatre, baths, and villas. As a result of these recent discoveries archæologists are convinced that the ancient Punic city and the Roman Carthage occupied slightly different sites.

Consult Church's *Carthage* in the 'Story of the Nations Series'; N. Davis' *Carthage and her Remains*; Boissier's *Afrique Romaine*; Petrie's *Tunis, Kairouan and Carthage*; Grant's *Studies in North Africa* (1921).

**Carthage**, city, Illinois, county seat of Hancock county, on the Chicago, Burlington and Quincy and the Wabash Railroads; 13 miles east of Keokuk. It is the

seat of Carthage College (Lutheran). Pop. (1910) 2,373; (1920) 2,129.

**Carthage**, city, Missouri, county seat of Jasper county, on the Spring River, and on the Missouri Pacific and the St. Louis and San Francisco Railroads; 56 miles west of Springfield. It is the intersecting point of two primary highways, one connecting with St. Louis, the other with Kansas City. Its most important industry is the mining of lead and zinc. Manufactures include furniture, plows, flour, canned goods, textiles, shoes, beds, ice, brick, and lime. There are also foundries and machine shops. Marble is quarried and small fruits are grown in the vicinity, which is famous, also, for its Jersey cattle.

In the Civil War Carthage was the scene of an indecisive battle, when on July 5, 1861, for several hours, General Sigel, with 1,500 men, held in check 3,500 Confederates under Jackson and Price. Sigel was superior in artillery, but was forced to fall back to cover his baggage train. The killed and wounded numbered about 50 Federals and 150 Confederates. Pop. (1910) 9,483; (1920) 10,068.

**Carthage**, village, New York, in Jefferson county, on the Black River and on the New York Central Railroad; 16 miles east of Watertown. It has two modern high schools. Industrial establishments include paper and pulp mills, tanneries, furniture and carriage factories, machine shops, foundries, and ice plants. Pop. (1910) 3,563; (1920) 4,320.

**Carthage**, former village, Ohio, in Hamilton county, on the Baltimore and Ohio, the Cincinnati Northern, and the Erie Railroads; 7 miles northeast of Cincinnati. It has recently been incorporated in the city of Cincinnati.

**Carthagina**. See CARTAGENA.

**Carthago Nova**. See CARTAGENA.

**Carthamin** (C<sub>14</sub>H<sub>16</sub>O<sub>7</sub>), a coloring matter extracted from the safflower (q. v.) (*Carthamus tinctorius*) by means of alkaline solutions. It is a red powder, soluble in alkaline solutions, and precipitated by acids; it is also soluble in alcohol, giving a rich purple color. Carthamin is used as a component of rouge.

**Carthusians**, ORDER OF, a Roman Catholic monastic order founded in 1086 by St. Bruno, who with six followers retired to the lonely spot known as La Chartreuse, near Grenoble, and there built three small huts and a tiny chapel which later developed into the great monastery of La Grande Chartreuse (see CHARTREUSE). In 1170 the order received recognition by the Pope,

and after that spread rapidly through Italy, Spain, and Switzerland. It reached England in 1180, where the name was corrupted to Charter House.

The Carthusians are divided into fathers and lay brothers. Asceticism, fasting, prayer, reading, and manual labor, combined with an almost absolute retirement, and an abstention from speech except when at church or during their weekly walk, are the characteristics of the brotherhood. The Carthusian nuns, dating from the twelfth century, observe similar but somewhat less rigid rules.

In the eighteenth century there were some 170 Carthusian monasteries, the majority of which were in France, and the most magnificent of which were La Grande Chartreuse (France) and Certosa di Pavia (Italy). The Revolution struck the order a heavy blow, the French monasteries were vacated, and most of the monks retired to Spain. At present there are about twenty-five Carthusian monasteries. Consult Bontrais' *The Monastery of the Grand Chartreuse*.

**Cartier**, kär-tyä', SIR GEORGE ETIENNE (1814-73), Canadian statesman, was born in St. Antoine, Quebec. He was educated at St. Sulpice College, Montreal, was admitted to the bar in 1835, and entered parliament as a Conservative in 1848. He was appointed attorney-general for Lower Canada in 1856, and from 1858 to 1862 was associated with Sir John Macdonald in the Cartier-Macdonald ministry. During this time he carried through the codification of the civil laws and laws of procedure of Lower Canada, a work of the utmost value, took an aggressive part in the building of the Grand Trunk Railway, and was one of the leaders in the movement for Confederation. He was minister of militia and defence (1867-72) in Sir John Macdonald's Cabinet, and in 1872 went to England, where he died the following year.

**Cartier**, JACQUES (1494-1557), famous French explorer, was born in St. Malo. Having gained a reputation as a fearless navigator, he was chosen to head an expedition to America and in 1534 he reached Newfoundland and penetrated the St. Lawrence as far as Anticosti Island. The following year he sailed up the St. Lawrence to the Indian village of Hochelaga, where later was to be the city of Montreal—a name originally given by Cartier, in the form 'le Mont Royal,' to a neighboring mountain. He also gave the name St. Lawrence to a small bay opposite the island of Anticosti.

In 1541, having been appointed 'captain-general' of a

new expedition, Cartier was sent on ahead 'to the lands of Canada and Hochelaga,' which, according to King Francis, 'form the extremity of Asia towards the West.' His object this time was to found a colony, and he established a settlement, which he called Charlesbourg-Royal, on the St. Lawrence, at the mouth of the Cap-Rouge. Roberval, the newly appointed viceroy, failed to arrive, however, and the settlers became so discouraged and homesick, that in the spring of 1542 Cartier took them back to France, refusing to return when ordered to do so by Roberval, whom he met soon after beginning his homeward voyage. For his discoveries and explorations he received a patent of nobility, and after 1542 lived in St. Malo until his death. Cartier's *Voyages* may be found, in French, among the *Historical Documents* published in 1843 by the Quebec Literary and Historical Society, and in English, in Pinkerton's *General Collection of Voyages and Travels*. Consult, also, Parkman's *Pioneers of France in the New World*; Winsor's *Cartier to Frontenac*; Baxter's *Jacques Cartier*.

**Cartilage**, the gristle or elastic substance in which bone is formed, and which remains permanently as the covering of the ends of bones in joints. Cartilage is white or bluish white, and semi-transparent. Three varieties are generally described: (1) Hyaline, so called because of its glassy semi-transparency, covers the ends of bones in movable joints, and forms the junction of ribs and breast bone, and parts of the larynx and trachea. (2) Fibrocartilage, with parallel wavy fibres in the groundwork, is that form which is found between the vertebræ. (3) Elastic cartilage, made more elastic than the others by the branched fibres composing its matrix, is found in the ear, and, with hyaline cartilage, in the larynx. All bones are preformed in cartilage, with the exception of some of those of the head.

**Cartilaginous Fishes**, that subclass of fishes in which the skeleton is cartilaginous and the teeth and scales (with the exception of slight hints in the vertebral column) are the only bony structures. It includes the sharks and rays. See ELASMOBRANCHS.

**Cartography**. See MAPS AND MAP MAKING.

**Cartomancy**, a form of fortune telling by cards. See DIVINATION.

**Carton**, R. C. (1853- ), English actor and dramatist, whose real name was R. C. Critchett, was born in London. He appeared as an actor in 1875 in *The Sea of Ice*, and after various

successful rôles retired from the stage in 1885 to devote himself to writing. He collaborated with Cecil Raleigh in *The Great Pink Pearl* and other plays, and in 1890 produced his first play written alone, *Sunlight and Shadow*. This was followed by his serio-comic *Liberty Hall*, produced at St. James's Theatre by George Alexander, *The Home Secretary*, *Robin Goodfellow*, *The Squire of Dames*, *The Tree of Knowledge*, *A White Elephant*, *Lord and Lady Algy*, *Wheels within Wheels*, *Lady Huntworth's Experiment*, *The Ninth Waltz*, *Public Opinion*, *Lady Barbarity*, *The Off Chance*, *Nurse Benson*, *The Undercurrent*, *Mr. Preedy and the Countess*, *One Too Many*, and others.

**Cartoon**, kar-tōon', originally a full-sized drawing upon strong paper of a design to be carried out in oil paint, fresco, tapestry, stained glass, or mosaic. The

Vinci's *Battle of the Standard* and Michelangelo's *Pisa Cartoon* are equally famous in art history; but they have disappeared, and the designs are only known from engravings. Of recent years the term has been used to denote the semi-satiric drawings, dealing with political or social events, which appear in the humorous papers. In the latter sense it is now also applied to the caricatures which are issued as separate prints. See CARICATURE.

**Cartouch**, kâr-tōōch', a canvas case in which cartridges are conveyed from the ammunition box to the gun in a field battery, in order to keep them dry. The name signifies also the pouch box carried by soldiers for holding rifle cartridges; but bandoliers in many services have now superseded cartridge boxes.

**Cartouche** (Fr. 'roll of paper'), kâr-tōōsh', an architectural ornament resembling a roll of

Types of Cartridges

design is transferred, by tracing or punching, from the cartoon to the panel or wall, when painting or mosaic is to be used; in tapestry, the main outline of the design is traced on the warp and the tapestry-worker, with the cartoon beside him, imitates it in colored threads. The most widely known cartoons are those prepared (1515-16) by Raphael for tapestries woven at Brussels (not at Arras, as is often erroneously stated) for Pope Leo X. The seven which survive are in the Victoria and Albert Museum, South Kensington. Leonardo da

paper, usually intended for an inscription or device. The name was given by Champollion to the ovals on monuments and in papyri on which the hieroglyphic characters for the names of Egyptian kings are inscribed. It also signifies the modillions or ornamental blocks supporting the eaves of a house.

**Cartridge**, a military term signifying, in its present use, one complete round of ammunition for a small arm (rifle, pistol, carbine, shotgun, etc.). The first cartridges were made for muzzle-loading guns, and consisted of

the powder and the ball or shot tied together in one bundle. The soldier tore off the paper from the powder end of this cartridge, poured the powder into the barrel, rammed home the ball and paper surrounding it, often by striking the butt of his musket on the ground, put on a percussion cap and fired.

Modern cartridges for military use consist of a brass case, an oblong lubricated bullet of lead and tin composition with a cupro-nickel jacket, a primer of mercury fulminate, and a charge of smokeless powder. Such a cartridge is called a *ball cartridge*, in contradistinction to one similar in all respects, but having a bullet of paper which is called a *blank cartridge*. There are also *dummy cartridges* containing no powder or primer, and a *multiball cartridge*, containing two or more round balls used for short ranges only and never in actual war.

Gallery practice cartridges contain a round ball and reduced charge of powder. The brass case acts as a gas check and is a necessity in breech-loading rifles and carbines. The revolver cartridge is similar to that for the rifle, only shorter. Sporting cartridges for shotguns consist of a strong paper case with brass base, and shot of various sizes instead of a bullet; those for rifles are similar to the military cartridge. All modern cartridges are central fire, that is, have the primer in the centre of the base, instead of rim fire, in which the hammer struck the rim and cut into the primer; or pin fire, in which a flat hammer fell on a radial pin which exploded the primer. See AMMUNITION; ARTILLERY; GUNS; PROJECTILES; RIFLE.

**Cartwright, EDMUND** (1743-1823), English inventor, was born in Marnham in Nottinghamshire and became rector of a church in Leicestershire (1779), where he made agricultural experiments on his glebe land. After visiting the cotton-spinning mills of Sir Richard Arkwright, he invented the power loom (1784), and between 1789 and 1793 took out four patents for a wool-combing machine, for which he received a grant of £10,000 from the British government.

**Cartwright, JOHN** (1740-1824), English political reformer, elder brother of Edmund Cartwright (q. v.), was born in Marnham, in Nottinghamshire. At eighteen he entered the British navy, saw some service under Lord Howe, and in 1766 was gazetted first lieutenant of the *Guernsey* on the Newfoundland station. His sympathies were with the American colonies dur-

ing the Revolutionary War, and he declined to fight with Lord Howe's command in America. He wrote on political subjects—the ballot, universal suffrage, etc.—but was fined £100 for sedition (1820). In 1774 he published *American Independence, the Glory and Interest of Great Britain*, and in 1775 he wrote *A Letter to Edmund Burke, controverting the Principles of American Government laid down in his lately published speech on American Taxation*.

**Cartwright, PETER** (1785-1872), American Methodist clergyman, known as the 'backwoods preacher,' was born in Amherst county, Va. He was converted at a camp-meeting in 1801, and after 1802 was an itinerant Methodist preacher, chiefly in Kentucky, Ohio and Tennessee. He returned to Illinois in 1824, served for two terms in the Illinois legislature, and in 1846 ran, unsuccessfully, for election to Congress against Abraham Lincoln. Rugged, tireless, enthusiastic, an effective speaker, he did much to build up the Methodist Church in the Middle West, and was a representative pioneer preacher. His *Autobiography* is of great interest. Consult also Stevens' *The Backwoods Preacher*.

**Cartwright, SIR RICHARD JOHN** (1835-1912), Canadian statesman, was born in Kingston, Ontario, and received his education at Trinity College, Dublin. He entered the Canadian Parliament as a Conservative in 1863, but, dissatisfied with the financial policy of his party, went over to the Liberal side in 1873. He was minister of finance under Mackenzie (1873-8), and thereafter was a leader in the Liberal party. In 1896 he became first Minister of Trade and Commerce in Sir Wilfrid Laurier's cabinet. He was acting Premier in 1897, and again in 1907. He proposed and was a member of the Anglo-American Joint High Commission that met in Quebec in 1898, was made a member of the Imperial Privy Council, and was appointed to the Senate in 1904. He was knighted in 1879. Consult his *Reminiscences* (1912).

**Cartwright, THOMAS** (1535-1603), English Puritan divine, was born in Hertfordshire. He became (1569) Lady Margaret divinity professor at Cambridge, but was later (1570) deprived of office. He engaged in a controversy with John Whitgift (q. v.) and was several times imprisoned for nonconformity.

**Cartwright, WILLIAM** (1611-43), English divine, poet, and dramatist, was born in Northway, Gloucestershire. He became reader in metaphysics at

Oxford (1635), took orders, and was famed for his plays, and for his florid and eloquent sermons. An ardent royalist, he was appointed on the council of war (1642), and fell a prisoner into the hands of Lord Say. His collected works, *Comedies, Tragicomedies, with Other Poems* were issued in London in 1651.

**Carucate**, kār'ū-kāt, or CARUCATE, a term of mediæval origin denoting a 'plough-land' or 'plough-gate'—i. e. as much land as could be tilled in one year by a single plough drawn by eight oxen.

**Carucci, JACOPO**. See PONTORMO.

**Carúpano**, kā-roō'pā-nō, seaport, Bermudez, Venezuela, 150 miles west of the island of Trinidad, between the Araya and Paria peninsulas. It is a commercial centre and exports coffee, cocoa, sugar, brandy and pottery. Lead ore exists in the neighborhood. Pop. 12,000.

**Carus, kā'rus, JULIUS VIKTOR** (1823-1903), German zoologist, was born in Leipzig. He was custodian of the museum of comparative anatomy at Oxford (1849-51), professor of comparative anatomy and professor extraordinary of zoology at Leipzig, and lecturer at Edinburgh University (1873-4). His many estimable books include *Prodromus Faunæ Mediterraneæ* (1884-93), *System der Thierischen Morphologie* (1853), and a translation of Darwin's works. He edited the *Zoologischer Anzeiger* from its foundation (1878).

**Carus, KARL GUSTAV** (1789-1869), German physiologist and physician, was born in Leipzig. He studied medicine, became professor of obstetrics at Dresden (1814), was appointed court physician (1827), and was elected president of the Imperial Academy (1862). Among his numerous works on anatomy and physiology may be mentioned *Gründzuge der vergleichenden Anatomie* (1828), and *System der Physiologie* (1838-40). To his friendship with Goethe we owe *Goethe* (1843) and *Goethe und seine Bedeutung für diese und künftige Zeit* (1863). He published also *Lebenserinnerungen und Denkwürdigkeiten* (4 vols. (1865-6)).

**Carus, MARCUS AURELIUS**, emperor of Rome (282-283 A. D.), was præfect of the prætorian guards under Probus, and when that emperor was murdered by the army in 282, became his successor by the choice both of troops and senate. After repelling a Sarmatian invasion into Illyricum, he marched against the Persians, and overran Mesopotamia, capturing Selucia and Ctesiphon. When he was about to extend his

march beyond the Tigris, he died suddenly, whether from disease, treachery, or lightning is not known.

**Carus, PAUL** (1852-1919), American author, was born in Ilsenburg, Germany, and was graduated (1876) from the University of Tübingen. Having established himself in Chicago, he became editor of the *Open Court* and the *Monist*. His works include *The Soul of Man* (1891); *Primer of Philosophy* (1893); *Monism: Its Scope and Import* (1891-2); *Religion and Science* (1893); *The History of the Devil* (1900); *The Sord of Metaphysics* (1903); *The Age of Christ; God, an Enquiry into Man's Highest Ideals; Nietzsche and Other Exponents of Individualism; The Principle of Relativity from the Standpoint of the Philosophy of Science*; and a number of books on Chinese religion and philosophy.

**Caruso, ka-roo'zō, ENRICO** (1873-1921), Italian operatic tenor, was born in Naples, and at the age of fifteen decided to devote himself to music. He studied with Vergine, Lamperti and Concone, made his *début* at Naples in 1894, and scored his first great success as Alfredo in *Traviata* in the same city in 1896. He appeared in Milan in 1898, and thereafter sang in St. Petersburg, Moscow, Warsaw, Rome, Paris, London, and Germany. His American *début* was made in 1903, in *Rigoletto*, at the Metropolitan Opera House, where he continued to sing until stricken by the illness that resulted in his death. Caruso had a voice of extraordinary power and beauty and was generally considered the greatest operatic tenor of his day. His repertoire included *Aida*, *Rigoletto*, *La Bohème*, *La Favorita*, *La Traviata*, *Madame Butterfly*, *Cavalleria Rusticana*, *Faust*, *Carmen*, *Lucrezia Borgia*, *Le Prophète*, *Manon Lescaut*, *Il Trovatore*, *Samson et Delilah*, *Don Giovanni*, and others. He died in Naples on Aug. 2, 1921, and at the order of King Victor Emmanuel was buried with special obsequies from the royal basilica of San Francesco di Paola in Naples.

**Caruthersville, ka-rooth'ertz-vil**, city, Missouri, county seat of Pemiscot county, on the Mississippi River and the St. Louis and San Francisco Railroad; 220 miles southeast of St. Louis. It has manufactures of ice, cotton, cottonseed oil, and lumber. Pop. (1910) 3,655; (1920) 4,750.

**Carvel, kär'vel, or CARAVEL** a light, short, masted ship with a square poop, formerly used in Spain and Portugal; also a small vessel once used by the French for herring fishing. In a

carvel-built craft the edges of the planks meet, but do not overlap.

**Carver, JOHN** (c. 1575-1621), leader of the Pilgrim Fathers, was born in England, took refuge, with others in Holland in 1607-8 and became agent for the expedition to New England. He left in the *Mayflower* on Sept. 6, 1620, and arrived in Massachusetts, where the town of New Plymouth was built. He was the first governor of Plymouth Colony (1620-21), and was re-elected in March, 1621, but died of sunstroke in April.

**Carver, JONATHAN** (?-1780), American traveller, was born in Conn. He served in the French and Indian War, and after its close travelled extensively (1766-8) in the then almost unknown Northwest, acquired by England from France by the treaty of Paris (1763), reaching the Mississippi by way of the Fox and Wisconsin rivers. In 1769 he went to England, and in 1778 there appeared in London, under his name, a book entitled *Travels through the Interior Parts of North America*. This book was exceedingly popular and became recognized as one of the best accounts ever published of the characteristics and customs of the Indians; but according to the recent investigations of E. G. Bourne, much of the book (which, it seems probably was not written by Carver, though his notes were doubtless used) is merely a paraphrase of previous accounts of the Indians and of travels among them.

**Carving** is the art or act of cutting ornamental or naturalistic forms in stone or marble, ivory or wood. As a rule, work in stone or marble, whether in the form of separate figures or groups or of important figure-reliefs, is called sculpture; the less important carved ornament on buildings is described as architectural carving or sculpture, and the word carving is applied in a special sense to work in ivory and its substitutes and in wood.

Carving, in this restricted sense, is one of the oldest of the arts, and among half-civilized or savage peoples it is usually found in greater perfection than flat-colored decoration. The carved or incised bones found in prehistoric caves in France are perhaps the oldest art objects known and in Egypt and Nineveh carved work in ivory dates from early times. In Greece ivory was used for many ornamental purposes, and a number of famous statues, such as the colossal figures of Athene at Athens and Jupiter at Olympia, were executed in ivory and gold. From late Roman times there is an almost unbroken series of examples of ivory carving. Under

Byzantine influence Eastern forms of surface decoration became evident, and figure work, almost entirely religious in motive, became stiff and formal. The mediæval period, which followed, has left many fine pieces, and of these several of the most beautiful and spirited are French. The ecclesiastical work (shrines, altar-pieces, crosiers, book covers, statuettes) is full of the spirit of the Gothic church builders; the domestic (mirror cases, combs, caskets, horns), of the chivalry of the age; in both colors and gold were freely used.

The Early Renaissance produced numerous fine ivory carvings of a similar kind, but more delicate in treatment, more complete in form, and showing classical influences. Many connoisseurs consider the work of the sixteenth century the best extant, but refined invention gradually died out, imitation gained the ascendant, and cleverness is almost the sole merit of many elaborate pieces of the seventeenth and eighteenth centuries. Ivory is also a favorite material in India, China, and Japan; but while Eastern carvers show great skill and possess a sense of the grotesque, their figure work is usually debased. (See **IVORY**, particularly illustration of Carved Ivory there given.)

Wood carving is probably of even greater antiquity than ivory carving, the wooden sculpture of Egypt being the earliest that survives; but, although wood carving was practised in Greece and Rome it is not until the mediæval period that authentic examples are again available. These, of course, partake of the architectural styles of the periods to which they belong. In churches, particularly in the north of Europe, statuettes, shrines, and elaborate altar-pieces, carved in wood, gilded and colored, were common, and stall-work and screens were often both elaborate and fine. In the same countries the fronts of the timbered houses presented a great field for the carver, and inside roofs and panellings were often carved. In Italy and in France, where Italian influences were strong, carved furniture was also in fashion. During the late seventeenth century Grinling Gibbons (q. v.) a Dutchman, introduced into England a style of wood carving which had great and persistent influence there. (See **FURNITURE**.) Consult Alfred Maskell's *Ivories and Wood Sculpture*.

**Cary, ALICE** (1820-71) and **PHOEBE** (1824-71), American poets, sisters, were born in the Miami Valley, near Cincinnati, and educated themselves at home. Alice began to write poems

REREDOS OF ST. MARY ABCHURCH, LONDON.

*(Reputed to be the finest example of the carving of Grinling Gibbons.)*

and sketches for the press at the age of eighteen years, and these were followed by a volume of *Poems by Alice and Phoebe Cary* (1850). The sisters removed to New York in 1850 and lived thereafter principally in that city. Their New York residence was the scene of weekly receptions, attended by literary and artistic people, for many years. Alice's writings are characterized by grace and sweetness, and include *The Clovernook Papers* (1851-3), *Lyra, and Other Poems* (1853) *Ballads, Lyrics, and Hymns* (1866), and several works of fiction. Phoebe's was a minor note; she published *Poems and Parodies* (1854), *Poems of Faith, Hope, and Love* (1868), and contributed a number of hymns to collections of the day, the best known being that entitled 'Nearer Home.' See Mary Clemmer Ames's *Memorial of Alice and Phoebe Cary* (1873).

**Cary, ANNIE LOUISE** (1842), American singer, was born at Wayne, Me., graduated at the Gorham, Me., Female Academy, and studied under Lyman W. Wheeler at Boston, Mass., and under Giovanni Corsi at Milan. Before leaving for the latter city, where she passed three years, Miss Cary's magnificent contralto voice had been heard in concerts in this country. On the completion of her musical education she made her debut in Italian Opera at Copenhagen, and sang for several years in various cities of Northern Europe. Returning to the U. S., she joined the Italian Opera Company at the New York Academy of Music, with which she remained for six years, having as fellow-members some of the leading singers of the time, and achieving the greatest artistic triumphs of her career. Miss Cary revisited Russia in 1875-7, and on her return resumed her American appearances, retiring to private life on her marriage, 1882, to Charles Monson Raymond, a New York banker.

**Cary, ARCHIBALD** (c.1730-86), American patriot, was born in Virginia, and served in the Virginia House of Burgesses. He joined the earliest movement against British oppression, was a member of the committee of correspondence (1773) and of the Virginia Convention of 1776, and as chairman of the committee of the whole reported the resolutions instructing the Virginia Delegates in Congress to propose independence. He was President of the Virginia Senate from the organization of the state government until his death.

**Cary, HENRY FRANCIS** (1772-1844), translator of Dante, born at Gibraltar; published his trans-

lation of the *Inferno* (1805), followed by the whole of the *Divina Commedia* (1814), which still holds a foremost rank. See *Memoir* by his son (2 vols. 1847).

**Caryatides** (Gr. *Caryalís*), an architectural term signifying those draped female figures, in Hellenic buildings usually of the Ionic style, which supply the place of pillars. One of the finest examples of the use of caryatides occurs in the Erechtheum in Athens. Michael Angelo also employed them.

*Caryatid, from the Erechtheum, Athens.*

**Caryocar.** A genus of trees, natives of tropical America. They are celebrated for the kernels of their drupes, which are embedded in a mealy pulp, and consist of a delicious white, oily jelly-like mass, covered by a membrane. An oil is extracted from them which is almost as good as that of olives, and they are called souari- or butter-nuts. *C. Nuciferum* is cultivated in the W. Indies. The timber of caryocar is used for house and boat building.

**Caryophyllaceæ**, an order of flowering plants characterized by the pistil being syncarpous, the leaves entire and opposite, placenta free central, the stem swollen at the nodes, calyx and corolla each of five parts. Among the chief genera may be named *Cerastium*, *Stellaria*, *Dianthus*, *Lychnis*, *Silene*, and *Saponaria*.

**Caryota**, a genus of spineless palms with bipinnate leaves, the genus which is sometimes known as the fish-tail palms, from the triangular shape of the leaflets which are attached at their apices. When fully grown the plants bear large green or purple flowers, the spadices hanging down in graceful bundles. The caryotas are easily grown in a

warm green-house, being propagated by seeds or by suckers. Among the species may be named the wine-palm, *C. urens*, which reaches a height of over forty ft. It is found in India and in the E. Indies and has fruit so acrid that the pulp stings flesh that it touches. During the hot season, much sugar (*Jaggery*) and wine or 'toddy,' are made by boiling down or fermenting the copious juice which escapes from wounded flower-spachos; thus the names of 'jaggery'-or 'toddy'-palm. A starchy food is obtained from the trunk. A fibre with brownish-black filaments, which often resemble horsehair, and which can be curled over a finger nail, is of importance, and is taken from the leaves. It is made into cordage, baskets and brushes, and has been used, with horsehair, for stuffing cushions.

**Casa, GIOVANNI DELLA** (1503-56), Italian writer, born in the Mugello valley, near Florence. Pope Paul III. made him archbishop of Benevento and nuncio at Venice (1544), where he distinguished himself as a violent opponent of the Protestants. Later Paul IV. appointed him Secretary of State, a post he held till his death. His fame rests chiefly on the little book, *Il Galateo, ovvero de' Costumi* (written between 1551-5; Eng. trans. 1576; new ed. 1892), which presents an admirable picture of the court manners of the Italian renaissance. See Forcellini's edition of the *Opere* in 3 vols. (1952); a selection appeared at Milan in 1879. A Life by Casotti was prefixed to the Florentine edition of 1707.

**Casaba**, or **KASSABA**, tn., vilayet Smyrna, Asia Minor, on railway to Alashehr, 54 m. S.S.E. of Konieh; is famous for its pears and melons, and exports cotton and raw silk. Pop. 23,000.

**Casabianca, LOUIS DE** (1755-98), French naval officer, born in Corsica. He took part with the Comte de Grasse in the American Revolutionary War; was mortally wounded at Aboukir (the battle of the Nile), and perished with his burning ship, his little son declining to desert him. See the poem by Mrs. Hemans.

**Casablanca**, or **DAR-EL-BEIDA**, walled sept. tn., w. coast of Morocco (q.v.), 15 m. N.E. of Mazagan. During the native uprising of 1907 the town was bombarded (Aug. 6) by French vessels, and looted by Arabs, who killed many people.

**Casa Grande**, vil., Pinal co., Ariz., on the Tucson div. of the S. Pac. R. R. Fifteen m. E. by S. is the famous ruin constructed by a prehistoric race.

**Casale**, or **CASALE MONFERRATO**, fort. tn. and episc. see, prov. Alessandria, Italy, 21 m.

by rail N.W. of Alessandria, on the r. bk. of the Po. The cathedral dates from the 8th and 12th centuries. There are some other interesting churches (San Domenico, begun in 1489) and private palaces (one with frescoes by Giulio Romano). Pop. (1901) 31,790.

**Casamance**, riv., W. Africa, in the French colony of Senegal; forms a wide estuary which enters the ocean in about 12° 30'.

**Casanova**. (1.) GIOVANNI GIACOMO DE SEINGALT (1725-98), Venetian adventurer, remarkable for his wit, accomplishments, and intrigues. He travelled from capital to capital in Europe, frequenting the most aristocratic society, and leading a generally rakish life. Besides a translation into verse of the *Iliad*, he wrote *Memoirs* (12 vols. Leipzig, 1828-38), which are vastly entertaining as a picture of the corrupt manners of his time. (2.) GIOVANNI BATTISTA (1722-95), his brother, was a painter, and became professor in the Academy of the Fine Arts, Dresden. He wrote *Monumenti Antichi*. (3.) FRANCESCO (1730-1805), another brother, born in London, was also a painter, who obtained a high reputation in Paris for battle-pieces and landscapes, and also in Vienna, where the Empress Catherine II. of Russia employed him to illustrate her victories over the Turks. His pictures exist in Rouen, Nancy, Lyons, and other French towns; and his *Ferry Boat* hangs at Dulwich College, London.

**Casas Grandes**, tn., Chihuahua state, Mexico, 160 m. N.W. of Chihuahua, and connected by rail with El Paso, New Mexico. Primitive ruins are numerous in the locality. It was discovered by the Spaniards in 1660.

**Casati**, GAETANO (1838-1902), Italian explorer, born at Lesmo, near Monza. At the request of the Commercial Geographical Society of Milan he undertook a journey to the Sudan, during which he explored the region of the river Welle-Makua, and (1881) met the German traveller Junker. In 1883 he arrived at Lado, where he joined Emin Pasha. In 1888 he had a narrow escape, being condemned to death by Kabba Rega, king of Unyoro, to whom he was sent on a mission by Emin Pasha. In 1889 he returned to Italy, and published *Dieci Anni in Equatoria e ritorno con Emin Pascha* (1891).

**Casaubon**, ISAAC (1559-1614), Swiss classical scholar, born at Geneva, became professor of Greek there (1582) and at Montpellier (1596). He next became royal librarian at Paris; but on the death of Henry IV., who protected him, his pronounced Prot-

estantism made it advisable for him to leave Paris. Settling in London in 1611, he wrote a confutation of Cardinal Baronius, which laid him open to the charge of having been hired by James I. Casaubon, whose zeal in the accumulation of knowledge was ceaseless, belonged to the class of humanists who devoted themselves to wide and catholic research. He was appointed prebendary of Canterbury and Westminster, and was buried in Westminster Abbey. Besides publishing editions of Athenæus (1600), Aristotle (1590), Polybius (1609), Strabo (1587), Perisus (1605), and other classical writers, Casaubon was the author of the following works: *De Sæturica Græcorum Poesi et Romanorum Satira* (1605), *De Libérale Ecclesiastica* (1607), and *Exercitationes contra Baronium* (1614).—Casaubon's son, MÉRIC CASaubON (1599-1671), was also a distinguished scholar, appointed professor of theology at Oxford. He published a defence of his father, wrote several Latin works, and edited Terence, Marcus Aurelius, Epictetus, etc. See *Casauboniana* (1710); Casaubon's *Ephemerides*, ed. by J. Russell (1850); *Isaac Casaubon*, by Mark Pattison (1875; 2d ed. 1892); and Nazelle's *I. Casaubon, sa Vie et son Temps* (1897).

**Casca**, PUBLIUS SERVILIUS, tribune of the plebs at Rome in 44 B.C., and one of the murderers of Cæsar. He fell in the battle of Philippi (42 B.C.).

**Cascade**, mountain range in N.W. of the United States, traversing, with a N. and S. trend, the states of Washington, Oregon, and N. California. It precipitates the moisture from the W. winds, and on that side is bordered by fertile lands and well-timbered slopes; whereas, the region to the E. is arid or desert. Except in N. Washington, where it is composed chiefly of granites, it is a volcanic range, covered by successive flows of lava. With a general summit elevation of from 6,000 to 7,000 ft., rising to 8,000 ft. or more in N. Washington, the range bears on its crest or flanks many extinct volcanoes, such as Shasta, in Cal. (14,380 ft.); Jefferson (10,350 ft.), and Hood (11,225 ft.), in Ore.; and Adams (12,470 ft.), St. Helens (10,000 ft.), Rainier or Tacoma (14,363 ft.), Glacier Peak (10,436), and Baker (10,827 ft.), in Wash.

**Cascara Bark**, or CASCARA SAGRADA, or CHITEM-BARK, is obtained from a small tree (*Rhamnus Purshiana*) which belongs to the natural order Rhamnaceæ, and grows abundantly in the western United States. It is collected in spring and early summer, when it is easily peeled

from the wood, and when dried curls into quills. The fluid extract is prepared from the dried bark and is used in medicine as an aperient and tonic. It is believed to act chiefly on the muscular coats of the intestine.

**Cascarilla Bark** is obtained from the twigs and branches of *Croton Eleuteria*, a small tree of the Euphorbiaceæ, found in the Bahama Is. Its outer layer is a grayish-white cork, with a checkered appearance. The bark has a pleasant, aromatic odor, and an aromatic but disagreeably bitter taste; when burned, it gives an agreeable scent, and is therefore used in incense. It is also a tonic and febrifuge. The name 'cascarilla' is given to various commercial, bitter, medicinal barks, in S. America.

**Cascina**, comm., prov. Pisa, Tuscany, Italy, on riv. Arno, 7½ m. S.E. of Pisa; engaged in cotton-weaving. Battle fought here in 1364, between the mercenaries of Pisa and Florence, when the latter, under Galeotto Malatesta, defeated their opponents. Pop. (1901) 25,895.

**Casco Bay**, a bay on the coast of Cumberland co., Me. It extends from Cape Elizabeth to Bald Head, near the mouth of the Kennebec R., a distance of 20 m. across its mouth. The islands of the bay, said to number 365, are nearly all utilized as summer resorts. Portland is at its W. end.

**Case**, the grammatical term for the various inflectional forms of the substantive parts of speech. Modern English has two cases in the noun—*viz.* the nominative, or normal form of the substantive, and the genitive or possessive, expressing origin: '*men's* sons.' In the pronoun we have, in addition, the dative, expressing the direction of an action—'*I gave it him*'; and the accusative, denoting the object of the action—'*I saw him*.' Other Indo-European languages possess a vocative case, used in direct address; an ablative, answering to our prepositions '*with*' or '*from*'; an instrumental, '*by means of*'; and a locative, '*in*' or '*at*.'

**Case**. See TRIAL, PRINTING.

**Casation** (Lat. *casus*, 'cheese') is an advanced stage of degeneration in animal tissues, in which they become of a cheesy consistency. It is particularly associated with tubercular conditions. See TUBERCLE.

**Case-hardening**, the operation by which wrought iron is hardened by converting the surface into steel. Tools, keys, fire-irons, parts of machinery, etc., to be hardened are packed into an iron box with charcoal, derived from horn, leather, etc., and heated to dull redness for

varying periods, according to the size of the article and the thickness of coating required. The carbon enters into combination with the iron, and produces a superficial layer of steel, by much the same action as that by which steel is obtained in the cementation process. Potassium ferrocyanide is often sprinkled on the red-hot iron to supply the carbon. Various modifications of this principle are in use, notably the Harveyizing of steel armor plates, which consist, for the most part, of a tough, malleable steel, but are coated externally with an intensely hard surface.

**Caseine**, a proteid which is formed in milk, and is the principal constituent of cheese. Under the influence of rennet or acids it separates, and produces curd or caseine. The caseine precipitated by acid differs in several important respects from that precipitated by rennet; for the latter is coagulated, contains phosphates, and is a valuable and concentrated food product. In the milk this proteid is combined with the phosphate of lime; on the addition of acid, the alkaline phosphate is converted into an acid phosphate, and the caseine becomes insoluble. See CHEESE.

**Casemate**, in modern military engineering, a bomb or shell proof chamber, usually erected upon or under the parapet of a fortification, and used as a shelter for guns, barracks, magazines, and hospitals. Casemates are constructed of masonry or concrete, the vaulted roof being covered with earth of a thickness sufficient to resist the penetrative power of an exploding shell.

**Casentino**, picturesque valley of the upper Arno, in the province of Arezzo, Italy. It was celebrated by Dante, and is now a much-frequented tourist resort.

**Caserta**. (1.) Province of Italy, called Terra di Lavoro down to 1871, and forming part of Campania; stretches from the S. Apennines (7,250 ft.) s.w. to the Tyrrhenian Sea. In spite of its mountainous character it is very fertile, and yields wheat, forage crops, wine, olives, fruits, timber, marble, and fish. Area, 2,033 sq. m. Pop. (1901) 785,357. (2.) Town and episc. see of Italy, cap. of above prov., 17 m. N.E. of Naples; has grown up around the royal castle, built here in 1752 by Charles III. of Naples. Large silk works in vicinity. Pop. (1901) 32,709.

**Case School of Applied Science**. A scientific school in Cleveland, O., founded in 1881 on an endowment given by Leonard Case. The institution has had rapid development and ranks among the important tech-

nological schools of the country. It is organized in departments of mathematics and astronomy, English, economics, modern languages, geology and mineralogy, drawing and applied mechanics. The last forms the foundation of the special work done in the department of civil, mechanical, electrical, and mining engineering, physics and chemistry, and is required of all students. A course in general sciences is provided for students who desire a scientific education with specializing in any single department. The students in 1905 numbered 400 and the faculty 28. The library contained 5,000 volumes.

**Case-shot**, or **CANISTER**, a form of projectile formerly much used in gunnery. It consists of a quantity of small shot, etc., enclosed in a metal case or canister, which bursts on being discharged. Case-shot, owing to its small effective range, is now practically superseded by the use of that of machine guns. See AMMUNITION.

**Case System**. A method of teaching law introduced into Harvard University in 1869 by Professor C. C. Langdell, by which the student is referred directly to the cases which form the law upon the subject of study. This method is now in use in Columbia University, New York University, and other law schools throughout the United States and has received favorable comment abroad.

**Casey**, THOMAS LINCOLN (1831-96), American soldier and civil engineer, was born at Sackett's Harbor, N. Y., and graduated (1852) at West Point, where he became assistant professor of engineering two years later, serving until 1859. He made a notable record as an engineer officer during the Civil War, and in 1877 was given charge of the public buildings and grounds in the District of Columbia. Among other works he completed the State, War, and Navy Building, the Washington Monument, and the Potomac Aqueduct. In 1888 he was appointed brigadier-general and chief of engineers in the U. S. army, and the following year was given charge of the construction of the new building for the Library of Congress, which was practically finished at the time of his death.

**Cash**, that which was usually contained in the strong-box—money. In modern commercial language, cash includes not only specie or coin, but bank notes and even checks—in fact, all money or money payable on demand, in contradistinction from bills or other securities.

**CASH NOTE**. An old name for a 'goldsmith's note' (see BANK); its modern equivalent is a check.

**CASH ON DELIVERY SYSTEM**. Method in vogue in India, Egypt,

New South Wales, Austria-Hungary, Belgium, France, Germany, Holland, Italy, Japan, and Switzerland, whereby postal authorities, railway companies, and other carriers not only deliver goods to a purchaser, but collect the sale price and transmit it to the vendor. The system has been strikingly successful in India and Germany.

**Cashel**, a city in Co. Tipperary, Ireland. Ruins of the cathedral, founded in the 12th century, with remains of an abbey, palace, and round tower, form a conspicuous group on the summit of a bold limestone mass. The parish church of St. John now serves as the cathedral. The famous 'Synod of Cashel' was held here in 1172. Pop. (1901) 2,938.

**Cashew Nut**. The fruit of a tree (*Anacardium occidentale*), native to tropical America, that, in the United States, can be cultivated only in southernmost Florida, since it is very sensitive to cold. Its leaves are oval, and it bears panicles of starchy, fragrant pink flowers. The peduncle of the fruit becomes greatly enlarged, fleshy, and pear-shaped. It is red or yellow in color, is known as 'cashew apple,' and forms an important article of food, being pleasantly acid; it is also the source of a liquor. At its tip is the kidney-shaped nut, whose kernel is protected by a double shell, and is edible when roasted. A milky juice, which is very acrid, and turns black when exposed to the air, is obtained from the tree, and is useful for varnishing, especially as a protection against ants. A gum, moreover, exudes from the tree.

**Cashgar**. See KASHGAR.

**Cashibos**, a tribe of South American Indians on the Ucayali River, who eat the infirm and aged of their own people, and generally live in scattered groups in the woodlands. They are a fine race, of very light complexion. See Brinton's *The American Race*, 1901.

**Cashmere**. See KASHMIR.

**Cashmere or Shawl Goat**, a breed of the domesticated goat (*Capra hircus*), remarkable for the thick undercoat of wool which occurs beneath the long hair. It is a rather small variety, with pendulous ears and long, flattened horns, which are curved outwards and backwards, and have a sharp edge in front. It is most abundant in Tibet, but is also bred by the Kirghiz in Central Asia. There is considerable variation in color, the animals being sometimes of a uniform white tint, and at others dark brown or even black. The undercoat is combed out in summer, and is used in the manufacture both of

shawls and of a very fine and soft cloth. Attempts have been made to acclimatize the Cashmere goat in various countries of Europe, but they have met with little success.

**Casiguran**, pueb., Sorsogon prov., Luzon, Philippines, 7 m. s. of Sorsogon, on Sorsogon Bay. The sea at this point has been encroaching on the coast for a long period at the rate of  $3\frac{1}{2}$  ft. per year. Pop. (1903) 7,873.

**Casilda**, seapt., Santa Clara prov., Cuba, 3 m. s. of Trinidad. Though not deep the harbor is capacious. Pop. (1899) 2,234.

**Casimir-Périer**, JEAN PAUL PIERRE (1847-1907), ex-president of the French republic, was born at Paris. On the formation of a republican cabinet in 1877, he was appointed under-secretary of public instruction, and retained the post until the Dufaure cabinet went out of office (1879). He retired from the Chamber (February, 1883), when the law was passed excluding members of French royal families from public employment—conduct which, though in accordance with family tradition, caused him to be suspected of leanings towards the Orleanists. Re-entering Parliament, he was appointed under-secretary for the war department (October, 1883), but retired with his chief, General Camperan (January, 1885). Owing to his personal influence with the Republican majority, he was elected (1890) vice-president of the Chamber, and in 1893 president. From December, 1893, to May, 1894, he was prime minister and minister for foreign affairs. On the assassination of President Carnot, in June, 1894, Casimir-Périer, at the time president of the Chamber, was elected president of the republic, but resigned on June 15, 1895.

**Casino**, an establishment very popular in country places or summer resorts for the promotion of social intercourse. The building, generally one of the most handsome and important in watering-places and other holiday resorts, usually contains conversation, dancing, music, reading, billiard, and other rooms.

**Cask**. See COOPERAGE.

**Caskets**, or CASQUETS, dangerous group of islands in English Channel, 8 m. w. of Alderney; the scene of the wreck of the *White Ship* (1120), and of that of the *Victory* in 1744. Victor Hugo has immortalized them in his *Toilers of the Sea* (trans. 1886).

**Caslon**, WILLIAM (1692-1766), the first great typefounder that England produced, was born at Cradley, Worcestershire. Aided by Bowyer and other printers, he set up in business in a small way in St. Luke's, London. For

many years few books of any importance were printed with the types of any other foundry. Caslon took as his model the types of the Elzevir family. The earliest dated specimen of his printing types in book form is in the library of the American Antiquarian Society at Worcester, Mass. It is called *A Specimen of Printing Types*, by William Caslon and Son (1763).

1887), he published *Kirchenhistorische Anekdoten* (1883), and *Quellen zur Geschichte des Taufsymbols und der Glaubensregel* (4 vols. 1866-75).

**Caspe**, tn., Spain, 48 m. from Saragossa; one of the most ancient cities in Spain. Well-known sulphur baths of Fonte in neighborhood. Pop. (1901) 7,735.

**Caspian Sea**, the largest inland sheet of water on the earth,

**Casoria**, tn., prov. Naples, Italy, 6 m. n.e. of Naples. Pop. (1901) 12,725.

**Caspari**, CARL PAUL (1814-92), German scholar and theologian, born at Dessau, and appointed, in 1857, professor of theology at Christiania—a chair he held till his death. Besides theological and philological studies, including an Arabic grammar (5th ed.

lies on the border-line between the w. of Asia and the e. of Europe (Russia), with Persia at its s. extremity. Its longest axis stretches from n. to s., a distance of 760 m., while its width varies from 115 to 280 m., and its area covers 170,000 sq. m. The shores are for the most part low, flat, and sandy, but show a cliff-like character along the face of the

Ust-Urt plateau in the N.E. and along the s., where the narrow Persian coast provinces of Gilan and Mazaderan are backed by the lofty range of the Elburz. On the w., again, the eastern extremity (Apsheon) of the Caucasus pushes itself out into the sea. Its surface lies 84 or 85 ft. below the level of the Black Sea, but itself fluctuates to the extent of 3 or 4 ft., according to the season. In spite of the fact that it receives the largest river in Europe, the Volga, as well as the Ural, Atrek, Kizil-Uzen, Kuma, and Terek, the Caspian is slowly shrinking, chiefly in consequence of the vast evaporation. At no very distant geological period this sea was one with the Sea of Aral, and was connected not only with the Black Sea by way of the Sea of Azov, but also in all probability with the Arctic Ocean. The bottom appears to be divided into three basins, varying in depth from 26 to 500 fathoms. Enormous quantities of sturgeon and shad are taken every year, especially in and near the estuary of the Volga. The principal seaports on the w. shore are Astrakhan, Petrovsk, Derbent, Baku, Lenkoran; on the s. or Persian shore, Resht, Enzeli, and Astrabad; and on the Asiatic or E. coast, Krasnovodsk and Mikhailovsk. Russia maintains a small fleet on the Caspian. The Manych depression or river, which runs from the Caspian to the river Don near the Sea of Azov, suggested as early as the 18th century the idea of connecting these two seas by a canal, and various projects for this purpose have been suggested, the latest being one formulated in 1901 for constructing, at an estimated cost of \$21,899,250, a canal between Astrakhan and Taganrog, 150 ft. wide and 22 ft. deep. Another proposal is to connect the Don and the Volga at Tsaritsyn.

**Cass, GEORGE WASHINGTON** (1810-88), American engineer and railway official, was born at Dresden, O., and graduated (1832) at West Point, resigning from the engineer corps in 1836. Shortly afterward he was appointed to the engineer force to construct a national road through Md., Pa., and Va. It fell to his share in this duty to erect the first cast-iron bridge built in the U. S. He was engaged in engineering work on the Monongahela River, and drifted into the steamboat and transportation business. From 1849 to 1854 he was engaged in organizing the business of the Adams Express Company, and was its president in 1856-62. He was president of the Pittsburg, Fort Wayne and Chicago Railway in 1862-84, and of other railways for shorter terms.

**Cass, LEWIS** (1782-1866), American statesman, born at Exeter, N. H., on Oct. 9, 1782. He studied for seven years (1792-9) in the Phillips Exeter Academy, joined his father in Ohio, crossing the Alleghany Mountains on foot, about 1799 studied law under Return Jonathan Meiggs; was admitted to the bar in 1802, and practised successfully at Zanesville. He soon entered politics, was elected to the lower house of the state legislature in 1806, and was U. S. marshal for the district of Ohio (1807-13). In the War of 1812 he served in the West, first under Gen. William Hull, in whose surrender at Detroit—at which he was indignant—he was included, and then under Gen. W. H. Harrison, participating in the Battle of the Thames (Oct. 5, 1813), and became a brigadier-general in the regular army in March, 1813. From 1813 to 1831 he was governor of the territory of Michigan, whose limits were much larger than those of the present state and which was then sparsely settled, and in this capacity he showed great administrative ability; conciliated the Indians, with whom he made a number of important treaties; built roads and made other public improvements, and encouraged exploration. Altogether his name is one of the greatest in the history of the Northwest. From 1831 to 1836 he was Secretary of War in Pres. Jackson's cabinet, and from 1836 to 1842 was the U. S. Minister to France, which position he resigned largely because of his disapproval of the Webster-Ashburton treaty, recently negotiated by Secretary of State Webster and Lord Ashburton. Before his resignation, however, distrustful as always of Great Britain, he had done much to persuade France not to give her adhesion to the quintuple treaty, by which, for the suppression of the slave trade, Great Britain sought the formal bestowal upon her of the right of search on the high seas. Cass was a Democratic member of the U. S. Senate from 1845 to 1848, and again from 1849 to 1857, taking a prominent part in debate, being conspicuous for his Anglophobia; and for opposing the Wilmot Proviso and supporting the Compromise of 1850, and the Kansas-Nebraska Bill of 1854, he received the condemnation of the anti-slavery element in the North, by which he was charged, apparently without justice, with truckling to the South in order to gain the Presidency. In 1848 he was the candidate of his party for this office, but was defeated by Gen. Taylor, and in 1852, after a close contest, he was defeated for the nomination of his party by Pierce. In 1857 he became Secretary of State in the

cabinet of Pres. Buchanan. He strongly disapproved of the President's weak and vacillating policy with regard to the South after the election of Lincoln, and in Dec., 1860, he resigned because of Buchanan's refusal to reinforce the Charleston forts and to take efficient measures to secure the collection of revenue at that port. He subsequently lived at Detroit, Mich., until his death on June 17, 1866. See McLaughlin's *Lewis Cass* (1891), in the 'American Statesmen Series.'

**Cassaba.** See KASSABA.

**Cassagnac, ADOLPHE BERNARD GRANIER DE** (1806-80), French journalist and politician, born in the department of Gers. In 1832 he started in Paris as a journalist of the extreme type, his violent articles leading him into innumerable duels and lawsuits. He was a decided opponent of the emancipation of the slaves (1837); adverse to the revolution of 1848; allied himself with Louis Napoleon in 1852; and from that year to 1870 represented Gers in the Assembly. In Parliament as well as in the press, especially in *Le Pays*, a paper founded by him in 1866, he vigorously opposed liberal ideas and liberal reforms. After the fall of Napoleon III. he became a prominent member of the Bonapartist party. Cassagnac left several historical works: e.g. *Histoire des Classes Nobles et des Classes Anobies* (1840), *Histoire des Causes de la Révolution Française* (1850), *Souvenirs du Second Empire* (1879-82).

**Cassagnac, PAUL ADOLPHE MARIE PROSPER DE GRANIER DE** (1843-1904), French journalist and politician, son of Adolphe Cassagnac, was born in Paris. In 1866 he became director, and subsequently editor and duellist, of *Le Pays*. An important member of the Bonapartist party, he took a prominent part in every agitation for the overthrow of the Republic. He was a member of the Assembly almost uninterruptedly after 1876, though his otherwise brilliant oratory was marred by the violence of his language. In 1886 he founded the paper *L'Autorité*. Having deserted the Bonapartists, he was one of the committee of six who arranged with General Boulanger his *coup d'état* (1889). He is the author of *Empire et Royauté* (1873), *Mémoires de Chislehurst* (1873), *Histoire Populaire Abrégée de Napoléon III.* (1874-5), etc.

**Cassander** (d. 297 B.C.), son of Antipater, the general, and one of the successors, of Alexander of Macedon. Cassander having seized Athens (318), put to death Olympias, Roxana, and Alexander Ægus (mother, wife, and son of Alexander the Great), and established himself in 301 B.C. as king of

Macedonia. In 315 B.C. he had rebuilt Thebes, destroyed by Alexander twenty years before.

**Cassan'dra**, in Greek legend, one of the daughters of Priam, king of Troy, and Hecuba. After the fall of Troy she became the captive of Agamemnon, and with him was murdered by Clytæmnestra and Ægisthus after their return to Greece. She was beloved of Apollo who gave her the gift of prophecy but, on being spurned by her, ordained that her predictions should never be believed.

**Cassandra** (anc. *Palene*), the most westerly of the divisions of the Chalcidice peninsula, jutting into the Ægean Sea between the Gulfs of Salonica and Cassandra (anc. *Toronaicus Sinus*).

**Cassatt', MARY** (1845–1926), American artist, was born in Pittsburgh. In 1875 she went to Europe to study art, and in 1879 settled permanently in Paris. After exhibiting for several years in the Salon, she was invited by Degas to join in the exhibitions of the Impressionists, to which alone she subsequently contributed. Miss Cassatt's chosen field was the portrayal of women and children, in oil, water color, and etching. She was a master draughtsman, and by her remarkable technique was able to triumph over the unattractiveness of many of her models. She is represented in the Metropolitan Museum, New York; the Corcoran Art Gallery, Washington; and the Luxembourg. She was a member of the Legion of Honor. Among her best known paintings are *The Bath*, *Breakfast in Bed*, *Children Playing with a Cat*, *Mother's Caress*, *Maternity*.

**Cassa'tion**, COURT OF, the supreme judicial authority in France, whose function it is to see that, in the administration of justice by the different tribunals, the law has been properly applied. It does not enter into the merits or process of the litigation, but confines itself to the purely legal aspect of the case. The Court of Cassation was constituted by the National Assembly in 1790. Its members are chosen from among the presidents or procurers of the court of appeal, high functionaries at the ministry of justice, law professors, and eminent members of the bar at the Court of Cassation. They are elected for life or till they reach the age of seventy-five, and are appointed by the President of the Republic upon the recommendation of the Home Secretary. The court is divided into three divisions—Court of Requests, Civil Court (both for civil suits), and Criminal Court; and to each court fifteen judges are attached, with a president in addition. Besides these, there is

the first president of the entire court.

**Cassava**, kas-ä'va (*Manihot utilissima*), known also as Manioc or Mandioc (Brazil) and as Yuca or Yuca (elsewhere in South America), a tropical shrub about 6 feet in height, with palmately divided leaves and a large tuberous root (8 to 10 in.) containing an acrid, milky juice. There are two varieties, the Sweet Cassava and the Bitter, the latter containing a poisonous principle—hydrocyanic acid—which, however, is expelled by heat.

Cassava

1. Section of male flower. 2. Section of female flower. 3. Root.

The roots of the cassava form a staple article of food in Africa and South America, having something of the taste and quality of parsnips. When freed from juice, grated, and baked, they are also eaten as 'cassava bread.' The condiment cassareep is made from the grated roots and the juice is sometimes extracted, fermented, and prepared as a beverage known as piwarry. But it is in the manufacture of starch that the cassava is of the greatest importance, that product being prepared by pulping the root, washing out the starch, and drying it. Tapioca is made from cassava starch by heating it gently on iron plates until it forms granules. In Florida the cassava is used chiefly as a feed for stock.

**Cassel**. See KASSEL.

**Cassell**, kas'el, JOHN (1817–65), English publisher, founder of the London firm of Cassell & Co., was born in Manchester. He issued the *Working Man's*

*Friend* (1850), the *Illustrated Exhibitor* (1851), and other publications with moderate success, but it was not till he put out his *Popular Educator* (1852) and the *Family Paper* (1853) that he may really be said to have established a great business.

**Cassena**. See YAPON.

**Cassia**, kash'a, a botanical genus including several hundred species of herbs and trees belonging to the order Leguminosæ, natives of Africa and the warmer parts of America and Asia. The annual *C. chama-christa*, the partridge pea, whose foliage is sensitive to the touch, and the perennial *C. marylandica* are hardy, and can be grown in gardens in sheltered, sunny places. The latter bears racemes of bright yellow flowers in late summer. The best known of the tender species is the South American shrub *C. corymbosa*, which grows to a height of eight feet, and bears corymbs of yellow flowers in summer. Senna, used in medicine as a cathartic, is prepared chiefly from *C. acutifolia*, and *C. angustifolia*. The cassia of the Bible is the spicy bark of aromatic trees belonging to the genus *Cinnamomum*. The best cassia bark comes from China, whence we also receive aromatic cassia buds. From the bark an oil is distilled which resembles oil of cinnamon.

**Cassianus**, kas-i-ä'nus, JOANNES EREMITA, or JOANNES MASSILIENSIS (?360–448), a Scythian monk and theologian, who spent his early life in the monastery of Bethlehem with Germanus, afterward visiting Egypt, Constantinople, where he was made a deacon (403) by Chrysostom, and Marseilles (415), where he established two religious societies, one the abbey of St. Victor. He was canonized after his death. Cassianus adopted some of the views of Pelagius, and opposed the extreme doctrines of St. Augustine and Prosper concerning original sin and human depravity. He left *Collations*, or conferences of the fathers of the desert; *Institutions*, in twelve books; and seven books on the Incarnation.

**Cassin**, kas-sa', JOHN (1813–69), American ornithologist, was born near Chester, Pa., and entered business in Philadelphia (1834). Subsequently he devoted himself to ornithology, and prepared many reports for the U. S. Government, including *Ornithology of the United States Exploring Expedition* (1845), *Ornithology of Gillies' Astronomical Expedition to Chili* (1855), *Ornithology of the Japan Expedition* (1856), and the portions relating to rapacious and wading birds in the *Explorations and Survey for a Railroad Route from the*

*Mississippi to the Pacific Ocean* (1858). He noted, described, and classified a large number of birds not given by Audubon and Wilson.

**Cassini**, kās-sē'nē, COUNT ARTHUR PAVLOVICH (1835- ), Russian diplomat, entered the public service in 1854, being appointed to a small place in the Ministry of Finance. The following year he was transferred to the Ministry of Foreign Affairs, and thereafter was regularly promoted in the diplomatic service, holding positions in all the European capitals until he was appointed Russian minister at Peking in 1891. At that court he became conspicuous as the instigator and developer of Russia's Manchurian policy, and he drafted the Manchurian convention. In 1897 he was made minister and shortly afterward ambassador to the United States. In 1905 he was transferred to Madrid.

**Cassini**, kās-sē'nē, a family of distinguished astronomers. GIOVANNI DOMENICO CASSINI (1625-1712), was born in Perinaldo near Nice, and became professor of astronomy at Bologna (1650). His discoveries relating to the planets Mars and Venus and his settlement of the theory of Jupiter's satellites so enhanced his reputation in France that on the invitation of Colbert, he went to Paris, where he was made astronomer-royal and first director of the Paris observatory (1671-1711). His works include *Opera Astronomica* (1666) and *Origines et progrès de l'astronomie* (1693).—His son, JACQUES (1677-1756), born in Paris, succeeded to his father's appointments. He was made a member of the London Royal Society (1696), and became acquainted with Newton, Halley, and Flamsteed.—CESAR FRANÇOIS, or CASSINI DE THURY (1714-84), son of Jacques and grandson of Giovanni, devoted himself chiefly to geology. He published *Description géométrique de la terre* (1775), and *Description géométrique de la France* (1784), but is best known by his topographical map of France, finished in 1793 by his son, JACQUES DOMINIQUE, Comte de Thury (1748-1845), who, on his retirement in 1793, terminated his family's connection with the observatory of Paris, after a period of one hundred and twenty-two years.

**Cassino**, ká-sē'nō, town, Italy, in the province of Caserta, nearly midway between Rome and Naples, 69 miles northwest of the latter. It occupies the site of the ancient Casinum, which was colonized by the Romans in 312 B.C., and has remains of a Roman amphitheatre and other ancient buildings. Down to the year 1871 it was known as San

Germano. Back of the city, crowning a hill 1,700 feet high, is the famous monastery of Monte Cassino, founded by St. Benedict in 529. On the secularization of the Italian monasteries in 1866, it was declared to be a national monument, and now contains a theological seminary, as well as its own church (rich in marbles, frescoes, mosaics, and pictures), valuable library and archives, and a small picture gallery. Pop. (1921) 7,310.

**Cassino**, a card game, is usually played by two or four, although an odd number may play, the number being limited by the capacity of the deck of 52 cards. The dealer distributes four cards to each player, one or two at a time, the card or cards before his own being laid face up on the table. The object of the game is to take as many cards from the board as possible and is attained by pairing, combining, building, and calling. Pairing consists of taking one or more cards from the board by means of a card of the same denomination in the player's hand. Combining is done by adding the pips on any number of cards on the board to make up the number on a card in the hand of the player and then taking. Building is done by taking a card from the hand and adding it to one or more on the board to make them equal to another card in the hand. A player may not add to his build later, that is, change an eight into a ten by adding a two-spot, but an opponent may. Calling is done by grouping together a number of similar builds, combinations, or similar cards, and naming them. For instance: A player holds two eights and there is an eight, or build or combination of eight on the table, in which case he may play one of his eights upon the eight, or build or make a combination of eights and call 'eights,' when nothing but an eight can take it. Each player beginning on the left of the dealer must play to the board, or take, or make a combination or build. When the hands of four have been exhausted cards are again distributed, and so on until the pack is exhausted. The winner of the last card in the last deal takes all the cards left on the board. The game is twenty-one points and the value of points is as follows: big cassino (ten of diamonds), 2 points; little cassino (two of spades), 1 point; each ace, 1 point; the majority of the cards of the suit of spades, 1 point; the majority of all the cards, 3 points; sweeps (clearing the board of cards), 1 point. Occasionally, in building, the jack is reckoned as 11, the queen as 12, king, 13, and ace, 1 or 14.

**Cassiodorus**, kas-i-ō-dō'rus, FLAVIUS MAGNUS AURELIUS (c. 480-c. 570), Latin statesman and man of learning, was chief minister successively to Théodoric, Amalasontha, Athalaric, Theodatus, and Vitiges. After the victory of Belisarius (about 540 A.D.) he retired to the monastery of Viviers in Bruttium, which he had founded. He insisted on intellectual activity on the part of his monks, including the copying of manuscripts and the translation of Greek texts into Latin. There survive a collection of his own state papers, and a *Chronica* from the creation down to 519 A.D., with a full list of the Roman consuls.

**Cassiopeia**, kas-i-ō-pē'ya, an antique northern constellation adjacent to Cepheus, traversed by the Milky Way. Tycho Brahe's Nova blazed in its neighborhood in November, 1572.  $\eta$  Cassiopeiae is a fine binary, revolving in about two hundred years.

**Cassiopeia**, in Greek legend, the mother of Andromeda (q.v.).

**Cassiques**, kāsēks' (*Cassirina*), Central American passerine birds which construct large purse-like or pocket-like nests of grass or fibres hung in colonies from the ends of the branches of trees. They belong to the family Icteridæ, which includes the American orioles and blackbirds.

**Cassiquiare**. See ORINOCO.

**Cassiterides**, kas-i-ter'i-dēz, a group of islands from which the Phœnicians procured tin. They have been generally supposed to be the Scilly Isles, but have been identified also with the adjacent coast of Cornwall, and with the islands in Vigo Bay in Spain.

**Cassiterite**, kas-it'er-it, TIN-STONE, or BLACK TIN, impure tin dioxide, SnO<sub>2</sub>, the principal source of tin. It is black, or sometimes deep brown, in color, and is often crystallized in tetragonal crystals, which have a brilliant lustre and great hardness. Its high sp. gr. (7) greatly facilitates the washing and sorting of tin ores. 'Stream tin' is cassiterite in rounded, water-worn grains or pebbles, found among the sand and gravel of streams. 'Wood tin' has a fibrous structure. Tinstone is associated usually with granite masses, and with the veins which these send out into the rocks around them. It has been mined in Cornwall since the time of the Romans, but the industry has declined. The chief modern sources are the Federated Malay States, the island of Banca (Dutch East Indies), and Bolivia. Other producing countries are Australia, China, Nigeria, Southwest Africa, the Congo, India, Portugal, and Spain. Tourmaline frequently accompanies tinstone; topaz and

lithia micas are commonly found in tin-bearing granites. Cassiterite is found in the Black Hills, S. D., Texas, Maine, Virginia, California, and Alaska.

**Cassius**, distinguished Roman clan. (1.) SPURIUS CASSIUS VISCCELLINUS, consul in 502, 493, and 486 B.C. He founded the greatness of Rome by making (493) the league with the Latin cities, and (486) that with the Hernicans. He is also said to have proposed the first agrarian law at Rome, and for that to have been accused of aiming at monarchy, and put to death by the patricians; according to some accounts, indeed, by his own father. (2.) CAIUS CASSIUS LONGINUS, the murderer of Julius Cæsar. He fought with Pompey in the civil war, but after the battle of Pharsalia surrendered to Cæsar, who not only pardoned him, but made him prætor in 44, with the promise of the government of Syria. Yet he instigated the conspiracy against Cæsar, and was the means of securing the help of Brutus. After Cæsar's death he went (43 B.C.) to Syria, defeated Dolabella, and, after ravaging Syria and Asia, together with Brutus met Augustus and Antony at the battle of Philippi (42 B.C.). In the first engagement his troops were defeated, while Brutus was successful; and he compelled his freedman to slay him. He is well represented in Shakespeare's *Julius Cæsar*. (3.) CASSIUS PARMENSIS, so called from Parma, his birthplace, was also one of the murderers of Cæsar. After the battle of Philippi he joined Sextus Pompeius, then went over to Antony, and when the latter had been defeated at Actium, was put to death by Augustus (30 B.C.). He wrote epigrams and elegies, only fragments of which are extant.

**Cassivelaunus**, a British prince who ruled the country north of the Thames, and led the national resistance to Cæsar's second invasion in 54 B.C. He was defeated, and obtained peace by becoming tributary to Rome.

**Cassock** (Ital. *casacca*), originally a long military horseman's cloak, but latterly restricted to a garment worn by clergymen or other ecclesiastical functionaries. In the Roman Catholic Church its color varies—black for priests, purple for bishops, scarlet for cardinals, white for the Pope. The cassock of the Church of England clergyman is a long, black, close-fitting frock, worn under the surplice. It is only used on occasions of church service. It is sometimes worn by minor functionaries, as vergers and choristers.

**Cassowary** (*Casuaris*), one of the five living kinds of running birds, confined to Australia, New Guinea, and the adjacent islands. They are somewhat smaller than

the allied emeus, and differ markedly from them in the presence of a bony helmet on the head, and usually wattles on the naked neck. The glossy, hairlike plumage is black; and the cock—which, as usual among running birds, incubates and takes care of the young—is smaller than the hen. The birds inhabit wooded country, often the dense scrub, and are naturally shy, though old males are fierce when brought to bay. The eggs are from three to six in number, and are of large size.

**Castaldi**, PAMFILO (1398–1490), Italian humanist and poet, born at Feltre in Lombardy. He founded there a school in which he taught literature and the Italian language, its great repute attracting many foreigners. Italian writers (*e.g.* Bernardi) claim that Castaldi is the real inventor of movable types, and therefore of printing; and that the secret was carried to Gutenberg by Johann Fust or Faust, who is alleged to have been one of Castaldi's pupils and intimates. It is also stated that Galeazzo Sforza granted Castaldi the privilege of establishing a press at Milan in 1472. See Bernardi's *P. Castaldi e l'Invenzione dei Caratteri Mobili per la Stampa* (1865), and Fumagalli's *La Questione di P. Castaldi* (1891).

**Castalia**, a spring on Mount Parnassus, near Delphi, held to be frequented by Apollo and the Muses, and thus a fount of poetical inspiration.

**Castanet**, a simple clapper instrument, consisting of two small concave pieces of hard wood or ivory, shaped somewhat like the capsule of a chestnut slit through the middle. The pieces are fastened together by a cord, which is slipped over the thumb of the performer, who strikes the two halves together with his fingers. Usually the player has a pair of castanets in each hand. The instrument is of Spanish origin, and it is still largely used by the Spaniards and Moors as an accompaniment to their dances and guitars. The crotalum of the ancients resembled the castanet.

**Castañas**, DON FRANCISCO XAVER, DUKE OF BAILÉN (1756–1852), Spanish commander, born in Vizcaya. During the Peninsular war he co-operated with Wellington, and rendered complete the successes of Albuera, Salamanca, and Vitoria. He received his ducal title in consequence of the victory he won over General Dupont de l'Étang at Bailen (1808).

**Caste**. In India, class distinction, or caste—much more pronounced and rigid than among western peoples—is entirely an accident of birth. In whatever caste a man is born, in that caste

he continues. Caste is the offspring of Brahmanism, and the Brahman is the central feature of the system; all others acknowledge him as lord. The origin of this marvellous institution, which, established more than three thousand years ago, still maintains its hold over the Hindu race, probably grew at first out of racial distinctions, when the earliest Aryan immigrants into India settled among the aborigines. Accordingly the pure Aryan, issuing from the Creator's mouth, was the Brahman. Next came the Kshatriya, or caste of fighting men, who were appropriately alleged to have sprung from Brahma's arms. From this caste princes and rulers were selected to govern under the counsel of the Brahman.

Vegetarian communities recognize the importance of the agriculturist, so the Vaisya—the issue of the Creator's loins—ranks third in the social scale. The degraded Sudra was the offspring of Brahma's feet. The consequent developments were so varied that it is now impossible, within a limited space, to give an exhaustive list of the endless divisions and subdivisions of the four original castes.

One of the most important 'caste prejudices' has reference to food. Members of different castes may neither eat nor drink together, and no one may partake of a dish prepared by one of lower caste than himself. Most Hindus are vegetarians; to all the cow is a sacred animal. To a Hindu loss of caste means not merely social ostracism, but excommunication from religious rights, and exclusion from sanctuaries: and few Europeans can conceive the horror with which many Hindus regard the consumption of animal flesh; and when flesh-eating leads to the sacrifice of the sacred cow, the disgust and abhorrence of the high-caste Brahman are beyond expression.

In a climate in which the pulses are deadened to activity, and the tendency is in the direction of voluptuous languor, caste has taught repression and self-control. High barriers against indiscriminate intermarriage have preserved purity of blood and intellectual ability; encouragement of hereditary trade and pursuits has led to the creation of experts. Caste is not dead. It still appeals to the people, and, whether for good or evil, it is a potent factor in British dealings with the Hindu subjects of the Indian empire. See Rev. M. A. Sherring's *Hindu Tribes and Castes* (1872–81).

**Castelar**, EMILIO (1832–99) Spanish statesman, orator, and author, born at Cadiz; educated

at Madrid University, where he afterward occupied the chair of history and philosophy (1856). Devoting himself to politics while still young, he soon acquired great influence by his eloquence and was frequently persecuted by the government for liberal sympathies. Founding (1864) *La Democrazia*, he wrote with caustic bitterness against the government, and was removed (1865) from his professorship. Condemned to death after the attempted insurrection in 1866, he escaped to Paris, but returned to Spain in 1868. His advanced views were fully expounded in *Cuestiones Políticas y Sociales*, published in 1870, which was followed in 1871 by *Discursos Parlamentarios*. He largely assisted in the downfall of King Amadeus (1873), and in September of that year was appointed dictator by the Cortes, but resigned (1874). In addition to the works already mentioned, Castelar wrote a *Historia del Movimiento Republicano en Europa* (2 vols. 1872-4), *La Cuestion de Oriente* (1876), a *Life of Columbus*, (in the *Century Magazine*, 1892), a pamphlet against Caesarism, and many minor works. See *Emilio Castelar*, by Sanchez del Real (1873); *Don Emilio Castelar*, by David Hannay (1895); and Gonzalez Araco's *Castelar* (1900).

**Castelbuono**, tn., prov. Palermo, Sicily, 6 m. by rail s.s.e. of Cefalu. Pop. (1901) 10,761.

**Castelfranco**. (1.) Town and episc. see of Italy, prov. Treviso, 15 m. w. of Treviso; the birthplace (1476) of Giorgione. It is still in part surrounded by its ancient walls, and in its cathedral is a Madonna by the great painter. Here the French defeated the Austrians in 1805. Pop. (1901) 12,440. (2.) Town, Italy, 7½ m. s.e. of Modena; engaged in silk trade. Pop. (1901) 13,484.

**Castel Gandolfo**, tn., prov. Rome, Italy, 14 m. s.e. of Rome, on the left shore of Lake Albano. Has a papal summer palace, built by Urban VIII. in the 17th century; also noblemen's seats. Pop. (1901) 1,980.

**Castellammare**. (1.) Town, Sicily, on the n. coast, 45 m. by rail w.s.w. of Palermo; trade in wine, olive oil, anchovies, and corn. The people—20,665 (1901)—fish for tunny and anchovies. (2.) C. DI STABIA, tn. and episc. see, Italy, on Gulf of Naples, 17 m. by rail s.e. of Naples; was founded on the ruins of the ancient Stabia, which perished at the same time (79 A.D.) as Pompeii. It is visited for sea-bathing and its sulphur baths. The people manufacture macaroni, cotton, soap, needles, etc., and prosecute fishing and shipbuilding. Exports: macaroni, green and dry

fruit, cheese, and olive oil. There is a former royal villa (Quisisana), now a hotel, an arsenal, and the ruins of a castle built by the Emperor Frederick II. Pop. (1901) 32,589.

**Castellana**, tn., prov. Bari, Italy, 8 m. s.w. of Monopoli (on the Adriatic). Pop. (1901) 11,400.

**Castellanos**, JUAN DE (c. 1510-90), Spanish poet, born at Seville, but passed the greater part of his life at Tunja, New Granada (Colombia), best known as the author of *Elegias de Varones Ilustres de Indias* (1589), a rhyming chronicle of the exploits of Christopher and Diego Columbus, Bobadilla, Aguirre.

**Castellon**. (1.) Province, Valencia, Spain; area, 2,495 sq. m.; on the Mediterranean coast. Extremely mountainous, except a plain between the range and the sea. Fisheries very productive, and, with fruit-growing for export, form the principal wealth of the province. Some silver-lead, and cinnabar mines in Espadan range are worked actively, and there are factories of scarfs, mantas, saddle-bags of semi-Moorish taste. Pop. (1901) 310,828. (2.) C. DE LA PLANA, cap. of above prov. Fortress, 4 m. from Mediterranean, on railway from Valencia to Tarragona. A busy, prosperous place, manufacturing flax goods of all sorts. Great centre for export of oranges, wine, etc. Pop. (1901) 29,904.

**Castel San Pietro**, tn., prov. Bologna, Italy, 15 m. by rail s.e. of Bologna. Pop. (1901) 13,426.

**Casteltermini**, tn., prov. Girgenti, Italy, 16 m. n. of Girgenti; has trade in rock-salt and sulphur. Pop. (1901) 13,022.

**Castelvetro**, tn., Sicily, prov. Trapani, 27 m. by rail e.s.e. of Marsala; stands in a fertile plain which produces wine, olives, cotton, silk, and flax. A few miles to the s., near the coast, are the ruins of the ancient Selinus. Pop. (1901) 24,510.

**Casti**, GIAMBATTISTA (1721-1803), Italian poet, born at Prato; studied at the seminary of Montefiascone. Eventually the emperor made him his court poet. Having fallen into disgrace after his patron's death, he retired to Florence, and then to Paris (1798), where he died. A complete edition of Casti's works appeared at Paris in 1838. His chief works are *Poema Tartaro* (1803), a satire on the Russian court; *Gli Animali Parlanti* (1802; Eng. trans. 1816 and 1819); *I Tre Giulj* (1762; Eng. version by M. Montagu, with a memoir of the author, 1826; another ed., *The Three Goats*, 1841). While at Vienna, Casti wrote excellent *libretti* for Paisiello and Salieri.

**Castiglione**, tn., Sicily, prov. Catania, at the n.e. foot (2,040 ft.)

of Mt. Etna; famous for its hazel nuts. Pop. (1901) 12,998.

**Castiglione**, BALDASSARE, COUNT (1478-1529), Italian writer, born at Casanatico; entered the service, successively, of several Italian rulers, including Duke Lodovico Sforza (il Moro) and Pope Clement VII., for whom he went to Spain in 1525 as papal nuncio. He died at Toledo, a man of brilliant gifts, who had seen life intimately at the courts of Mantua, Urbino, Rome and Spain, England and France. Accordingly his picture of the 'perfect courtier' of his time is a notable work. The *Cortegiano* (1528; best modern ed. is that of Cian. 1894) is in the form of conversations held between ladies and gentlemen in the palace of Urbino. The style is refined and elegant, and as a contribution to the history of civilization the book is invaluable. English versions have been made by Hoby (1561; twice reprinted in 1900) and by Opdycke (1901). See *Lives*, etc., by Marliani (Introduction to the *Opere*, 1733), by Serassi (Introduction to the *Cortegiano*, 1766), by Martinati (1890), and by C. Bufardecì (1900).

**Castiglione**, CARLO OTTAVIO, COUNT (1784-1849), Italian philologist, born in Milan; established his reputation by the *Mémoire Géographique et Numismatique sur la Partie Orientale de la Barbarie* (1826), wherein he attempts to reveal the history of those towns in Barbary whose names are preserved on Arabic coins. With Cardinal Mai he published the Gothic version of the Old and New Testaments by Ulfilas (1819). See *Life* by Biondelli (1856).

**Castile**, or CASTILLE, a former kingdom of Spain, divided into Old Castile and New Castile, and occupying the central plateau of the peninsula. Old Castile, with an area of 25,372 sq. m., was in 1833 divided into the provinces of Valladolid, Palencia, Burgos, Santander, Logroño, Segovia, Soria, and Avila; New Castile (area, 27,935 sq. m.) into Toledo, Madrid, Guadalajara, Cuenca, Ciudad Real. Castile formed in the 8th century part of Leon, but in 923 became practically independent, and a hundred and ten years later received its first king in the person of Ferdinand I., son of Sancho the Great of Navarre. Ferdinand extended his dominion over Leon, Asturias, Galicia, etc., but on his death there was a division of his territories among his three sons. Alfonso VI. (d. 1109) reunited the kingdom in 1072, and Ferdinand III. (d. 1252), by capturing Cordova, Seville, and Cadiz from the Moors, further enlarged and consolidated it. In 1465 Isabella became queen

of Castile, and four years later married Ferdinand, king of Aragon. After 1048 the history of Castile merges in that of Spain. The Castilians are distinguished by their haughty gravity of demeanor, their inclination to bigotry, and their lack of education. Their dialect is the official language of Spain; and Madrid, standing between the two Castiles, became under Philip II. the capital of the whole country.

**Castilho, ANTONIO FELICIANO, VICOMTE DE (1800-75),** Portuguese poet, born at Lisbon. Although he became blind at the age of six years, he became celebrated very young through his bucolic collection, *Carlas de Echo e Narciso* (1821). His poetical works of an elegiac character, are marked by great delicacy of feeling and by a masterly harmony of languages. We mention *Amor e Melancolia* (1828), *A Noite do Castello* (1836), *A Primavera* (2nd ed. 1837), and *O Outono* (1863). He also translated Ovid's *Metamorphoses* (1841) and *Fasti* (1859) and Virgil's *Georgica* (1865). He adapted with success several of Molière's comedies, Goethe's *Faust*, and Shakespeare's *Midsummer-Night's Dream*. See Julio de Castilho's (his son) *Memorias de Castilho* (1881).

**Castillejo, CRISTOVAL DE (1490-1556),** Spanish poet, born at Ciudad Rodrigo. He is one of the last representatives of the old Spanish school, and fought against the classical-Italian forms of literature which were then being introduced into Spain. His compositions, mostly of a satirical character, exhibit great versatility of form and of language, and true poetic inspiration. Many of them were circulated in ms. only, for fear of the Inquisition. The first complete edition of his works is that in the 32nd volume of the *Biblioteca de Autores Españoles* (1854). Among other works are *Diálogo de las Condiciones de las Mujeres*, a powerful satire against women; *Sermon de Amor*; and *Historia de Piramo y Tisbe*.

**Castine, tn.,** Hancock co., Me. 29 m. s. of Bangor on a promontory in Penobscot Bay. It is the seat of the Eastern State Normal School, and has a public library. It is well known as a summer resort, has a fine harbor, ship-yards, and manufactures of cordage, brick furniture, etc. Pop. (1910) 933.

**Casting** is (1) a process, and (2) its product.

(1) Casting is the process of pouring melted metal or other fusible substance into moulds, where it cools and hardens into the shape of the mould. By a natural extension, the term is applied equally to pouring into moulds a substance

rendered temporarily liquid in any other way, as by mixing with water (cement, plaster-of-Paris), or by dissolving (gelatine, sugar).

Casting of metals is so widely employed in the industrial arts that the word casting without other qualification refers to metal. A large part of the iron, brass and type-making industries depends on casting. Glass, wax, and similar fusible substances are often cast.

iron and brass, being made slightly damp so as to hold the impress of the pattern and resist the pressure of the molten metal. Some sand moulds are baked, and those parts of moulds which serve to 'core' out interior hollows in the shape desired are nearly always baked (cores). Loam moulds are used for certain purposes, being baked before casting. In a few cases iron is cast in iron or part-iron moulds,

Slag and analogous melted minerals are sometimes cast to form bricks and the like.

The details of the casting process vary with the melting temperature of the substance, its physical and chemical affinities for other substances when melted, and the nature of available mould materials. The kind of mould that can be used is an essential factor. In the case of iron and brass, the preparation of the moulds is the most important part of the art of founding, to which casting belongs (see IRON FOUNDED). Sand containing a small percentage of clay or loam is used for most moulds for

usually to obtain a hard chilled surface, but recently (1909), by a newly developed process, for soft iron castings also (removing the castings from the mould when barely solidified, and letting cool slowly, to 'anneal' the iron). Moulds for other materials vary according to the substance being cast, chiefly according to the melting temperature and to the desired surface finish.

Casting without moulds is practised only in rare instances, as in making shot by allowing melted lead to go through a screen, from which the drops can fall far enough to harden. 'Squirting' the dissolved

cellulose for incandescent-lamp filaments is an analogous process.

Sometimes casting serves to join two pieces. Wrought-iron or steel rods are sometimes embedded in a casting by setting them in the mould to project part way into the hollow of the mould. Joining of two pieces by casting is also done in setting anchor bolts or railing posts into a stone base, when melted sulphur or lead is run into the hole around the bolt or post.

Casting iron is the most difficult of casting processes, and its troubles are typical of those inherent in casting. The high tem-

perature of the melted iron restricts the choice of mould substances, as noted. In melting the metal, contamination by the fuel and gases takes place, and the ready oxidation of iron by air causes a certain loss of iron. The iron that is tapped from the furnace not only contains some entrained and dissolved gases, which must separate out in either ladle or mould if the casting is to be sound, but also by its heat generates steam and gases from the material of the mould. These must be allowed to pass out of the mould freely (outward through the sand, where they burn when

reaching the air), or they will burst the mould, or at best make the resulting piece porous and useless. When the actual casting has been successfully accomplished, the hot piece must cool slowly and uniformly; if one part solidifies long before the rest of the piece, the uneven distribution of contraction during cooling will warp the piece out of shape or will give rise to dangerous stresses in the finished piece. Annealing, *i.e.*, reheating the cooled piece to red heat and allowing it to cool very slowly in the oven, is a means of removing such stresses, but on

file; are weak against tensile stresses; are apt to be non-homogeneous, and may have unknown shrinkage strains in their interior. Gas bubbles or porous spots frequently occur in them. Some of these characteristics are due to the chemical composition of the metal required for easy melting. (Cast iron contains about 3% carbon, partly in combined and partly in free or graphitic form;  $\frac{1}{2}$  to 1% silicon, and other impurities. Steel and wrought iron, having generally much lower impurities, are harder to melt, and would be fatally contaminated by direct con-

CASTING.—A steel foundry with small Bessemer Converter. In foreground a finished casting still buried in the sand of the mould, the flask having been stripped off to allow it to cool.

perature of the melted iron restricts the choice of mould substances, as noted. In melting the metal, contamination by the fuel and gases takes place, and the ready oxidation of iron by air causes a certain loss of iron. The iron that is tapped from the furnace not only contains some entrained and dissolved gases, which must separate out in either ladle or mould if the casting is to be sound, but also by its heat generates steam and gases from the material of the mould. These must be allowed to pass out of the mould freely (outward through the sand, where they burn when

account of its additional cost is seldom employed.

(2) Casting denotes also the *product* of the process, or the piece cast. Ordinarily, it means a piece of iron (cast iron) the shape of which was produced by moulding and pouring. As nearly every machine is in the main an aggregation of castings, the qualities of iron castings are influential in determining machine design.

Castings are rather rough of surface; have a hard skin, due to contact and partial fusion with the sand of the mould; are not precisely true to form; are rather brittle, and not flexible, or duc-

tact with the melting fuel.) Other characteristics noted are due to the casting process itself.

Where castings must fit given dimensions exactly, they have to be dressed (by turning, planing, chipping, filing, etc.). For fastening together different castings by smaller joining-pieces (bolts, pins, etc.), steel must be used to obtain the necessary strength. As a consequence, also, of the brittleness of castings, riveting is never employed to join them. Broadly speaking, on account of the low strength and distinct brittleness of cast iron, a casting must have three or four times the

cross-section of an equivalent forged or rolled-steel piece. However, the great ease of forming any desired shape by the casting process makes castings absolutely essential; and since most machinery requires to be relatively massive, in order to absorb vibrations and give rigidity, it usually happens that the dimensions necessitated by this requirement are ample for strength.

*Steel castings* have come into considerable use, of recent years, for those purposes wherein great strength and absence of brittleness are demanded. The steel is melted in an open-hearth gas furnace, such as is used for making steel, and is poured into sand molds in the same way as cast iron. Steel castings are usually annealed, to make them soft and ductile, and get rid of shrinkage strains.

The design of both iron and steel castings is chiefly fixed by the matter of shrinkage strains. It is found highly desirable to make the thickness of metal as nearly uniform throughout a casting as possible, so that the rate of cooling after pouring may be uniform. Sharp re-entrant angles are to be avoided, where possible, because incipient cracks may be found in such corners. Thus, castings should be given well-rounded contours, filleted angles and corners, and webbed or box-shaped sections, to secure the required strength without local massing of metal. The cross-sections are to be so proportioned as mainly to experience compressive stresses. A primary object, also, is to minimize the amount of dressing or 'machining' needed for securing accurate and smooth contact surfaces.

**Cast Iron.** See IRON.

**Castle,** a term denoting a stronghold. Among Irish antiquaries, *caiseal* (pron. *cashel*) is restricted to a certain kind of walled enclosure of considerable extent, having rooms within its walls, which are of great breadth. In Great Britain, again, the word has been applied to forts surrounded by ramparts of earth, or stone, or vitrified stone; to palisaded forts, to the 'peels' of the Anglo-Scottish Borders and other towers of the same description, to brochs, and to large feudal castles. These last two instances, however, are linked together, according to Sir Walter Scott, by the keep, which he maintains to be an elaboration of the more primitive broch. (See Note L to *Ivanhoe*, and compare with plans of brochs the descriptions of the keeps of Conisborough and Barnard Castle in G. T. Clark's *Medieval Military Architecture in England* (1884), vol. i.

pp. 207-210, and 431-453.) In other countries castles have also presented a great variety of forms.

In Palestine, for example, the ruins of no less than four different kinds of castles have been found in one place—at Ta'anuk of T'ana, near Jaffa. Of these, the oldest, supposed to be Canaanite, is of unhewn stone, two are Israelite of different periods, and the latest is Arabian. The Arabian castles are of great interest from the fact that Arab influence is very perceptible in European mediæval castles. Even to-day, as Mr. Theodore Bent discovered, the castles of the Hadramaut bear a distinct resemblance to those of Europe during the middle ages. This resemblance is due not to Arab conquest in S. Europe, but to the long residence of Europeans in Syria during the crusades. The crusaders' castles in Syria were themselves of the highest interest. Of Reginald of Châtillon's castle of Kerak near the S.E. coast of the Dead Sea, it is stated that the massive walls rose to a height of 100 ft. and were in one place 27 ft. thick. Like its Eastern congeners, it displayed the features of concentric defence—an idea not properly understood by European architects prior to the crusades. This style of fortress attained its full development in England, under the direction of Edward I., although it had actually been introduced before his time; and the ruins of the castles of Conway, Carnarvon, Beaumaris, and Harlech, all in Wales, still testify to his skill. The chief characteristic of this style of defence is that an attacking force can find no spot, all along the walls, where it is free from the fire of the besieged. And further, even when the outer works have been taken, the besiegers find themselves confronted by a second and a third line of defence. The whole fortification was surrounded by a wide and deep moat—where possible, full of water. The only access to the gateway was by a drawbridge, itself protected by an outwork called a barbican. This taken, the besiegers found themselves before a portcullised gateway, behind which were heavy doors studded with iron. On either side were strong towers commanding the gateway, and above was a projecting 'machicolation,' from which molten lead, scalding water, or great weights were dropped upon the besiegers. The whole line of the outer wall was protected by bastions at every fifty yards, and bastions and walls were alike crenellated. And even if the gateway were forced or the adjoining ramparts scaled, the attacking force only found

itself in the large open area called the 'outer bailey,' exposed to a heavy fire from the walls and battlemented roof or the keep, and from the gateway of the 'inner bailey.'

Within the enclosure last named were the barracks, the hospital, and the chapel. The great dining-hall was in the keep, the upper stories of which formed the residence of the nobleman or governor. The walls of the hall were hung with tapestry, or ornamented with scenes painted in distemper on the plastered walls and ceiling. Banners, standards, and armorial bearings, interspersed with arms and armor, further enlivened the walls. The floor, of pavement or of enamelled tiles, was strewn with rushes, scented herbs, or straw, renewed daily. A long oaken table stood in the middle of the hall, with benches on either side, and at the upper end was a silken-canopied chair of state for the lord. A wooden gallery for the musicians, placed half-way up the wall, occupied one end or corner of the hall.

After the 13th century a greater degree of luxury began to prevail in these castles, and in later centuries they imperceptibly ceased to be strongholds, their defensive features being refined away. See Clark's work already cited; M'Gibbon and Ross's *Castellated and Domestic Architecture of Scotland* (1887-92); Viollet le Duc's *Dictionnaire de l'Architecture Française* (1858-86).

**Castleford**, tn., W. Riding of Yorkshire, England, 3 m. N.W. of Pontefract, on the Aire. A centre for the manufacture of glass bottles, earthenware, and chemicals. Pop. (1911) 23,101.

**Castle Garden**, a round building in Battery Park, New York city, at the S. end of Manhattan I., originally called Fort Clinton. From 1855 to 1890 immigrants were received and examined here, but that is now done on Ellis I., New York harbor. Castle Garden is now used for an aquarium.

**Castlemaine**, BARBARA VILLIERS, COUNTESS OF CASTLEMAINE (1641-1709), daughter of Wm. Villiers, second Viscount Grandison. She married Roger Palmer (1659), created Baron Limerick and Earl of Castlemaine (1661). Her intimacy with Charles II. seems to have commenced a year later, and continued in the most flagrant manner till 1673. Her influence with the king was paramount, and she was instrumental in securing the dismissal of Clarendon. She was created Baroness Nonsuch, Countess of Southampton, and Duchess of Cleveland (1670). Barbara Villiers spent the latter years of her life at Chiswick. She is described as a 'beautiful

termagant,' avaricious, but recklessly extravagant. Her children by Charles II. were Anne, Countess of Sussex (1661); Charles, Duke of Southampton (1662); Henry, Duke of Grafton (1663); Charlotte, Countess of Lichfield (1664); and George, Duke of Northumberland (1665). See *Memoirs of Barbara, Duchess of Cleveland*, by G. S. Steinmann (1871-8).

**Castlereagh**, ROBERT STEWART, VISCOUNT, SECOND MARQUIS OF LONDONDERRY (1769-1822), second son of the first Marquis of Londonderry. He became a Tory in 1795, and in consequence was appointed (1797) keeper of the Privy Seal. He adhered at first to Catholic emancipation, but nevertheless labored assiduously with Pitt for the Act of Union. After that measure had been secured, Castlereagh was appointed president of the Board of Control (1802) in Addington's ministry, but in January, 1805, became war minister under Pitt, and afterwards held the same office in the Portland cabinet until September, 1809. The vigorous character of his policy was shown in the bombardment of Copenhagen and in the Peninsular War; but the abortive Walcheren expedition (1809) led to serious differences between him and Canning. A duel ensued between them on Putney Heath, when Canning was slightly wounded. As Foreign Secretary under Lord Liverpool, in 1812, Castlereagh became the moving spirit of the coalition against Napoleon, and the spirited campaigns of 1813-14 were practically due to him. He was England's representative at the Congresses of Châtillon and Vienna (1814-15), Paris (1815), and Aix-la-Chapelle (1818). At this period he incurred much odium at home in consequence of the drastic domestic measures of the government. He was held responsible for the 'Peterloo massacre' and the arbitrary 'Six Acts,' and also for the prosecution of Queen Caroline; was pilloried as the creature of Metternich and the agent of the Holy Alliance. He committed suicide at his seat, North Cray Place, in Kent. An excellent diplomatist, he had undoubted courage and judgment; but it is not surprising that his contempt for and harsh treatment of the people made his name a byword. See Sir A. Alison's *Lives of Lord Castlereagh and Charles Stewart* (1861), and *Correspondence and Dispatches of Lord Castlereagh*, edited by his brother, C. W. Vane (12 vols. 1848-53).

**Castleton**, tn., Rutland co., Vt., 11 m. w. of Rutland, on the Castleton R. and on the Del. and Hud. R. R. It is the seat of a State Normal School. Carriages and ploughs are manufactured and

slate and marble are extensively quarried in the neighborhood. Pop. (1910) 1,885.

**Castleton**, (1.) Parish and tn. in High Peak div. of Derbyshire, England, 9 m. N.E. of Buxton. The ruin of the Castle of the Peak, built by William Peveril, natural son of William the Conqueror (see Scott's *Peveril of the Peak*), stands on a neighboring height. Castleton has interesting caves, and mines yielding fluor spar. Pop. (1901) 547. (2.) C. of BRAEMAR. See BRAEMAR.

**Castor**, or CASTOREUM, consists of the dried preputial follicles of the beaver. In the fresh state the glands contain a yellowish creamy substance, which when dried becomes dark in color. The brown resinous secretion contains a crystalline substance termed castorine, besides salicine (obtained from the willow bark which the animal gnaws), benzoic acid, phenol, and a volatile oil. These glands were formerly cut up and macerated in spirit to form a tincture which was used as a stimulant and antispasmodic.

**Castor**= $\alpha$  Geminorum, a bright northern star (photometric magnitude 1.6). With a third-magnitude companion it makes a stately couple, in slow revolution; first measured by Bradley in 1719.

**Castor and Pollux** (Gr. Polydeuces), the Dioscuri or 'sons of Zeus,' were, according to Homer, sons of Tyndarus and Leda, and brothers of Helen and Clytæmnestra. Castor was famous for his horsemanship, Pollux for his boxing; both died before the siege of Troy, but were permitted to enjoy immortality, though only on alternate days. Later stories call Zeus their father; he visited Leda in the form of a swan, and she brought forth two eggs, from one of which Castor and Pollux were born, and from the other Helen and Clytæmnestra. They were worshipped at Sparta, and thence through Greece and Italy, and were regarded as the protectors of sailors. Their worship was introduced in Rome at an early date, and it was said to be owing to their assistance that the Latins were defeated in the battle of Lake Regillus. The Roman knights revered them as their patrons. In more modern times they gave title to an opera by Rameau (1737); and Rubens's fine picture of *Castor and Pollux carrying off the Daughters of Leucippe* at Munich should also be mentioned. See J. Rendel Harris's *The Dioscuri in the Christian Legends* (1903).

**Castor Oil**, an oil expressed from the seeds of *Ricinus communis*, consisting mainly of the glycerol ester of ricinoleic acid (C<sub>17</sub>H<sub>33</sub>O<sub>2</sub>), and procured chiefly from Calcutta. It is almost with-

out color or smell, with a disagreeable acrid taste and a viscid consistency (sp. gr. .96). The dose is from a teaspoonful to two tablespoonfuls. It is seldom used pure externally, but is contained in flexible collodion and compound soap liniment. It acts as a simple purgative, stimulating peristalsis and the intestinal glands. It will also act when given as an enema. It enters the blood, and leaves the body by all the excretions, giving a purging action to mother's milk. Because of its simple, non-irritating effect, it is much to be recommended as a purgative for children. It can be given in soft, elastic capsules, of any size desired. If a lemon or orange is squeezed into a glass and the oil poured on it, the oil will float and pass untasted on the juice.

**Castor-oil plant**. A euphorbiaceous plant (*Ricinus communis*), from the tropics, but frequently planted for the sake of its broad, palmately lobed leaves, and richly colored stems. The seeds for which the plant is cultivated in India, are crushed to extract a demulcent, purgative oil, 'castor-oil,' which is used also in the arts. These seeds contain a poisonous principle, however.

**Castra Bonnensia**, Rhineland. See BONN.

**Castration** (Lat. *castro*), the operation of removing the testicles of the male. One testicle may be lost through operation or disease without emasculation resulting. If the human male be castrated before puberty, he has no procreative power, and in several ways he approaches the feminine type. His beard is thin, or he has none; his voice is high-pitched and feminine, the thyroid cartilage remaining small, as in boys. On account of this effect on the voice, the operation of castration has been performed in Italy on professional singers. In Mohammedan countries it is commonly performed upon slaves, to make them safe guardians of the seraglio. When the operation is performed before puberty, it does not seem necessarily to affect the strength or stature. Mention has been made of an African eunuch in the household of a Turkish pasha. He stood head and shoulders above a crowd, and spoke with a voice like a tin whistle. If castration is performed after puberty, there is often a lapse of some time before procreative power is lost. The sufferer shows progressive changes in voice and appearance, and there is considerable risk of mental degeneracy and melancholia.

**Castrén**, MATTHIAS ALEXANDER (1813-52), Finnish philologist, born at Tervola. The publication by Lönnrot of the *Kalevala* stimulated Castrén to study the

Finnish language, and the first fruit of his labor was the treatise *De Affinitate Declinationum in Lingua Fennica* (1839). After a tour through Carelia, he published (1841) his Swedish translation of this great national epic, the metre and style of which were imitated by Longfellow in his *Hiawatha*. In 1842 he stayed in the land of the Syrjäns, a Finnish tribe between the Urals and the Pechora; and from 1845-9 participated in the Russian scientific expedition to Siberia, travelling among the Ostiaks, Samoyedes, and Buriats, and studying their languages. In 1851 he was appointed the first professor of Finnish at Helsingfors. Among his works are *De Affixis Personalibus Linguarum Altaicarum* (1850). After his death appeared *Föreläsningar i Finsk Mythologi* (1853); *Ethnologiska föreläsningar öfver Altaiska Folken* (1857); *Tillfälliga Uppsatser* (1870), in which is contained Castrén's biography; *Grammatik und Wörterverzeichnisse der Samojedischen Sprachen* (2 vols. 1854 and 1855). See *Life* by Snellman in his *Samlade Arbeten* (10 vols. 1892-1901).

**Castres**, *tn.*, dep. Tarn, France, 26 m. s. of Albi, with remains of a Roman camp, on the site of which, around a Benedictine abbey, the city was built (647). During the 16th century it was an important Huguenot stronghold, but was destroyed in 1629. Soap, leather, paper, and cotton goods are manufactured. Pop. (1901) 27,308.

**Castries**, or **PORT CASTRIES**, *tn.* and port of entry on w. coast of St. Lucia, W. Indies. It is the capital of the island, and its harbor (British naval station) is perhaps the finest in the W. Indies. The exports include sugar, cacao, logwood, etc. Pop. (1901) 7,757.

**Castriot**, **GEORGE**. See **SCANDERBEG**.

**Castro**, *tn.*, Asiatic Turkey. See **CHIOS**.

**Castro**, **CYPRIANO** (1863), president of the republic of Venezuela, was born in the state of Los Andes. He is half white, half Indian (Andino), and is credited with great powers of oratory and debate. He first interested himself in local politics, and formed a party which went by the name of *Castristas*. But though he played a conspicuous part on the government side in the rebellion against President Palacio, fomented by General Joaquin Crespo (1892), it was not until Andrade succeeded (1898) to the Presidency that Castro came into a position of real power. Andrade soon degenerated into a despot, and in 1899 Castro took the field against him. He fought his way into the capital, Caracas, and Andrade fled to Curaçao. Castro assumed office

as president on Oct. 24, 1899, and was re-elected in February, 1902. In December of that year he embroiled his country with the allied Germans and British. Subsequently he annulled most of the concessions granted to foreigners, inflicted indignities on foreign residents, declined to settle international claims, and thereby had the chief ports of Venezuela blockaded by foreign powers. In 1908, pending an ultimatum from The Hague, he went to Europe, whereupon Dr. Juan V. Gomez, the vice-president, assumed control. Castro was deposed, and was not allowed to land in South America on his return. (See **VENEZUELA**.)

**Castro**, **JOÃO DE** (1500-48), Portuguese captain and geographer, born at Lisbon. Going to the Indies (1545), he crushed the ruler of Cambodia, relieved the town of Diu (celebrated by Camoens), conquered Broach and Malacca, and sent his lieutenant, Antonio Moniz, to plant additional settlements in Ceylon. Castro was appointed viceroy (1547), but died the following year at Goa, nursed to the last by his beloved comrade, Francis Xavier. He left an account of the Red Sea, *Roteiro . . . da Viagem ao Mar Roxo*, not published until 1833, though there was an English translation of this work under the title, *A Rutter of Don João of Castro of the Voyage which the Portugals made from India to Zoes—i.e. Suez* (1625); *Roteiro da Costa da India* (1843); and *Roteiro de Lisboa a Goa* (1882). See *Life* by Jacinto Andrada (1651; Eng. trans. by Wyche, 1664).

**Castro del Rio**, *tn.*, prov. Cordova, Andalusia, Spain, on r. bk. of the Guadajoz, 17 m. s.e. of Cordova. It has a Moorish castle and other ruins, and has some manufactures, and trades in cattle and grain. Pop. (1900) 11,821.

**Castrogiovanni** (anc. *Enna*), a *tn.* and episc. see, prov. Caltanissetta, Sicily; is finely situated on the hollow summit of a hill (3,270 ft.), 13 m. (53 m. by rail) n.e. of Caltanissetta. It has a cathedral, founded in 1307, and an ancient citadel, and in classic times possessed a famous temple of Demeter, and another of Proserpine. Pop. (1901) 26,081.

**Castro-Urdiales**, *tn.*, prov. Santander, Spain, 17 m. n.w. of Bilbao; pretty fishing port on Bay of Biscay. Exports of iron ore (1900), 688,129 tons, also of tinned sardines. Pop. (1900) 14,191.

**Castro y Bellvis**, **GUILLEN DE** (1569-1631), Spanish poet and dramatist, a friend of both Cervantes and Lope de Vega. Though lacking in invention, he is by many critics considered to have surpassed even Calderon in pathos.

His best-known works are *Las Mocedades del Cid*, and its sequel, *Hazañas del Cid*, which was adapted to the French stage by Corneille, and was republished (1890) in a critical edition by Ernest Merimee. See Lord Holland's *Life of Castro* (1817), Segall's *Corneille and the Spanish Drama* (1902), and Martinenche's *La Comédie Espagnole en France* (1902).

**Castruccio-Castracani** (1281-1328), Italian general, born at Castruccio, near Lucca. He became a soldier in England (1301), France, and Lombardy. His townsmen recalled him and made him their leader (1314), whereupon he defeated the Guelphs, and joined forces with Ugucione, the Ghibelline leader of Pisa. When Ludwig v. of Bavaria went to Italy in 1327, Castruccio rendered him good service, for which he was appointed Duke of Lucca, Pistoja, Volterra, etc., and Senator of Rome. His ideal was to found a great Ghibelline state in Tuscany, with Lucca as its capital. See Manucci's *Azioni di Castruccio-Castracani* (1843), and Winckler's *Castruccio-Castracani, Herzog von Lucca* (1897).

**Castua**, *tn.*, Istria, Austria, 6m. n.w. of Fiume. Pop. (1900) 17,988.

**Casualty**. An accident. Some unforeseen circumstance in which human agency has no part.

**Casuarina**, the name given to a genus of tropical trees and shrubs, chiefly Australian, with long, pendent, and leafless, though graceful, branches. The jointed structure of the stems gives the trees somewhat the appearance of equisetums. They are valued for their hard wood. The best-known species are *C. equisetifolia*, *C. stricta*, and *C. distyla*. The timber of some of the species is known as beef-wood in New South Wales.

**Casulistry**, the science which deals with difficult cases of conscience—i.e. which undertakes to apply acknowledged principles of conduct to doubtful cases, or cases where there seems to be a conflict of duties. The science was developed systematically by the mediæval church in the 14th and 15th centuries. (See Sidgwick's *Hist. of Ethics*, pp. 151 ff.; 3rd ed. 1892.)

**Casus Belli** (Lat. 'cause of war'). See **INTERNATIONAL LAW**.

**Caswell**, **RICHARD** (1729-89), American soldier and political leader, born in Cecil co., Md. He early removed to N. C., became a lawyer and political leader there, and from 1754 to 1771 was a member of the colonial assembly, being Speaker in 1770 and 1771. He helped to suppress the Regulators in 1771, taking part in the battle of Alamance; in the American Revolution was an active Patriot or Whig; was a member of the

Continental Congress (1774-6); led the N. C. militia in the battle of Moore's Creek (q.v.); took a prominent part in framing the state constitution; was the first governor of the state (1776-9); and in the battle of Camden, as brigadier-general, commanded the N. C. troops, which formed the American centre and which soon after the beginning of the fighting fled precipitately from the field. He was speaker of the N. C. Senate (1782-4), was again governor of the state (1784-7), and in 1789 was once more a member of the N. C. Senate.

tiger, leopard, jaguar, etc.) and small (lynxes, wild cat, etc.) cats, often differing from one another chiefly in external characters.

The domestic cat is believed to have been derived from the Egyptian *F. caffra*, and not from the fierce wild cat (*F. catus*) of Europe, a larger and more powerful animal. In spite of prolonged domestication, the cat is less variable than the dog, and more prone to revert to a wild or semi-wild state. The chief variations are seen in color, in regard to which there are some interesting points—compare the fact that pure

shading as possible, and with green eyes. Blue Persians, or slaty animals approaching to a blue, should have a very level shade of color all over, and very deep orange or amber eyes. The elegant pure whites with blue eyes are becoming quite fashionable, and deep coal-blacks with dark-yellow eyes, creams, fawns, and orange-colored Persians are gaining favor. Other shades of the long-haired variety are brown tabby, silver tabby, tortoise-shell, and smokes.

The markings form more important points in judging the com-

*Fancy Breeds of Cats.*

1. Siamese. 2. Russian. 3. Tabby. 4. Chinchilla. 5. Blue Persian.

**Cat**, generally the members of the mammalian family Felidæ. The cat genus (*Felis*) includes the most highly specialized of the carnivores. The mechanism by which the claws are retracted reaches here its highest degree of perfection, and the sharp, compressed claws are themselves exceedingly powerful weapons. The teeth are only thirty in number, as compared with the forty-two of the dog; and of these thirty, two—the last cheek teeth in the upper jaw (molars)—are so small as to be practically functionless. The other cheek teeth are all sharp-edged, and serve to cut off the large pieces of meat which are bolted by the animals without mastication. The tongue is roughened, and functions as a rasp. To this genus belong the large (lion,

sandy cats are always males. For a very full account of the structure and relations of the cat, see St. George Mivart's *The Cat* (1881).

The cat section (*Æluroidæ*) of the carnivores includes not only the true cats, or Felidæ, but also the civets (*Viverridæ*), the aardwolf (*Proteleidæ*), and the hyæna (*Hyænidæ*). For a general treatment of the whole group, including origin and descent of domestic cats, see E. Ingersoll's *Life of Mammals* (1906).

The Persian or long-haired domestic cat is the most popular and most 'fancied' breed. This variety is bred in many shades of color. The most valuable of these is the pale self-silver or chinchilla, of a dull silver color all over, with as little marking or

mon or short-haired cats. A very interesting variety is the Siamese, said to occur in pure blood only in the palace of the King of Siam and believed to be derived from a wild species of the East. It is of a pale-cream color, with feet, lower part of legs, muzzle, and ears all black. A fine all-blue cat comes from Russia and Iceland, and there are characteristic breeds from India, Abyssinia, and other parts of the world. One of the most striking varieties is the Manx cat, originating in the Isle of Man, the peculiarity of which is the disproportionate elevation of the handquarters, and the extreme shortness of the tail.

Many societies devoted to the perfection of breeds of cats exist in Europe, and especially in England, and many shows are held an-

nually. Recently a society of cat fanciers has been formed in the United States, and shows are annually held in New York City.

*Diseases of Cats.*—These are in all cases identical with the diseases of dogs. See Cherville's *Les Chiens et les Chats* (1888), Friedberger and Fröhner's *Veterinary Pathology* (new ed. 1904-5), F. T. G. Hobday's *Canine and Feline Surgery* (1900), and J. Woodroffe Hill's *Diseases of the Cat* (1901). Huidekofer's *The Cat* (1895) is an American authority on the races, training and treatment of domestic cats.

*Controverted Questions of Geology* (1895).

**Catacombs**, the group of subterranean vaults and galleries in the neighborhood of Rome, memorable as the sepulchres of the early Christians. But the name is also held applicable to the Baths of Cleopatra at Alexandria, and to the underground crypts of exactly the same description as their Roman congeners, at Naples, Syracuse, Chiusi, and elsewhere.

The Roman catacombs consist of some forty or fifty groups of subterranean labyrinths or gal-

in many cases, that it is impossible for two people to walk along them abreast, economy of space being clearly an important matter with the early excavators. The rocky walls on both sides of the passage have been hewn out into long tiers of niches or recesses, aptly compared to the berths in a passenger steamer, each niche or 'berth' having been made into a resting-place for a corpse. In some cases two bodies have been found in one niche. Each of the niches has been closed with a slab of marble or of terra-cotta, having the name of the deceased usually

**Cataclysmal Action.** The geologists of the early part of the 19th century were much inclined to account for all that is remarkable in the rocks or in the geological structure of a country by ascribing it to the action of powerful forces, producing great catastrophes and tremendous upheavals (cataclysms) in former geological periods, but now no longer in operation. These theories are now discredited, and an attempt is made to account for all geological phenomena by causes similar to those which we can see in action around us. This latter principle is sometimes known as uniformitarianism. See J. Hutton's *Theory of the Earth* (1795), J. Playfair's *Illustrations of the Huttonian Theory of the Earth* (1802), and Prestwich's

galleries and chambers cut out of the soft stone (tufa) of the hills surrounding Rome. Some of them are comparatively near the surface of the earth; but beneath these, in the majority of cases, there are successive stories of greater depth, the lowest level being at a depth of seventy feet. The number of stories may be two, three, four, or even five; and their innumerable galleries run parallel to each other, or cross each other at right angles. If the galleries in the Roman catacombs could be added on to one another in a continuous line, they would stretch for a distance of 545 miles. And yet the estimated superficial area of the catacombs is only 615 acres. Passages are so narrow (from  $1\frac{3}{4}$  to  $2\frac{1}{2}$  ft. in width)

engraved upon it, with a pious legend attached. The language used in all the earlier inscriptions is Greek. All the later inscriptions, however, are in Latin. Eventually, in the 4th century, larger chambers were made, for the special purpose of holding religious services.

As the catacombs represent a fashion of burial previously followed by Egyptians and Jews, so the tombs of these Roman Christians present several pagan features. Ornaments, memorials, and domestic utensils are not infrequently found beside the dead body, for use in the future world, as in avowedly pagan burials. The arrangement of the tomb of the Scipios and those of the Christian cemetery of Domitilla

[in the Roman catacombs] are so similar,' observes Dr. Joseph Anderson, 'that if there had been nothing but the mere constructional features and sepulchral arrangements to guide us in forming an opinion, they would both have been assigned to one period and one origin. The catacombs of Naples contain frescoes of purely classical design, having nothing distinctively Christian about them.' And in the catacomb of St. Prætextatus, Hermes is figured as the conductor of the dead. On the other hand, the frescoes of the catacombs are chiefly devoted to Scriptural theme. It is especially noteworthy that there are also Jewish catacombs in Rome. These were excavated about the 3rd century. They are, of course, devoid of all Christian symbolism, the seven-branched candlestick being their most frequent device. Their inscriptions are in Greek and Latin.

The most important of the catacombs are: St. Calixtus, with its *camera papale*, containing the tombs of martyred bishops of the 3rd century, and in another part Byzantine mural paintings of the 8th century; Domitilla, with 1st-century frescoes, and more than nine hundred inscriptions; St. Priscilla, with its frescoed Madonna of the 2nd century; St. Agnes, perhaps the most archaic specimen; San Sebastiano; and St. Prætextatus.

The catacombs ceased to be used as a burial-place after the sack of Rome by Alaric in 410, and during the Middle Ages their very sites seem to have been forgotten. The scientific researches of Antonio Bosio (d. 1629) and a host of later students have, however, once more brought to light their actual characteristics and their historical associations. During the past generation the work of scientific explorers has greatly added to the number of ascertained catacombs; but the discovery, in 1901, of the catacombs beneath the Monte di Dio, in Naples, was entirely due to accident. See Bosio's *Roma Sotterranea* (1632), which has had several successors of the same name, notably that of Giambattista de' Rossi (1822-94), and Northcote and Brownlow's *Roma Sotterranea* (1878-80). See also Mommsen's 'Roman Catacombs,' in *Contemporary Review*, vol. xvii. (1871). The catacombs of Paris are subterranean quarries, from which the stone for building the city was obtained. In 1787 they were first utilized for storing the bodies removed from various burying-grounds.

**Catalan**, group of Romance languages largely spoken in the Spanish provinces of Gerona, Barcelona, Tarragona, Lérida,

Valencia, Alicante, and Castellon de la Plana, as well as in the French department of Pyrénées Orientales and the Balearic Is. Catalan is an established language, with its own grammar and dictionary, and dating from the 13th century; ranks in importance next to the Castilian, which is the official language of Spain. It is probably an offshoot of Provençal, and became a literary language between the 14th and the 16th century, attaining its zenith in the *Cants d'amor* and *Cants de mort* of Aurius March. Raymond Lully (d. 1315) and the historians Muntaner and Desclot wrote notable Catalan prose, and Balaguer and Verdaguier are the poets of the Catalan revival which dates from 1859. For language and literature, see Morel-Fatio, in Grober's *Grundriss der romanischen Philologie*.

**Catalani**, ANGELICA (1799-1849), Italian singer, born at Sinigaglia, near Ancona. She made her début as a soprano at Venice (1795), and for some thirty years was almost unrivalled. Her voice was of great power, sweetness, and flexibility, with a compass which extended to G in altissimo. After singing at Lisbon (1801-6), she went to London, where she remained until 1814, when she went to Paris and assumed the direction of the Italian Opera. In 1816 she made a tour through Europe. In 1822 she appeared again in London, and although her voice had lost its former power, she still electrified her audiences. See Ferris's *Great Singers* (1893).

**Catalaunian Fields**, the celebrated battlefield where the confederated peoples of Gallia, under the leadership of Ætius, defeated Attila, king of the Huns, in 451. It is generally considered to be the plain around Châlons-sur-Marne, though some authorities identify it with the plain round Metz, while yet others put it near Troyes.

**Catalectic Verses**, verses in which one of the normal number of syllables is omitted. Verses which contain the complete normal number are acatalectic.

**Catalepsy** is a nervous disorder, characterized in a typical case by loss of movement, of consciousness, and of sensation. Although it may occur in either sex, it is far more common among women than men, and commonest among young women. In cases of hysteria the cataleptic tendency may be traced to a certain definite date and cause. Suddenly, and usually without any premonitory symptom, the condition comes on. The patient falls silently, and becomes rigid in every limb, and at first it is extremely difficult to overcome the resistance of her muscles. She is uncon-

scious, or subconscious, and insensible to pain, and the reflex movements are abolished to some extent. Later, the extreme rigidity of the muscles passes off. The arm, when bent to any position, yields readily, going just as far as it is taken, but not an inch on the patient's own initiative, and the position is retained for many seconds, or a few minutes. In this condition of unconsciousness and flexibility the patient may continue for hours or days, apparently in an ordinary, though deep, sleep, except for the peculiar muscular condition. The breathing is shallow, the heart beats slowly and softly, and the temperature tends to fall rather below normal. The patient may rouse at intervals and relapse, or, suddenly coming to her normal condition, she may show nothing more of a cataleptic tendency. Often the recovery is at once complete. In some cases consciousness returns some time before speech. There may be other departures from the typical case, such as incomplete loss of consciousness, or of sensibility to pain, or of the reflexes. The same condition may occur during hypnosis, or in atonic melancholia, or in katatonia.

**Treatment**.—Between attacks of hysteric catalepsy the patient must be treated as neurasthenic, and attention paid to whatever will improve the general condition and give rest to the nervous system, with, of course, special regard to the exciting cause, if it can be recognized. There are differences of opinion as to the course to adopt during the cataleptic state. There should be no attempts made to arouse the patient. If the condition be prolonged, the patient should be fed with a stomach tube. See Dana's *Text-Book of Nervous Diseases* (1905). The cataleptic state is now and then very well imitated for fraudulent purposes.

**Cataloguing**. Any collection of books, if constantly added to, soon gets beyond the grasp of its collector, and to enable it to be used it becomes requisite that a catalogue be prepared. This is specially true of libraries to which the public has limited or free access. 'A library is not worth anything without a catalogue,' says Carlyle. The catalogue is at every step the guide-board to the reader. It must enable one to find a book of which either the author or the title is known, and it must show all the books the library has by a given author. It must also show what it has on a given subject or in a given kind of literature. There must, therefore, be an author catalogue, in

which should be included titles of anonymous books, and other striking titles. There should also be a subject catalogue, which should include form entries, such as dictionaries, periodicals, poetry, fiction. When these two catalogues are combined into one, giving authors, titles and subjects in a single alphabet, the catalogue is called a dictionary catalogue. For other types of catalogue see under *Definitions* in Cutter's 'Rules,' referred to below. Its simplicity of arrangement and the readiness with which it is comprehended by the average reader have led to a very general adoption of the dictionary catalogue in libraries, though some still separate the author and subject catalogues into two alphabets.

Printed catalogues so quickly become out of date by the addition of new books to the collections they cover that libraries have almost universally adopted the card system. In this the cataloguing is done on cards measuring 12.5 centimetres in length by 7.5 or 5 centimetres in height. These cards are alphabetically arranged in drawers in cases, and new entries are put in place as soon as ready, thus keeping the catalogue constantly up to date. From 1902 to 1906 the Library of Congress furnished other libraries its printed catalogue cards, at rates much below the cost to the libraries for making them; the saving to the libraries of the country using these cards in 1904-5 is estimated as equal to the cost to the Government of the maintenance of the entire cataloguing force at Washington for the year. The earliest English rules for cataloguing were those compiled in 1839 by Sir Anthony Panizzi, J. Winter Jones and three others, a committee of the trustees of the British Museum, for use in making the *catalogue of printed books*; these have been frequently reprinted. In 1852 Mr. C. C. Jewett, of the Smithsonian Institution, published a report on the construction of catalogues of libraries, with rules and examples. In 1870 the Boston Public Library issued a small edition of points to be considered in cataloguing. The United States Commissioner of Education published in 1876, as the second part of the report on *Public Libraries in the United States*, a code of *Rules for a Dictionary Catalogue*, prepared by Mr. C. A. Cutter, a fourth edition of which, rewritten, was issued in 1904. Through the educational influence of these rules, and of others based upon and more or less closely following them, published by the English

and American Library Associations, cataloguing has become a well-defined art. 'No rules can take the place of experience and good judgment,' but the best results of both are embodied in these rules. The code issued by a committee of the American Library Association is more specially designed for use in learned rather than in public libraries.

In 1876, also, Mr. Melvil Dewey, late New York State Librarian, devised and published a scheme for the decimal classification of books in libraries. By this system the field of knowledge is divided into nine main classes, numbered 1 to 9, general works falling into no one of these classes, being assigned to a tenth numbered 0. Each class is similarly subdivided into ten divisions, each division into ten sections, and so on decimally as far as may be needed. Subjects are arranged in simple numeric order, constituting a class list which brings books on the same subject together on the shelves, and in the card catalogue as well, with books on cognate subjects in the immediate vicinity. As a relative location scheme for shelf classification, it admits of indefinite expansion and has no superior; but to make use of the card catalogue one must first consult an alphabetical index of subjects to find the class number to which the book may have been assigned. It is the most generally adopted of any scheme of classification, but many libraries (that of Columbia University among them) arrange their card catalogues in the drawers in the simpler alphabetical order of the dictionary catalogue. Mr. Cutter has also published an expansive classification for the use of libraries.

In 1893 the United States Commissioner of Education published a *Catalogue of the A. L. A. Library* of books exhibited at the World's Columbian Exposition in Chicago. The books were arranged in this catalogue on both the decimal and dictionary plans, and given the call (shelf) numbers of both the Dewey and Cutter classifications. An enlarged edition of this catalogue, covering eight thousand selected volumes for a popular library, with notes, was published by the Library of Congress in 1904. This catalogue may be followed as a model for cataloguing and for classification, as well as be used in selecting books for a library, public or private. Consult C. A. Cutter's *Rules for a Dictionary Catalogue* (Washington, 1904); *Expansive Classification* (Northampton, 1904); M. Dewey's *Decimal Classification and Relative Index*

(Boston, 1904); *Card Catalogue Rules* (1894); E. C. Richardson's *Classification, Theoretical and Practical* (New York, 1901).

**Catalonia**, an old principality and province in the extreme northeast of Spain. The Pyrenees form its base, and the Mediterranean Sea and Aragon its east and west sides respectively. The district is mountainous in character. Numerous streams traverse the valleys, and these, together with a well-managed system of artificial irrigation, render Catalonia the leading agricultural district of Spain. The coast-line is bold and rugged. The Ebro, the Llobregat, and the Ter are the chief rivers. The district has since 1833 consisted of the provinces of Gerona, Barcelona, Lérida, and Tarragona, with a total area of 12,483 sq. m., and a pop. (1900) of 1,967,000. Barcelona, the capital, is the second town in Spain; other towns of importance are Tarragona, Gerona, Lérida, Reus, and Manresa. The cork oak gives rise to a great industry, and large quantities of grain are grown, but it is as a manufacturing district that Catalonia has now risen into prominence. It has extensive manufactures of cotton, woollen, and silk goods, laces, leather, and paper. The minerals worked include coal, copper, zinc, lead, and tin.

Catalonia was the Hispania Tarraconensis of the Roman conquerors. In the 5th century it was overrun by the Goths and Alani. It was under Mussulman rule in the 8th century. In 1137 it was joined to Aragon, and the two were in 1479 united to Castile; but the Catalans did not readily submit to loss of independence, and repeatedly revolted. After its conquest by Philip v., in 1714, it lost its separate constitution. The Catalan dialect, more akin to the Provençal of France than to the Castilian of Spain, is still spoken and written.

**Catalpa**. A genus of trees and shrubs (Bignoniaceae), of which the best known is the Southern Indian bean-tree (*C. Catalpa*). It is frequently seen in parks, having an awkward habit of growth, with large limbs and dome-shaped head. Its foliage appears late in the spring, when in cultivation in the north, and consists of broadly ovate leaves, pubescent beneath. The flowers are large, white, mottled with yellow and purple and in showy panicles; the cylindrical fruits are long, slender, brown capsules, drooping from the tree during the winter, like so many enormous string-beans.

**Catalysis**. Certain chemical reactions occur at vastly increased rates in presence of a third substance (often small in quantity),

which itself remains apparently unchanged. This substance is known as the catalytic agent. In the preparation of oxygen from chlorate of potash, the addition of manganese dioxide causes the oxygen to be liberated at a much lower temperature, and much more rapidly. Deacon's process for the manufacture of chlorine is based on the use of cuprous chloride as a catalytic agent, and finely-divided platinum greatly accelerates the combustion of oxygen with hydrogen.

**Catamaran**, a raft used in the East, particularly by the natives of the Madras and Coromandel coasts. It consists of three pieces of wood lashed together, one of which serves as a keel, and the other two serve as sides. The rowers stand or kneel, and paddle with a bamboo, and are able to carry messages or letters (which are put into a kind of leather cap) to ships which are unable to communicate with the shore on account of the surf. These craft, which sometimes carry sail, are able to live in almost any sea. When cross planks are fitted, cargo, and even ordnance, can be shipped or landed.

Catamaran of the Coromandel Coast.

A catamaran (double boat) was at one time a form of pleasure and racing boat in U. S. waters; but few are now seen. Steam catamarans have been constructed, but have never been successful.

**Catamarca**, an Andean prov., Argentine Republic, bounded on the n. by Los Andes and Salta, on the e. by Tucuman and Santiago del Estero, on the extreme s.e. corner by Córdoba, on the s. by La Rioja, and on the w. by Peru. Area, 47,531 sq. m. The mountainous portion of the province is barren, but the soil is fertile. Live stock, cotton, grain and fruits are produced, and there are deposits of copper. Gold, silver, lead, graphite and iron are also mined. Pop. (1903) 101,761. Cap. Catamarca.

**Catamarca**, SAN FERNANDO DE. City, Catamarca prov., Argentine Republic, in an Andean valley, 120 m. s.s.w. of Tucuman. It is the seat of a national college and has a Franciscan monastery. It is connected by

rail with Córdoba. It is a trade centre and a shipping point for produce of the region, including cotton, distilled liquors, etc. Pop. (1899) 7,397.

**Catamount**. See PUMA.

**Catanduanes**, isl., Albay prov., Philippines, separated from the e. coast of Luzon by Maqueda Channel. Area, 704 sq. m.; 17 dependent isls. 10 sq. m. Three mountain systems radiate from a central peak, Mt. Catilamong, to the n., s. and s.w. There are several rivers, and the soil is fertile. Abaca, rice, sesame, corn, cotton, indigo, cocoanuts and fruits are grown. Gold dust and nuggets are gathered by the natives in the streams, and livestock raising and fishing are important industries. Birac, the chief town, is 225 m. e.s.e. of Manila. Pop. (1903), all civilized, 39,288.

**Catania**. (1.) Province of Italy, occupies the middle of the e. side of Sicily. Mount Etna fills its n.e. quarter, and s. of it is the fertile plain of Catania, drained by the Simeto. Behind these two regions the country is mountainous (2,250 to 4,000 ft.). It yields wheat and olives, as well as wine

S. Italy; occupies the middle of the Calabrian Peninsula, and previous to 1871 was called Calabria Ulteriore II. The mountainous parts (La Sila) are mostly covered with forests, and cattle-grazing is one of the chief occupations. Corn, wine, olives, fruits, and silk are the principal products. Area, 2,030 sq. m. Pop. (1901) 476,227. (2.) Town and episc. see of Italy, c.p. of above prov.; 110 m. by rail n.e. of Reggio di Calabria. Silk, velvet, and olive oil are the chief manufactures. Pop. (1901) 31,824. Both province and town were devastated by the great earthquake and tidal wave of Dec. 28, 1908.

**Cataplastm**. See POULTICE.

Ancient Catapult.

**Catapult**, an engine for hurling projectiles, first used as an implement of war by the ancient Romans. The larger kind was mounted on a strong wooden platform, the trigger or projector was drawn back by ropes, and then held by a catch, while the missile was placed on it prior to letting it fly. By this means very heavy rocks were projected a considerable distance. The smaller implements were carried in the hand, and used for discharging javelins, darts, etc., at close quarters.

**Cataract** is any opacity of the crystalline lens of the eye, with consequent diminution of vision, varying from mere dimness to a total blindness to everything save the difference between light and darkness. Cataract may occur at any age, and from various causes. It may be congenital or juvenile, traumatic (*i.e.* resulting from violence), secondary to other eye-disease, or primary; and it may be senile—*i.e.* resulting from degenerative changes not associated with any definite disease, but apt to occur after middle age has passed. Senile cataract is usually found in both eyes, though one eye may be much earlier affected than the other. Cataracts are also classified as 'hard' and 'soft'—a distinction which affects the method of treatment. Congenital and juvenile cataracts are soft; senile cataracts are hard. They may be 'stationary' or 'progressive'; there are rare cases of 'retrogressive' cataract, in which spontaneous absorption takes place. The latter are usually, if not always, the result of an involuntary

(40 million gallons annually), fruit (oranges, lemons, etc.), sulphur, and silk and cotton manufactured goods. Chief tn. Catania. Area, 1,917 sq. m. Pop. (1901) 705,412. (2.) Town and episc. see, cap. of above prov., at foot of Mt. Etna, 59 m. by rail s.w. of Messina. A place of residence for Sicilian magnates, the seat of a university (925 students in 1901) and a famous academy of natural sciences; it is also one of the chief Sicilian seaports, exporting sulphur, fruits (oranges and lemons), oil, wine, etc., and importing coal, cereals, and vegetable produce, hides, skins, etc. There is a double harbor (20 to 23 ft. water). Pop. (1901) 149,295. The Greek colony of Catania was founded in 730 B.C. by the Naxians. Hiero took it (476), and settled it anew, with the name of Ætna. The town was inundated by the tidal wave following the great earthquake of Dec. 28, 1908.

**Catanzaro**. (1.) Province of

operation, such as an accidental blow, which ruptures the capsule of the lens, after which the lens becomes absorbed. The immediate cause of cataract is in most cases not known. In congenital cases it tends to be associated with rickets and other disorders of nutrition. In some other cases, particularly in juvenile cataract, which is not congenital, it is the result of an injury, often a small punctured wound. It may also be secondary to degenerative changes which start in other parts of the eye and spread to the lens. It is believed that the structure of the lens renders it peculiarly liable to suffer from slight failure of nutrition.

**Diagnosis.**—When the cataract is advanced, a gray cloudiness of the pupil can be seen with the naked eye; but if it be only incipient, examination with the ophthalmoscope is necessary to detect it. The rate of development varies greatly. From two to three years is considered the average time for a senile cataract to 'ripen'—i.e. to cover the lens and prevent the distinguishing of more than light from darkness.

**Treatment.**—The ultimate treatment of cataract is in most cases operation. Until operation is deemed advisable, the eye can in some cases be made more serviceable by the use of weak 'mydriatics'—i.e. pupil-dilators; in others, specially constructed glasses add to the comfort; in yet others, though rarely, the use of 'myotics'—i.e. pupil-contractors—is of service. Operations are 'discission,' or needling, and 'extraction.' Discission is used for young people only, in whom the cataract is soft. A needle is inserted at the corneo-sclerotic junction, and the anterior surface of the capsule is opened. The substance of the lens is then stirred, until, gradually passing out into the aqueous humor which lies in front of the capsule, it is slowly absorbed. Extraction is performed by making an incision across the upper corneo-scleral margin; the capsule is opened anteriorly, and the lens lifted and pressed out. Both operations are, of course, performed with every antiseptic precaution.

Secondary cataracts may arise after operation, and are generally attributed to degenerative changes in the capsule, which is not removed with the substance of the lens. It has been suggested (Bates, in *N. Y. Med. Jour.*, July 7, 1900) that secondary cataract is due not to the capsule, but to fibrinous fluid, which takes the place in the anterior chamber of the aqueous humor removed by the operation. Bates advises the immediate in-

jection of normal saline solution into the anterior chamber after the operation, and the suturing of the wound.

**Catarman**, pueb., Samar, Philippines, 55 m. N.N.E. of Catbalogan, at the mouth of a river on the N. coast. There is a good anchorage here. The town was destroyed in 1871 by a volcanic eruption from low land on the w. In the next four years this volcano attained a height of 2,000 ft. Pop. (1903) 9,994.

**Catarrah** (Gr. 'down-flow'), an early stage in the inflammation of mucous membranes, consisting of increased discharge from their surfaces, as shown in a common cold, which is accompanied by catarrh of the nasal mucous membrane.

**Catasauqua**, bor., Lehigh co., Pa., 3 m. N. of Allentown, on the Lehigh R. and on the Central of N. J., the Lehigh Valley and the Phila. and Read. R. Rs. It is situated in the so-called cement belt and has manufactures of iron and steel, cars, silk, shoes and tobacco. Pop. (1910) 5,250.

**Catawba River**, a river of N. C. and S. C., which unites with the Congaree to form the Santee R. Below Rocky Mt., S. C., it is called the Wateree. It rises in the Blue Ridge and flows E. to Iredell co., N. C., whence its course is towards the S. Its length to Rocky Mt. is 250 m.

**Catawissa**, bor., Columbia co., Pa., 37 m. W.S.W. of Wilkesbarre, on the l. bk. of the N. branch of the Susquehanna R., on the Pa., the D., L. and W. and the Phila. and Reading R. Rs. It has car works, machine shops, shoe, pulp and paper manufactories, etc. (1910) 1,930.

**Catbalogan**, cap., Samar, Philippines, on w. coast, at river mouth on shore of a bay, 328 m. from Manila. It is a port of call for the Manila steamers, and carries on a large trade in hemp and coconut oil with that city. The anchorage is unsafe during monsoon weather. Pop. (1903) 7,758.

**Cat-bird**, a name applied to two distinct passerine birds—to the American *Galeoscoptes carolinensis*, a member of the thrush family (Turdidae), and to the Australian *Aluredus viridis*, one of the birds of paradise (Paradisidae). The former is one of the American mocking-birds, which have long bills and dull-colored, thrush-like plumage, and takes its name from its mewing call, but also has in spring a most sprightly and varied song. It nests in thickets, and lays dark-green eggs.

**Catch-as-catch-can**. See WRESTLING.

**Catchfly**, a large genus (*Silene*) of the pink family. Some

species are viscid-pubescent, and occasionally entangle stray insects in their hairs. Among the most beautiful cultivated species are *Silene alpestris*, a dwarf, perennial, hardy, white-flowering kind, which blooms in May, and is specially suited for the rock border. *S. pendula* bears pinkish flowers throughout the summer. This species is a hardy annual, very vigorous in habit. *S. acaulis*, the cushion pink, is a dwarf alpine plant, which bears rose-colored flowers in June and July. *S. schaffa* is a Persian species, about five inches in height; it bears purplish flowers in autumn. Certain species are adventive from Europe, as the fragrant, pale-flowered *S. noctiflora*, which blooms at night; the bladder campion (*S. vulgaris*), with inflated, veiny calices; and the small and purple-flowered Sweet William (*S. Armeria*). The wild pink (*S. Caroliniana*) is a common, native catchfly, which is perennial, tufted and very sticky. Its flowers range from white to rose-pink, and although found usually in dry soil, it responds wonderfully to cultivation in better environment. The fire pink (*S. Virginica*) is more slender, and has large crimson flowers. The sleepy catchfly (*S. antirrhina*) opens its pink flowers early for a short time in sunshine. *S. stellata* is a tall, showy catchfly, or starchy campion, which has panicked cymes of white flowers, with fimbriated petals and inflated calices.

**Catching Bargain**, bargain made with an heir, reversioner or expectant, for the purchase of his interest in expectancy or reversion. Under certain conditions the court will grant relief to the heir or reversioner. See REVERSION.

**Catchment Area**, or DRAINAGE BASIN. See RIVER, and WATER-SUPPLY.

**Cateau-Cambrésis**, LE, manufacturing town, dep. Nord, France, 16 m. E.S.E. of Cambrai. The town rose slowly round the ancient palace of the archbishop of Cambrai, now turned into a factory. Textiles are spun and woven, sugar is refined, and the other industries include brewing, metal-founding, and mosaic work. Marshal Mortier was born here. Pop. (1901) 10,451.

**Catechism**, a treatise drawn up for instruction in the form of question and answer. The word has not in itself any exclusively theological reference, but popular custom confines the term to religious works of the required form. The first catechisms were no doubt drawn up for the guidance of catechumens or candidates for Christian baptism, and would be very short. The longer treatises of later date are connected with

special movements for the spread of religious knowledge among the people. Thus, in the 8th and 9th centuries, men like Otfried of Weissenburg in Alsace, and Kero and Notker Labeo of St. Gall, prepared catechisms which were largely used as instruments of popular education. The Waldenses, the Albigenses, the Wycliffites, and the Bohemian Brethren were all active in the production of catechisms. Naturally, a movement like the Reformation was fertile in the same direction. Luther, besides a short Primer (1520), published a Larger and a Smaller Catechism in 1529. A notable catechism was that of Brenz (1527-8). Calvin also issued a Smaller Catechism (1536) and a Larger (1541). Calvin's catechisms have been superseded, even in the Swiss Church, by the Heidelberg catechism, compiled by Casper Olevianus and Zacharias Ursinus (1563). This was revised and authorized by the Synod of Dort (1619), and is accepted by the German and Dutch Reformed Churches at home and abroad. Dissent and reaction from reformed doctrine have also produced catechisms. The Socinians adopted a Larger and a Shorter Catechism at Racow in Poland (1605). The Quakers, besides one attributed to Fox (1660), have that of Barclay (1672). In the Church of Rome a catechism was drawn up by instruction of the Council of Trent, and, after several revisions, was finally accepted in 1566. This was rather a theological treatise than a catechism proper, and has been superseded in popular use by the Longer and Shorter Catechisms of Peter Canisius (1554 and 1556). Other Romanist productions are the catechisms of Bellarmine (1603) and of Bossuet (1687). The *Schema de Parvo*, a summary of Bellarmine's, was sanctioned by the Ecumenical Council of 1870. In the Greek Church, Peter Mogilas, Metropolitan of Kiev, drew up a catechism about 1640; but those now in use are the catechisms of Platon (1762) and Philaret (1839), both Metropolitans of Moscow. In England, the best-known catechism is that which is found in the Book of Common Prayer. It is in two parts, of different dates. The first, containing the baptismal covenant, the creed, the commandments, and the Lord's Prayer, was drawn up in the reign of Edward VI. The latter part, containing the doctrine of the sacraments, was written on the suggestion of James I. at the Hampton Court Conference in 1604. It is attributed to Dean Overall. A Larger Catechism, which seems to correspond to the first part of that now in use, had been published in Edward

VI.'s reign. It was afterward extended (1570) by Dean Nowell. In this form it was thought too long for practical purposes, and accordingly as above stated, the previous Shorter Catechism was supplemented. In Scotland, the best-known catechisms are that of Craig, which was authorized by the Assembly in 1592, and the Larger and Shorter Catechisms of the Westminster Assembly, authorized in 1648. The Shorter is the only one now in general use. It is a clear and powerful statement of the Calvinist position, often in phrase of great majesty and beauty. In America, catechisms, when used at all, are naturally those of the European churches with which the American bodies are historically connected. See Niemeyer's *Collectio Confessionum* (1840); Schaff's *Hist. of the Creeds of Christendom* (1876).

**Catechu**, PALE; is an extract prepared from *Uncaria gambier*, a climbing shrub found in the Malay Archipelago. It is made from the leaves and young shoots of the plant, and comes into the market in dry cubes about one inch square. It tastes at first bitter and astringent, but afterward sweetish, and is used in medicine as a local astringent in the form of a lozenge, or as a general astringent in diarrhoea; but its chief use is in the dyeing and tanning industries. There is another substance closely related to this, termed Black Catechu or Cutch, which is an extract prepared from the heartwood of *Acacia catechu*, a tree common in India. The latter substance is not used in medicine, but only in dyeing and tanning. To prevent confusion, the term 'gambier' should be given to the former and 'cutch' to the latter.

**Catechumen**, one who is taught by word of mouth. Candidates for baptism were so called by the early Church. They were divided into four classes: (1) *Inquirers*, who were instructed privately; (2) *Audientes*, or hearers, who, being sufficiently advanced, were admitted to the *Missa catechumenorum*, but left after the gospel and sermon (see MASS); (3) *Prostrati*, or *orantes*, or *genuflectentes*, who shared in the worship of the congregation; (4) the *Electi*, or *compentes*, who were ready and desirous to be baptized. Owing to the dread of post-baptismal sin, many persons remained in the third class until the near approach of death.

**Categorical**. A categorical judgment is contrasted as one which 'asserts an actual fact absolutely' with a hypothetical judgment, which 'asserts only the consequence that follows upon a supposition.' On the question whether this distinction is to be

taken as absolute, or only as a distinction between two characters that pertain in varying degrees to all judgments, see B. Bosanquet's *Knowledge and Reality*, ch. i. (1885), and the same writer's *Logic*, vol. i., pp. 94-96 (1888).

**Categorical Imperative**, Kant's technical term to signify the unconditional law of duty as contrasted with a command which is valid only under the supposition of an already accepted end. For example, the categorical law, 'Thou shalt not promise deceitfully,' becomes merely hypothetical if it is obeyed only in order that the agent's credit may not be injured; for the agent's interest is then the really determining ground of his action, and he no longer observes the law simply as a law of duty.

**Category**, a term in logic and philosophy. Its most important special uses are the Aristotelian and the Kantian.

The Aristotelian doctrine of the categories is a classification of the kinds of predicates—*i.e.* of the different kinds of assertions that may be made about a subject. These categories are ten in number, the first and fundamental being that of substance, the others adjectival predicates applicable to a thing or substance—*viz.* quantity, quality, relation, place, time, situation, possession, action, and passion.

Kant uses the term category to signify the conceptions under which, according to his theory, we must think phenomena—*e.g.* phenomena as events in time must be brought under the category of cause and effect. (See KANT.) His table of categories consists of four groups of three each—the categories of quantity (*viz.* unity, plurality, totality), the categories of quality (*viz.* reality, negation, limitation), the categories of relation (*viz.* substance, causality, reciprocity), the categories of modality (possibility, existence, necessity). Kant's categories refer only to phenomena—*i.e.* to sense experience, or, roughly speaking, to the objects of physical science. By later thinkers the term has been extended to cover any fundamental and necessary conception under which reality, whether physical or otherwise, must be thought; and thus Hegel's logic or system of categories is a metaphysic which is universal in its range. (See HEGEL.)

**Catena**, properly VINCENZO DI BIAGIO (c. 1471-1531), Italian painter of the Venetian school, a pupil of Giovanni Bellini. Though a great portrait painter, he also excelled in historical subjects. Later he imitated Giorgione. Typical examples of his

fine portraits are *Count Raymond Fugger*, a patient rendering of pallid flesh (Berlin Museum), and a superb *Knight kneeling before the Madonna* (National Gallery). His religious and historical work may be seen in the Venetian churches, Academy, and Doge's Palace.

**Catenary**, in mathematics, is the curve assumed by a uniform flexible chain or rope when suspended from two points, and hanging freely under the influence of its own weight. Since by suitably varying the distribution of weight along a chain we may make it hang in the form of any assigned curve, which then becomes a special form of catenary, it is usual to distinguish the catenary in which the uniform chain hangs as the common catenary. As a curve it has many interesting properties, being one of the few curves for which the length of arc between two points can be expressed in terms of the positions of the points. Also, the area bounded by the arc, by the vertical lines through the extremities, and by the horizontal line which cuts across them, can be expressed by means of a simple formula. If this horizontal line is drawn at a particular distance below the lowest point of the catenary, it can be shown that the height of any point of the curve above this line is the length of chain whose weight would be equal to the tension in the hanging chain at the point chosen. Then the area bounded by the vertical line through the lowest

Catenary.  
cc, Common catenary.

point of the catenary, and the vertical line through the extremity of any chosen arc, is equal to the length of arc multiplied by the height of the higher extremity of the arc above the horizontal line. This particular horizontal line is called the directrix. If the chain is loaded in such a way that the weight of any part is proportional to the horizontal projection of the part, the chain will hang in a parabola. This is the particular form of catenary assumed by the supporting chains of a suspension bridge, in which the load is practically the roadway distributed uniformly in a horizontal direction, the weight of the supporting chain being negligible in comparison.

**Caterpillar**, the name given to the larvæ of lepidopterous insects. A caterpillar is a somewhat wormlike animal, with a distinct head, bearing strong mandibles,

simple eyes, and short antennæ; a thorax, consisting of three segments, each furnished with a pair of jointed legs; an abdomen, consisting of ten segments, though some of these may be indistinct, and bearing a variable number of unjointed 'false legs' or 'prolegs.' The last of these are specially modified, and are called claspers. Internally the caterpillar displays a capacious stomach, rudimentary generative organs, and the peculiar silk-glands which open on the head and spin the threads used in forming the cocoon. Caterpillars are usually more or less sedentary—compare the imperfect sense organs and absence of wings—and as they are exceedingly voracious and expend but little energy, they store up within their bodies large supplies of food. It is these supplies which are used up during the process of conversion into the adult (*imago*); and as the adult takes but little food, it is they also which provide the stores necessary for the production of the numerous eggs. But the caterpillar's remarkable powers of assimilation render it peculiarly liable to the attacks of parasites (ichneumons), which, by reason of the reserves within the body, can go on living at the expense of their host, without producing any apparent injury during larval life. When the caterpillar's powers of assimilation are reached it ceases to feed, and passes into the pupa state. As the parasites have devoured the stores which should have supported it during this quiescent period, death ensues. Numerous caterpillars are destroyed in this way, so that the ichneumons are really useful insects in that they keep down the numbers of their destructive hosts.

Caterpillars are very variable in color and markings, and while some, such as the common cabbage caterpillars, are apparently only colored by half-digested food, others are remarkable for their bright tints or their elaborate armature of hairs or spines. Those—such as the larvæ of the clothes-moth (*Trichophaga*) and the codlin-moth (*Carpocapsa*)—which live concealed are often very maggot-like, though structurally caterpillars. For American caterpillars, see authorities mentioned under MOTHS and BUTTERFLIES; for process of rearing caterpillars in confinement, see Soule's *Caterpillars* (1901).

**Catesby**, MARK (?1679–1749), English naturalist and F.R.S., born and died in London. After travelling in N. America (1710–19) he returned to England with a collection of plants. Again he travelled to Carolina (1722–6). He published *Natural History of Carolina, Florida, and the*

*Bahama Islands, with Observations on the Soil, etc.* (1731–43), with colored figures drawn and etched by himself. These were the first published drawings of North American animals.

**Catesby**, ROBERT (1573–1605) English conspirator, born at Lapworth, Warwickshire. In 1604 he joined Thomas Winter and Guy Fawkes in the Gunpowder Plot (Nov. 4, 1605), and escaping to Holbeach, Staffordshire, was there shot. See GUNPOWDER PLOT, and Jardine's *Narrative of the Gunpowder Plot* (1857).

**Cat-fish** (Siluridæ), a family of bony fishes in which the skin is either naked or furnished with bony plates; barbels are present about the mouth, and the air-bladder, when present, communicates with the ear by means of auditory vesicles. The skeleton shows many peculiarities: for example, the pectoral girdle is modified so as to give strength and mobility to the spine with which the pectoral fin is usually armed. The family is largely represented in America, especially in warm latitudes, where these fish live mainly in sluggish waters, and feed near the bottom. Some reach a large size, and are liked as food, but most of them are moderate or small in size, and regarded as uneatable or of little value. Some notable foreign cat-fishes are the 'wels' (*Silurus glanis*) of the Germans, a large fresh-water fish, found in certain of the rivers of Europe; the 'electric cat' (*Malapterurus electricus*) of Africa, the species of *Doras* and *Callichthys* from South America, and others.

**Catgut**, the material used for violin, guitar, and harp strings, for stringing rackets, and other similar purposes, is commercially obtained, not from the small intestines of the cat, but from those of the sheep, and also, for the rougher purposes, from those of the horse. The intestines are cleaned, then soaked in water until the external membrane can be scraped off; this, which the French call *filandres*, is used for rackets. The inner membrane of the small intestines is steeped in an alkaline solution of potash, and is then drawn through holes in a metal plate or thimble, to regulate the thickness and to insure the circular section.

**Cathari** (from Gk. *katharos*, 'pure'), dualistic heretics of the middle ages, who perpetuated the teachings of the Manichæans and Paulicians, if they did not owe their origin directly to them. Their name seems to have been assumed because of a supposed purity of doctrine and life, but was applied to them by their opponents in irony (*cf.* the English 'Puritans'). They appeared near

### TYPES OF CATERPILLARS.

1. *Papilio*. 2. *Polyommatus Adonis*. 3. *Thanaos*. 4. *Hipparchia*. 5. *Odonestis*. 6. *Callimorpha*. 7. *Deilephila* (*euphorbia sphinx*). 8. *Acherontia* (*death's-head moth*). 9. *Acronycta Psi*. 10. *Cossus* (*wood-eating goat moth*). 11. *Trochilium* (*a burrower*). 12. *Vanessa*. 13. *Argynnis*. 14. *Polyommatus alsus*. 15. *Thecla*. 16. *Abraxas*. 17. *Cerura* (*sphinx*). 18. *Ourapteryx* (*geometrid, or measuring-worm*).

Turin about 1035, and several were condemned at Goslar in Germany in 1052. Before this they had been found in France, whence they spread into Spain and Flanders. The Crusaders found them in Eastern Europe in the twelfth century, where they were known as *Bogomiles* (q.v.); probably they originated in the Balkan Peninsula. Under the name of *Patarenes* they became prominent in Northern Italy, and spread thence over the entire country and Sicily, but disappeared about 1400. In Germany they are not mentioned after 1231. They attained to no importance in England, though a few are known to have been there in 1159 and again in 1210.

The Cathari held that matter is intrinsically evil and the source of all evil; that men's bodies are evil and the product of the evil principle. They accepted the New Testament, but in a translation differing considerably from the Vulgate, and held certain apocryphal books in great esteem. They aimed by an ascetic life to free themselves from the power of the body; and the more advanced abjured all animal food as well as wine and marriage. In France they were confounded with the Albigenses (q.v.).

**Catharine.** See CATHERINE.

**Cartharics.** See PURGATIVES.

**Cathay,** ka-thá', the name given by Marco Polo to the Chinese Empire. It is derived from Khitan or Khitai, which designates several Mongolian tribes who conquered the northern part of China and ruled over it till 1123. See CHINA.

**Cath'cart,** suburb of Glasgow, Scotland.

**Cathcart,** SIR GEORGE (1794-1854), British general, son of Sir William Cathcart (q.v.). He joined the army in 1810 and served with the Russians as aide-de-camp in the campaigns of 1813 and 1814, and under Wellington at Quatre Bras and Waterloo. From 1818 to 1846 he served in Prussia and in Canada, in 1846-51 was deputy-lieutenant of the Tower of London, and in 1852 was appointed governor and commander-in-chief of the Cape of Good Hope, where he brought to a close the Kaffir War. Appointed adjutant-general (1853), he served in the Crimea and was killed at Inkerman (November, 1854). He is the author of *Commentaries on the War in Russia and Germany in 1812-13* (1850).

**Cathcart,** SIR WILLIAM SCHAW (1755-1843), British general and diplomatist, first Earl Cathcart and Baron Greenock, was born in Petersham. He fought in the Revolutionary War in America (1777-80), in Flanders and Germany (1805), and

was created Viscount Cathcart in 1807. He commanded the Copenhagen expedition (1807) and became ambassador to Russia (1813-20).

**Cathe'dral,** primarily the throne of a bishop, placed in the apse of his church, called in Greek his *kathedra* ('seat'); hence the church was designated as a cathedral church, and in the tenth century the noun cathedral appears, meaning the *seat* of a bishop. Cathedrals vary in rank with the dignity of the see to which they belong, and may be episcopal, archiepiscopal, metropolitan, or patriarchal.

In the United States there are cathedrals in all the Roman Catholic and in most of Protestant Episcopal dioceses. The finest cathedral in the country is that of St. John the Divine (P.E.) on Cathedral Heights, New York City. The Roman Catholic St. Patrick's Cathedral (q.v.), New York City, was begun in 1858 and completed in 1889 at a cost of over \$2,500,000.

The following are the chief cathedrals of European countries:

**Italy:** Bari, Bologna, Como, Ferrara, Florence, Lucca, Milan, Modena, Orvieto, Palermo, Piacenza, Pisa, Siena. For St. Peter's at Rome see the article SAINT PETER'S.

**Germany:** Bonn, Cologne, Freiburg, Mainz, Ratisbon, Speyer, Ulm, Worms.

**Austria-Hungary:** Vienna.

**France:** Amiens, Beauvais, Bourges, Chartres, Laon, Lyons, Notre Dame at Paris, Noyon, Orleans, Le Puy, Poitiers, Rheims, Rouen, Strassbourg, Tours, Troyes.

**Spain:** Barcelona, Burgos, Granada, Leon, Salamanca, Seville, Tarragona, Toledo.

**Belgium:** Antwerp, Brussels, Ghent, Louvain, Malines, Tournai.

The following list gives the Established Church cathedrals of *England and Wales*. See separate article on ST. PAUL'S CATHEDRAL, London.

Canterbury (Arch-bishop)	Manchester
York (Archbishop)	Monmouth
London (St. Paul's)	Newcastle
Durham	Norwich
Bangor	Oxford
Bath and Wells	Peterborough
Birmingham	Ripon Minster
Bradford	Rochester
Bristol	St. Albans
Carlisle	St. Asaph
Chelmsford	St. David's
Chester	St. Edmundsbury
Chichester	and Ipswich
Coventry	Salisbury
Ely	Sheffield
Exeter	Sodor and Man
Gloucester	Southwark
Hereford	Southwell Minster
Lichfield	Swansea and Brecon
Lincoln	Truro
Liverpool	Wakefield
Llandaff	Winchester
	Worcester

For further information see articles on the cities mentioned. For the clergy of a cathedral, see CANON; CHAPTER; DEAN. For cathedral architecture, see ARCHITECTURE.

Consult F. H. Allen's *The Great Cathedrals of the World*; Wilson's *French Cathedrals*; Pratt's *Cathedral Churches of England* (1910); Gade's *Spanish Cathedrals* (1911).

**Cathelineau** ká't' - lēnō, JACQUES (1759-1793), French insurgent general, was born in Pin-en-Mauges. An ardent royalist, he became leader of the Vendéans, put himself at the head of a handful of stubborn recruits, and became famous for his military exploits, the greatest of which was the storming of Cholet. As a commander in the Revolution, he took Nantes, but was mortally wounded by a musket ball, and his troops were dispersed.

**Cath'er,** WILLA SIBERT (1876- ), American author, was born in Winchester, Va. She was educated at the University of Nebraska (B.A., 1898; LITT.D., 1917), and was granted the honorary degree of LITT.D. by the University of Michigan (1924). From 1906 to 1912 she was associate editor of *McClure's Magazine*. Her publications include: *April Twilight* (1903); *The Troll Garden* (1905); *Alexander's Bridge* (1912); *The Bohemian Girl* (1912); *O Pioneers* (1913); *The Song of the Lark* (1915); *My Antonia* (1918); *Youth and the Bright Medusa* (1920); *One of Ours* (Pulitzer prize novel, 1922); *A Lost Lady* (1923); *The Professor's House* (1925); *My Mortal Enemy* (1926); *Death Comes for the Archbishop* (1927).

**Catherine,** kath'er-in, St., the name of several saints in the Roman Catholic Church. (1) ST. CATHERINE, virgin and martyr, commemorated Nov. 25, is said to have been of royal parentage, and to have lived at the end of the third century. She was martyred at Alexandria under the Emperor Maxentius in 307 or 312, being bound to a spiked wheel. Hence the *Catherine wheel*, with which she is commonly represented. She is one of the most highly honored saints in both the East and the West, and her legend has an important place in art. She is the patroness of philosophers and learned schools. (2) ST. CATHERINE OF SWEDEN, abbess of Wadstena (died 1381), commemorated on March 22. (3) ST. CATHERINE OF BOLOGNA, abbess of the convent of St. Clares, Bologna, who died in 1463, commemorated March 9. (4) ST. CATHERINE OF GENOA, noted for her devotion to the sick, especially during the plague

of 1497–1501. She died in 1510 and is commemorated March 22. (5) **ST. CATHERINE DE RICCI OF FLORENCE** (1522–1590), entered the Dominican nunnery of St. Vincent at Prato, commemorated Feb. 13. (6) **ST. CATHERINE OF SIENNA** (1347–80), one of the most famous saints of the Dominican Order, which she entered in early youth. She was a mystic and ascetic who practised the most extreme self-mortifications, believed that she saw visions and had the gift of prophecy, and claimed to be the bride of Christ and to bear the stigmata of his wounds on her body. She played a part in the politics of her day, and the return of the Pope from Avignon to Rome (1377) may be partially ascribed to her influence; the Florentines used her services in their negotiations with Gregory XI. She was canonized by Pope Pius II. (1461); her day is April 30.

**Catherine I.** (c. 1680–1727), wife of Peter the Great (q.v.), and empress of Russia, was a peasant's daughter, and married a Swedish dragoon. She afterward attracted the notice of the Emperor, and after being for some years his mistress, was privately married to him in 1707, the marriage being publicly avowed in 1711. Catherine was solemnly crowned in 1712, and on the death of Peter in 1725, she was acknowledged Empress of All the Russias.

**Catherine II.** (1729–96), empress of Russia, daughter of a Prussian field marshal, was born in Stettin, and selected by the Empress Elizabeth in 1745 as the wife for the heir to the Russian throne. Her husband, on his accession to the throne in 1762, endeavored to divorce her, but Catherine, who had won the favor of the clergy and the army, was able to organize a conspiracy against him, which ended in his being dethroned and murdered in 1762.

Becoming sole ruler, Catherine governed her empire with great energy, her reign being second only to that of Peter the Great in importance. She organized the administration of the country, dividing it into fifty governments (provinces) in 1775; amended the taxation; created banks; encouraged agriculture (she introduced into Russia the cultivation of potatoes); attracted foreign colonists, especially Germans; and founded towns which bear her name. The army was reorganized, and its discipline improved. In 1785 she regulated the privileges of the nobility, and the bourgeoisie were given a special status in the organization of the municipalities. She founded a college for surgeons, as well as

hospitals (especially the famous hospitals in Moscow) and military schools. She endeavored also, at the beginning of her reign, to promulgate a general code of laws. She sought, but in vain, to introduce into Russia a complete system of education. She founded the Academy, and herself wrote several comedies. In all her reforms she was animated by the spirit of the French philosophers of the eighteenth century, being in close touch through correspondence with Grimm, Voltaire, and others; while she attracted Diderot to St. Petersburg.

The prodigalities of Catherine's numerous favorites roused bitter discontent, and several pretenders appeared, claiming to be Peter III. (e.g., Pugacheff). Catherine waged war with Turkey (1772 and 1792) and with Sweden (1790), and after each of these, as well as through the successive partitions of Poland, added to the extent of her empire. Putting aside her loose private life and her numerous favorites—among the earliest being Stanislas Poniatowski, last king of Poland, and among the latest Potemkin—she fully deserves the title of "Great" which has been bestowed upon her, though in her last years the excesses of the French republic filled her with distaste for the liberal ideas of her earlier life.

See **RUSSIA, History**. Consult W. Tooke's *The Life of Catherine II.*, Capefigue's *La Grande Catherine*; Bury's *Catherine II.* (1900); Waliszewski's *The Romance of an Empress*; Sergeant's *Courtships of Catherine the Great*; Gribble's *The Comedy of Catherine the Great* (1912). Anthony's, *Catherine the Great* (1926).

**Catherine Archipelago.** See **ALEUTIAN ISLANDS**.

**Catherine de' Medici**, de mā'de-chē (1519–89), queen of France, was born in Florence. She was married to Henry, Duc d'Orléans, afterward Henry II. of France, but played no great part in French politics till 1559, when the first of her three sons, who all ruled over France, ascended the throne as Francis II. Opposed to her she found two parties, each as strong as the crown—the Guises and the ultra-Catholics on the one hand, and the Protestants, under Henry of Navarre, on the other. For the Protestants she had no liking, as the doctrines of Calvin were not favorable to absolutism, at which she aimed; but none the less she entered into an alliance with them against the Guises, until the Treaty of Amboise (1563) showed that they had become too strong. She then entered into an alliance with Spain and the Guise party for the extirpation of her-

etics, which resulted in the Massacre of St. Bartholomew (see **BARTHOLOMEW, MASSACRE OF Sr.**). During the reign of her second son, Charles IX. (1560), and still more during the reign of her third son, Henry III. (1574), she was virtual ruler of France. Her policy was Italian in its shiftiness, and she probably injured the royal cause by oversubtlety; but in spite of this, and in spite of her heartlessness and cruelty, she tided the kingdom over a period of grave difficulty. See **FRANCE, History**. Consult Sichel's *Catherine de' Medici*; *Lettres de Catherine de' Medici* (ed. De la Ferrière, 6 vols.).

**Catherine of Aragon**, (1485–1536), first wife of Henry VIII. of England, was the youngest child of Ferdinand and Isabella of Spain. She was first married to Arthur, eldest son of Henry VII., in 1501, but was soon left a widow; and in 1509, by a papal dispensation, was married to her brother-in-law, afterward Henry VIII. (q.v.). Though he fell in love with Anne Boleyn in 1522, it was not till 1529 that Henry began to entertain doubts of the legality of the papal dispensation which had enabled him to marry Catherine and prevented him from marrying his mistress, Anne Boleyn; but since the Pope proved obdurate, and would not decree a divorce, Henry VIII. broke with Rome, and Cramer in 1533 declared the parties no longer man and wife. Consult Hume's *Wives of Henry VIII.*

**Catherine of Braganza**, (1638–1705), queen-consort of Charles II. (q.v.) of England, daughter of John, duke of Braganza (afterward king of Portugal), and Louisa de Gusman, daughter of the Duke of Sidonia. She married Charles in May, 1662, and brought him the island of Bombay as part of her dowry. She resided in England until 1692, when she returned to Portugal.

**Catherine of France**, or OF VALOIS (1401–38), daughter of Charles VI. of France. In 1420, in accordance with the Treaty of Troyes, she became the wife of Henry V. of England. Her second marriage (1423) with Owen Tudor gave rise to the Tudor line of English sovereigns.

**Catherine of Sienna, St.** See **CATHARINE, ST.**

**Catherwood**, MARY HARTWELL (1847–1902), American author, was born in Luray, O., and received her education at the Granville, O., female college. She then removed to Newburgh, N. Y., and began to write for various periodicals. In 1887 she was married to James S. Catherwood and removed to Illinois. She wrote a series of historical novels

depicting the customs and manners of the French Canadians, including *The Romance of Dollard* (1889), *The Story of Tonty* (in which La Salle figures), and *The Lady of Fort St. John*. She gives delightful pictures of the district around Hoopston, Ill., where she lived, in *Old Kaskaskia* (1893), and *The Spirit of an Illinois Town* (1897). Her more purely historical works consist of *The Days of Jeanne D'Arc* (1897), and *Heroes of the Middle West* (1898).

**Cath'eter**, a tube, formed of one of several different materials, and made in various sizes, for introduction, e.g., into the bladder for the purpose of removing urine, or into the Eustachian tube when obstruction is suspected there. The Eustachian catheter is always rigid, curved for introduction through the nose, and made of silver or silver plated. Air is forced through it into the Eustachian tube, and in that way the tube is kept open during catarrh, or reopened (if possible) when inflammation has brought its walls together. Catheters for drawing off urine may be rigid, or of different degrees of flexibility, according to their material, from the stiff silver instrument to that made of soft rubber, with intermediate degrees of flexibility in those made of coated silk webbing, celluloid, and gum elastic. The flexible varieties are softened by hot water, so that they can be bent to the desired curve before use; and a wire stylet preserves the curve until the instrument has been introduced, after which the stylet is withdrawn.

**Cath'etom'eter**, an instrument of precision for the accurate measurement of small vertical displacements or differences of height. It consists of an upright bar, which must be adjusted to a truly vertical position, and on which a telescope, kept always parallel to itself, moves up and down. The difference of level of two observed points is shown on the vertical scale engraved on the upright bar, the final refined measurements being made by means of the cross wires and micrometer eyepiece of the telescope. As an illustration of the use of one form of cathetometer, we may refer to the determination of the index error and the error of capillarity in standard barometers. The barometer to be tested is placed in a vacuum chamber alongside a standard, and its indications are observed with the cathetometer and compared with the measurements as given by the standard.

**Cath'ode**. See ANODE; ELECTROLYSIS.

**Cathode Rays**. See VACUUM TUBES.

**Catholic Apostolic Church**. See IRVING, EDWARD.

**Catholic Church**. The term catholic literally signifies 'universal.' It was first employed from about 160 A.D. to mark the difference between the orthodox 'universal' Christian church and heretical bodies. The Church of Rome has always laid claim to the title, on the ground that it is the only pure channel of the faith. For a full account of the Church of Rome, see the article ROMAN CATHOLIC CHURCH.

**Catholic Emancipation**. In Protestant countries, after the Reformation, penal regulations, and in some cases civil disabilities, were imposed on Roman Catholics. For instance, the celebration of the mass was in England felony in a foreigner, and high treason in a native. In both England and Ireland Roman Catholics could not purchase land, and where they held it by inheritance could be summarily displaced by the nearest heir, being Protestant; and Roman Catholics were not deemed fit to act as guardians even of Roman Catholic children.

The earlier measures taking the education of the children of Roman Catholics out of their parent's hands fell into abeyance in the seventeenth century; but no formal proposal was made till 1780 to remove even the more monstrous of these penal disabilities. In that year Parliament passed a bill freeing from the more oppressive disabilities those Roman Catholics who were prepared to take a test oath in which, among other things, the temporal jurisdiction of the Pope in England was denied. Further relief was granted in 1791, and extended to Scotland in the following year. In Ireland, where these laws were carried to the greatest extreme, Grattan moved for repeal in 1780, and the Irish Rebellion of 1798 was largely due to continued enforcement of them. A certain amount of logical force had been given to the demand for repeal by the concessions which were made by the Treaty of Paris (1763) to the French Canadians, who consequently enjoyed full civil rights which were denied to native Roman Catholics at home.

A Roman Catholic association was formed in Ireland in 1824, and Daniel O'Connell lent to the agitation the magic of his eloquence. In 1829 the Duke of Wellington at last introduced a measure which threw open to Roman Catholics the Houses of Parliament and most public offices. Many of the minor restrictions which even then remained have since been removed. Roman Catholic bishops have been tac-

itly allowed to assume territorial designations. On the coronation of Edward VII. the Coronation Oath came under discussion, but nothing was done. In 1911, however, on the accession of King George, a form of oath was devised less offensive to the susceptibilities of Catholic subjects (see CORONATION). As the law stands, the sovereign, the regent (when there is such), the lord chancellor, and the lord high commissioner to the Church of Scotland must not be of the Roman Catholic faith. See TEST ACTS.

**Catholic Epistles**, or GENERAL EPISTLES, a title given to the seven letters in the New Testament traditionally associated with the names James, Peter (2), John (3), and Jude, and intended to indicate a feature which, common to them all, distinguishes them from the Epistles of Paul—viz., their being addressed, not to any particular church or individual, but to Christians at large.

**Catholic Knights of America**, founded by Archbishop Feehan, when bishop of Nashville, in 1877, is a benefit society for Roman Catholics in the United States. It provides them with the usual advantages of fraternal organizations, and women are admitted to membership on the same terms as men. There were in 1916 27 State councils, 513 subordinate councils, and 18,542 members. Benefits dispersed in last fiscal year, \$558,979. Supreme secretary, Henry Siemer, St. Louis, Mo.

**Catholic League**, formed by the Catholic princes of Europe at Munich in 1609 to counteract the Evangelical Union formed by the Protestant princes in the previous year. Maximilian, duke of Bavaria, led the League, and Frederick IV., elector palatine of the Rhine, led the Union, which became very powerful after its alliance with Henry IV. For a time war was imminent, but the murder of the French king in May, 1614, left it too weak to attack.

**Catholics, Old**. See OLD CATHOLICS.

**Catholic Summer School of America**, founded 1892, is an educational institution modelled on the Chautauqua summer school, which meets every year from July to September at Cliff Haven, on Lake Champlain, New York. It is an offshoot of the Catholic Education Union, and gives the Roman Catholic point of view in its popular lectures on many subjects. Reading circles and study clubs continue the work of the School through the year. The School publishes *Mosher's Magazine*.

**Catholic Truth Society**, established in England in 1872 to as-

sist both Roman Catholics and Protestants in obtaining a better knowledge and practice of the Roman Catholic Church by disseminating suitable works of instruction and devotion. Organizations on similar lines have been established in many other countries, including the United States.

**Catholic University of America**, a Roman Catholic institution of higher education, located in Washington, D. C., was incorporated in 1887 with the approval of Pope Leo XIII. It includes graduate and undergraduate courses, and is organized in five faculties—theology, law, philosophy, letters, and science. The government rests with a self-perpetuating body of trustees chosen from bishops, clergy, and laity. The archbishop of Baltimore is the perpetual chancellor, exercising his administrative functions through a rector appointed every six years by the Holy See.

Affiliated with the University are St. Paul Seminary in St. Paul, Minn., and St. Paul College, the Marist College, Holy Cross College, the College of the Holy Land, St. Austin's College, College of the Immaculate Conception (Dominicans), the Oblates College, the Apostolic Mission House, Trinity College for Women, and the Catholic Sisters College, all in the District of Columbia. Summer schools are conducted in Washington and in Dubuque, Ia. In 1916 the University grounds covered 213 acres, and the property of the University was valued at \$3,500,000. There were 75 teachers, and 554 students, of whom 144 were ecclesiastics; the library comprised 100,000 volumes.

**Catholikos**, a title which seems to have been applied to the superintendent-general of missions, or of churches, on and beyond the borders of the Roman empire. It is also the title of certain dignitaries of the Armenian Church.

**Catiline** (CATILINA or CATALINA, LUCIUS SERGIUS), born about 108 B.C. He was in his youth a zealous supporter of Sulla. He was praetor in 68 B.C., and governed Africa the next year. In 63 B.C. he formed a conspiracy to secure the government, and is said to have plotted the murder of the consuls in 65 B.C., only failing by giving the signal too soon. In 63 the conspiracy assumed more dangerous proportions; but Cicero denounced (Oct. 21, 63) Catiline and drove him from Rome. His accomplices were betrayed and executed in the city; and he fell at the head of his disorderly forces at Pistoria in Etruria, in a battle against Antonius, Cicero's colleague in the

consulship. He had courage and ability, but otherwise displayed the worst vices of the Roman character. Ibsen has idealized him in an early drama. Consult E. S. Beesly's *Catiline, Clodius, and Tiberius*.

**Cat Island**. See BAHAMAS.

**Catkin** (*amenium*). Although the vegetative growth of all inflorescences tends to be more or less shortened and compressed in consequence of their reproductive purpose, we have this peculiarly manifested in the catkin, which is a crowded spike or tuft of small unisexual flowers with reduced scale-like bracts. Examples are found in the willow, hazel, oak, birch, alder, etc. In some, as in the hazel and oak, the male flowers only are in catkins, the female catkin of the flower being reduced to a few brown scales, while the female flowers of the oak are solitary, each on its own branchlet.

**Catlettsburg**, city, Kentucky, county seat of Boyd county, on the Ohio River, and the Chesapeake and Ohio Railroad; 150 miles northeast of Frankfort. It has flour and saw mills, machine shops, and potteries. Pop. (1900) 3,081; (1910) 3,520.

**Catlin**, GEORGE (1796-1872), American painter and writer, was born at Wilkesbarre, Pa. He studied for the law, but soon turned to drawing and painting. In 1832 he went to the Far West to study the American Indians, and spent the next eight years among them, painting portraits of individuals (not less than 470 full length) and pictures illustrative of life and manners, most of which are now in the National Museum at Washington. In 1862-7 he travelled in South and Central America, and lived in Europe until 1871. His works include: *Manners, Customs, and Conditions of the North American Indians* (1841); *The North American Portfolio* (1844); *Notes of Eight Years in Europe* (1848); *Last Rambles Among the Rockies and Andes* (1868). Consult *George Catlin; My Life Among the Indians* (ed. by M. G. Humphreys, 1909).

**Catlinite**, or pipestone, an indurated clay shale occurring as a narrow seam in the heavily bedded quartzites of Southwestern Minnesota.

**Catmint**, or CATNIP (*Nepeta*), a genus of hardy labiate plants with a five-toothed tubular calyx, a corolla tube longer than the calyx, and its two front stamens shorter than the others. *N. Cataria*, common in North America, has hoary foliage and is very aromatic; its flowers, produced in late summer, are white with purple dots, and are borne in dense axillary whorls. Its peculiar fragrance is attractive to cats.

**Catnip**. See CATMINT.

**Ca'to**, DIONYSIUS, is the name prefixed to a little volume of moral precepts in verse, which was a great favorite during the Middle Ages, but the author of which is unknown. Its usual title is *Dionysii Catonis Disticha de Moribus*. It begins with a preface addressed by the supposed author to his son, after which come fifty-six injunctions. Next follow 164 moral precepts in dactylic hexameters. The book was early translated into most of the Western languages. An English version was printed by Caxton.

**Cato**, MARCUS PORCIUS (234 B.C.-149 B.C.), frequently surnamed CENSORIUS or CENSOR, also SAPIENS ('the wise'), and afterward PRISCUS or MAJOR—to distinguish him from his great-grandson, Cato of Utica—was born at Tusculum, and was brought up on his father's farm in the Sabine country. He made his first campaign in his seventeenth year, distinguished himself at the capture of Tarentum (209), at the defeat of Hasdrubal on the Metaurus (207), and in the later years of the Second Punic War. At the same time he had been making himself a reputation as an orator and statesman. He became quaestor in 204, served under the pro-consul Scipio Africanus in Sicily and Africa, was aedile in 199, and praetor the following year, when he obtained Sardinia as his province. In 195 he was raised to the consulship. Spain fell to him as his province, and here he showed such vigor and military genius in crushing a formidable insurrection that in the following year he was honored by a triumph. In 191 he served in the campaign against Antiochus, and to him the great victory won at Thermopylae was mainly due. He now turned himself strenuously to civil affairs, and strove with all his might to stem the tide of Greek refinement and luxury, and advocate a return to a simpler and stricter social life after the ancient Roman pattern. In 187 he opposed the granting of a triumph to M. Fulvius Nobilior after his return from Aetolia victorious, on the ground that he was too indulgent to his soldiers, that he cherished literary tastes, and even kept poets in his camp. These rude prejudices of Cato were not acceptable to the senate, and his opposition was fruitless. In 184 Cato was elected censor, and discharged so rigorously the duties of his office that the epithet *Censorius*, formerly applied to all persons in the same station, became his permanent surname. He repaired the water-courses, paved the reservoirs, cleansed the drains, raised the

*Copyright, 1917, by Brown Bros.*

### THE CATSKILL AQUEDUCT.

1. Driveway along the Crest of the Olive Bridge Dam, of the Ashokan Reservoir. This Dam is a Masonry Structure 190 Feet Thick at the Base, 220 Feet High, and 4,650 Feet Long; Contains 420,000 Cubic Yards of Cyclopean Masonry, 56,000 Yards of Concrete Blocks, and 2,000,000 Cubic Yards of Embankment. 2. Rye Outlet Bridge at Kensico, of Reinforced Concrete, 110 Feet Above the Bed of the Reservoir; 924 Feet Long, Including the Approaches.

rents paid by the publicans for the farming of the taxes, and diminished the contract prices paid by the state to the undertakers of public works. More questionable reforms were those in regard to the price of slaves, dress, furniture, equipage, and the like. Good and bad innovations he opposed with equal animosity and intolerance, and his despotism in enforcing his own idea of decency may be illustrated from the fact that he degraded Manilius, a man of praetorian rank, for having kissed his wife in his daughter's presence in open day.

In 175 B.C. he was sent as ambassador to Carthage, and was so impressed by the strength of that city that for the rest of his life, whatever question was before the senate, he always introduced the phrase, *Delenda est Carthago* ('Carthage must be destroyed'). Cato represents the Roman character in its extremest type, both of virtue and of vice: courageous, plain living, and patriotic, he was revengeful, arrogant, and even brutal to his inferiors. He wrote several works of which only the *De Re Rustica*, a collection of the rules of good husbandry, has come down to us. There exist a few fragments of his *Origines*, a summary of the Roman annals.

**Cato, MARCUS PORCIUS** (95 B.C.—46 B.C.), named CATO THE YOUNGER, or CATO UTICENSIS (from the place of his death), was educated in the house of his uncle, M. Livius Drusus. From Macedonia, where he was military tribune in 67, he went to Pergamus in search of the stoic philosopher Athenodorus. He brought him back to his camp, and induced him to proceed with him to Rome, where he spent the time partly in philosophical studies, and partly in forensic discussions. In 63 B.C., as tribune of the plebs, he strongly supported Cicero in the senate on the proposal that Catiline's fellow conspirators should be executed. Until the civil war between Cæsar and Pompey, Cato was an active supporter of the senatorial party; but after Pompey's defeat at Pharsalia (48 B.C.) he went to Africa, and joined Metellus Scipio, who was routed at Thapsus in 46 B.C. Utica held out; but Cato advised the townspeople to surrender for fear of provoking Cæsar's indignation. After spending a night in reading Plato's *Phædo*, he committed suicide by stabbing himself in the breast.

**Catoche, Cape**, kã-tõ'chã, the northeast point of Yucatan, was the spot where the Spaniards first saw Mexico (1517).

**Catop'tries**. See DIOPTRICS.

**Catorce**, kã-tõr'thã, or ALAMOS DE CATORCE, town, San Luis Potosí state, Mexico; 108 miles

north of San Luis Potosí. It is situated at the base of a high mountain, and has important silver and tin mines. Pop. 18,000.

**Ca'to Street Conspiracy**, a plot formed in London, England, in 1820 by certain revolutionary spirits for the murder of Lord Castlereagh and other ministers of the crown, so called from the place of meeting in Cato Street, Edgeware Road. The plot was revealed to the police by one of the gang, Arthur Thistlewood, the ringleader, and four others were hanged, while five more were transported for life.

**Cats, JAKOB** (1577—1660), Dutch poet, born at Brouwershaven (Zeeland). After filling civil appointments in Holland, he was sent in 1627 as ambassador to London; became, in 1648, minister of justice in Holland; and in 1651 was again ambassador in London. He is the author of several volumes of poetry, characterized by their easy style, which, with their familiar moral and didactic tone has made them immensely popular with his countrymen; in fact, the poems of 'Father Cats' were long associated with the Bible in popular favor. Among his best works are *Moral Emblems* (1618; Eng. trans.), *Selfstryt* (1620; Eng. trans.), *Houwelyk* (1625), and his most ambitious effort, *Trouwing* (1653).

**Cat's-eye**, an ornamental stone used especially for rings. It is always cut *en cabochon*; and when light falls on the rounded surface, a narrow bright line of paler color is produced by reflection from numerous long parallel fibres which traverse the mineral. The resemblance to the narrow, elongated pupil of the eye of the cat is the source of the name.

There are two varieties of cat's-eye, the Occidental and the Oriental. The former is quartz enclosing fine fibres of asbestos; but often these have weathered out, leaving narrow tubules; the appearance, however, is not affected by this. (See CROCIDOLITE.) In quartz cat's-eye the color may be white, pale, or dark gray, yellow, brown, green, or sometimes blue. The Oriental is far more valuable, and among Eastern peoples is one of the most highly prized of gems. It is chrysoberyl, with similar fibrous enclosures, and is much more beautiful, with a far finer lustre. The most esteemed are those of a brown color, with a narrow and well-defined bluish line of light. Oriental cat's-eye is found principally in Ceylon, and is also known as cymophane. Occidental cat's-eye is found in Bavaria, Malabar (India), Ceylon, and many other localities.

**Catskill**, village, New York,

county seat of Greene county, on the Hudson River, the West Shore Railroad, and Hudson River steamboat lines; 34 miles south of Albany by rail. Manufactures include woollens and hosiery, glass and bricks. It was settled about 1680. Pop. (1900) 5,484; (1910) 5,296.

**Catskill Aqueduct**, one of the greatest engineering feats ever accomplished, whereby 300,000,000 gallons of water are daily conveyed to New York City from the Catskill Mountains, a distance of over 100 miles, was authorized in 1905, and was to be placed in complete operation in April, 1917. The Aqueduct is 92 miles long, not including the great city tunnel over 17 miles long and various pipe-line extensions. Of the 92 miles, 55 are of concrete, near the surface, horse-shoe shaped, 17 feet high and 17½ feet wide; 14 miles are concrete-lined grade tunnels, horse-shoe shaped, 17 feet high, and 13½ feet wide; 17 miles are concrete-lined pressure tunnels, some 14 feet in diameter; and 6 miles are inverted siphons of riveted steel pipe, 9 and 11 feet in diameter, the plates being  $\frac{7}{16}$  to  $\frac{3}{4}$  inch thick, lined with 2 inches of cement mortar and covered with concrete, the whole in earth embankment.

The Ashokan Reservoir, at the northern extremity of the Aqueduct, is located about 500 feet above sea level; it has an area of 13 square miles, and a capacity of 132,000,000,000 gallons. From this reservoir the Aqueduct runs close to the surface, except for short siphons under streams and short tunnels through hills, for a distance of 10 miles to Rondout Creek, beneath which there is a pressure tunnel 4½ miles long. Emerging at the surface, it cuts through a hill for a mile and a half, then follows the surface for about four miles, and passes beneath the Walkill River by a second pressure tunnel at a depth of from 350 to 480 feet. From this point it follows the surface for 17 miles, dips 650 feet under Moodna Creek, and continues at that depth to Storm King, on the west shore of the Hudson River. Here it descends 894 feet, passes under the river, and rises to 450 feet above sea level on the east shore. For 27 miles it continues along the surface, except for tunnels and siphons, to the Kensico storage reservoir. Sixteen miles farther on, just north of the New York City line, it reaches the Hill View equalizing reservoir.

The City Tunnel extension of the Catskill Aqueduct is in rock, concrete lined, 15 to 11 feet in diameter, 200 to 750 feet below the surface. It extends beneath

the Harlem River, Manhattan Borough, the East River, and Brooklyn Borough. From the Brooklyn end of the City Tunnel pipes extend to the boroughs of Queens and Richmond (Staten Island), the Narrows being crossed by a submerged cast-iron pipe with flexible joints. Numerous concrete-lined uptake shafts, with special valves, connect the city tunnel with the distributing mains of the city. The Silver Lake terminal reservoir on Staten Island receives the flow of water which has not been used. The total cost of the project was nearly \$150,000,000.

Eventually water will be drawn from the Schoharie, Rondout, and Catskill Creek watersheds, as well as from the Esopus; and the total supply available daily will be 750,000,000 gallons. Consult L. White's *The Catskill Water Supply of New York City* (1913).

**Catskill Formation**, so called because first studied in the Catskill Mountains, New York, denotes a series of sandstones and shales of Upper Devonian age, seen on the northern slopes of the Appalachian Mountains. They are shallow-water deposits, formed during the time when the marine sediments of the Hamilton, Portage, and Chemung groups were being laid down in deeper waters. Their colors are usually red, brown, greenish, and steel gray, and the sandstone often splits into thin horizontal layers, which are quarried for flagstones. Fossils are not common in this group, which bears the same relation to the marine Devonian of Eastern North America as the Old Red Sandstone (q. v.) does to the marine formations of Great Britain.

**Catskill Mountains**, a group of mountains comprised in the Appalachian system, situated in Greene and Ulster counties, New York, with minor ramifications extending into Delaware and Schoharie counties. They cover an area of about 500 square miles, with a general trend from southeast to northwest. On the west they are practically continuous with a high plateau of Western New York; on the east, for a distance of about 12 miles, they approach to within 8 miles of the Hudson River, then descend abruptly from heights of 2,000 and 3,000 feet into the plain below. Among the loftiest summits are Slide Mountain, 4,205 feet; Hunter, 4,025 feet; Black Dome, 3,990 feet; Black Head, 3,937 feet; Doubletop, 3,905 feet; Peekamoose, 3,863 feet; Panther Mountain, 3,760 feet; High Peak, 3,660 feet; and Indian Head, 3,585 feet.

The Catskill Mountains consist of Devonian sandstones and

shales. They are well timbered with hardwood forests, and the scenery, diversified by precipices, ravines ('cloves'), streams, and waterfalls, is very picturesque. They contain some of the best situated and most popular resorts in the country. Kingston and Catskill, connected by steamer with New York, are the principal points of access to the region. Consult *Bulletin of American Geographical Society*, Vol. xxxix., No. 4 (1907); John Burroughs' *In the Catskills* (1910).

**Catt**, CARRIE CHAPMAN LANE, American leader of woman suffrage, was born in Ripon, Wis. She was educated in the State Industrial College of Iowa, studied law, and became principal of the high school and general superintendent of schools in Mason City, Ia. She has been active in the cause of woman suffrage since 1890, lecturing extensively in the United States, Europe, and many other lands. She organized the International Woman Suffrage Alliance, of which she has been president since 1904, and in 1916 became president for the second time of the National American Woman's Suffrage Association. She has been twice married, to Leo Chapman (1884), and after his death to George W. Catt (1890).

**Cat Tail**. See BULRUSH.

**Cattaro**, kát'tá-rō (Slavonic *Kotor*), seaport, Dalmatia, Austria; 35 miles southeast of Ragusa. It stands at the head of the Bocche di Cattaro, and is strongly fortified. The town gives name to a Roman Catholic see and an Orthodox Greek see. Originally a small independent state, Cattaro joined herself to Venice in 1420, and shared her fortunes down to 1797; in 1814 she passed under the rule of Austria. The town was almost destroyed by earthquake in 1563, and again in 1667. Pop. (1911) 6,041.

**Cattaro, Gulf of**, or **BOCCHÉ DI CATTARO**, a spacious inlet of the Dalmatian coast, Austria, affording deep water close up to the shore, and dividing into four larger and several smaller basins. It is 19 miles long.

**Kattegat**. See KATTEGAT.

**Cattell**, JAMES MCKEEN (1860), American psychologist, was born in Easton, Pa., and was graduated from Lafayette College (1880), continuing his studies at Göttingen, Paris, Geneva, Johns Hopkins, and Leipzig (1880-6). He was a lecturer at Cambridge University (1888), and was professor of psychology at the University of Pennsylvania from 1888 to 1891, when he was called to the chair of experimental psychology at Columbia, becoming professor of psychology at that institution

in 1896, where he has served as head of the departments of anthropology (1896-1902), and of philosophy (1902-05). He was editor of *Science*, *The Psychological Review*, *The Popular Science Monthly*, and *American Men of Science; a Biographical Directory* (1906; new ed. 1910).

**Cattell**, WILLIAM CASSIDY (1827-98), American educator, was born in Salem, N. J., and was graduated from Princeton (1848) and Princeton Theological Seminary (1852). He was professor of Latin and Greek at Lafayette College in 1855-60; pastor of the Pine Street Presbyterian Church, Harrisburg, Pa., in 1860-63; and president of Lafayette College from 1863 to 1883. During his presidency he was instrumental in obtaining \$1,000,000 for the college, and its buildings and equipment were greatly improved.

**Catt'ermole**, GEORGE (1800-68), English water color painter and book illustrator, born at Dickleborough, Norfolk. Having executed drawings for Britton's *English Cathedrals* in 1816, he exhibited in the Royal Academy (1819-27), and in 1833 became a member of the Society of Painters in Water Colors. He illustrated the *Waverley Novels* (1830), *Master Humphrey's Clock* (1840-1), and other works. He was distinguished by great versatility, and by considerable power of grouping and composition.

**Catti**, kat'i, or **CHATTI**, tribe of ancient Germany, inhabiting parts of modern Westphalia, Nassau, Hesse-Darmstadt, and Hesse-Kassel. They were never subdued by the Romans.

**Cattle**. Although sometimes used in a broader sense to include horned stock, horses, and sheep, the word 'cattle' is properly applied to bovine animals belonging to the species *Bos taurus*—the domestic cow, ox, and steer. The exact origin of cattle has not been definitely known, but has been generally assigned to two wild species. Darwin concluded that European cattle were descended from *Bos primigenius* and *B. longifrons*. In recent writings, Lydekker refers all cattle to the aurochs, *Bos primigenius* or *B. urus*, eliminating *B. longifrons*. The aurochs he holds to be a descendant of *B. planifrons*, which was a polled or hornless animal and became extinct in geological times. He considers all the British park cattle, such as the Chillingham cattle, Charleley, Cadzow, etc., to be stunted descendants of the aurochs. These cattle are in a semi-wild condition, being difficult to approach, and preserve many of their wild instincts, such as the habit of hiding their calves. They are smaller than ordinary cattle,

of white or light gray color, and have black muzzles and feet, although red or black calves are occasionally dropped by them.

Zoologically, cattle are related to the bison of Europe and the American plains, buffaloes, yaks, the musk ox, and the zebu, and with them form the Bovidae, or ox division of the Ruminantia. Economically, they are perhaps the most useful of the domesticated animals. Their flesh is part of the daily food of man—butter, cheese, and milk are on every table; their hides go to make leather; their hair forms part of plaster; their hoofs are used for glue; their bones for fertilizer, ornaments, and buttons, and many other purposes.

Cattle have been domesticated in Europe and Asia from prehistoric times, and are mentioned in writings at least 4,000 years old, the indications being that different types were known at that date. The tendency toward variation early made itself apparent, and this with the influences of environment, notably climate and food, resulted in a variety of types. These factors were taken account of by the ancients, although there are no indications that they reached any very high degree of development. The selection and crossing of individuals, with reference to securing a definite type or set of characteristics, has been the most potent factor in improving cattle and developing distinct breeds. The improvement of cattle in the modern sense commenced only in the middle of the eighteenth century. Bakewell undertook the improvement of the British Longhorns, and was followed by the Culleys, the brothers Colling, the Booths, and Bates, who undertook a similar task for the Shorthorns of the Northern counties. At that time it was thought impossible to fatten an ox under four or even five years old, but by increased care and skill, combined with intelligent selection, it became possible to fatten them at the age of two years.

The principal objects aimed at by the great breeders of the latter end of the eighteenth century were: (1) early maturity; (2) utility of form, (3) beauty of form, (4) uniformity of type, (5) aptitude to fatten, and (6) strength of constitution. To guard against reversion or breeding back to unworthy ancestors, cattle were selected whose pedigrees were known, and no animals were used that were not purely bred. The difficulty of procuring suitable sires caused the same bull to be mated with females closely related to him, and some of the most famous sires were used for three or four

generations in the same herd. This system of 'in-and-in' breeding proved less injurious than might have been expected. The longer the pedigree the more reliable was the result—that is, if the successive sires and females used in building it up were all of the requisite merit and purity of blood. This system of careful breeding was accompanied with rigorous weeding out of all inferior animals.

With the establishment of certain principles of breeding, other lines of improvement were undertaken, such as increased milk yield, improvement of the quality of the milk, and prolongation of the period of milk flow. The results in these lines have been no less remarkable than in the development of early maturity and beef-producing qualities. This specialization has proceeded so far that in the United States two general classes of cattle are recognized, beef cattle and dairy cattle, although between the extremes of these two groups certain breeds are recognized as dual-purpose animals, with the beef and the milking qualities both developed to considerable degree. With a single exception the breeds in the United States have been introduced from Europe, and mainly from Great Britain, although of late much attention has been given in this country to breeding for improvement. In the United States and Canada cattle are classified as (1) pure bred, whose lineage is kept in public records; (2) grades or common cattle of mixed breeding, but usually possessed of some pure blood; and (3) scrubs or unimproved stock.

**Beef Cattle.**—The best type of beef cattle is squarely and compactly built, full and broad over the back and loins, possessing depth and quality particularly in these regions. The hips are evenly fleshed, the legs full and thick, the under line parallel with the straight back. The neck is full and short. The eye should be bright, the face short, the bones of fine texture, the skin soft and pliable, and the flesh mellow, elastic to the touch, and rich in quality. The muzzle should be broad and strong, indicating superior feeding capacity, and the forehead broad and full.

**Breeds of Beef Cattle.**—The principal breeds among beef cattle in America are the Aberdeen-Angus, Galloway, Hereford and Shorthorn or Durham. The *Aberdeen-Angus*, sometimes called the Polled Angus, is a black, hornless breed of Scotch origin of pronounced beef qualities. These cattle are compactly built; the body is well rounded and of relatively great

depth, the legs are short, the head is short and wide, the chest wide and deep, and the back broad and straight. The bulls attain a weight of 2,200 pounds and the cows of 1,400 pounds. A high percentage (up to 65 per cent.) of meat, fine-grained and of excellent quality, is produced. The Aberdeen-Angus was introduced into the United States in 1873 and met with great favor, especially in the West and Middle West. It is bred also in Canada, the British Isles, France, Denmark, Germany, New Zealand, South America, and the Sandwich Islands.

The *Galloway* is also a black, hornless breed, originating in Scotland and bearing a general resemblance to the Aberdeen-Angus. The animals are smaller than the latter, shorter legged, and have a longer, more shaggy coat, which is beautifully waved. Their natural environment has made them an especially hardy breed, of excellent grazing qualities, but their milking qualities are undeveloped, and, as a rule, they do not mature as quickly as some other beef breeds. Their meat is excellent and their breeding qualities are high. Galloway cattle were brought to America at an early date, and are raised especially in the Far West and the Canadian Northwest.

*Hereford* cattle are descended from the aboriginal breed of Great Britain. Distinguishing characteristics are the white face; red body broken with white on the breast, belly, legs, and crest and tip of the tail; large, rectangular, compact body; soft hair, often curled; and fairly widespread horns. The legs are short and placed well under the body. Herefords are among the heaviest cattle, the males often weighing as much as 2,200 pounds and the females 1,500 pounds. They mature early, take on flesh rapidly on good pasture, and yield meat of excellent quality, the proportion of dressed meat to live weight being relatively large. They are poor milkers often furnishing insufficient milk for their calves. The breed has many admirers in the show ring, among stock raisers, and among butchers, and is one of the best of the exclusively beef cattle. It was introduced into America in 1817, and is popular in the West and Southwest and in New England. It has met with success also in Canada, Australia, New Zealand, and the Argentine. A breed of *Polled Herefords* has recently been established, the absence of horns commending them to stockmen.

The most popular and the most widely distributed of the breeds of beef cattle are the *Shorthorns* or *Durhams*, which

originated in Northeastern England and have been continuously improved by breeders, starting with Charles and Robert Colling (1780), Thomas Bates, Richard Booth, Amos Cruikshank, and others. They were imported into America between 1783 and 1795, and have been exported to nearly every country colonized by Anglo-Saxons, being numerous in Australia, New Zealand and Argentina, as well as in Great Britain, United States and Canada. They are a large breed in size and weight (cows 1,400 lbs.; bulls 1,800 to 2,200 lbs.), of a red, red and white, or roan color, with occasionally an all-white specimen, and compactly built, with rectangular bodies, lean, shapely heads, small short horns, and short legs. They are unsurpassed in earliness of maturity, are excellent feeders, furnish tender, juicy meat, and dress well, the proportion of bone and of fat being relatively small. They are generally possessed of good milking qualities, and some families have this developed to such an extent as to class them among dual-purpose or even dairy animals.

The *Devons* are sometimes classed with the beef breeds and sometimes as dual-purpose animals, suited to both beef and milk production. They were formerly prized as draft animals, some of the finest oxen being of that breed, large, and of a rich red color. The breed is one of the most ancient and pure of the distinct British breeds.

**Raising Cattle for Beef.**—Profitable beef production depends upon the selection of a suitable cow herd and the use of a good pure-bred bull, so managed that each generation of cows is an improvement upon the preceding one. Healthy cows of strong constitution and good quality, which do well on limited feed rations, as indicated by uniform fleshing, loose, pliable skin, and glossy coat, should be selected for the breeding herd. During the summer months the cows should be maintained largely on pasture, supplemented, when necessary, by silage or forage crops. In the early fall they may be maintained on meadows and after-math, and later on stalk fields. Winter rations vary in different sections. Cows raised solely for breeding purposes may be fed on silage and dry roughages combined with a small quantity of protein-rich concentrates. Cows kept also for dairy purposes should be fed after the manner of dairy cattle (see *below*). The following rations for wintering cows in various sections of the United States are taken from

Velvet-bean and cornstalk fields	

Special attention should be paid to the care and feeding of the bull. He should be kept in a separate paddock or lot and

should be well fed the year around, but especially so just prior to the breeding season. His ration may consist mainly of roughage, with a small quantity of grain.

The breeding herd may be so managed that either spring or fall calves are raised. The period of gestation is 283 days. If the cows are in a vigorous, healthy condition at the time of calving they will need little assistance. The newborn calf should have the fetal membrane removed from its nose and mouth at once, and it may be necessary to pull the tongue slightly and to exert some pressure on the ribs to stimulate respiration. The average weight at birth is 66 to 92 pounds.

If the cattle are raised solely for beef production, the calves are allowed to run with their dams until weaned. For straight beef production only a small quantity of feed is needed in addition to the mother's milk, but the young calves should be taught to eat grain and hay to prevent loss of flesh at the time of weaning. Calves intended for 'baby beef,' that is calves ready for market at the age of sixteen to twenty months, should be started on grain when from four to six weeks old. Equal parts by weight, of shelled corn, whole oats, and wheat bran may be used, and the grain allowance should be increased gradually up to the time of weaning. If the herd is depended upon for milk as well as for beef production, the cows are milked and the calves are raised on skimmed milk and supplemental feeds, the latter being increased gradually until the calf can do without milk when from six to eight months old. Spring calves should be weaned before the end of the pasture season in the fall to allow them some time on grass if winter pasture cannot be provided. Fall calves should be weaned after being placed on pasture the following spring. All calves should be dehorned and the males castrated before weaning.

After weaning, beef calves should be fed on whole oats or whole corn, a little oil meal (cottonseed or linseed), and plenty of legume hays. Grass is unequalled as a flesh builder, and in winter should be approximated by silage or roots. Calves intended for mature beef may be sold as 'stockers or feeders,' that is, to be fed further before slaughtering, or may be fattened on the farm.

Great progress has been made in the United States in the improvement of the cattle raised and fed for beef, by developing earlier maturity, ability to fatten

well and give good return for the feed, and better dressing qualities on the block, with a larger proportion of better cuts of meat and less offal. In developing these more profitable cattle the pure-bred beef breeds have been crossed with the native stock, and the improvement has spread from the pastures of the Middle West to the range. The large stock yards recognize five definite market classes of beef cattle: (1) 'Beef Cattle,' including fattened steers suited to dressed beef, export, and shipping, and graded as prime, choice, good, medium, and common rough steers, baby beef, Texas, and Western Range cattle; (2) 'Butcher Stock,' including the better grades of heifers, cows, and bulls, and common or inferior steers which have failed to fatten satisfactorily; (3) 'Cutters and Cannery,' composed of thin cows and bulls, and inferior steers and heifers—in fact, anything of a low, inferior grade; (4) 'Stockers and Feeders'; and (5) 'Veal Calves.' All but the fourth class are slaughtering stock, and each class is divided into several grades recognized in buying and in the market quotations.

**Dairy Cattle.**—In general appearance the dairy cow shows certain marked characteristics which serve at once to distinguish it from the beef stock. The body tends to be wedge-shaped rather than rectangular, the head is narrow and long, and the distance between the eyes is great. The neck should be long and thin; the shoulders thin and lithe, and narrow at the top; the back open, angular, and tapering toward the tail; the hips wide apart and covered with little meat. The good dairy cow is also thin in the region of the thigh and flank, but deep through the stomach girth, as a result of the long open ribs. The udder is large, attached well forward on the abdomen, and high up behind. It should be full but not fleshy. The lacteal or milk veins ought also to be large, and extend considerably toward the front legs.

**Breeds of Dairy Cattle.**—The leading dairy breeds in the United States are the Ayrshire, Guernsey, Jersey, Holstein-Friesian, Dutch Belted, and Red Polled. To this list must be added the Shorthorns, described under beef cattle, among which, as there stated, are some excellent milking strains. The breed has been represented in some of the largest competitive breed tests, and has made an excellent showing.

**Ayrshires,** named for the county of Ayr, in Scotland, where the breed originated, are of medium size (bulls 1,400 to

1,800 lbs.; cows 900 to 1,100 lbs.), red and white spotted, short-legged, fine boned and of sprightly appearance. They are believed to be of mixed ancestry, made up largely of the blood of the Holderness, Dutch, Alderney, Kerry and West Highland breeds engrafted upon the native stock. The cows have excellent grazing qualities, doing well on a wide range of scanty pasture or upon coarse forage, but respond promptly and profitably to liberal feeding. Ayrshires are large and persistent milkers. A yield of 5,500 lbs. a year, as an average for a working herd in good hands, is often realized. While not exceptionally rich, the milk is somewhat above the average, the percentage of butter fat being between  $3\frac{1}{2}$  and 4 per cent.

The Guernseys and Jerseys are Channel Island breeds, the parent stock of which was derived to considerable extent from Normandy, and were long known in this country as Alderney cattle. While the origin of the two breeds is practically the same, more of the characteristics of the parent stock of Normandy have been retained in the *Guernseys*. They are rather larger than the Jerseys, stronger boned and coarser. They are light in color, yellow predominating, often with large patches of white on the body and legs. Darker shades, approaching brown, are found on some cows and are quite common on bulls. The skin is of a rich yellow color, suggesting richness of milk, which in fact has a higher color at all seasons than that of any other breed. The horns are white or amber. Guernsey cows give a liberal milk yield, and the milk is uncommonly rich in fat (4.68 per cent.) being especially well suited to butter production. They have great power of assimilating food and converting it into milk, although they will not generally bear much forcing. They are held by some to be harder than the Jerseys, and heavier milkers, but both of these points are stoutly disputed. Guernsey cattle are raised chiefly on their native island of Guernsey, and in England, the United States (New England, New York, Pennsylvania, New Jersey, Wisconsin) and Canada.

**Jersey** cattle have exceeded the Guernseys in popularity in America, as judged by their number and distribution, and are unquestionably the most popular dairy cattle in the country, probably outnumbering all the other dairy breeds combined, excluding the Holsteins. The Jersey is small (cows 850 lbs.) and deer-like in form, lean and muscular, intelligent and gentle

in disposition, with a handsome head and large, bright eyes set wide apart. The color varies from creamy white to fawn, tan, mouse-color, and all shades of brown to deep black. With all these colors there is usually considerable white, distributed in large patches. The milk is exceptionally rich (5.61 per cent. butter fat) and of a deep golden color, and the yield is often large. At home the Jersey has been bred for butter without regard to the amount of milk, but in the United States an attempt has been made to increase the yield of milk, with much success. The cows are noted for persistence in milking, making a long season of profit, with great evenness of product until near the close of lactation. Some remarkable records have been made by individuals and by entire herds. Several herd records show average yields of 6,000 and 7,000 lbs. per cow in a year, and there are records of single animals producing 9,000 to 12,000 lbs. per year, and at least two cows 17,000 lbs. of milk. Jersey butter records are correspondingly large, running as high as 600 to 800 and even 1,000 lbs. in a year. Good herds can be depended upon to produce 350 to 400 lbs. of butter per cow. Jerseys are heavy feeders, and have great capacity for assimilating feed, and using it profitably in milk production. They do not fatten readily, but are essentially machines for elaborating rich milk. Jersey cattle are widely distributed, being adaptable to varying conditions of climate and environment.

The *Holstein-Friesians*, commonly called *Holsteins*, are second only to the Jerseys in popularity in the United States, where they were introduced by the early Dutch colonists of New York. They are black and white cattle, from North Holland and Friesland, the exact origin of which is not definitely known, although the breed is one of the very oldest of the dairy breeds. The animals of both sexes are large sized—the largest of the dairy breeds, which, with their black and white markings, gives them a striking appearance. The black and white are never mixed, and are quite irregularly distributed. The cattle have great constitutional vigor, mature early, are heavy feeders, and produce a large quantity of milk of rather low fat content. Cows giving 40 to 60 lbs. of milk a day are regarded as average animals, and an average of 7,500 to 9,000 lbs. a year is expected from a good herd. There are numerous records of 100 lbs. a day for several days in succession, and of 20,000 to 30,000 lbs. a year.

The world's record production is that of the Holstein Segis Pieterje Prospect, 37,381.4 lbs. of milk and 1,448.68 lbs. of butter in 365 days. The milk of the large producers is usually low in total solids and deficient in fat. The breed has been popular for producing milk for city supply, and has been regarded as especially adapted to cheese making. Some families give milk of fully average richness, and have shown themselves to be profitable butter producers. The average butter fat content is 3 to 4 per cent.; the fat globules are small, the cream rises slowly, and has little color. Holstein-Friesians are bred in Belgium, Northern Ger-

many, and Russia, as well as in Holland and America (East and Middle West).

hardy breed not widely distributed.

*Raising Dairy Cattle.*—In raising dairy cattle good healthy cows, showing the best characteristics of their class and with a milk-production record of 6,000 pounds or more, should be bred to the best pure-bred bull that can be obtained. The cows may be pastured during the grazing season and stabled during the winter months; the soiling system may be employed, by which they are kept more or less closely confined throughout the year and furnished with green crops; or a combination of the two systems may be used, pasturage being supplemented by silage

The bull should be fed liberally on ground oats, wheat bran, gluten meal, oil meal, silage and clover hay and should have sufficient exercise to keep him in a vigorous condition.

The young heifers should be fed on skimmed milk, early supplemented by meal and hay or grass. They are ready to be bred at approximately twenty-one months so that the first calves are dropped at the age of two years and a half. The lactation period following is a fair indication of the milking qualities of the cow. The yield of milk generally increases up to the seventh year, remains stationary from the seventh to the tenth or

Photo from "Wide World" Photos.

*World's Record Holstein: Segis Pieterje Prospect of the Carnation Stock Farms.*

This cow has broken all records by producing 37,381.4 pounds of milk and 1,448.68 pounds of butter in 365 days, or 4,000 pounds greater than the previous world record.

many, and Russia, as well as in Holland and America (East and Middle West).

*Dutch Belted* cattle are black and white cattle from Holland, the white being in the form of a belt around the centre of the body. The belt varies in width, but rarely reaches as far forward as the shoulders or back to the hips. They are heavy milkers, although they do not equal the Holsteins, and their milk is of only average richness. They have never come greatly into favor in America.

Other dairy breeds which may be mentioned are the hardy French Canadian, somewhat resembling the Jersey breed, natives of Quebec, where they are chiefly raised, and the Kerry, from Western Ireland, a small

in the late summer. A grain ration is also desirable, and an abundance of pure water if the cows are to be in good condition for parturition and heavy milking.

Regular and abundant feeding are essential to profitable dairying. In the summer, unless the soiling system is used, the main dependence may be placed on pasturage, supplemented during the later months by summer silage or, where that is unavailable, by grain. In the winter silage (especially corn), hay, and concentrates in the form of grains, and oil meals should be used. An ideal ration, according to one authority, consists of corn silage, 40 lbs.; clover hay, 15 lbs.; ground corn, 3 lbs.; cottonseed meal, 1 lb. See also DAIRYING.

twelfth year, and then declines.

In the improvement of cattle for dairy purposes the chief points aimed at have been early maturity, the lengthening of the period of lactation, economical use of the feed, and good return for it in the yield and richness of milk. In all of these respects very remarkable changes have been effected, and some highly developed types have been produced. The improvement is still going on within the breeds and among the grade animals, the dairymen now realizing the importance of selecting their cows with reference to economy of production, and that many cows have been kept at a positive loss. This selection and weeding-out process has been greatly promoted by the perfection of the

LEADING BREEDS OF CATTLE

1. British Wild Bull. 2. Longhorn Cow. 3. Shorthorn. 4. Hereford. 5. Devon Cow.  
6. Sussex. 7. Red-polled Cow. 8. Native Jersey.

Babcock test (see MILK) for the fat content—a simple test which the ordinary dairyman can use and which requires little time. This, with the extension of the practice of keeping records of the individual cows, has placed milk production on a strictly business basis; but, unfortunately, there are still very many farmers and dairymen who know little of the relative productiveness of the individuals of their herd—this despite the fact that milk is now almost universally paid for at creameries and cheese factories on the basis of its fat content, *i.e.* the pounds of fat furnished during the month rather than the quantity of milk delivered.

It was formerly believed that certain breeds were especially adapted to butter production and others to cheese production, and this contention was stoutly maintained by the exponents of breeds of large milk yield but rather low fat content, it being held that the casein and not the fat was the controlling factor. The great breed tests carried on at Chicago, Buffalo, St. Louis and other places in connection with international expositions, together with the extensive work of the agricultural experiment stations, have largely done away with this notion. It is found that the fat is, after all, the important factor, as there is a fairly constant relation between it and the casein, and that by proper methods of manufacture the yield of cheese will bear a direct relation to the fat content of the milk. In other words, a good butter cow is also a good cheese cow.

**Dual-purpose or general purpose cattle**, as the name implies, combine beef-producing and milk-producing qualities. They are more massively built than dairy cattle, but lack the breadth and smoothness of the purely beef cattle. There are three breeds of importance in America: Brown Swiss, Polled Durhams, and Red Polled.

The *Brown Swiss*, as its name indicates, had its origin in Switzerland. It is the best known of the Swiss breeds in the United States. It is regarded by some authorities as a distinctly dairy breed, although it is rather fleshy. It is medium in size (cows 1,300 to 1,400 lbs.) small boned, and has a fine, silky coat, varying in color from a mouse-color and brownish dun to darker shades, with the head, neck, legs and quarters nearly black. The cows give a good flow of milk, which holds out well, and is well up to the medium in quality (3.3 per cent. butter fat). This is probably the most popular of the continental breeds in Europe, and is rapidly coming into favor

in the United States and Canada on account of its merits.

The *Polled Durham* breed originated in the United States more especially in Ohio, the Shorthorns being the basis. The animals resemble the Shorthorns in size, color, and general appearance, but are hornless. They are often classed among the beef breeds, but many of them have considerable dairy excellence. In this respect they practically duplicate the 'milking Shorthorns.'

The *Red Polled* is a comparatively new breed, originating in the counties of Norfolk and Suffolk, England. These animals resemble the Devons almost as closely as the Polled Durhams resemble the Shorthorns, yet the two breeds are probably not closely related. They stand well up toward the head in popularity among the dual-purpose breeds in the United States. They rank well both as beef producers and as milkers. A yield of 5,000 pounds of milk a year is not uncommon; the percentage of butter fat is about 3.8.

**Cattle Breeding Associations.**—All of the above breeds of cattle are represented in this country by associations which register thoroughbred animals and issue herdbooks, in addition to promoting the general interests of the breed. See BREEDING.

**Diseases of Cattle.**—Cattle are subject to a large number of diseases attacking the respiratory, digestive, and generative organs. Only the most important of these can be touched upon in this work.

**Bovine Tuberculosis.**—One of the most important of the bacterial diseases of cattle, both from the point of view of the farmer and breeder and of the general public, is tuberculosis. The farmer may lose some of his herd by death, while others, though appearing quite well, may prove, when slaughtered, to be so badly infected as to be unfit for food. The chief danger to the community at large is of infection through milk, from infected cattle, which may contain the disease germs in enormous numbers.

Bovine tuberculosis is an infectious disease, caused by the tubercle bacillus, and characterized by the formation of tubercles or nodules—small grayish-yellow bodies, which may exist in almost every organ, and give rise to numerous disease processes which vary according to their situation. Its occurrence is favored by poor ventilation, overcrowding, insufficient air space, and all conditions hostile to general health.

The causative organism is contained in the oral and nasal

discharges and in the excreta. These dry, and small particles are disseminated through the air, which is then inhaled by healthy animals, the germs thus finding their way into the throat, lungs, lymph glands, and general circulation.

The clinical symptoms of bovine tuberculosis are, generally speaking, unreliable, and diseased cattle may show practically no evidences of infection. As the disease progresses, however, the animal may lose flesh, the coat may become rough, and the eyes dull. Coughing may occur if the lungs are affected, and enlarged lymphatic glands may be detected. The tuberculous process may be localized in a single organ or generalized throughout the system. It is revealed post-mortem by the presence of the nodules or tubercles already mentioned.

'Tuberculin,' a glycerine extract from pure cultures of tubercle bacilli, is the most reliable diagnostic agent. Injected subcutaneously, it produces a distinct rise of temperature in tuberculous animals, while in cattle free from tuberculosis it produces no effects.

For the eradication of tuberculosis from a herd, the Danish method initiated by Professor Bang appears the most feasible. It consists briefly of (1) testing all cattle with tuberculin; (2) isolation of all reacting animals; (3) separation of calves from diseased cows at birth, and feeding them on boiled milk, so that they may grow up free from infection. Preventive measures include the provision of an open-air life for cattle wherever possible, ample ventilation, and good sanitary conditions in cowsheds. Prophylactic vaccination has had encouraging results, although the duration and the degree of immunity conferred are limited.

**Foot-and-mouth disease** (*Aphtha epizootica*) is an acute infectious disease which attacks all ruminating animals, though horses and dogs less readily, and occurs also in man. Germany, France, and other European countries have frequently been ravaged by it, but outbreaks in the United States have been quickly suppressed. It is due to a virus which exists in the saliva, the respired air, and in all the secretions and discharges of the body, and spreads rapidly. One attack does not confer immunity from another, so that the same animal may be attacked repeatedly at short intervals. The average period of incubation is from three to five days.

The mortality is one per cent. or less in the mild ordinary form

### LEADING BREEDS OF CATTLE

9. Guernsey Cow. 10. Galloway Bull. 11. Aberdeen Angus. 12. Ayrshire. 13. Highland.  
14. Welsh Cow. 15. Kerry Cow. 16. Dexter.

of the disease; five to fifty per cent. in the malignant form, which sometimes appears. The disease may last in a herd for a month or six weeks, although individually its duration is only eight to fourteen days.

For symptoms, treatment, and preventive measures, see FOOT-AND-MOUTH DISEASE.

*Rinderpest*, or *Cattle Plague*, is the most fatal of all cattle diseases. It is highly infectious, and attacks only ruminating animals. It has been known since the fourth century, its original habitat having probably been the steppes of Southern Russia. It has been estimated that during the first half of the eighteenth century, 200,000,000 cattle died in European countries from rinderpest. For some years the disease has played havoc with the cattle in South Africa, the last serious outbreak having occurred in 1902. It has been observed in various parts of America.

Rinderpest appears to be a form of septicaemia. The virus is both fixed and volatile. It exists in all the secretions and excretions of the body; can be conveyed by diseased animals and by intermediary bearers, gaining access to the blood through the respiratory or digestive passages. The poison remains infective for four or five months, but is not difficult to destroy by disinfectants. The period of incubation is from three to seven days.

Symptoms are, first, high fever, rapid pulse, shivering fits, loss of appetite, cessation of rumination and of milk secretion. The more characteristic symptoms are discharge from eyes, nose, and vagina in females; flow of saliva from the mouth; very violent, offensive diarrhoea, sometimes mixed with blood; red discolorations and patches on the mucous membranes of the mouth and vagina. These patches soon become covered with bran-like scales or crusts, which are shed, and leave red erosions or ulcers in the mucous membrane. There is great prostration; the animal lies down continually and grinds its teeth, the temperature falls, and death ensues. The mortality is from 90 to 95 per cent. One attack confers immunity for life, on recovery.

Treatment is useless. To prevent the spread of the disease the strictest precautions should be observed. Carcasses of animals dying should be burned or buried with quick lime and thorough disinfection should be practiced. Preventive inoculation has been tried with favorable results in South Africa.

*Pleuro-pneumonia Contagiosa*.—Contagious pleuro-pneumonia

of cattle is a disease peculiar to the bovine race, and cannot be transmitted to other animals. It has been known since the seventeenth century, and consists of an infectious inflammation of the lungs and pleura. Its actual cause is unknown, but is probably a minute organism. The disease can be readily conveyed by diseased cattle, or by intermediate bearers, as attendants, litter, etc. Respired air is, however, the chief cause of infection. The virus may exist in infected sheds for a year or more and then become active, if there has been no disinfection. The period of incubation is from three to six weeks as a rule, but may be much longer. One attack confers immunity on recovered animals for years, and probably for life.

The mortality is from thirty to fifty per cent. From 1860 to 1892 this disease prevailed in the United States. It was finally eradicated in 1892, and has not occurred in this country since that date.

Symptoms are those of ordinary pleuro-pneumonia, with cough, difficulty in breathing, grunting, emaciation, fever, etc. There are two forms of the disease—the acute and the chronic. Postmortem examination reveals the characteristic marbled appearance of the lungs in section, due to broad bands of connective tissue surrounding the lobes. The lung tissue is hepatized, and of various colors.

Curative measures are useless and dangerous. All diseased animals, and all animals that have been in contact with diseased cattle, must be slaughtered; and there must be thorough disinfection of sheds, which must be kept vacant as long as possible. Also there should be strict port and frontier inspection of all foreign cattle.

*Texas fever*, also called red water, Southern cattle fever, etc., is an infectious blood disease characterized by high fever, emaciation and destruction of the red blood corpuscles. The blood parasite is carried from one animal to another by the cattle tick. The quarantine line for this disease extends along the northern line of the area infested with the tick. Texas fever may be fatal in from five to eight days, and the mortality is high. There is no efficient treatment. Susceptible cattle may be immunized by inoculating them with the blood of cattle which have recovered from the disease. This is effective in about 98 per cent. of cases. Some benefit is obtained from the injection of hemoglobin to replace that lost by the destruction of the red blood corpuscles. Recently a movement has been set on foot to eradicate Texas

fever permanently by destruction of the tick. By a system of pasture rotation the cattle ticks may be starved to death.

*Mycotic stomatitis*, or sore mouth, is a sporadic, non-infectious disease, characterized by inflammation and ulceration of the oral mucous membranes, due to the ingestion of irritant fungi. There may be an associated swelling of the feet, and erosions may appear on the udder and teats. Treatment consists in removal of the herd from the pasture, careful feeding with bran mashes, ground feed, or gruels, and the use of a cleansing and antiseptic wash (as a 2 per cent. solution of carbolic acid), followed by an astringent. The disease is not, as a rule serious, and recovery, with proper treatment, is prompt, though fatal cases do occur.

Cattle also suffer from contagious abortion, infectious diarrhoea of calves, anthrax and actinomycosis (qq. v.), parturient paralysis, variola, and parasitic affections.

**The Cattle Industry.**—The cattle industry has reached a high state of development in the United States. The quality of the stock kept is improving, and more attention is paid to securing stock adapted to the purpose for which it is kept, and especially the needs of the butcher. The open range of the West is practically gone, although there are extensive areas held by cattle-men under fence. The breeding stock on these large ranches has been greatly improved, and this is reflected in the better grade of cattle received at the stockyards.

According to the reports of the Department of Agriculture, there were in the United States on January 1, 1920, about 23,747,000 milch cows, worth \$2,021,681,000, and 44,485,000 other cattle, valued at \$1,919,445,000, or a total of \$3,941,126,000. Of these numbers only about 1¼ per cent. of the dairy cows and 1 per cent. of the other cattle are registered stock, the remainder being natives, grades, and crosses.

In connection with this article, see also DAIRYING; MILK; BUTTER; CHEESE; MEAT; PACKING INDUSTRY; FEEDING STUFFS; also the general article on STOCK RAISING and the special sections on *Stock Raising* in the articles on the various countries of the world.

**Bibliography.**—Consult Shaw's *Management and Feeding of Cattle* (1909); C. H. Eckles' *Dairy Cattle and Milk Production* (1911); Lydekker's *The Ox and Its Kindred* (1912); Wilcox' *Farm Animals*; also the numerous *Farmers' Bulletins* and Publications of the Bureau of Animal Industry on this subject.

**Cattleya**, kat'le-a or kat-li'a, a genus of epiphytic orchids indigenous to Central and South America. There are about forty species, most of which are distinguished by large handsome flowers and rich coloring running through all the shades of white, rose, lilac, crimson, carmine, and yellow. They are the showiest of the orchids and have great commercial value owing to their decorative possibilities. They are comparatively easy of cultivation, thriving in a somewhat lower temperature than that required for most plants of a similar nature. For the culture of cattleyas see ORCHIDS.

**Cattywar**. See KATHIAWAR.

**Catullus**, ka-tul'us, GAIUS VALERIUS (c.87-c.54 B.C.), the greatest lyric poet of ancient Italy, was born in Verona. He appears to have belonged to the equestrian order, and his years were spent mainly at Rome, where he settled about 62 B.C., and at his villas, to which he was fond of retiring, at Tibur and Sirmio. In Rome he became intimate with the two Ciceros, the Metelli, Hortensius, and Lucretius, and there he met the lady whom, under the name of Lesbia, he celebrated in verses which stand at the head of the lyric poetry of passion. In 57 B.C., he accompanied the propraetor, Gaius Memmius, to his province of Bithynia. Returning to Rome, he entered impetuously into the contest which was then being waged between the senatorian and the democratic parties, espousing the cause of the senate.

Catullus' poems consist of 116 pieces, mostly of short length. Many of them are close imitations of Greek poetry, especially of the style of Callimachus of Alexandria; but it is rather on his love poems, satirical and society verses, and elegies that his reputation is founded. As compared with those of Horace, his lyrics are possibly rough; but it is the roughness of vigor and power, which was more congenial to the character and language of Rome than the polish of the later poets. Among his longer compositions are *Epithalamium Pelei et Thetidos*, *Coma Berenices*, and *Attis*. Editions include those of Postgate (1894), Palmer (1896), Owen (1893), R. Ellis (1889), Riess (1884). English verse translations have been made by Martin, Cranshoun, Ellis, Hart Davies, Grant Allen, and Cornish. Consult: W. Y. Sellar's *Roman Poets of the Republic*.

**Catulus**, kat'ul-us, Roman family of the Lutatian clan. GAIUS LUTATIUS CATULUS was consul in 242 B.C., and proconsul in the next year, when he brought

the first Punic War to an end by defeating the Carthaginian fleet near the Ægatian Islands. QUINTUS LUTATIUS CATULUS was consul in 102 B.C., and in the next year, as proconsul, succeeded, along with Marius, in annihilating the invading hordes of the Cimbric at Invecellæ. In politics he belonged to the aristocratic party and in the civil war of 87 B.C. was proscribed by Marius, and, unable to escape, committed suicide. QUINTUS LUTATIUS CATULUS, son of the above, was consul in 78 and censor in 65 B.C. Though a supporter of the aristocratic party, his upright character won him the respect of the people. He opposed, in 67 and 66 B.C., the Gabinian and Manilian laws, which conferred unusual powers on Pompey; was a keen opponent of Cæsar; and applauded Cicero's action in suppressing the conspiracy of Catiline. He died in 60 B.C.

**Catumbella**, kâ-tööm-bel'lä, or KATUMBELLA, river in Angola, West Africa, rising northwest of Caconda (Kakonda). Near the mouth is the village of Catumbella.

**Cauca**, kou'kä', department of Colombia, extending along the Pacific coast from the Gulf of Darien to the frontier of Ecuador. Area 20,403 square miles. It is mountainous, being traversed throughout its length by the Western Cordilleras of the Andes. The river valleys of the Atrato, San Juan and Patia in the western part are hot, damp, and unhealthy and are sparsely populated, but the Cauca valley in the central eastern part has a generally healthful climate and an exceedingly fertile soil in which tropical crops flourish. The department is rich in minerals, gold, silver, platinum, copper, salt, coal, and iron being found in the Cauca valley. Coffee, tobacco, cacao, sugar, and fruits are raised; the sugar and coffee being of excellent quality. Popayán (pop. 18,724) is the capital. Pop. 211,756.

**Cauca**, river of Colombia, which, rising in the Andes near Popayán, flows north and joins the Magdalena near Tacaloo. It is early 700 miles long and is navigable for a large part of its course. Its valley is exceedingly fertile.

**Caucasian** or **Caucasic Race**, a name given to the white race of mankind, as distinguished from the brown, yellow, and black, by Blumenbach, who, since the finest skull in his collection was Georgian, accepted the Caucasian as the highest type of the Indo-European stock. While the name is in reality a misnomer, since the peoples of the Caucasus do not fairly represent this highest branch of

the human family, it has nevertheless been universally applied to the fair type of man as opposed to the black or yellow. Keane, in his *Man: Past and Present* (new ed., 1920), gives the range of the Caucasian peoples as all extra-tropical habitable lands except China, Japan, and the Arctic zone and inter-tropical America, Arabia, India, and Indonesia. He divides them into three types; Mediterranean, Nordic, and Alpine. The first type includes most Iberians, Corsicans, Sards, Sicilians, Italians; some Greeks; Berbers, and other Hamites; Arabs and other Semites; some Hindus; Dravidians, Todas, Ainus, Indonesians, and some Polynesians. The Nordic type includes Scandinavians, Northwest Germans, Dutch, Flemings, most English, Scotch, some Irish, Anglo-Americans, Anglo-Australians, English and Dutch of South Africa; Thrako-Hellenes, true Kurds, most West Persians, Afghans, Dards and Siah-posh Kafirs. The Alpine type is composed of most French, South Germans, Swiss and Tyrolese; Russians, Poles, Czechs, Jugoslavs; some Albanians and Rumanians; Armenians, East Persians, and Galchas. For the characteristics of the race see ETHNOLOGY. Consult Tylor's *Anthropology*; Deniker's *The Races of Man*; Ripley's *Races of Europe*; Keane's *Man: Past and Present* (1920).

**Caucasus**, kô'ka-sus, a region of Southeastern Europe occupying the isthmus lying between the Black and Caspian Seas, with an area of 181,173 square miles, formerly a part of the Russian Empire. The main range of the Caucasus mountains (q. v.), which is the most striking natural feature of the region, divides it into two parts, Ciscaucasia in the North and Transcaucasia in the south. Ciscaucasia is generally level, an extension of the Russian plains, with many marshes and lagoons, but Transcaucasia is rugged and mountainous, traversed by parallel chains of the great mountain system. The chief rivers are the Kuban and Terek in the north and the Rion and Kura in the south. The only lakes are in Transcaucasia, the largest being Gok-cha in Erivan.

The climate, while generally healthful, is exceedingly varied, as is also the vegetation. In the north it is sparse and poor, but in the central part magnificent forests clothe the mountain slopes, and still farther south figs, chestnuts, pomegranates, and almonds flourish.

The mineral wealth is great, but is as yet little developed. Petroleum wells are numerous,

the Baku fields being one of the world's great oil sources; mineral springs occur in many places; and coal, copper, iron, lead, sulphur, manganese, salt and some gold are found.

Agriculture is the chief occupation. Cereals, tobacco, cotton, and vines are raised. Mulberry trees are grown, and silk culture and wine making are of importance. The nomad tribes are occupied in cattle-grazing; the native peoples make rugs, woolen cloaks, and silver-trimmed articles, but manufacturing is in a primitive condition. Grain and petroleum are the chief exports. Railways run from Baku to Batum and Poti, from Baku to Petrovsk and

caucasia, composed of the provinces of Kuban and Terek and the government of Stavropol, and Transcaucasia, composed of the provinces of Batum and Kars, the districts of Sukhum and Zakatatz and the governments of Baku, the Black Sea, Elizavetpol, Erivan, Kutais and Tiflis.

Under Peter the Great Russia began to be interested in the acquisition of the Caucasus and by the end of the eighteenth century she had acquired practically all of Ciscaucasia. By cessions from Persia and Turkey and by voluntary submission from some of the more peaceful tribes she had extended her control by 1830 to include nearly all of the region,

erally considered to be the boundary line between Europe and Asia, stretching from the Taman peninsula in the Black Sea to the Apscheron peninsula in the Caspian Sea, an extent of nearly 750 miles. The general direction of the system is from northwest to southeast. The higher and central part is formed of parallel chains averaging 12,000 feet in height, connected by elevated plateaus, traversed by narrow fissures of extreme depth. The highest peaks are Elbruz (18,470 feet), Koshtantau (16,900 feet), Dikhtau (17,000 feet), and Kazbek (16,546 feet). Elbruz and Kazbek are of volcanic origin. The range towers far above the snow-line, which here

Novorossiisk, and from Tiflis to Erivan, with a branch to Kars. A military road connects Vladikavkaz with Tiflis over the Dariel Pass (see DARIEL).

In 1915 the total population of the Caucasus was estimated at 13,229,000, including Circassians, Tatars, Turks, Lezgians, Kurds, Armenians, Georgians, Greeks, and Jews. The inhabitants belong to many religious sects and are often fanatical and superstitious. Tiflis is the capital, other important towns being Baku, Vladikavkaz, Derbend, Erivan and Batum. A remarkable diversity of languages is spoken the chief division of which is known as the Alarodian. There are nearly 70 different dialects.

Under the Russian régime the Caucasus was divided for administrative purposes into Cis-

but it required 30 years of fighting before the fearless mountain tribes were subdued. At last, in 1859, Shamzl, leader of the native peoples, surrendered, and by 1865 the conquest was completed. In the Russo-Turkish War (1877-8), Russia obtained a part of Turkish Armenia, which was annexed to the Caucasus. Following the Russian Revolution and the Great War (1914-19) republics were proclaimed in Georgia, Azerbaijan, and Kars. Armenia (q. v.) also laid claim to part of the area. Consult Freshfield's *Exploration of the Caucasus*; Abercomby's *A Trip through the Eastern Caucasus*; Baddeley's *The Russian Conquest of the Caucasus*; Graham's *A Vagabond in the Caucasus*.

**Caucasus Mountains**, kò'kasus, a lofty mountain chain, gen-

erally considered to be the boundary line between Europe and Asia, stretching from the Taman peninsula in the Black Sea to the Apscheron peninsula in the Caspian Sea, an extent of nearly 750 miles. The general direction of the system is from northwest to southeast. The higher and central part is formed of parallel chains averaging 12,000 feet in height, connected by elevated plateaus, traversed by narrow fissures of extreme depth. The highest peaks are Elbruz (18,470 feet), Koshtantau (16,900 feet), Dikhtau (17,000 feet), and Kazbek (16,546 feet). Elbruz and Kazbek are of volcanic origin. The range towers far above the snow-line, which here

1878-87); Chantré's *Recherches Anthropologiques dans le Caucase* (4 vols. and atlas, 1885-7); Wardrop's *The Kingdom of Georgia* (1888); Freshfield's *The Exploration of the Caucasus* (2 vols. 1896); Merzbacher's *Aus den Hochregionen des Kaukasus* (2 vols. 1901).

**Cauchy**, AUGUSTIN LOUIS, BARON (1789-1857), French mathematician, was professor (1816) at the Ecole Polytechnique, and at the Collège de France and the university, also member of the Institute. He became professor of mathematical astronomy at Paris in 1848. Amongst his very numerous and important works are: *Théorie des Ondes* (1815), crowned by the Institute; *Leçons sur les Applications du Calcul Infinitésimal à la Géométrie* (1816-28); *Leçons sur le Calcul Différentiel* (1829); *Mémoire sur la Dispersion de la Lumière* (1836). His *Œuvres Complètes* were published by the French Academy in twenty-six volumes (1882, etc.). See Valson's *Le Baron A. Cauchy* (2 vols. 1868).

**Caucus**, in politics, a meeting of supporters of a definite line of policy for the purpose of choosing representatives who will express their views, or of deciding upon some change of political creed. The term is also applied to the informal and secret meetings of party leaders, who seek, in advance of regular conventions or primary elections, to determine the course of such conventions or elections. In the legislative bodies of the states, as well as in the Federal Congress, the caucus of all the members of a party is employed to secure unity of party action. In the state legislatures the caucus usually decides upon whom the party shall support for United States Senator.

**Cauda-galli Grit**. See CORNIFEROUS PERIOD. One of the New York formations belonging to the Devonian series. The rock is a rather close-textured, siliceous shale, characterized by the peculiar drooping fossil furoid or plant which gives its name to the whole formation. It lies below the Onondaga limestone.

**Caudium**, an ancient tn. in Samnium, Italy, on the road between Capua and Beneventum. Near it was the pass known as the Furculæ Caudinæ, or Caudine Forks, in which a Roman army was compelled to surrender by the Samnites in 321 B.C.

**Caul**, a part of the amnion or foetal membrane; receives this name when a child is born with it covering the head, instead of with the head piercing it, as is generally the case. To be born with a caul was, and in some places still is, considered lucky. The caul is also believed to bring luck to the person who after-

ward owns it, and especially to guard the bearer against drowning. Hence large sums were formerly paid for cauls by seamen.

**Caulaincourt**, ARMAND AUGUST LOUIS, MARQUIS DE (1772-1827), French statesman, born at Caulaincourt, Department of the Aisne. He was imprisoned as a royalist, but escaped. Under Bonaparte he became grand equerry (1804), general (1805) and finally (1808) Duke of Vicenza. After being Ambassador to Russia (1807), he shared in the Russian campaign, having vainly urged Napoleon against it. During the 'hundred days' he was Napoleon's Foreign Minister. The restoration deprived him of office and peerage. His memoirs appeared as *Souvenirs du Duc de Vicence* (1837-40).

**Cauliflower**. The cauliflower is, like the broccoli, a cabbage in which the flower stems and abortive flowers have been artificially developed. The crop grows best in a cool, moist climate. In the United States it grows especially well on Long Island and in some of the Northern Atlantic and Great Lake states. It requires a well-enriched, moist, loaming soil. The young plants are started and handled like cabbage plants. The plants in the field are set 18 inches apart, in rows about 2 ft. apart, and given thorough shallow cultivation. When the head is forming, the outer leaves are brought up over it and tied or pinned together. This gives a blanched, clean, white head, which otherwise would be of a dirty-brown color and of low market value. Snowball and Early Dwarf Erfurt are excellent sorts for either early or late crops.

**Caulking**, or **CALKING**, the process of driving oakum (or old ropes untwisted and pulled asunder) into the seams of a ship's planks, in sides or decks, and covering it with pitch or rosin, to make the vessel tight.

**Caulopteris**, a name given to certain fossil tree-ferns, the external surface of which is densely covered with leaf scars, large, and more or less circular, enclosing another horseshoe-shaped mark. These stems are often silicified, and their interior structure can be perfectly made out. Some of them were of large size; it is believed that they may have been forty feet and more in height. They are especially characteristic of the Carboniferous formation, in which certain coal beds are practically entirely made up of the trunks of tree-ferns.

**Caunus**, an important ancient city on the s. coast of Caria, in Asia Minor, opposite the island of Rhodes; was a colony of Crete; famous for its dried figs.

**Cauquènes**, tn., Chili, cap. of

Maule prov., 55 m. N.N.W. of Concepcion, on the S. bank of the Rio Maule, surrounded by grain fields and vineyards. Pop. 8,574.

**Caura**, territory of Venezuela, S. America, s. of the Orinoco R. Its products are chiefly tonka beans, the fruits of *Dipterix odorata*. It is drained by the Caura. The population is very small.

**Caus**, CAUX, or CAULX (for all forms exist), SOLOMON (1576-1626), French engineer, born in Normandy; educated in England, where he spent his early years. He was in the service of the King of France (1620). In 1615 he published *Raisons des Forces Mouvantes avec Diverses Machines*, wherein he gave such unmistakable foreshadowing of the steam-engine that its invention has been claimed for him.

**Causalgia**, a term sometimes applied to a morbid condition of the peripheral end organs of nerves, and associated with a glossy appearance of the skin, with burning pain and possible ulceration, whitlows, and the shedding of nails. It is a variety of neuritis.

**Cause**. The Aristotelian doctrine of causation recognized four kinds of causes—material, formal, efficient, and final. Thus, in the case of a house, the stone and wood are the material cause, the plan of the house the formal cause, the builder the efficient cause, and the shelter which the house is intended to afford the purpose or final cause of its construction. In the case of organic or living things, to which probably Aristotle's scheme was primarily applied, the form—that is to say, the principle of life—is immanent from the beginning (though undeveloped), and is, moreover, when fully realized, itself the end or final cause of the organism. So that the formal and the final cause are here coincident and identical, while the efficient cause becomes merely the first impulse from without that starts the process of immanent self-development. The modern scientific doctrine of cause and effect is concerned primarily with mechanical processes, the fundamental feature being the uniformity of succession exhibited. If the phenomenon or set of conditions A B C is followed by the phenomenon or set of consequences  $\alpha \beta \gamma$  on one occasion, it is assumed that the like set of conditions will be followed by the like set of consequences on every other occasion. Upon this general assumption the methods of physical science—*e.g.* the inductive methods analyzed by Mill—are based.

Two main problems have been discussed in connection with this fundamental assumption. The

first of these, started and argued with great acuteness by Hume, is whether the assumption is a rational and necessary principle, or only a blind though persistent belief, produced in each particular case of its application by the constant association of ideas which results from the repetition of a particular sequence of events. Hume's continually reiterated ground for denying the necessity of the principle is that, so far as we can see *à priori*, a given phenomenon A might just as well cause the result  $\beta$  as its actual result  $\alpha$  (for example, for anything we can see, bread might have been poisonous instead of nourishing); and the mere frequency with which  $\alpha$  does follow upon A cannot generate a necessity which was absent from their first connection. But to this it must be replied: (1) that the particular necessity for the particular connection A— $\alpha$  is precisely the problem which science has to solve (for example, to discover why bread is nourishing, we must ascertain the chemical nature of bread on the one hand, and of human tissue on the other); (2) that the general principle asserts only the stability or necessity of causal connection in general, and does not promise us any insight into the particular nature of particular connections.

The second problem in connection with the principle of causality arises when the analysis of the causal relation is pushed to its logical conclusion. In the ordinary scientific use of the conception of causation, a distinction in time is assumed between the cause and the effect. Now, this distinction is possible only so long as our statement of the cause or conditions is incomplete. If all the conditions of an effect are given, the effect is given with them, being, in fact, nothing distinct from the totality of its conditions of partial causes: for example, the conjunction of gunpowder and a spark is already an explosion. It would seem, then, that with the complete statement of the conditions the element of time is eliminated. See J. Venn's *Empirical Logic* (1889), ch. ii.

**Causerie** (Fr.), an article dealing informally with matters of literary interest. The best known are the *Causeries du Lundi* of Sainte-Beuve, where, however, the causerie, like the essay, belies its humble title, and has become a very elaborate production.

**Causses** (Lat. *calx*, 'lime'), lofty calcareous plateaus in the depts. of Aveyron, Lozère, Gard, and Hérault, France, on the steep western slopes of the Cévennes (area, some 2,000 sq. m.). Numerous streams have excavated cañons

that divide the plateaus into four main and many smaller 'causses' or promontories, the chief being Sauveterre, Méjean, Norie, and Larzac. Surface pits (*avens*), subterranean streams (the Tarn alone, in a distance of 31 m., receives thirty), and stalactite caverns abound. On the southern frontier of the Noire stands Montpellier-le-Vieux, 'the dolomite city.' See M. Betham-Edwards's *The Roof of France* (1889); E. A. Martel's *Les Cévennes et la Région des Causses* (1890).

**Caustic**, in chemistry, a term used for certain substances which have a corrosive action. 'Lunar caustic,' or nitrate of silver, is used in surgery to destroy and stimulate unhealthy and sluggish-healing surfaces. The word is used as a prefix to 'potash,' 'soda,' and 'lime,' indicating respectively the hydroxide of potassium (KOH) and of sodium (NaOH), and the oxide of calcium (CaO). All these have a corrosive action on cellular tissue, owing to their powerful attraction for water.

**Caustic** is the name given to the curve or surface of maximum brightness formed by the concentration of rays of light after they have been reflected from a reflecting surface, or refracted

*r*, Ray of light; *s*, surface of liquid.

a new medium. One of the simplest and most familiar examples is the caustic formed on the surface of tea or coffee when light from a window or a flame falls on it after reflection from the polished interior side of the cup. The two-arched curve formed in this way separates the surface into two regions, on one of which no reflected ray whatever falls. All such rays pass through the other region, and every ray is a tangent to the caustic curve. Each point of the caustic may, therefore, be regarded as the meeting-point of two consecutive rays at least. Where the two caustic arches meet there is a comparatively great concentration of rays, so that this point, known as the focus, is much brighter than other parts of the caustic. Caustics may also be produced by rays which have been refracted; and here, because of the dispersion of the differently colored constituents of white light, beautiful color effects are frequently observed.

Each ray forms its own caustic, slightly displaced from the caustic formed by a ray or a different color, so that the appearance is that of a colored band. A very good example of this is the ordinary rainbow.

**Cautery** (Gr. 'burner') is an instrument for the application of dry heat to the body tissues, so as to cause marked local irritation or even destruction of tissue, according to the degree of heat applied, and the time for which it is applied. The usual forms of cautery are the (1) actual, (2) thermo, (3) galvano, (4) hot air, and (5) cautery by concentrated solar rays. The actual cautery is heat directly applied through a heated metal instrument—e.g. Corrigan's button. The degree of heat (black, red, or white heat) is decided by the effect desired. Black heat acts as a counter-irritant; dull red heat is counter-irritant and styptic, besides destroying tissue locally. An instrument applied at a bright red heat destroys tissue, but does not form a good seal for stopping hæmorrhage. White heat forms no eschar at all, and so cannot be used to stop hæmorrhage; and a white-hot wire practically cuts like a knife. In Paquelin's cautery, and in similar instruments (thermo-cautery), the hollow blade to be applied is first heated in a spirit-lamp, and its heat is retained and regulated by means of spirit vapor driven through it. The galvano-cautery is heated by a galvanic current. Antisepsis must be secured, both in the surface to be cauterized and in the instruments, before the operation is performed. For the recent application of hot air and sun rays as cauterizing agents, it is claimed that no mechanical injury is done to the tissues, that healing is more satisfactory, and that scarring is much less.

**Cautin**. (1.) Coast prov., Chile; cap. Temuco. Area, 5,830 sq. m. Pop. (1895) 78,221. (2.) Or RIO IMPERIAL, riv., Chile, S. America. It rises on w. side of Andes, and flows w. for 180 m. to the Pacific.

**Cautio**. See ROMAN LAW.

**Cautio** (Civil Law). A bond in which the debtor promises to pay at a future day money received. In England and France much the same as a surety, *which see*.

**Cauto River**, the largest riv. in Cuba. Rising in the mountains N. of Santiago de Cuba, it flows w. through a course of 120 m., 75 of which are navigable, to the head of the Golfo de Guacanabo.

**Cauvery**, riv., India, rising in the mountains of Coorg, flowing through Mysore (where, below Seringapatam, it descends in beau-

tiful falls and rapids round the island of Sivasa-múdran) and Madras for about 475 miles, to empty itself by means of one of the largest deltas in India (northern arm, Coleroon; southern arm, Cauvery) into the Bay of Bengal.

**Cava del Tirreni**, ká'vá dá'ē ter-rá'nē, town and episcopal see, Italy, in the province of Salerno; 6 miles northwest of Salerno. It is charmingly situated among wooded hills and is a favorite resort in the warmer months. A little to the south is the famous Benedictine monastery of La Trinità della Cava, founded in 1025, containing valuable archives, now the property of the nation. The chief industry is the manufacture of textiles. Pop. (1920) 8,691.

**Cavaignac**, ká-vā-nyak', JACQUES MARIE EUGÈNE GODEFROY (1853-1905), French public official, son of Louis Eugène Cavaignac, was born in Paris. He entered the army and was decorated for bravery in the Franco-German War. Subsequently he studied engineering and law, but from 1882 devoted himself to political life. He entered the Chamber as a republican in 1882, was under-secretary of war in 1885, and minister of marine in 1892. As minister of war in Brisson's cabinet (1898), he played a prominent part in the Dreyfus affair (q.v.), but upon the discovery of the Henry forgery, he resigned rather than countenance a new trial of Dreyfus. He wrote *La formation de la Prusse contemporaine* (1891-8).

**Cavaignac**, LOUIS EUGÈNE (1802-57), French soldier and politician, was born in Paris. He served with distinction in Algeria, and in 1844 was appointed general of brigade. In the revolution of 1848 he was made governor-general of Algeria; but was soon recalled to Paris, where, as minister of war and dictator, he drove the insurgents from the barricades in a series of sanguinary engagements. The risings having been quelled, Cavaignac resigned his dictatorship, but was immediately appointed president of the Council. He was a candidate for president of the republic, but was defeated by Louis Napoleon. Though a quiescent spectator of the *coup d'état* of 1851, he was temporarily imprisoned. Consult *Life* by Deschamps (2 vols.).

**Cavillon**, ká'vá'yon' (anc. *Cabellio*), town, France, in the department of Vaucluse; 14 miles southeast of Avignon. The culture of silk worms is a flourishing industry, and the town boasts a model silkworm-rearing establishment. Olives, melons, and the vine are grown. Roman remains have been found in the vicinity. Pop. (1921) 8,991.

**Cavalcanti**, ká'val-kán'tē, GUIDO (c. 1255-1300), Italian poet, was born in Florence of a Guelph family. In 1300, when the Guelphs divided into factions, the Blacks and Whites, and the former were in the ascendant, Guido, as a White, was exiled to Sarzana, but because of ill health was permitted to return to Florence, where he died. He was a warm friend of Dante, who dedicated to him his *Vita Nuova*, and who refers to him in the *Inferno*, the *Purgatorio*, and the *De Vulgari Eloquentia*. Cavalcanti's most famous poem is the *canzone* on the Essence of Love (*Donna mi prego*), which contains much original thought. His other lyrics are less philosophical, but more beautiful, his ballads and pastorals being especially charming. The best edition of the poems is Ercole's *Guido Cavalcanti e le sue Rime* (1885). Consult, also, Rossetti's *Dante and his Circle*.

**Cavalcaselle**, ká-vál-ká-sel'lá, GIOVANNI BATTISTA (1820-97), Italian author and art critic, was born in Legnago. He studied art in Venice and Munich, and having taken part in the Italian revolution of 1848, was obliged to seek refuge in London. There, in collaboration with Joseph Crowe, he prepared *Early Flemish Painters* (1857), which is still a standard work. After his return to Italy, he published his *History of Italian Painting* (1864-71), and biographies of Titian (1877) and of Raphael (1863), in which he was assisted by Crowe. In 1876 he was appointed Chief Inspector of Antiquities and Fine Arts in Rome.

**Cavaller**, kav-a-lēr', a horseman, whence a knight, a gentleman. The name is perhaps most familiar as applied to the followers of Charles I. of England. It survived until the struggle over the Exclusion Bill in 1679, when it gave place to Tory. See also CHEVALIER.

**Cavalleri**, ká-vá-lyā'rē, EMILIO DEL (c. 1550-c. 1602), Italian composer, was born in Rome, and spent most of his life at the court of Ferdinand de' Medici, where he was on intimate terms with the leading artists and musicians of the day. He was one of the earliest advocates of instrumental accompaniment and one of the first to employ vocal ornament, such as *tremolo*. His work comprises four musical dramas—*Il satiro*, *La disperazione di Fileno*, *Il giuoco della cieca*, and *La rappresentazione di anima e di corpo*. The last of these is regarded as the first Italian oratorio.

**Cavalla**, ká-vál'lá, more correctly KAVALA, seaport, Greece, on the Gulf of Cavalla (Ægean Sea). It is in a rich tobacco growing district, and large

amounts of that commodity are exported. Cavalla formerly belonged to Turkey but was allotted to Greece at the close of the Balkan War. It was the birthplace of Mehemet Ali. Pop. (1920) 22,939.

**Cavalotti**, ká-vá-lot'tē, FELICE (1842-98), Italian writer and politician, was born in Milan. In 1860, after publishing a bitter attack on Germany, *Germania e Italia*, he joined the forces of Garibaldi. Later he opposed the monarchy, and as editor of the *Gazzettino* proved himself a thorough democrat and radical. He was killed in a political duel in 1898. His publications include the dramas *Alcibiade*, *Messeni* and *Cantico de' Cantice*, and *Il Libro dei Versi*.

**Cavalry**, soldiers organized and armed with rifle, pistol, and sabre, mounted on horses, and trained to fight either on horseback or on foot. As an arm of the military service it has been exceedingly important in the past, but it is of less value in modern warfare, in which battles take the form of struggles for the possession of trenches, forts, and other fixed positions.

When operating with other troops, the duties of the cavalry are, in general, to cover the movements of their own troops, to secure information of the movements of hostile troops, to break up the hostile advance, to make raids, and to seize and hold advanced positions. During combat, it operates against the hostile flanks, takes advantage of breaks in the enemy's lines, fills up gaps that may occur in its own lines, and acts as a highly mobile reserve. After battle, its duties are to pursue and harass the enemy or, if its own troops are defeated, to cover their retirement.

In covering the movements of its own troops, use is made of patrols varying in size from an officer and six or eight privates to a troop or even a squadron. These patrols form a screen in front of and on the flanks of their own troops, often at considerable distances, being connected in such a way as to prevent penetration by hostile patrols. They gather and transmit information of the enemy, at the same time preventing hostile patrols from gaining information about their own movements. When contact is established with the enemy, large patrols are sent out to engage it, develop its strength, and harass its advance.

**Cavalry in Mounted Fighting.**—The effect of cavalry on unbroken infantry has hitherto usually been moral rather than actual, and in view of the efficiency of modern firearms, this is more than ever the case in the present day. This 'shock action' must

be prepared for by a concentrated artillery fire so as to demoralize the enemy as much as possible. If the element of surprise is introduced, however, a cavalry charge has a great chance of success. Against shaken or flying infantry it is always effective. Naturally, considering that speed is the great desideratum in its attacks, the question of suitable ground for the manoeuvring of cavalry is all-important. There are many striking historical examples of the disastrous effect produced on charging cavalry by sudden unforeseen natural obstacles: the sunken road at Waterloo is a case in point.

Except in small forces, the charge is made in two successive waves or lines, about 150 yards apart. During the advance and prior to the attack, scouts or patrols cover the movement, reconnoitre for the enemy, select routes, open fences, and otherwise assist the advance. Combat patrols provide security for the flanks and rear. The formation of the attacking troops and the method of attack depend upon the situation. In every mounted attack, the command is divided into a reserve and an attack echelon. The reserve follows the attack echelon at from 100 to 400 yards. The attack echelon usually contains the bulk of the force and is deployed in two or more waves, the rear waves in support of the leading wave. As the approaching forces near each other, the scouts or covering patrols are absorbed in the attack echelon, which tries to deceive the enemy as to its point of attack. If possible, the main blow is made either to envelop or strike the enemy in flank. Each succeeding wave protects a flank of the wave in front, rear waves attempting to outflank the hostile force. The reserve protects the flanks of the attack echelon, strikes the decisive blow, pursues the enemy, meets counter blows, or covers the withdrawal of the attack echelon if it is defeated.

**Cavalry in Dismounted Fighting.**—The custom of occasionally dismounting cavalry and making them fight on foot, first used with distinguished success by the Federal forces in the American Civil War, has been steadily growing. The modern tendency, however, is to use cavalry for fighting purposes almost entirely as mounted infantry; and although the continental nations of Europe still consider the lance and sword as useful cavalry weapons, the carbine and automatic rifle are now regarded as the most valuable arms. By using the horse as a means of rapidly covering long distances, cavalry is superior to infantry

for making those wide turning movements in attacking an enemy which are necessitated by modern tactics.

In the **United States Army** there are fifteen regiments of cavalry, the strength of which is fixed by executive order, under the provisions of the amended National Defense Act of June 6, 1920. These fifteen regiments are organized into one complete cavalry division, one incomplete division, and seven separate regiments.

The cavalry division consists of: headquarters and the headquarters troops, signal, ordnance, and veterinary; two cavalry brigades; one battalion of horse artillery; one mounted engineer battalion; one ambulance company; one division train; attached medical troops.

The brigade is composed of: brigade headquarters and headquarters troop, two regiments of cavalry, and a machine-gun squadron of four troops.

The regiment comprises: regimental headquarters, headquarters troop, service troop, and two squadrons of three rifle troops each.

The normal peace strength of a cavalry division is 6,072 officers, warrant officers, and enlisted men; of a brigade, 2,803; of a regiment, 1,155, but for reasons of economy, all units at present are maintained at about 70 per cent. of peace strength. Several divisions may be combined into a cavalry corps for the execution of a special mission.

An army includes among its component parts two cavalry divisions. Cavalry does not form an integral part of the army corps or of the division, but is assigned to each for duty when its use is indicated.

The cavalry recruit must be between 5 ft. 4 in. and 5 ft. 10 in. in height and weigh not over 165 pounds. The United States has two remount depots, one at Fort Reno, Oklahoma, and one at Front Royal, Virginia, where horses bought in open market or bred at the depots are trained for the mounted services.

For the historical development of Cavalry see **ARMY**.

**Cavan**, kav'an, inland county of Ireland, in Ulster; area, 746 square miles. The surface is mountainous in the northwest, with numerous streams and several lakes. The principal river is the Erne. Coal, iron, and copper occur, and there are mineral springs. Agriculture is the chief industry, but, except in the valleys, the soil is poor. Linen bleaching is also important. Pop. 90,000.

**Cavatina**, ká-vá-tē'ná, a term originally meaning a one-part song but later applied to a smooth melodious air forming

part of a grand movement. Mozart's *Andromeda*, Mendelssohn's *St. Paul*, and many other operas contain examples.

**Cave**, EDWARD (1691-1754), English printer, was born in Newton, near Rugby. In 1731 he founded the *Gentleman's Magazine*, which he edited under the nom de plume of 'Sylvanus Urban' until his death in 1754.

**Cave**, WILLIAM (1637-1713), English divine, was born in Pickwell, Leicestershire. After being chaplain to Charles II., he was canon of Windsor (1684), and vicar of Isleworth, Middlesex (1690), till his death. He wrote *Primitive Christianity* (1672), *Antiquitates Apostolicæ* (1678), and *Scriptorum Ecclesiasticorum Historia Literaria* (1688-98).

**Cave Animals**, a term used in zoology in two senses—first, and most legitimately, for fauna living in caves (*i.e.*, animals which have been structurally modified to fit them for this mode of life); second, as a convenient designation of various mammals of which fossils are found in Pleistocene deposits in European caves, to distinguish them from their living allies. In this latter sense we speak of the cave bear (*Ursus spelæus*), the cave lion, and the cave hyæna, though these were not in any special sense cave-dwelling animals.

The true cave dwellers are usually much modified in accordance with their habitat, especially as regards eyes and coloring. The conditions which obtain in the larger caves are not unlike those at great depths of the sea; and in the partial or complete suppression of eyes and the development of special tactile organs the members of the two faunas show a marked resemblance. *Proteus anguineus* of the caves of Carniola and Dalmatia, is a blind, colorless, amphibian, which retains throughout life the external gills present only in the young of many other amphibians—*e.g.*, the common frog. In captivity it shows itself sensitive to light, and if persistently exposed to it, becomes dark colored, or even black. An analogous amphibian, *Typhlomolge rathbuni*, has been found in caves in Texas. It has concealed eyes and is colorless. Other cave animals include fish, notably the famous blind fish *Amblyopsis* (*q.v.*) of the Mammoth Cave in Kentucky; beetles, such as the carabids (see **CARABIDÆ**), especially the members of the widely distributed genus *Anophthalmus*, and silphids (*e.g.*, *Adelops*); carnivorous grasshoppers, as *Dolichopoda palpata* and other forms; myriapods, spiders, and crustacea. Consult Packard's *Cave Fauna of North America*.

**Caveat**, ká'vi-at (Latin, 'let

him beware'), is a formal notice given to one holding public or judicial office, that he is not to perform a certain act without first giving intimation to the caveator or person giving the notice. The term is derived from the canon law, being the initial word of an ecclesiastical writ, issued, for example, to hinder the presentation or collation of an undesirable person to a benefice. In modern times it is used extensively to prevent probate of a will, or administration of the estates of an intestate being granted to a third party without the caveator being heard.

Caveats are also of importance in patent practice, when one who has made an invention but wishes time to perfect it seeks to prevent a patent for the same invention being granted to another without his claim to priority of discovery being considered. In the United States, that part of the Patent Law providing for caveats was rescinded in 1910, and they are no longer issued. See PATENT.

**Caveat actor** ('let the doer beware') is a legal maxim which, in certain exceptional circumstances, makes a person fully responsible for any loss or damage resulting from his acts, quite irrespective of any intention or negligence on his part. The maxim will apply, for example, where the defendant was a trespasser on the plaintiff's land, or where a lion or other ferocious animal kept by the defendant has caused injury to the plaintiff.

**Caveat emptor** ('let the purchaser beware') is a principle of modern commercial law, which requires a buyer to make an inspection on his own account of the articles he is purchasing, and in the absence of an express warranty frees the seller from any claim on the ground that certain faults were not pointed out. This rule, of course, holds good only where the purchaser has the opportunity of making an inspection, and is not compelled to rely on the word of the vendor.

**Cavedone**, *kā-vā-dō'nā*, GIACOMO (1577-1660), Italian painter, was born in Sassuolo, near Modena. He studied under Ludovico Carracci at Bologna, where he settled, becoming for a time assistant to Guido. His chief works are *The Last Supper*, *Among the Doctors*, and a fine *Madonna and Child*.

**Cave Dwellings**. See CLIFF DWELLERS; MOUND DWELLINGS; TROGLODYTES; UNDERGROUND DWELLINGS.

**Cavell**, EDITH (1865-1915), British nurse, was born in Swardston, Norfolk, was educated in London and Brussels, and received her training as a nurse in the London Hospital. After holding various hospital

positions, she was in 1907 appointed matron of the Berken-dael Medical Institute, Brussels, a training school for secular nurses, which, following the outbreak of the Great War, became a Red Cross hospital. While continuing her work in the hospital, Miss Cavell was active in assisting allied soldiers to escape, by means of false credentials, across the Dutch frontier. In August 1915 she was arrested by the German police, and having admitted the charges against her, was found guilty and was shot as a spy, Oct. 11, 1915. In May 1919, after a memorial service in Westminster Abbey, her body was removed to Norwich cathedral.

**Cavendish**, pseudonym of HENRY JONES (q.v.).

**Cavendish**, LORD FREDERICK CHARLES (1836-82), second son of the seventh Duke of Devonshire, was born in Eastbourne, Sussex. From 1859 to 1864 he acted as private secretary to Lord Granville, and in 1865 he entered Parliament for the West Riding of Yorkshire, a constituency he represented till his death. He was private secretary to Gladstone (1872), a junior Lord of the Treasury (1873-80), and financial secretary of the Treasury (1880-82). Appointed chief secretary to the Lord Lieutenant of Ireland, Earl Spencer, he took the oath of office on May 6, 1882. On the same day he and T. H. Burke, an unpopular subordinate, were stabbed to death in Phoenix Park, Dublin. Eight months later, twenty 'Irish Invincibles' were tried for the murder; three turned Queen's evidence, five of the rest were hanged, three sentenced to penal servitude for life, and the remaining nine to various terms of imprisonment.

**Cavendish**, GEORGE (? 1500-1561), biographer of Wolsey, became Wolsey's gentleman usher, and remained in close attendance upon him till his death (1530), when he retired to Glemsford, in Suffolk, having married a niece of Sir Thomas More. About 1560 he wrote his *Life of Cardinal Wolsey*, one of the most interesting short biographies in the English language. Its pensive wisdom and simple sincerity reflect a pleasing picture of the gentle and refined nature of its author, and enable us to see intimately with our own eyes the outlines of one of the great figures in history.

**Cavendish**, HENRY (1731-1810), English natural philosopher, was born in Nice, France, and devoted his life to scientific investigations. As a philosopher he is entitled to the highest rank. In 1760 he discovered the extreme levity of inflammable air, now known as hydrogen gas—a discovery which led to balloon

experiments and projects for aerial navigation; and later he ascertained that water resulted from the union of two gases. The famous *Cavendish Experiment* was an ingenious device for estimating the density of the earth. Cavendish also wrote on astronomical instruments and his *Electrical Researches* (1771-81) were edited by Clerk Maxwell. Consult Wilson's *Life*.

**Cavendish**, MARGARET. See NEWCASTLE, DUKES OF.

**Cavendish**, THOMAS (1560-1592), English navigator, was born near Ipswich, England. He shared in Grenville's expedition to Virginia (1585). In 1586 he sailed from Plymouth with three ships, and by way of Sierra Leone and Brazil reached the Strait of Magellan. During his cruise in the Pacific he burned three Spanish towns and numerous ships. Then, with a rich booty, he returned by way of the Indian Archipelago and the Cape of Good Hope to England—completing his circumnavigation of the globe in 1588. In 1591 he sailed on a second expedition, which ended in disaster.

**Cavendish**, WILLIAM (1592-1676), duke of Newcastle, became a favorite at the court of James I., who in 1620 created him Viscount Mansfield. Charles I. in 1628 made him earl of Newcastle, and in 1638 appointed him governor to his son, afterward Charles II. He loyally supported the King in the Civil Wars, and was general of the forces north of the Tweed. After the Battle of Marston Moor (1644), he retired to the Continent, where he resided till the Restoration.

**Cavendish Family**. See DEVONSHIRE.

**Cave of Adullam**. See ADULLAM; ADULLAMITES.

**Cave of the Winds**. See NIAGARA RIVER AND FALLS.

**Caves**, natural depressions in the earth's crust, formed by the action of such agencies as air, water, and volcanic upheavals. According to the method of their formation, caves may be divided into several groups. The sea caves, so numerous on rocky coasts, are the result of the action of the waves, which, casting sand and gravel against the cliff, have gradually undermined it. This takes place most rapidly along lines of fracture and fissures, which are readily eaten into, with the formation of depressions. In this process the air, too, plays an important part; driven by the pressure of the advancing water into every crevice of the rock, it suddenly expands and dislodges showers of fragments when the wave falls back. In this way a cave is often carried far beyond the limits reached by the waves themselves, and may tunnel up-

ward, emerging at the surface at a considerable distance from the edge of the cliff. Such 'blow holes,' sending out puffs of spray with every wave of a storm, are frequent on rocky shores. In raised beaches (q. v.) caves due to the force of the waves at an earlier period are often quite dry, and are even used for human habitation.

An even greater number of caves are due to the action of spring water and underground rivers dissolving the rocks in which they circulate. As limestone is of all common rocks the most soluble in spring water containing carbonic acid, caves occur oftenest in this rock. Familiar examples of such caves are the Mammoth Cave (q. v.) and other caves of Kentucky; the Luray Cavern (see LURAY) of Virginia; Jenolan in New South Wales; the Adelsberg Grotto (see ADELSBERG) in Carniola, and Matlock in Derbyshire. In extensive tracts of limestone the rivers may flow entirely in underground channels, while the surface is an arid desert, as in the Causses (q. v.) in Central France. These channels are a succession of vaulted chambers, with pillars and pendent columns deposited by the water dripping from the roof (see STALACTITES AND STALAGMITES); or the roofs may fall in, leaving circular sinks in the ground above (see SINKHOLES).

Another group of caves, which may be better described as rock shelters, is found in inland cliffs, where hard and soft beds alternate. The soft layers are readily eaten back by the action of frost and rain, forming shallow recesses.

Lava caves are characteristic of volcanic regions and are due to the escape of the central part of a lava flow at a period when the surface cooled to form a hard crust, while the interior was still liquid. Large caves of this kind occur in the Sandwich Islands and in Iceland.

Not only have natural caves frequently been the refuge of primeval man and of many of his descendants, but there gradually developed the practice of artificially improving and elaborating such shelters, and ultimately of hewing out habitations in what was previously solid rock. The cave temples of India, as those at Elephanta, although they are not actual dwellings, are probably the finest illustrations of this custom; other examples occur in Asia Minor and in North Africa. The cliff dwellings of Arizona are also partly cut out of the rock. Consult Shaler's *Sea and Land*; Lubbock's *Origin of Civilization*; Lyell's *Antiquity of Man*; Hovey's *Celebrated American Caverns*.

**Caviare**, kav-i-är', the salted

roe (immature ovaries) of the sturgeon (*Acipenser sturio*), considered a table delicacy. To prepare it the roe are beaten with twigs to separate the eggs from the membrane; the mass is then rubbed over a fine wire screen, through which the eggs drop into a container below, salt is added and carefully stirred until it forms a brine. The brine is poured off, and the eggs are packed in kegs. The best caviare comes from Russia, near Astrakhan and the Volga, but large quantities are also prepared in Sweden, Norway, and Germany. In the United States eggs of fish other than sturgeon are prepared as caviare; the product must, however, be labelled with the name of the fish used.

**Cavite**, province, Luzon, Philippine Islands, bordering on Manila Bay, and adjoining the provinces of Manila, Laguna de Bay, La Laguna, and Batangas; area 510 square miles. It is mountainous but fertile; the principal products being sugar, rice, coffee, and indigo. Sugar refining and the manufacture of cotton and hemp cloth are the leading industries. Pop. (1918) 157,355.

**Cavite**, kä-vē-tā', city, Luzon, Philippine Islands, capital of Cavite province, is situated on a small promontory, 9 miles southwest of Manila. It is a walled town with buildings of stone and regularly laid out streets. It is the terminus of a railway from Manila, the chief naval station of the archipelago, and has an arsenal, fortifications, dock-yard, dry dock, hospital, and convents. Tobacco manufacture is an important industry. Near by is Terra Alta, a sanatorium for foreigners. Pop. (1918) 22,169.

**Cavour**, kä-vōör', COUNT CAMILLO BENSO DI (1810-61), restorer of Italian unity and nationality, was born in Turin, then capital of Sardinia, a descendant of one of the ancient noble families of Piedmont. He attended the military academy in his native city, and upon completing his course was appointed to a post in the engineers, which he resigned in 1831, retiring to private life.

In 1847, in conjunction with Count Cesare Balbo (q. v.), Cavour established a newspaper, *Il Risorgimento*, in which he advocated a representative system of government, somewhat after the English pattern. On his suggestion, the king was petitioned for a constitution, and this was granted in February 1848. In the Chamber of Deputies, which he entered in 1848, Cavour strenuously opposed the ultra-democrats, and counselled an alliance with England. In the Marquis d'Azeglio's ministry he was suc-

cessively Minister of Agriculture and Commerce, Minister of Marine, and Minister of Finance. In 1852 he was appointed to succeed D'Azeglio as Premier, and from this time devoted himself to bringing about the unification of Italy. Taking upon himself at different times, in addition to the premiership, the duties of the ministry of finance, commerce, and agriculture, and latterly of home and foreign affairs, he greatly improved the financial condition of the country, introduced measures of free trade, consolidated constitutionalism, weakened clerical influence, and made Sardinia a power of some account in Europe.

It was through Cavour's advice and influence that Sardinia took part in the Crimean War, and as a result of this he managed to bring the Italian question before the Congress of Paris in 1856. In 1858 he had with the Emperor Napoleon a secret meeting, at which the programme for driving Austria out of Italy was drawn up; and during the early part of 1859 there followed a diplomatic contest with Austria, which Cavour conducted with masterly tact and astuteness. The Peace of Villafranca, coming after the successful war of 1859, and leaving Austria in possession of Venetia, was a bitter disappointment to Cavour. He resigned his office; yet he had no reason for despair, as the power of Austria in the Italian peninsula was really broken. On returning to office in 1860 he resumed his great undertaking, but by new methods. Still keeping the one great end in view, he secured the absorption of Parma, Modena, and Tuscany into the dominions of Victor Emmanuel; but to appease France, he was compelled to acquiesce in the cession of Savoy and Nice. For this he was much blamed by Garibaldi and his sympathizers. In March, 1860, the states of Central Italy acknowledged the sovereignty of Victor Emmanuel, and by autumn the Sardinian troops and their Garibaldian allies had secured the Papal States and Southern Italy. In the spring of 1861 the first Italian Parliament met at Turin, and Victor Emmanuel was King of Italy. Cavour, worn out in public life, died in that city in the following June.

Consult *Lives of Cavour*, by Massari (1873), Mazađe (1877), Edward Dicey (1861), and Gottschall (1876); *La politique de Cavour*, by C. Bianchi; *Cavour*, by F. X. Kraus; his *Letters*, edited by Chiala; *Le Comte de Cavour: récits et souvenirs*, by De la Rive; *Camillo di Cavour*, by Ciro d'Areo; Orsi's *Cavour and the Making of Modern Italy, 1810-1861*.

**Ca'vy**, a small rodent of the family Caviidae found in South and Central America. The true cavies are small animals, with short legs and ears and a complete absence of tail; the wild forms, uniformly colored, live chiefly in burrows excavated by themselves and are timid and shy. They often furnish food for man and for other animals. Among the best known species are the Restless Cavy (*C. porcellus*), a small greyish brown creature found in Brazil, and Cutler's Cavy (*C. cutleri*), almost black in color and generally thought to be the ancestor of the domesticated guinea pig (q.v.). The Patagonian cavy (*Dolichotis patagonica*), now nearly extinct, is much larger, resembling the hare in size and appearance, but having longer legs. The capybara and agouti (qq. v.) are near relatives.

**Caw'dor**, village, Scotland, in Nairn county; 10 miles northeast of Inverness. It is the traditional scene of Duncan's murder (Shakespeare's *Macbeth*) in 1040, but the castle dates only from 1454. Pop. of par. (1921) 838.

**Cawein**, kâ-win', MADISON JULIUS (1865-1914), American poet, was born in Louisville, Ky. He began the composition of verse at an early age, and in 1887 published his first book, *Blooms of the Berry*, which received warm praise for its delicate appreciation of nature. Other volumes include: *Accolon of Gaul* (1889); *Red Leaves and Roses* (1893); *Poems of Nature and Love* (1893); *The Garden of Dreams* (1896); *Myth and Romance* (1899); *Kentucky Poems* (1902); *The Vale of Tempe* (1905); *Nature Notes and Impressions* (1906); *The Shadow Garden* (1910); *The Republic* (1913); *The Cup of Comus* (1914). He was a member of the National Institute of Arts and Letters.

**Cawnpur**, kôn'pūr, or CAWN-PORE, chief city of the district of Cawnpore, United Provinces, India, on the south bank of the Ganges, 46 miles southeast of Lucknow. The British maintain a large military cantonment here and have made the city the commercial centre of Northern India. There is trade in grain and other agricultural produce, and cotton and leather goods are manufactured. Cawnpur was the scene of tragic events during the Sepoy Mutiny of 1857. An exhausted garrison of Europeans, which, under promise of safe-conduct to Allahabad, had surrendered to Nana Sahib, the adopted son of the last Peishwa, were fired upon as they embarked on the river; and the women and children rescued from this massacre were brought back to the city and foully butchered. The events of the mutiny are com-

memorated by the Memorial Gardens and the Memorial Church. Pop. (1921) 216,436.

**Caxamarca**. See CAJAMARCA.

**Caxias**, kâ-shē-âsh', town, Brazil, in Maranhão, on the left bank of the Itapicuru; 200 miles southeast of Maranhão. It has trade in rice and cotton. Pop. 15,000.

**Cax'ton**, WILLIAM (c. 1421-91), the first English printer, was born near Hadlow in Kent. He

By Ewing Galloway, N. Y.

*Cawnpur: Memorial Cross over the Well in which the Bodies of the Mutiny Victims were Buried.*

was apprenticed to a mercer in London, at whose death (1441) he left England, and settled in Bruges. There he remained for more than thirty years, the last eight or nine of which he was governor of the English Merchant Adventurers in that city. In 1474, with the co-operation of Colard Mansion, a printer of Bruges, he issued his *Recuyell of the Histories of Troye*, the first book printed in English, followed in 1475 by *The Game and Plays of the Chesse*. Returning to England in 1476, Caxton set up a printing press near Westminster Abbey and for fifteen years he assiduously printed chivalric romances, religious works, and translations, all of which he edited and twenty-two of which he translated. The *Dictes and Sayings of the Philosophers*, published in 1477, is believed to have been the first work actually printed in England. His books, numbering 99, all printed in black letter, included Malory's *King Arthur*, translations of Cicero's *De Senectute* and *De Amicitia*, and editions of Chaucer, Lydgate, and Gower. Upon Caxton's death, his materials passed into the hands of his assistant, Wynkyn de Worde (q.v.).

Consult *Life and Typography*

of *William Caxton and The Biography and Typography of Caxton*, both by William Blades; also *Lives*, by Ames, Dibdin, and Lewis. Lowndes' *Bibliographers' Manual* (1834) contains a list of the works issued from Caxton's press.

**Cayambe**, kâ-âm'bā, a volcano in Ecuador, 50 miles northeast of Quito. It stands almost on the equator, rising to an altitude of 19,255 feet.

**Caycos**. See CAICOS.

**Cayenne**, kâ-en' or ki-en', capital of French Guiana (South America) and the only port in the colony, is situated on the northwest shore of Cayenne Island, between the Cayenne and Mahury Rivers. It is the seat of a college and has a museum and library. It was once the site of a penal settlement. The Isle du Diable, on which Dreyfus was incarcerated, lies 30 miles to the northwest. Pop. (1921) 10,146.

**Cayenne Pepper**. See PEPPER.

**Cayes**, AUX, ô kâ', seaport town, Haiti, on the southern coast; 100 miles southwest of Port-au-Prince. It is the seat of a bishopric and of a United States consular agency. Exports include coffee, sugar, and dyewoods. Pop. 15,000.

**Cayley**, ARTHUR (1821-95), English mathematician, was born in Richmond, in Surrey. He distinguished himself as a student at Cambridge, and in 1863 was elected to the Sadlerian professorship of mathematics there. His address as president of the British Association in 1883 became historic, as it foreshadowed many developments in mathematical science that have since taken place. In 1882 he visited the United States, where he lectured in Johns Hopkins University. Cayley contributed to nearly every subject in the range of pure mathematics. Specially noteworthy are his theory of invariants and covariants; the introduction of the 'absolute' into the discussion of metrical properties; his theories in analytical geometry in regard to curves and surfaces, and his memoir on matrices in the development of branches of algebra. As a writer he is best known by his *Elementary Treatise on Elliptic Functions* (1876; 2nd ed. 1895), and by his papers, amounting to more than nine hundred, which were published by the Cambridge University Press (1889-98).

**Caylus**, kâ-lüs', ANNE CLAUDE PHILIPPE DE TUBIÈRES, COMTE DE (1692-1765), French engraver and archaeologist, was born in Paris and served in Spain in the war of the Austrian Succession. Later he travelled extensively, devoting himself to the pursuit and encouragement of art in all its forms. He was an

accomplished etcher, producing an enormous number of plates, some of which are valuable as preserving the works of celebrated artists. His attempt to discover the site and ruins of Troy and other explorations are described in his work *Recueil d'antiquités égyptiennes, étrusques, grecques, romaines, et gauloises* (7 vols., 1752-67). Besides this, he wrote biographies of Mignard, Lemoine, Bouchardon, and Watteau, and other works which were published under the title *Œuvres badines* (12 vols., 1787). Consult Rocheblave's *Essai sur le Comte de Caylus*.

**Caylus, MARIE MAPGUERITE LE VALOIS DE VILLETTE DE MURCAY, COMTESSE DE** (1672-1729), cousin of Mme. de Maintenon, and herself an ornament of the court of Louis XIV., was born in Paris. Her interesting *Souvenirs* were published by Voltaire at Geneva (1770; reprinted 1804, 1860, and 1879). Comte de Caylus, the archæologist, was her son.

**Cayman.** See CAIMAN.

**Caymans, or CAYMAN ISLANDS,** three islands (Grand Cayman, Little Cayman, and Cayman Brac) in the Caribbean Sea; 180 miles northwest of Jamaica, of which they form a dependency. They are of coral formation and are very fertile. Good fishing grounds surround them, and great natural caves extend under their shores. Grand Cayman is 17 miles long by 4 to 7 miles broad. Its capital is Bodden-town. The chief exports are dyewoods, phosphates, fish, and turtles. Cocoanuts from Cayman Brac and Little Cayman form an important article of export. Pop. (1921) 5,253.

**Cayor, ki-ör', or KAYOR,** district of Senegal, on the west coast of Africa, between the Senegal River and Cape Verde; inhabited by Joloffs or Yolofs. The soil is fertile and produces cotton, indigo, and grain. Pop. 150,000.

**Cayster, kā-is'ter,** river in Asia Minor, flowing into the sea northwest of Ephesus. Homer alludes to its swans, which still abound.

**Cayuga, kā-yōō'ga,** lake of glacial origin in the central part of New York State, stretching north and south for 35 miles, with a maximum breadth of 2 to 3 miles, and an elevation of 381 feet. It drains north to Lake Ontario by the Seneca and Oswego Rivers. The city of Ithaca (q.v.) stands at its head.

**Cayuga,** a tribe of North American Indians belonging to the Iroquoian confederation. They formerly lived near the shores of Cayuga Lake, New York, but at the beginning of the American Revolution a large number of them removed to Canada and

never returned. At present some are in Oklahoma, some in New York, near Cayuga, and the majority on the Grand River reservation in Ontario.

**Cayuse, ki-ūs',** tribe of North American Indians, formerly living near the Umatilla River, Oregon, and in Washington. They are closely associated with the Nez Percés and are noted for their bravery. They now number about 300, all on the Umatilla Reservation, Oregon.

**Cayvan, ka-van',** GEORGIA EVA (1860-1906), American actress, was born in Bath, Me. Her first appearance as an actress was as Hebe in *Pinafore*, in 1879. The following year she appeared at the Madison Square Theatre, New York, as Dolly in *Hazel Kirke*. Later parts were Daisy Brown in *The Professor*, Liza in *The White Slave*, and Lura in *Romany Rye*. She played in San Francisco and other cities, was at one period in Dion Bouccault's Company, and from 1887 to 1894 was leading lady in Daniel Frohman's Lyceum Theatre Company. After one or two seasons of starring on her own account, she retired from the stage in 1897 on account of ill health.

**Cazembe, kā-zem'bē,** or KAZEMBE, the name given to a district in Central Africa formerly ruled over by an African chief whose hereditary title was also Cazembe. It lies near the southern end of Lake Mweru and is now divided between Rhodesia and the Belgian Congo.

**Cazin, kā-zān',** JEAN CHARLES (1841-1901), French landscape painter, was born in Samer (Pas-de-Calais). After obtaining his degree at the University of Lille, he studied under Lecoq de Boisbaudran and later went to England, where he interested himself in ceramic designing. He returned to France in 1875, and after 1883 painted chiefly landscapes, simple and beautiful in coloring and full of melancholy sentiment. In 1889 he was made Chevalier of the Legion of Honor. His best known works are *The Flight into Egypt*, *The Journey of Tobias*, *The Departure of Mary and Joseph from Judæa*, *Hagar and Ishmael*, *A Dead City*, *The Marne*, *The Bathers*.

**C. E.,** abbreviation for civil engineer; Christian Endeavor.

**Ceadda.** See CHAD, ST.

**Cean-Bermudez, thā'an-ber-mōō'dath,** JUAN AGUSTIN (1749-1829), Spanish man of letters, was born in Gijon. He was a pupil of Mengs, court painter to Charles III., and a well-known and prolific writer on Spanish art. His principal work, which is still the leading authority on its subject, is *Diccionario historico de los mas illustres profesores de las bellas artes en España* (6

vols. 1800). He also wrote a *Life* of his friend Jovellanos (1814) and published descriptions of works of art and antiquities in Spain.

**Ce'ano'thus,** a genus of small American trees or shrubs of the Buckthorn family (Rhamnaceæ). They are cultivated chiefly for ornamental purposes and are more commonly found on the Pacific coast. *C. americanus*, known also as New Jersey Tea or Redroot, is a hardy shrub with dense panicles of white flowers, whose leaves are said to be used as a substitute for tea. *C. thyr-siflorus*, known as the California Lilac, bears clusters of fragrant blue flowers like miniature lilac blooms.

**Ceará, sã-ã-rã',** state, Brazil, on the Atlantic coast, between Piauhy and Rio Grande do Norte; area 40,241 square miles. The surface slopes upward from the sandy coast on the north, forming great rolling plains, culminating in a series of low ranges in the south. The climate is generally hot, and droughts are common. The streams are small, and of little value for navigation. In some parts the soil is fertile, producing sugar, tobacco, cotton, and coffee. The woods yield timber, and there are good pasture lands. The leading industries are cotton spinning and rubber manufacture. The capital is Fortaleza. Pop. (1920) 1,319,228.

**Ceará.** See FORTALEZA.

**Ceará Mirim, mē-rēn',** town, Brazil, in the state of Rio Grande do Norte, on the Ceará Mirim river. Cattle-grazing and the manufacture of cotton and sugar are the leading industries. Pop. 18,000.

**Cebadilla.** See SABADILLA.

**Cebenna.** See CÉVENNES.

**Cebes, se'bēz,** a Theban, a disciple of the Pythagorean philosopher Philolaus, and also of Socrates, at whose death he was present. Plato, in his *Phædo*, which describes Socrates' last hours, makes him the most important character, after Socrates, in the dialogue. Diogenes Laertius says he wrote three dialogues, the *Pinax*, *Hebdome*, and *Phrynichus*; none are extant, though there exists under the name of the first a work which was formerly accepted as his. It discusses the trials and temptations of life, and inculcates the cultivation of philosophy and virtue as the only method of escape. The text has been edited by Prächter (1893) and, with notes, by Jerram (1878).

**Cebidæ, seb'i-dē,** a family of monkeys entirely confined to South America, and including the capuchins (genus *Cebus*), howling monkeys, spider monkeys, woolly monkeys, and others.

**CAXTON'S PRINTING OFFICE IN THE ALMONRY AT WESTMINSTER**  
*(Painted by Daniel Maclise, R. A. Reproduced by Permission of the Earl of Luton.)*

*Explanation of Figures:—*1. Earl Rivers, Caxton's patron. 2. The Abbot of Westminster. 3. The Duke of Clarence. 4. The Queen of Edward IV. 5. King Edward IV. 6. Richard of Gloucester. 7. Wallace Caxton. 8. Princess Elizabeth of York. 9. The young Princes murdered in the Tower. 10. Compositors and pressmen. 11. Bookbinders, engravers, and illuminators.

**Cebu**, sā-bōō', *Span. pron.* thā-vōō', one of the Philippine Islands, situated about the middle of the Visayan group. It is 139 miles long and 24 miles wide, with an area of 1,695 square miles. A mountain chain extends along its greater axis. Though Uling, the highest peak, is only 2,172 feet, the narrowness of the island makes the slopes so steep that communication between the east and west shores is difficult. Rainfall is abundant, and the soil is fertile, producing sugar, hemp, tobacco, rice, and cotton. Coal, silver, lead, and petroleum have been discovered, and there are forests of building woods. The island is famous for its cheese; and coconut wine, piña cloth, silk, and sinamay are manufactured. The rare shell, *gloria maris*, and the glass sponge, or Venus' flower basket (q. v.), have been found along its shores. Pop. (1918) 855,065.

**Cebu**, town, Philippine Islands, capital of the province of Cebu, on the eastern coast, 357 miles southeast of Manila. Sheltered behind Mactan Island, it has one of the finest harbors in the Philippines. Features of the town are the cathedral, with a tower of white coral; the picturesque old fort; the episcopal palace, and the 'Rizal,' a small building containing a cross reputed to have been planted in Cebu by Magellan, who is said to have died on Mactan Island (1521). Cebu is an important commercial centre. It was the capital of the islands from 1565 to 1571. Pop. (1918) 65,502.

**Cecchi**, chek'kē, ANTONIO (1849-96), Italian traveller, was born in Pesaro. In 1876 he accompanied the expedition of the Marquis Antinori to Abyssinia. He mapped the route from Zeila to Shoa. In 1885, at the request of the Italian government, he accompanied a mission to Massowah, explored the coast, and concluded a treaty of commerce with the Sultan of Zanzibar. He wrote *Da Zeila alle frontiere del Caffa* (3 vols. 1886), and *L'Abissinia settentrionale* (1887).

**Cech**, chek, SVATOPLUK (1846-1908), one of the foremost of the Czech poets, was born in Ostrédač, and educated in Prague. His style is natural, graceful, and vigorous, and his writing is characterized by a satiric humor. He is at his best in epic poems, such as *Adamilé* (1873) and *The Dream*, which, with several others, appeared in 1874, under the title *Poems*. Another collection of poems was published in 1880, including *Europe* and *The Circassian*. Cech also wrote the novels *Povidky*, *Arabesky a Humoresky* (4 vols. 1878-80), and *The Candidate for Immortality* (1884). He founded the review

VOL. II.—March '25

*Kvety*, which he edited for twenty years.

**Cecidomyiidae**, ses-i-do-mī'-yi-de, or GALL GNATS, a family of minute flies with hairy bodies, many-jointed antennæ, and slightly veined wings. The larvae are often destructive to crops, most of them forming galls on the leaves and twigs of plants. The best known member of the family is the Hessian Fly (q. v.). Some European species have been known to give birth to young while in the larval stage (pædogenesis).

**Cecil**, ses'íl, LORD EDWARD HERBERT (1867-1918), British soldier (D.S.O.), was the fourth son of the third Marquis of Salisbury. He was with the Dongola expeditionary force in 1896 as aide-de-camp to Kitchener, and was present at Firket and Hafir. In the campaign (1898) which led to the reconquest of the Sudan he was again aide-de-camp to Kitchener, and took part in the battles of the Atbara and Khartoum. Lord Cecil accompanied a special mission to King Menelik of Abyssinia (1897), and on the outbreak of the Boer War (1899) he took a leading part in the defence of Mafeking, under Baden-Powell. In 1902 he was appointed military secretary to the Sirdar of the Egyptian Army, and in 1903-5 director of intelligence in the Sudan. He was Under-Secretary of State for Finance in Egypt, 1905-12, and from that time till his death was financial adviser to the Egyptian government.

**Cecil**, LORD HUGH RICHARD HEATHCOTE (1869- ), British member of Parliament, was the youngest son of the third Marquis of Salisbury. He was private secretary to his father (1895-1906), and member of Parliament for Greenwich (1895-1906) and for Oxford University (1910- ). During the Great War he was lieutenant in the Royal Flying Corps. He is distinguished for his high Christian idealism and is one of the most influential private members in the House.

**Cecil**, ROBERT. See SALISBURY, MARQUIS OF.

**Cecil**, ROBERT, VISCOUNT CECIL OF CHETWOOD (1864- ), British statesman, son of the third Marquis of Salisbury, was called to the bar in 1887 and became a King's Counsel in 1899. He was private secretary to his father during the latter's premiership (1886-8), was member of Parliament for East Marylebone (1906-10) and for the Hitchen division of Herts (1912-23); was Under-Secretary for Foreign Affairs (1915-16); Assistant Secretary for Foreign Affairs (1918), and Minister of Blockade (1916-18). In 1919 he went to Paris to

assist in the formation of the League of Nations, of which he was later vice-president and at whose first assembly (1920) he represented South Africa. In 1924 he was awarded the Wilson Foundation prize for his efforts towards international peace. He was created a peer, taking the title Viscount Cecil of Chetwood, in 1923.

**Cecil**, WILLIAM. See BURLEIGH, LORD.

**Cecilia**, sē-sil'i-a, SAINT, the patron saint of music, a Roman maiden of noble family who is said to have been martyred under Alexander Severus, about 230 A.D. It is related of her that, on the eve of her marriage to the heathen Valerianus, she converted him to Christianity. Valerianus was martyred by the sword and she herself was thrown into a boiling bath; when this failed to kill her, she was beheaded. Cecilia has been regarded as the inventor of the organ, and in paintings is generally depicted as seated at that instrument, attended by angels or saints; notable examples are the paintings of Raphael, Carlo Dolci, Rubens, Domenichino, Reynolds, and Copley. Her festival day is November 22.

**Cecropia**, sē-kro'pi-a, a genus of soft-wooded, milky-juiced trees belonging to the order Moraceæ, found in most tropical regions. *C. peltata*, the best known species, also known as the Trumpet Tree or Snakewood, is native to the West Indies and South America. It has hollow branches, with membranous partitions at the nodes, on the removal of which the branches may be fashioned into wind instruments. The fruit is a small, one-seeded nut resembling a raspberry in taste. The tree contains a saline matter used in purifying sugar, the bark furnishes an astringent and is also used for cordage, and the wood is so light that it readily ignites under friction.

**Cecrops**, sē'krops, the mythical founder and first King of Athens. To him are attributed the institution of marriage, abolition of human sacrifice, and establishment of a purer worship.

**Cedar**, a genus of beautiful coniferous trees with persistent foliage and large spreading branches. There are three closely allied species, *Cedrus atlantica*, a native of North Africa, a large pyramidal tree growing to a height of 120 feet; *C. deodora*, found in the Himalayas; and *C. libani* or the Cedar of Lebanon. Cedars furnish a valuable timber, light, durable, and easily worked. It is supposed to be the shittim wood of the Bible. The cedars of Lebanon are by no means so impressive and numerous as once

they were. There were in 1917 about 400 of them standing, but even these were destroyed in the course of the Great War. *C. libani* grows slowly and is notable for its large trunk and wide-spreading branches. It exudes a kind of white resin formerly used in embalming. *C. deodora* and *C. atlantica* are similar in appearance to *C. libani*; the former is abundant in the Himalayas, and its wood is valuable for cabinet work.

In the United States the name cedar is applied loosely to species of *Cedrela*, *Juniper* and *Chamaecyparis*. The White Cedar (*Chamaecyparis thyoides*), found along the Atlantic seaboard, is really a cypress. It grows in swampy ground to a height of from 40 to 80 feet, and its timber is used for interior finishing, barrels, fences, boats, and small woodenware. The so-called Red Cedar (*Juniperus virginiana*) is a species of juniper found east of the Rocky Mountains. It has fragrant red wood, soft and easily worked, which is used for pencils, chests, interior finishing, and fence posts. The West Indian Cedar (*Cedrela*) furnishes a reddish wood largely used in making cigar boxes. See also JUNIPER.

**Cedar Bird.** See WAXWING.

**Cedar Creek, BATTLE OF**, a battle of the American Civil War, fought on Oct. 19, 1864, at Cedar Creek, a small stream in the Shenandoah Valley, Va., between about 19,000 Confederates under General Early and about 30,000 Federals, first under General Wright and later under General Sheridan; the last engagement in Sheridan's campaign against Early in the Shenandoah Valley. Sheridan had gone to Washington to confer with the Federal authorities, leaving Wright in command, when Early surprised his army, at first driving it in some confusion before him for about four miles. Sheridan, having reached Winchester on his return from Washington and hearing the firing, hastened on horseback to the scene of action, and reformed the Federal lines; and his disheartened troops, inspired with new enthusiasm by the presence of their popular commander, routed the Confederates. The Federal loss in killed, wounded, and captured was about 5,600; that of the Confederates about 2,900. Sheridan's ride from Winchester to the battlefield is commemorated by Thomas Buchanan Read's poem, *Sheridan's Ride*.

**Cedar Falls**, city, Iowa, Black Hawk county, on Cedar River, and on the Chicago Great Western, the Chicago, Rock Island and Pacific, and the Illinois Central Railroads; 93 miles west of

Dubuque. Pershing Way, Red Ball Route, Grant Highway, Black Diamond Trail, and the Short Line and Iowa Park Highways all pass through Cedar Falls. A free tourist camp is maintained in Island Park. The city is the seat of the Iowa State Teachers' College, and has the Sartori Public Library. The abundant water power is utilized in manufacturing lumber, furniture,

Cedar Mountain, Culpeper county, Va., between a Confederate force of about 20,000 under Gen. 'Stonewall' Jackson, and a Federal force of about 8,000 under Gen. N. P. Banks. Jackson had been ordered by General Lee to attack the van of General Pope's Federal army, and was himself impetuously attacked by General Banks, who, in spite of his inferior force, at first threw the

A Cedar of Lebanon.

canned vegetables, farm gates, cereals, flour, and agricultural implements. Pop. (1910) 5,012; (1920) 6,316.

**Cedar Gum**, a yellow transparent resin used in making varnish and in various medicinal preparations. It is obtained from *Lallitris arborea*.

**Cedar Mountain, BATTLE OF**, a battle of the American Civil War, fought on Aug. 9, 1862, at

Confederates into confusion, but was finally beaten back and defeated. The Federal loss in killed and wounded was about 2,300; that of the Confederates about 1,300.

**Cedar Oil**, an essential oil obtained from *Juniperus virginiana* (sp. gr. 9622). Its use in mounting microscopical specimens was originally suggested by Professor Abbe.

**Cedar Rapids**, city, Iowa, Linn county, on the Cedar River, and on the Chicago, Milwaukee and St. Paul, the Chicago, Rock Island and Pacific, the Chicago and North Western, and the Illinois Central Railroads; 64 miles southwest of Dubuque. Cedar Rapids is the seat of Coe College (1881) and has two schools, a business college, Masonic Temple, and Masonic and Public Libraries. The city's valuable water-power accounts for its rapid growth. Industrial establishments, according to the Federal Census of Manufactures for 1919, number 208, with \$39,055,539, capital and products valued at \$92,118,386. They include packing houses and foundries, and manufactures of pumps, farming implements, corn products, and cereals. Pop. (1900) 25,656; (1910) 32,811; (1920) 45,566.

**Cedar River**, or RED CEDAR RIVER, a left bank tributary of the Iowa River, rises in Freeborn and Mower counties, Minnesota, near the southern border, and flows southeast across Iowa to within 12 miles of the Mississippi, where it turns southwest and joins the Iowa. It is about 300 miles long.

**Cedartown**, town, Georgia, county seat of Polk county, on the Central of Georgia, and the Seaboard Air Line Railroads; 53 miles northwest of Atlanta. The region is productive in pine and cedar. Lumber, paper, paper boxes, hosiery, cotton, cotton-seed oil, and flour are manufactured, and large iron mines are operated in the vicinity. Pop. (1910) 3,551; (1920) 4,053.

**Cedar Waxwing**. See WAXWING.

**Cedula**, sed'ū-la, or CEDOLA (Ital.), a Spanish word derived from the Latin *schedula*, 'a small piece of paper.' It may designate a certificate of indebtedness, a promissory note, a government security, a personal registration tax, or any one of numerous other certificates.

**Cefalù**, chā-fā-lōō', town and episcopal see, Sicily, in the province of Palermo, on the northern coast; 42 miles southeast of Palermo. The most striking feature of the town is the Norman cathedral, erected in the twelfth century, and containing some remarkable mosaics. There are also ruins of a Norman castle, of a temple of Diana, and of the ancient Cephalædium, destroyed by the Saracens in A.D. 858. Sardine fishing is the chief industry. Pop. (1911) 14,341.

**Ceglie**, chāl'yā, town, Italy, in Lecce province; 19 miles north-east of Taranto. There is trade in fruit and grain. Pop. 20,000.

**Cehegin**, thā-ā-hēn', town, Spain, province of Murcia; 37

miles northwest of Murcia. It produces cereals, wine, hemp, honey, and great quantities of esparto, of which paper is made. There are black marble quarries in the vicinity. Pop. (1910) 13,313.

**Ceiling**, the covering of an interior wall surface, more particularly of the underside of a floor, which provides the roofing or enclosure at the top of a room or other space below. The ancient Egyptian temples and palaces were covered with flat stone slabs, and the walls and ceilings were frequently rendered smooth with a coating of plaster. Ceiling decoration was generally geometrical, i.e. intricate combinations of curves and straight lines, and color was employed boldly. The Babylonians and Assyrians inclined to vaulted ceilings, covered, like the walls,

so as to give the shape of a barrel vault. In ceilings of this description there seldom are many ribs, sometimes only a single one along the top. In the Perpendicular style, the ceiling often consists of a series of flat surfaces or cants, formed on the timbers of the roof. They are enriched with ribs, dividing them into square panels, with bosses or flowers at the intersections. Wooden ceilings are sometimes formed like stone-graining, with ribs and bosses, as at York, Winchester, and Lincoln. In the Elizabethan age ceilings were generally of plaster, but were ornamented with ribs having bosses or small pendants at the intersections.

At the present time flat ceiling decoration takes four main forms: a revival of mixed gesso painting or modelling on plaster;

*Decorated Ceiling (Italian).*

From the Ducal Palace, Venice (Renaissance).

with a form of stucco adorned with vivid coloring. Arched ceilings, known as *camere*, were employed by the Romans, but flat ceilings were in more general use; the beams were at first visible, but in later developments were covered with planks and plaster. Sometimes hollow spaces were left between the beams, which were frequently covered with gold and ivory, or with paintings or 'pateræ'—large flowers—such, for instance, as are used in the panels of the vault of the Pantheon. In Byzantine architecture the ceilings were richly embellished with mosaics of bright color.

Ceilings of churches in the Middle Ages were often painted and brilliantly gilded. The older ceilings generally followed the line of the roof timbers, which, in the Early English and Decorated, were often arranged

covering with an imitation of plaster work or wood carving; applying printed or embossed paper; and attaching metal ceilings. See also FRESKO and MURAL DECORATION.

**Celakovsky**, or CZELAKOWSKI, FRANTISEK LADISLAV (1799-1852), Bohemian poet and philologist, was born in Strakonitz. He was educated in the University of Prague, and held the chair of Slav philology at Breslau (1842) and at Prague (1849). His works include collections of folk-songs and poems, notably *Růže Stolista* ('Rose with a Hundred Leaves') and *Ohlas Pisni Ruskych* ('Echoes of Russian Songs'). At the time of his death he was engaged in preparing a supplement to Jungmann's Bohemian Dictionary. Among numerous translations which he made was a version of Scott's *Lady of the Lake*. His son, LAD-

ISLAV CELAKOVSKY (1834-1902), was professor of botany at the university of his native town of Prague from 1871 to his death. His works include *Prodromus der Flora von Böhmen* (1867-81); *Vergleichende Darstellung der Pflanzen in den Fruchtknoten der Phanerogamen* (1876); *Die Gymnospermen* (1890).

**Celandine**, a term applied to two very dissimilar plants. One, the greater celandine (*Chelidonium majus*), known also as swallow-wort, belongs to the order Papaveraceæ, and is a perennial plant, bearing stalked umbels of small yellow flowers and soft, irregularly pinnate leaves; whereas the lesser celandine (*Ranunculus Ficaria*) belongs to the order Ranunculaceæ, and is a perennial plant, bearing bright yellow, buttercup-like flowers in early spring, the petals being about nine in number. The leaves are heart-shaped.

**Celano**, THOMAS DE (d. ?1255), Latin poet, born at Celano in the Abruzzi; adherent of St. Francis, and custodian of the Minorite convent at Worms from 1221 to 1230. His claim to the authorship of the great Latin hymn *Dies Iræ* is generally admitted.

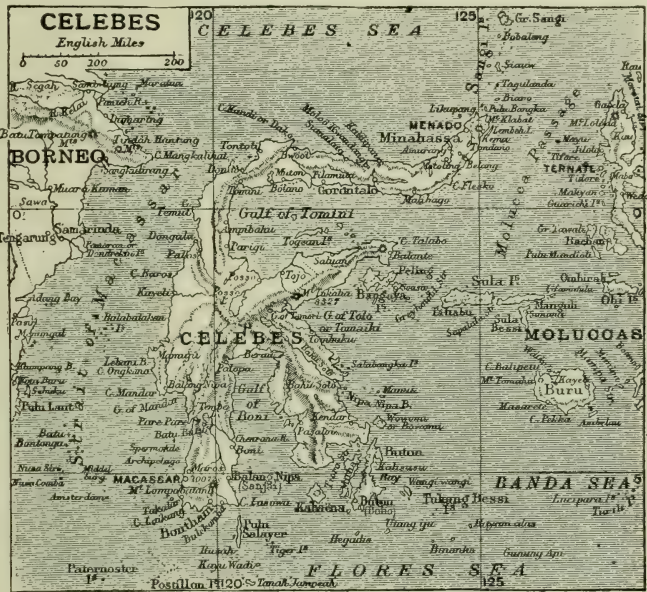

**Celaya**, tn., state of Guanajuato, Mexico, 220 m. by rail from the capital; noted for its cloth, carpets, and sweetmeats. Alt. 6,410 ft. Pop. (1900) 25,565.

**Celebes**, a singularly shaped island in the Dutch East Indies, lies E. of Borneo, being separated from it by the Strait of Macassar. It consists of a long, narrow backbone stretching N. to S., from which similar long, narrow, octopus-like arms point E., N.E., and S.E., separated from each other by the Gulfs of Tomini, Tomori (Tomaiiki), and Boni. The N.E. extremity of the N. arm, called Minahassa, and the S. extremity of the main axis, called Macassar, are the only parts which are really well known. Minahassa is of recent volcanic origin, rising to 7,500 ft. in Mt. Kema. In the S. Macassar runs up to 10,070 ft. in Bobokaraeng and 10,000 ft. in Bonthaeng (Bonthian). Another characteristic feature is the number of lakes, mostly at considerable altitudes, and some of great size, such as Lake Posso, in the centre, 1,640 ft. above sea-level; Lake Tondano, in Minahassa, 2,000 ft. Professor Alfred Russel Wallace believes that Celebes is a framework which is gradually growing into the full roundness of another Borneo; Professor O. Peschel, on the other hand, regards it as the skeleton of a once larger island; and Dr. Wickmann holds what seems to be an intermediate view. Messrs. P. and F. Sarasin, who have recently explored large portions of the

island, regard Lake Posso as filling not a crater but a primitive rift in the earth's surface. The climate is unusually healthy. Gold is found, and sulphur is plentiful in Minahassa. Coal (lignite) is mined in the E. and N.E. of Macassar. The fauna presents several points of interest, certain districts having their own peculiar species. Trade is chiefly confined to the ports of Vlaardingen or Macassar, Menado, and Kema in Minahassa. The people are mostly Malays, Buginese, and, in the interior, Indonesians. The total area is about 70,000 sq. m. Pop. estimated (1900) at 1,870,000.

The Dutch established factories on the island shortly after the

lands. The seed is started in hot-beds, seed-bed or window boxes, and preferably transplanted once before setting in the field. In the field the plants are set in rows 4 to 5 ft. apart and about 8 inches distant in the row. Frequent shallow cultivation is given until the plants are about 10 inches high. The earth is then drawn up with a hoe and packed around the plants in such a way as to form a close, compact bunch. As the plants continue growth more earth is drawn up around them, leaving only the tips of the leaves exposed. The earth excludes the light, and the new growth of the celery is thus blanched, crisp and of improved flavor. Other ma-

middle of the 17th century, and have retained possession of it ever since.

**Celebes Sea**, the division of the Pacific which lies between Celebes, Borneo, and the Philippines, in the E. Indies. It has been sounded to a depth of 13,040 ft.

**Celery** (*Apium graveolens*) is a native umbelliferous plant occurring wild in the temperate countries of Asia and Europe, in moist places, usually by the sea. The plant is hardy and is extensively grown in the United States and Canada for its blanched leaf stalks. These are eaten raw chiefly, but also cooked as a vegetable and used for seasoning soups and salads. Deep, loose, fertile soils, especially reclaimed muck lands, produce the greatest yield of celery, though the best quality is grown on loamy up-

materials like boards, drain tiles set over the plants, or papers wrapped around them, are used for blanching. By one system of culture the plants are set so close together (8x12 inches apart) that they exclude the light, and it is only required to set up boards or bank up the outer rows in blanching. Such close planting requires very rich soil, thorough culture, heavy fertilizing, an abundance of water, and special varieties of celery to succeed. Well-rotted barnyard manure and wood ashes are amongst the best fertilizers for celery, and the ground can scarcely be made too rich with these materials. Celery intended for winter use may be stored in late fall either in trenches outdoors or in a cool cellar. When stored in trenches out-doors the

trenches are dug 8 to 10 inches wide and deep enough so that the celery with the roots on may stand upright in the trench. The roots are covered with soil, but none put between the plants, which are packed in tight. The tops are covered with straw or other material, and as freezing weather comes on soil is added.

Golden Self-Blanching is one of the most popular varieties of celery and is especially valuable in intensive culture where self-blanching is sought. White Plume is also excellent and somewhat more resistant to bacterial disease. One of the largest varieties is Giant Pascal. Of the various diseases which affect celery nearly all can be controlled by the use of standard fungicides like Bordeaux Mixture.

**Céleste**, MADAME (?1814-82), French actress, born in Paris. She came to the U. S. when quite young, and made her début at the Bowery Theatre, New York (1827), afterward playing with much success in Philadelphia. Her first appearance in London was at the Queen's Theatre, as an Arab boy in the *French Spy* (1831). After a tour through Italy, Germany, Spain, and Scotland, she returned to London (1833), appearing at Covent Garden in the *Maid of Cashmere*, succeeded by a season at Drury Lane. She paid a second visit to the United States (1834-7). Her next venture was the management of the Adelphi, London (1844), where she created her most famous rôle, Miami, in *Green Bushes* (1845), and in 1859 became manager of the Lyceum. She again visited the U. S. in 1865-68. She retired in 1874.

**Celestina**, celebrated Spanish comedy (1502; new ed. 1900), is properly a dramatized novel. It appeared in English translation in 1631, and was reprinted in 1874 by Dodsley in *A Select Collection of Old English Plays*. Although the author or authors were long unknown, it is now accepted that the first act was written by the poet Rodrigo de Cota about 1480, and that Fernando de Rojas wrote the rest about 1490.

**Celestine**, or CELESTINUS, the title of five Popes: I. (422-432), II. (1143-4), III. (1191-8), IV. (1241-died sixteen days after his election), V. (1294). Under Celestine I. St. Palladius and St. Patrick were sent to Ireland. Celestine V. was the founder of the orders of the Celestine Monks and the Celestine Hermits.

**Celestines**, a branch of the Benedictine order who practised special austerities. Founded by Pietro da Murrona (1254), they were known as Murronites until his elevation (1294) to the papacy as Celestine V. The Celestine houses were numerous in Ger-

many till the reformation, and in France till 1766. Few now survive even in Italy. The Celcstine Hermits, an offshoot of the Franciscan order, due to the same founder, had but a short existence. See Heimbucher's *Orden und Kongregationen* (1896-7).

**Celestite**, a mineral consisting of sulphate of strontium, and belonging to the same group as barytes. It crystallizes in the ortho-rhombic system in crystals often long, columnar, and pointed. It has a good cleavage, and a hardness of  $3\frac{1}{2}$ ; and when a fragment is heated in the forceps before the blowpipe, the flame is colored scarlet red—a characteristic reaction of minerals containing strontium. Celestite is colorless, white, or bluish, the occasional sky-blue color being the source of the name. Although not one of the commonest minerals, it is by no means rare, and finds a limited commercial employment as a source of strontium compounds and in the refinement of sugar.

**Celibacy**, abstention from the married state by men, as a social and secular phenomenon, depends on the distribution of population according to age and sex and economic conditions. It has sometimes been regarded with disfavor, especially in countries where there is compulsory military service. The decadence of certain countries—e.g. Spain—has been attributed to the fact that a large proportion of the men live as celibates, and some critics—e.g. Galton—have claimed that the choice of the celibate life by the better members of society has, by the laws of heredity, reduced the quality of succeeding generations.

As a religious observance celibacy has held a prominent place in two world religions—Buddhism and Christianity. The instance of the vestal virgins of Rome is not typical of the religious practice of the ancient world. Religion was so much a family and a national concern, that celibacy found little place in its observance. Usually in the case of national religions a family or tribe was set aside as a perpetual priesthood—e.g. the tribe of Levi—and although continence was frequently prescribed during the period of exercising the priestly duties, celibacy was not prescribed. There is no trace in the Old Testament of any desire to exalt celibacy; and although among New Testament writers—e.g. St. Paul—chastity and virginity are regarded as the more excellent way, compulsory celibacy is not insisted on. The earliest Christian celibates were not ecclesiastics, but hermits and anchorites, and only gradually was celibacy enjoined upon the active clergy. The law of celi-

bacy has never been accepted by the Eastern or Greek Church; and Rome itself, in the United Greek Church, tolerates a married clergy, although no married priest can become a bishop. At the first Council of Nicæa (325 A.D.) an unsuccessful attempt was made to impose celibacy as a law on the church. Thereafterward the development of the idea is in the Western Church only. But the practice was not uniform, the rural clergy resisting the attempt to impose it obligatorily on them. Gregory VII. was powerful enough to secure a much more strict observance, and after the first and second Lateran Councils (1123 and 1139) clerical marriages were regarded as invalid. Since the Council of Trent, in 1563, pronounced for celibacy in the strongest manner, it has been strictly enforced as a law and obligation. In the ritualistic movement in the Church of England and the Protestant Episcopal Church in the United States, celibacy has been praised as a virtue and claimed as a duty by some advocates, but it has not, of course, been enforced as an obligation of the church. See H. C. Lea's *Historical Sketch of Sacerdotal Celibacy* (1886).

**Celina**, vil., O., co. seat of Mercer co., 92 m. W.N.W. of Columbus, on the Grand Reservoir, and on the C., H. and D., the Cin., N., and the Lake Erie and W. R. Rs. It has iron works, canneries and brickyards. Pop. (1910) 3,493.

**Cell** is a mass of protoplasm containing a nucleus, both nucleus and protoplasm having arisen through the division of the corresponding elements of a pre-existing cell. A typical cell is spherical in form; but this shape is rarely retained in multicellular animals, where the cells are usually subjected to pressure, except in the case of egg cells. In spherical cells the nucleus occupies an approximately central position. Structurally, this nucleus is to be regarded as a specialized portion of the protoplasm, and it is therefore convenient to use the term protoplasm to designate both the substance making up the cell body and that constituting the nucleus, the terms cytoplasm and karyoplasm being employed respectively for these two forms of protoplasm. In addition, in many cells a minute body called the centrosome also exists; but it is still doubtful whether this persists from generation to generation as the nucleus does. The cytoplasm has a complex structure, and it is possible that the structure not only varies in different cells, but also in the same cell at different times. It is frequently possible to make out in

the cytoplasm a network, or reticulum, made of a substance slightly denser than that which fills the spaces of the reticulum. Along the meshes of the net granules, or microsomes, are often scattered.

The nucleus, without which the cytoplasm is incapable of continued existence, is separated from the surrounding cytoplasm by a nuclear membrane, and is also of a complicated structure, but differs markedly from the cytoplasm. It exhibits an irregular reticulum composed of two different elements—first, of a substance called *linine*, apparently related to cytoplasm; and second, of the exceedingly important substance called *chromatine*. This stains very darkly with many dye-stuffs, whence its name, and its importance is shown by the fact that it is handed on from generation to generation. It contains a large amount of a phosphorus-containing substance called *nucleine*. Within the nucleus there are often bodies called *nucleoli*, which may be made of an aggregation of *chromatine*, or may be *plasmosomes* ('true nucleoli'), whose nature and function are not well known. Finally, the meshes of the nuclear reticulum are filled up by what is known as *nuclear sap*.

The third important element of the cell is the *centrosome*, a minute body, either double or single, which stains intensely with the dye *hemotoxyline*, and is surrounded by an 'attraction sphere,' or by a radiating aster. Only discovered in 1875, the centrosome is still inadequately known. It has been regarded as the centre of force in the cell, and is of great importance in cell division.

In many plant cells other cell organs exist in the form of *plastids*, which, like the nucleus, are capable of growth and division, and are handed on from generation to generation. The most important of these are the *chloro-plastids*, or *chlorophyll corpuscles*, and the *starch-forming leuco-plastids*. As a rule, the cell membrane, or cell wall, is only slightly developed in animal cells, but it is often thick and highly important in the cells of plants, where it is formed of the carbohydrate *cellulose*.

When cells have reached their limit of growth division takes place, the process, in the majority of cases, being of an exceedingly complicated nature. In a cell about to divide the nuclear membrane disappears, the *chromatine* increases in staining power, and takes on the form of a stout coiled thread. This thread, or *skoin*, breaks up into loops, and the loops form a central star.

Meanwhile the centrosome has divided into two, and these two take up positions at the poles of the cell, each being surrounded by a radiating aster.

halves then separate from one another, travelling along the *achromatine* threads to the poles of the cell, so that, in place of the original central aster, two

Types of Cell.

1. Typical cell; a, protoplasm; b, nucleus; c, nucleolus. 2. Cell from the intestinal epithelium of a worm, showing reticular structure: a, membrane of cell; b, protoplasm (cytoplasm); c, membrane of nucleus; d, achromatic substance of nucleus (karyoplasm); e, convoluted chromatin filament. 3. White blood corpuscle (leucocyte) of salamander: a, nucleus; b, nucleoli; c, attraction sphere. 4, 5, 6, 7, 8. Cells in various stages of mitotic division. 9. Ramified nerve cell from spinal cord: a, nucleus and nucleolus; b, axis-cylinder process (cut short); c, basket-work ramifications; d, pigment granules. 10. Pigment cells from the choroid coat of the eye. 11. Cartilage cells. 12. Cells of pavement epithelium from a serous membrane. 13. Muscle cells from intestine: a, nucleus. 14. A bone cell. 15. Vegetable cells, containing chloroplasts (a); b, b, nuclei. (All greatly magnified.)

From one centrosome to another there run fine non-staining (*achromatine*) threads, which constitute the nuclear spindle. On these *achromatine* threads the *chromosomes*, or loops of *chromatine*, lie, and each splits into two. The

daughter asters arise, one at each pole. From these daughter asters nuclei are constituted, the cytoplasm divides, and the cell division is complete. To the whole process the name of *karyokinesis*, or *mitotic division*, is given. In

a few cases—e.g. in many Protozoa—cells divide directly, without any karyokinetic process, the parent nucleus becoming constricted in the centre so as to form two new nuclei. The object of the ordinary karyokinetic process appears to be to produce an accurate division of the parent chromatine between the two new nuclei.

As previously indicated, the cells which are usually taken as typical are the sex cells, which are easily obtained free. The cells which constitute the tissues of multicellular animals differ markedly from such typical cells, the differences depending upon their adaptation to serve special functions. Thus, a striped muscle fibre is a greatly elongated cell, made up of a number of slender longitudinal fibrils, marked with stripes, or alternating bands of light and dark substance; and a nerve cell may have many elongated processes extending outwards from the cell body. In the Protozoa the single cell performs all the animal functions, but in the Metazoa there is much histological division of labor, and this is reflected in the structure of the cells.

For a general description of the cells of the Metazoa, see a textbook of histology, such as Prudden's *Handbook* (1901); and for a very full account of the problems connected with the cell and with cell theory, see E. B. Wilson's *The Cell in Development and Inheritance* (2nd ed. 1900).

**Cell, VOLTAIC, or PRIMARY BATTERY.** A voltaic cell is any combination of metallic and liquid conductors capable of supplying a steady current in a circuit of which it forms a part. In all cases chemical action is the source of the energy. A good voltaic cell should be of high and, as far as possible, of constant electro-motive force; should be free from polarization, and of low internal resistance; should be quiet

Simple Cell.

cent on open circuit; should give off no fumes when in action; should be cheap, durable, not liable to rapid exhaustion, and

easily renewed. No single cell meets all these requirements. For an ordinary commercial purpose, however, tolerable efficiency in one or two particulars is generally sufficient. The different kinds of cells in use fall into a few well-defined classes, the chief differences being in the various devices adopted to obviate polarization.

**The Simple Cell.**—A plate of copper *c* and a plate of zinc *z* dipping into a beaker which contains dilute sulphuric acid (about twenty parts by volume of water to one of acid) constitutes a simple voltaic cell. The electro-motive force of such a cell is 1.05 volts. As soon as circuit is made, zinc replaces the hydrogen in the sulphuric acid, and hydrogen bubbles are evolved at the surface of the copper plate. This produces what is known as electrolytic polarization, and the current falls off. The great problem for the electrician is how to dispose of this hydrogen, and, broadly speaking, the working efficiency of any cell depends upon the extent to which this is done.

Smee's Cell.

**Smee's Cell.**—In this type dilute sulphuric acid is again the exciting fluid. A zinc plate *z* forms the negative pole, but the copper plate is replaced by one of platinized silver—i.e. by a silver plate whose surface is roughened by being coated with finely-divided platinum. As the hydrogen collects here in minute bubbles, it detaches itself from the fine points, and, rising through the liquid, bubbles off. The device is only moderately successful, much of the gas continuing to adhere to the plate.

**Bichromate of Potash Cell.**—In this case bichromate of potash is the depolarizer employed. The excitant is again dilute sulphuric acid, in which the bichromate is dissolved. The plates are of carbon and zinc, generally two carbon plates with the zinc between, the carbons being joined outside the liquid by a metal strip. As the solution would attack the zinc, this plate can be raised out

of the liquid when the cell it not in action. This cell has the high electro-motive force of 2.1 volts and a low internal resistance. If employed to send a strong cur-

Bichromate Cell.

rent for some time, the E.M.F. falls off, for the liquid in contact with the carbon has been used up; but the cell recovers on standing inactive, or on being stirred.

**Leclanché Cell.**—This is the cell most extensively used in bell circuits. It commonly consists of a glass vessel containing a saturated solution of sal-ammoniac (ammonium chloride) and a zinc rod *z* or hollow cylinder. A porous pot of unglazed porcelain *p* occupies the centre of the cell, and holds a carbon plate *c* tightly packed round with small lumps of crushed carbon and black oxide of manganese (manganese dioxide). Diffusing through the porous pot, the sal-ammoniac moistens the powdered carbon and manganese dioxide, and thus enables the current to pass. The cell is clean, cheap, easily renewed, contains no corrosive acids, and emits no fumes. The E.M.F. is about 1.4 volts. In action the black oxide of manganese oxidizes the evolved hydrogen, but only somewhat slowly. Hence polarization soon occurs. This, however, matters little in

Leclanché Cell.

bell work, where the current is kept running only for a very short time and at intervals. An important modification of this cell

is the agglomerate Leclanché, in which the internal resistance is lessened by dispensing with the porous pot. Powdered carbon, manganese dioxide, and gum-lac

*Dry Cell.*

resin, intimately mixed in the proportions of 40 parts of manganese dioxide, 55 parts of carbon, and 5 parts of resin, are pressed into rectangular blocks, which are held up against the sides of the carbon rod by india-rubber bands.

*Dry Cells.*—A popular form consists of a cardboard cylinder containing a zinc cylinder *z* with wire *w* attached. This is lined with a paste *p* made of plaster of Paris 27 parts, water 51 parts, and sal-ammoniac 12 parts. A carbon rod *c* is then put in the centre, and the remaining space *s* filled up with a mixture of sal-ammoniac, powdered carbon, manganese dioxide, zinc sulphate, and glycerine, made into a paste with water. On standing, the paste hardens into a firm, glue-like mass. The cell may be used for all purposes for which the Leclanché is suited, and it possesses the advantages of having no liquid to spill or leak away, and of working equally well in any position.

*Daniell's Cell.*—The Daniell be-

*Daniell's Cell.*

longs to the important class known as two-fluid cells, in which depolarization is effected by electro-chemical means. The mem-

bers of this class are, as a rule, much more constant than the single-fluid cells, because the polarizing hydrogen is not allowed to form on the positive pole. The essential parts of the Daniell cell are a zinc rod immersed in dilute sulphuric acid, or zinc sulphate solution, and separated by a porous pot of unglazed earthenware from a copper plate dipping into a solution of copper sulphate. The copper-sulphate solution must be kept saturated. This is effected by having in the solution a supply of copper-sulphate crystals, which, as the solution becomes weaker, gradually dissolve in the liquid and restore its strength. If the cell is not required for immediate use, water may be placed in the porous pot, and the cell short-circuited, until sufficient sulphate of zinc is formed. When the cell is in action, the sulphuric acid attacks the zinc, forming zinc sulphate and liberating hydrogen. The molecules of hydrogen traverse the pores of the porous pot and continue into the outer cell,

*Grove's Cell.*

where the hydrogen combines with the copper sulphate, forming sulphuric acid, and depositing pure copper on the copper pole. The hydrogen thus never reaches the copper plate. The chemical reaction consists essentially in the replacement of copper by zinc in the solution. If zinc sulphate is used instead of sulphuric acid, the resistance is considerably higher, but the action is similar. Though the E.M.F. of the Daniell is only about 1.08 volt, it is more constant than that of any other cell in common use. On this account the cell is well fitted to serve as a standard of electro-motive force. In the gravity cell the porous cup is dispensed with and the zinc often cast in the form of a 'crow foot' is suspended in a solution of sulphate of zinc, which, by virtue of its lower specific gravity, rests above the sulphate of copper solution.

*Grove's Cell.*—Sir William Grove devised a cell which has both a higher voltage (as much as 1.9

volts) and a lower internal resistance than the Daniell. It differs from the Daniell in having platinum foil immersed in concentrated nitric acid instead of copper in copper sulphate. The hydrogen liberated by the solution of the zinc in the sulphuric acid, passing through the depolarizing nitric acid towards the platinum, decomposes the nitric acid, and is itself oxidized, forming water and nitrogen peroxide gas. This gas appears in the form of red fumes in the inner pot; but it causes no polarization, for being very soluble in nitric acid, it does not attach itself to the platinum, nor does it set up a counter E.M.F. A Grove will send a current continuously for several hours without exhaustion. One cell will raise a few inches of platinum wire to red heat; fifty quart cells in series will produce an electric arc light.

*Bunsen's Cell.*—This is merely a modification of the Grove cell in a cheaper form, the expensive platinum plate being superseded by a rod of carbon. The internal resistance and the voltage are practically the same as in the Grove's cell; and the chemical action is also similar, the evolved hydrogen decomposing the nitric acid and uniting with part of its oxygen to form water, dark-red nitrogen peroxide fumes being given off. Like the Grove, too, the cell may be kept in action several hours without polarizing appreciably, but care should be taken not to inhale the fumes. In view of its constancy, cheapness, and high E.M.F., the Bunsen is, on the whole, perhaps the best cell for general experimental work where a steady E.M.F. and large current are required.

*Bunsen's Cell.*

*Latimer Clark's Standard Cell.*—To secure the greatest possible accuracy in the measurement of electro-motive force, it is desirable to use the Latimer Clark cell, now adopted as the international standard of E.M.F. Its construction is complicated and difficult, and need only be at-

temped by experts. A quantity of pure mercury M occupies the bottom of the cell, and is covered by a layer of paste of mercurous sulphate MP. Above this comes a saturated solution of zinc sulphate ZSS into which a zinc rod ZR dips. Above the solution we have a layer of paraffined cork C to prevent evaporation, and over all a layer of cement CC. A represents an air space, and ZSC a supply of zinc-sulphate crystals. Contact is made with the mercury by a platinum wire enclosed in a glass tube which

Latimer Clark's Standard Cell.

is hermetically sealed. When the cell has been set up for some time its voltage is remarkably constant, standing at 1.434 volts at 15° c. In use the cell must not be short-circuited, as it then polarizes rapidly. Its voltage varies also with the temperature.

**Weston Cell.**—Another important standard cell is the Weston, in which the zinc and zinc sulphate of the Latimer Clark cell are replaced by cadmium and cadmium sulphate. A cadmium amalgam, consisting of metallic cadmium and mercury, forms the negative electrode of this cell, and above it is a solution of cadmium sulphate, and in some cases cadmium sulphate crystals. The other electrode consists of metallic mercury, covered by a paste of mercurous sulphate, the whole being hermetically sealed by cork and paraffine. This cell has an electro-motive force of about one volt, at 20° c., being said to have an electro-motive force of 1.0192 volts.

For arrangements of batteries, see OHEM'S LAW, ELECTRICITY, CURRENT, ACCUMULATOR. See H. S. Carhart's *Primary Batteries* (1891); W. R. Cooper's *Primary Batteries* (1901); Silvanus Thompson's *Elementary Lessons in Magnetism and Electricity* (1900); Poyser's *Magnetism and Electricity* (1892); Jamieson's *Elementary Manual of Magnetism and Electricity* (4th ed. 1897).

**Cellarius**, properly KELLAR, CHRISTOPH (1638-1707), German humanist and pedagogue, born at

Schmalkalden; after teaching for twenty-six years, was appointed (1693) professor of rhetoric at the newly-founded university at Halle. Cellarius contributed much to the revival of classical studies in Germany. Among his books are *Antibarbarus Latinus* (1677), *Orthographia Latina* (1700), *Historia Antiqua* (1685), *Historia Medii Aevi* (1688), *Historia Nova* (1696), also *Geographia Antiqua* and *Geog. Nova* (1686 and 1687). His *Dissertationes Academicae*, with Biography, were published in 1712. See Kiel's *De Ch. Celarii Vita et Studiis* (1875).

**Celle**, formerly also ZELLE, tn., prov. Hanover, Prussia, on the s. margin of the Lüneburg Heath, 23 m. by rail N.E. of Hanover. The parish church contains the tombs of the ducal family of Brunswick-Lüneburg, including that of Sophie Dorothea, the divorced wife of George I. of England. In the castle park is the mausoleum of Caroline Matilda, queen of Denmark and sister of George III. of England. Various Industries. Pop. (1900) 19,883.

**Cellier**, ALFRED (1844-91), English musical composer, born in London, of French parentage. He conducted in Prince's Theatre, Manchester (1871-5), at the Opéra Comique, Manchester (1876), and the Opéra Comique, London (1877-9). His easy style and agreeable flow of melody are strongly in evidence in the *Sultan of Mocha* (1874), though less suited for his more serious setting to Gray's *Elegy* (Leeds Festival, 1883). His other works are: *Charity begins at Home* (1870), *Longfellow's Masque of Pandora* (1881), *Tower of London* (1875), *The Spectre Knight* (1878), *The Carp* (1886), *Mrs. Jarramie's Genie* (1888), and *Doris* (1889), besides music adapted to the librettos *Dorothy* and *Moultbank*.

**Cellini**, BENVENUTO (1500-71), the greatest of the Italian artificers in gold during the renaissance; born in Florence. This complex personality—goldsmith, sculptor, warrior, braggart, and author—has left in his *Autobiography* (1728) a graphic picture of his day, with its vivid contrasts of skilled genius and barbarism. His youth was a series of violent escapades, flights from justice alternating with intervals of admirable workmanship. Finally he settled in Rome under papal patronage, and made numberless works of art, from elaborate silver vases for cardinals, and statuettes, to coinage dies for Clement VII.; while, for the same pope, he defended the castle of San Angelo against the besieging Bourbon troops (1527). Later he spent some time (1540-5) in Paris, and made a basin and ewer

in silver-gilt repoussé; the colossal bronze relief, *The Nymph of Fontainebleau*, now in the Louvre; and the fine golden salt-cellar now in Vienna. His one large bronze statue of Perseus, in Florence, made for the Grand-Duke Cosmo de' Medici, is technically a triumph; though, artistically, the bronze portrait of Bindo Altoviti, so much admired by Michael Angelo, is finer. For translation of his *Autobiography*, see *Life of Benvenuto Cellini* by J. A. Symonds (new ed. 1901); also *Lives* by Tassi (1847) and Mollinier (1894), and F. S. Potter's *A Wonderful Goldsmith* (1882), also Scott's *Sculpture, Renaissance, and Modern* (1886).

**'Cello**, contraction of violoncello. See VIOLIN.

**Cells**. As to the part the different classes of cells play in the structure and functions of the animal body, and theories involved, see BIOLOGY.

**Cellulitis** is inflammation of the loose cellular connective tissue of the body, either starting in the cellular tissue itself, or spreading to it from other tissues. It may be acute or chronic, circumscribed or diffuse. It may end in suppuration, in resolution or in the formation of fibrous adhesions. Owing to the comparatively low vitality of connective tissue, suppuration is common. Cellulitis must be distinguished from erysipelas, which is caused by a specific organism. Whereas erysipelas begins with a redness of the skin, with well-defined limits, cellulitis, on the other hand, is present for some time before the skin becomes much affected, the resulting blush is not so bright, and it tends to be ill-defined about its circumference. When suppuration occurs, it may, of course, implicate important structures burrowing into any adjacent organ, or disorganizing a joint, or causing death by general septic infection. Preventive treatment consists of the antiseptics of every wound or abrasion, however small, and particularly when any poison may be present, as in a sting or bite. In the early stages of cellulitis it is well to ensure the free action of the bowels. Pain is treated with anodynes, and locally by hot fomentations. If suppuration ensue, there must be free incisions made, to ensure the escape of pus, this being aided by warm antiseptic applications. Diet must be nutritious and easily digestible, and stimulants may be necessary.

**Celluloid**, or XYLONITE, consists essentially of a solid solution of the lower nitrates of cellulose in camphor. The cellulose, in the form of bleached cotton or tissue paper, is immersed in a mixture of certain proportion

of nitric and sulphuric acids to form nitrocellulose or pyroxylin.

After nitration is complete (thirty minutes or more), the product is washed to remove the acid or, more commonly, transferred to an hydraulic press or hydro-extractor in order that the acids may be recovered for further use. The next step in the process is *bleaching*. To accomplish this, the cellulose is reduced to a pulp and treated with a solution of potassium permanganate acidified by the addition of sulphuric acid. After a variable period (three to twelve hours), the bleaching liquid is run off from the vats, and the pulp is washed and then treated with sulphur dioxide (gaseous) to precipitate the remaining potassium permanganate, again washed to remove every trace of acid, and again hydro-extracted. Bleaching by hypochlorite is also practised. The bleached nitrocellulose is now thoroughly dried, usually in a drying press, after which it is ready to be made into celluloid.

In America the cakes from the drying press are ground and mixed in special mills with pulverized camphor, the moisture is expressed by hydraulic pressure, and the resulting product is rolled in a rolling mill, at a temperature of about 65° C. The nitrocellulose is thus dissolved in the melted camphor, and celluloid is produced. This is known as the 'dry process.' In the 'wet process' the nitrocellulose (50 parts) is put in vessels of stoneware and treated with a solution of camphor in ether and alcohol. The resulting mixture is rolled into sheets, hardened, and treated in the hydraulic press. Cutting, drying, dressing, and polishing complete the process.

Crude celluloid is a nearly colorless substance, transparent to translucent, and with a specific gravity of 1.25 to 1.45. It is insoluble in water and has considerable tensile strength. When heated to 90 to 125° C. it becomes plastic and is easily moulded. At this temperature, also, separate pieces can be welded together by simple pressure. It can be ignited only by a naked light, burning with a smoky flame. At 195° it decomposes instantly. It can be cemented to wood, leather, and other substances by collodion or a solution of shellac and camphor in alcohol.

Celluloid finds a wide range of application in manufacturing industries. It is used for combs, toys, and toilet articles; in the manufacture of lacquers; for dental appliances and optical instruments; in machinery for emery discs, packing rings, tubes, valves, etc.; for printing blocks and stamps; for beads and buttons; for phonograph records; for

photographic plates and films; and in solution, as a coating for aeroplane wings.

Consult books listed under CELLULOSE; also Masselon, Roberts, and Allard's *Celluloid* (Eng. trans. by Hodgson, 1912) and Böckmann's *Celluloid* (2d Eng. ed., by H. B. Stocks, 1921).

**Cellulose** is the chief component of all vegetable tissues, in which it exists in elongated

it may be seen that it is a white, opaque solid, odorless and tasteless, appearing under the microscope to consist of thin, flattened tubes. It is insoluble in water, but is soluble in a concentrated solution of zinc chloride, a property which finds application in the manufacture of vulcanized fibre; in an ammoniacal solution of cuprous oxide, from which it may be re-precipitated by neutraliza-

*Perseus (in bronze)*

*made by Benvenuto Cellini for the Grand Duke Cosmo de' Medici*

cells or fibres, and represents the result of the plant's activity in building up its structure from the elements of carbon dioxide and water. In composition it is a carbohydrate ( $C_6H_{10}O_5$ )<sup>n</sup>, with the same empirical formula as starch and dextrin, from both of which, however, it differs materially in its properties. Cotton-wool and filter-paper are almost pure cellulose, from which

tion with an acid; and in alkaline thiocarbonates, forming a solution known as viscose, extensively used in the manufacture of artificial silk (see SILK). When treated with strong solutions of caustic soda, cellulose swells and contracts, the hollow fibres being transformed into solid filaments, a phenomenon which is made use of in the process of 'mercerizing' (see MERCERIZATION).

Moderately concentrated acids toughen and parchmenitize cellulose, but in a more concentrated form they yield esters, of which the most important are the nitrates, employed commercially as pyroxylin and gun-cotton (qq. v.). The cellulose acetates (acetyl cellulose) are also of commercial importance, being extensively used in the manufacture of non-inflammable celluloid substitutes, as 'cellite,' and artificial silk (the so-called 'acetate silk'). Besides the applications of its derivatives, cellulose is employed in enormous quantities in the fibrous state in the form of cotton, linen, jute, hemp, etc., to make textiles, and in the state of pulp, obtained chiefly from wood and esparto, to make paper. Consult Cross and Bevan's *Cellulose*; Schwalbe's *Chemie der Cellulose*; Worden's *Technology of the Cellulose Esters* (10 vols.); Martin's *Industrial and Manufacturing Chemistry* (5th ed., 1920).

**Celman, MIGUEL JUAREZ.** See JUAREZ-CELMAN, MIGUEL.

**Celosia,** a popular garden annual belonging to the order Amarantaceae. There are about 35 species, all tropical. The leaves are entire, sometimes lobed, and the flowers grow in dense terminal or axillary spikes. There are two main types of celosia, the crested and the plummy. *C. cristata*, popularly known as Cockscomb, is the best known example of the crested type. It grows to a height of nine or more inches and bears beautiful red, violet, crimson, or yellow flowers. *C. argentea* and *C. Huttoni* are examples of the plummy type and are largely grown for decorative purposes.

**Cel'sius, ANDERS** (1701-44), Swedish astronomer and mathematician, was born in Upsala, and from 1730 to 1744 was professor of astronomy in the University there. He was commissioned by the Swedish government to visit the chief European observatories, and accompanied Maupertuis, Clairaut, and the other French savants, in 1736, on their famous expedition to Lapland to measure a degree of meridian. He wrote numerous and important works on astronomy, but is remembered chiefly as the inventor of the centigrade thermometer (see THERMOMETER). In his scale, however, the numeration ran downward instead of upward, as in the modern centigrade scale. In 1740 Celsius built the observatory of Upsala, and became its director.

**Celsius, OLOF VON** (1716-94), Swedish historian and poet, was born in Upsala. In 1744 he became assistant librarian at the University of Upsala, and in 1747 professor of history there. He was called as pastor to Stock-

holm in 1753, and in 1777 became bishop of Lund. Celsius was a member of the Academy from its foundation (1786). His historical works are especially noteworthy for the thoroughness of their criticism and the brilliancy of their style. The best known are *Konung Gustaf I.'s Historia* (2 vols. 1746-53) and *Konung Erik XIV.'s Historia* (1795). He began an ecclesiastical history of Sweden (*Svea Rikes Kyrkohistoria*), but finished (1767) only the first volume (down to 1022).

**Cel'sus,** an Epicurean philosopher who flourished in the second century. He is supposed to have been a native of Rome, and was a friend of Lucian. He is credited with the authorship of an attack on Christianity called *Logos Alethes* ('True Discourse'), which is not extant, but which was confuted by Origen in his treatise *Contra Celsum*.

**Celsus, AULUS or AURELIUS CORNELIUS,** a Latin writer on medicine. His work, in eight books, contains a discussion of the history of medicine; remarks on diet and the general principles of therapeutics, with the consideration of the treatment of the various diseases, the method advised being largely to allow nature to effect the cure, though the author also recommends a free use of the lancet on occasions; an account of surgery, which shows that many of the most serious operations were practised; and finally a pharmacopœia, containing many excellent prescriptions. There are editions by Ritter (1840) and Darëmborg (1859) and an English translation with Life by A. Lee (1831-6).

**Celt,** a now discarded term for the stone and bronze axes and chisels of prehistoric times. Stone axes present endless varieties of form, the extremes being those which have a cylindrical, pointed butt end, and those that are perfectly flat and thin. They vary in length from less than two inches to nearly sixteen inches, and in degree of finish from roughly chipped forms to specimens possessing the highest possible polish. Stone chisels are rare. Bronze axes comprise (a) the flat axe, which is the earliest form; (b) the flanged, frequently ornamented with punched designs; and (c) the socketed axe. Chisels of bronze are extremely rare.

**Celtiberi,** sel-ti-bē'rī, a people of ancient Spain, descended from Celts who at an early period invaded the Spanish peninsula and intermarried with the Iberians, the primitive inhabitants of the country. They dwelt in the mountainous country in the north and east. The Celtiberi became subjects of Rome in the

second Punic War, but frequently rebelled. Scipio the younger reduced them to submission after the fall of Numantia, in 134 B.C.; but they rebelled again under Sertorius, and only after his death, in 72 B.C., were definitely subdued and Romanized.

**Celts,** or KELTS, a name applied in early history to the peoples who lived in the west and north of Europe, regardless of precise limits or origin. At the height of their power they extended from the north of Scotland to the southern shores of Spain and Portugal, and from the northern coasts of Germany as far south as Rome. The Atlantic bounded their territory on the west, the Black Sea on the east.

With their powerful frames and heavy swords, the Celts were dangerous fighters in the attack; but their lack of cohesion and discipline rendered them incapable of resisting determined opposition. Their raids were the terror of the ancient world, and only the victories of Cæsar and the administration of Augustus reduced them to inactivity.

Celts

1. Flint chisel, 2, 3. Roughly worked flint implements. 4, 5. Finely finished hammer and axe. 6. Flat axe. 7, 8. Flanged axes. 9, 10. Socketed axes. 11. Gouge, 12. Chisel.

They never founded a lasting state, and although at an early date they began to live in towns, there were only slight bonds of union between individual communities. The Celts of Gaul and Britain became rapidly Romanized after their conquest, and Celticism soon collapsed.

The Celtic peoples, in so far as they can be identified by the uncertain test of languages, are represented in modern Europe (1) by the Gaelic-speaking communities of some parts of Ireland, the Scottish Highlands and

Islands, and the Isle of Man, and (2) by the Cymric-speaking inhabitants of Wales and Brittany. Belonging to this second division, although without such a strong title from the linguistic point of view, are those Cornish people whose near ancestors used a Cymric form of speech. Further, there is presumably a large proportion of Celtic blood in the mixed race forming the population of England, notably to the north of the Trent and throughout the western counties, and in the non-Gaelic-speaking peoples of parts of Scotland and Ireland.

Except for the Bretons, none of the continental peoples has retained a Celtic language. Yet the testimony of history shows that, from the Kalatians in the east to the Gauls and the hybrid Celtiberi in the west, Europe once possessed a large Celtic population. In the days of Pytheas (fourth century B.C.) the Celts inhabited most of the northwest of Europe, and from there came the chief tide of Celtic invasion that swept over the British Isles, subduing the native races, at various periods before the days of Julius Cæsar.

The Celts are described as tall, pale, and fair-haired, their dress consisting of a sleeved blouse, sometimes belted, with trousers fitting close to the ankle—the Highland 'trews' of the eighteenth century. The British Celts encountered by the Romans in the first century B.C. were conspicuous by their tartan clothing, usually red or crimson. They knew how to work such metals as iron, bronze, gold, and tin, and adorned themselves with collars of gold, bracelets, finger-rings, and necklaces of glass beads. The Celts of Gaul and Belgium wore plated armor of bronze and iron, and at other times chain-mail coats; and they, as well as their British kindred, ornamented their armor with enamel. Their weapons were swords, daggers, pikes, bows, javelins, slings, and lassos (similar to the South American bolas); and in battle they employed two-wheeled chariots with a bronze scythe projecting on either side.

The British Celts were stock-breeders and agriculturists, and from their wheat they produced 'methglin' or honey-beer. So highly advanced were they as seamen that Cæsar, beginning his invasion of Britain, found the combined navy of the Britons and the Bretons much superior to his own. Generally, however, the civilization of the island Celts lagged behind that of their continental brethren, due to the fact that they were colonists. Thus, although those of Britain had long made use of coined money—gold, copper, and (later) silver—they do not seem to have

had mints of their own until about 200 B.C. While the Celts of Gaul had well-built cities, their island kindred were living in hamlets and hill forts. It is clear that they practised 'head-hunting,' and preserved the skulls of their enemies as trophies. Their chief religion, Druidism, involved human sacrifice (see DRUIDS).

**Language and Literature.**—Celtic belongs to the Indo-European group of languages, and in its forms and inflections, so far as they are known directly or can be reconstructed, early Celtic closely resembled Latin and Greek. Its personal names, like the Greek and Teutonic personal names, are all compound terms, usually of two elements, of which one part qualified the other—e.g., Orget-oria, 'king of slayers'; Cinget-oria, 'king of heroes'; Catu-maros, 'great in battle.'

At an early period Celtic discarded the Indo-Germanic *p* sound initially and between vowels. Thus Latin and Greek *pro* became in Celtic *ro*; Lat. *piscis* is Gaelic *iasc*; Latin and Greek *pater* became Gaelic *athair*, 'father'; Welsh *edrydd*, 'patrimony.' At a later but still early period, Celtic divided in the treatment of the Indo-European *qu* sound, certain dialects retaining it; others changing it to *p*. Thus we have a *p* group and a *q* group of Celtic languages. Continental Celtic belonged on the whole to the *p* group, though there are some traces of retained *qu*—e.g., Sequana, 'the Seine.'

In modern Celtic the two groups are sharply defined: Welsh, Cornish (now extinct), and Breton are of the *p* group; Gaelic (Scottish and Irish) and Manx are of the *q* group, preserving *qu* as *c* or *ch*.

No early Celtic literature has been preserved, though there must have been much bardic poetry and many historical tales among the early Celts (e.g., Livy's account of the golden age of King Ambigatus implies a saga on this subject). The Druids did not commit their learning to writing, and the Bards may have followed their example. Yet by Cæsar's time writing was in vogue among the Gauls, who had come under the influence of Massilian culture. The Helvetii, when they went on their great migration, kept accurate muster rolls in Greek characters. After the Roman conquest, the Gauls of France took readily to learning (as also to agriculture), and even hired professors at the public expense. Cisalpine Gaul supplied some of the greatest Latin writers: Virgil, Catullus, and Livy bear Celtic names, and were probably Gauls. Seneca is also Celtic. The Celts of Britain, after the

introduction of Christianity, showed the same desire for learning, and Ireland from the latter part of the eighth century was renowned for its scholars.

See BRETON LANGUAGE AND LITERATURE; GAELIC LANGUAGE AND LITERATURE; WALES: *Language and Literature*.

**Bibliography.**—Consult Rhys' *Celtic Britain*; Rhys and Jones' *Welsh People*; Nicholson's *Celtic Researches*; Rolleston's *Myths and Legends of the Celtic Race* (1911); Shane's *The Celt and the World* (1917).

**Cement'**, any material, whether natural or manufactured, which causes adhesion between two surfaces, or serves as a matrix to combine particles into a whole. Cements may be divided for consideration into three classes: (1) Building Cements, or calcareous cements, which include common lime, hydraulic limes, cement proper (all the hydraulic cements), the gypsum plasters (of which plaster-of-paris is the foundation), and oxychloride cement; (2) Bituminous Cements, made with asphalt, tar, and pitch; (3) Adhesives and Lutes, including a wide variety of mixtures, ranging from ordinary glue and rubber cement to putty and pipe-joint cements.

**Building Cements.**—The use of some plastic substance to bind together the stones or other materials used in building is exceedingly ancient. The earliest cement was probably nothing more than ordinary mud. The Assyrians used bitumen to cement together the sun-dried bricks which they employed in construction, while the builders of the Great Pyramid made a mortar of burned gypsum. The Romans seem not only to have understood lime mortars and gypsum plasters, but they learned to mix volcanic ashes with burned lime, making what to-day is known as a 'puzzolan cement,' from Puzzoli, whence they obtained their ash.

During the Middle Ages little advance was made in the knowledge of building cements, common lime being used almost exclusively. The modern cement industry dates from the last half of the eighteenth century. John Smeaton (1724–92), in his work on the Eddystone Lighthouse, found that an impure clayey limestone furnished a better mortar than that ordinarily used. The modern Roman cement was developed during the early years of the nineteenth century. Artificial hydraulic cement was first manufactured in France in 1813, and in England in 1822. About 1825 Portland cement was invented.

**Lime** is calcium oxide, or a mixture of calcium and magnesium oxides, made simply by

burning limestone (q. v.) to drive off the carbon dioxide. Lumps of 'quicklime' remain, which may be marketed in this form or, after grinding, slaking in water, and pulverizing, as hydrated lime. For use, quicklime must be slaked by adding water, which converts the oxide into hydroxide. Pure lime becomes very hot in this process, magnesium limes heat only slightly. The hydroxide has the power of absorbing carbon dioxide from the air, thereby changing back to hard carbonate, a property which makes it useful for building purposes. Slaked lime, however, has a tendency to shrink on drying, and to counteract this, sand must be added, the usual proportion being 2 to 4 parts of sand to one of lime paste. This mixture constitutes the lime mortar which has been used since ancient times in laying up brick and stone masonry.

The disadvantages of lime mortar are that the absorption of carbon dioxide goes on very slowly; it cannot proceed at all under water; and the hardened product is of very low strength. Its advantages are its cheapness and its ease of preparation and of use. Lime mortar is credited with a strength of 30 to 50 lbs. per sq. in. after thirty to ninety days' hardening, but it has been found in tearing down very thick walls of considerable age that the innermost mortar was still unhardened, the carbon dioxide not having been able to penetrate to the interior.

Beside its use in building, lime mortar is sometimes used as wall-plaster, for which purpose hair is mixed therein (2 or 3 lbs. per ton of plaster) to give the plaster coat cohesion.

*Hydraulic Lime* is a lime containing enough silica and clay or magnesia to give it slight hydraulic properties (power of hardening with water alone), though still containing enough free lime to slake and heat when water is first added. These limes, used to some extent in Europe, are indefinite transition stages between ordinary lime and true hydraulic cement. Their hydraulic properties are slight compared either with the good natural cements or Portland cement, and they are little known in the United States.

*Hydraulic Cement* is a burned and finely ground mixture of lime, clay, and sand, in such proportions that the product, when mixed with water, undergoes a slow hardening by the formation of complex chemical compounds differing from any of the original materials. The most perfect kind is Portland cement, formed by mixing selected materials so as to give a product of definite composition.

*Natural Cement* is made from limestones which contain considerable impurity in the form of fine clayey matter. It is burned hard enough to cause reaction between the lime and earthy silicate, though not to fusion. This burned material is ground to a fine powder, which is then ready for use. The first cement made in the United States, dating back to 1823, came from near Rosendale, N. Y., where later extensive plants were established. The place has been the centre of this class of cements to the present time. Natural cements are also obtained from the Louisville district of Indiana and Kentucky, Mankato, Minn., the Lehigh region of Pennsylvania, the Fort Scott district of Kansas, and in smaller amounts elsewhere. European natural cements include the natural Portland cements and the Roman cements. (See CEMENT ROCK.)

*Portland Cement*, because of its great importance, must be considered more in detail. Although it is made from many different kinds of material, as marl, limestone, clay, slag, etc., the mixture resulting is so carefully controlled that almost precisely the same results are produced in all cases. A typical analysis is: 23 per cent. silica,  $7\frac{1}{2}$  per cent. alumina, 3 per cent. iron oxide, 2 per cent. magnesia,  $6\frac{1}{2}$  per cent. lime, and a trace of sulphur.

The ingredients of Portland cement, typically limestone and clay, are ground together (either wet or dry, depending on whether the raw materials are obtained in dry state or not), and then burned. Formerly they had to be formed into bricks, dried, and then placed in the chambers of vertical kilns, where they were slowly heated by a fire to the temperature of vitrification (2,500° to 3,000° F.). Since about 1890, however, the rotary kiln has worked a complete revolution, greatly cheapening the product. The rotary kiln was patented in England by Ransome in 1887, but, after early failure, was brought to practical success in the United States. The kiln, which turns slowly on its own axis, is a long steel cylinder lined with firebrick, from 5 to 15 feet in diameter, and from 60 to 250 ft. in length (80 to 265 for wet mixtures). It is inclined downwards slightly from the chimney, at which end the cement materials, ground to a fine powder, are fed in continuously. At the farther end the fuel, usually pulverized bituminous coal, is blown in by means of a fan or a jet of compressed air, and instantly bursts into violent combustion. The cement, which passes steadily forward owing to the revolution of the kiln, gradually reaches the hot zone, and is converted

into clinker. The waste heat serves gradually to raise the cement materials nearly to the clinking stage, as they approach the hot zone of the cylinder.

The clinker which drops out of the kiln is allowed to cool by weathering or by the employing of some cooling device, and is then conveyed to grinders. Grinding is a most thorough process, as it is necessary to reduce the material to a powder as fine as flour; a finely ground cement will leave not more than 15 to 25 per cent. residue on a sieve of 200 meshes per lineal inch (40,000 per sq. in.). Formerly mill-stones were used exclusively. Ball mills and tube mills have now come into favor. More recently, grinders having steel gyrators or impact members are being used extensively in America. During the grinding process it is usual to add a small percentage of gypsum or plaster to improve the setting properties. The finished product is stored for a time to age, so that any free lime contained in it may become carbonated.

The time in which a cement sets or becomes hard varies greatly, but it is possible to manipulate a cement by admixture with a small proportion of plaster-of-paris, so as to prolong considerably the interval between the period of gauging (or mixing with water) and the initial set. From twenty minutes up to five or six hours may represent the speed of setting in different samples. Ten hours is the maximum time allowable under government specifications.

In use, cement is mixed with 25 to 30 per cent. of water and one to three times its volume of sand, forming a mortar rather stiffer and less workable than lime mortar. This is used either as mortar, or, mixed with twice to three times its volume of broken stone or gravel, as concrete, the uses of which in engineering construction are manifold (see CONCRETE). For other applications and for the properties of Portland cement see PORTLAND CEMENT.

In the eighties natural cement was still the principal hydraulic cement used in America. In 1919 the production of Portland cement in the United States amounted to 80,777,935 barrels, valued at \$138,130,269. The total production of natural and puzzolan cements for the same year was 528,589 barrels, with a value of \$583,554. Natural cement is lighter in weight and color, develops only about half the strength, and has less sand-carrying power than Portland. It sets rather more rapidly.

*Puzzolan cement* is a cement made by mixing raw materials

and grinding, but not burning. It is little used in the United States, but considerably in Europe. Many volcanic earths display a slight hydraulic power when ground, and such earths, mixed and ground with quicklime, give a moderately strong cement. In Germany a volcanic rock called 'trass' is largely used for this purpose; trass cement is credited with greater resistance to sea-water than Portland. Santarin rock, obtained in the Grecian Isles, and Pozzuolana, mined in Italy and France, are materials of the same kind. All are chiefly silicates of alumina and iron, with some calcium, etc. Similar materials found in the United States have not yet been exploited. Furnace slags (also vitrified bricks when finely ground) have the same property, being of related composition, and these are used to some extent, both to make puzzolanic cement by grinding with lime, and to make a grade of Portland by mixing, burning, and grinding.

**Gypsum Plasters.**—Cements made from gypsum rely for their setting properties upon the combination of the sulphate of lime, which is their chief ingredient, with a portion of the water of crystallization, which has been expelled by heat. They include plaster-of-paris (q. v.), cement plaster, flooring plaster, and hard-finish plaster. Plaster-of-paris is made from a comparatively pure gypsum (q. v.). The preparation involves two main operations—grinding and calcining. If the so-called 'kettle process' is used, the gypsum is first finely pulverized in machines made for the purpose, and then charged into cylindrical 'kettles' of from 7 to 12 tons capacity, provided with flues and covered with sheet iron. These kettles are heated to the required degree (340° F.), and the hot material is run off into a fire-proof pit, whence it is screened to remove foreign particles. The calcining process requires from two to three hours. In the 'rotary process,' which has been adopted in some American plants, the gypsum is not pulverized until after calcining. The crushed rock gypsum is fed directly into the calciner and the product after cooling is conveyed to the grinding mills. For wall plaster hair or other fibre is added in the proportion of 1½ to 3 lbs. per ton of plaster.

Cement plasters are made in the same manner as plaster-of-paris, except that an impure gypsum is used or foreign materials are added to retard the setting process; the temperature for calcining is higher than for plaster-of-paris (396° F.). A pure plaster-of-paris will set in from five to fifteen minutes after hav-

ing been mixed with water. By the use of retarders the setting can be delayed so as to require one to two hours—an important requirement for structural work. Among retarders in common use are glue, sawdust, blood, and packing-house tankage.

Flooring and hard-finish plasters set more slowly than plaster-of-paris and cement plasters, becoming very hard. Flooring plaster is made by burning pure gypsum at a temperature of about 500° F. It is entirely free from water. Hard-finish cements are prepared similarly, but are chemically treated during the manufacturing process. One of the best known is Keene's cement, for which the burned gypsum is immersed in a bath of alum solution, dried, and again burned at a high temperature.

**Stucco** is a fine gypsum plaster, though the term is used loosely of any plaster or cement for the external coating of buildings. See **Stucco**.

**Bituminous Cements**, which are prepared chiefly from the natural asphalt, were used in the earliest times for compacting sundried bricks, and in place of other mortars in laying up brick and stone masonry. To-day, their chief uses are to form pavements, to cement together the elements of brick and stone pavements, to serve as roofing materials, to use in calking ships, and for waterproofing courses in foundations and along walls. They are employed also in numerous minor applications as true cements (for joining separate parts), besides serving as bases for paints. Coal and wood tars and natural asphalt are the raw materials. They are usually fluxed to suitable consistency with lighter mineral oils, and set mainly by the evaporation of the oil. Pure asphalt ranks highest, retaining its elasticity, while pitch or tar products become brittle by slow chemical changes; asphalt is also highest in cost.

Bituminous macadam or concrete is a modern paving material which makes use of the cementing properties of bitumens. The softened bitumen is mixed with broken stone and deposited and rolled in a layer 4 to 6 inches thick, forming a strong, elastic, and durable pavement. The widely used asphalt pavement, made of what amounts to an asphalt-and-sand mortar, also utilizes the cementing powers of asphalt.

**Adhesives and Lutes.**—These useful materials are so diverse that for details reference must be made to special works. They include such simple materials as fire-clay, used in cementing up the bricks of furnace linings; glazier's putty, which is whiting mixed with linseed oil; white lead

and red lead in linseed oil, and the 'rust joint,' consisting of iron filings wet with sal-ammoniac solution. They also include many more complex substances. Rubber cement is made by dissolving rubber in carbon disulphide, with or without addition of boiled linseed oil; leather cement is made of equal parts of hide glue and American isinglass, softened in water and boiled with pure tannin. Glue, or animal gelatine, is a widely used cement. Glue with half its quantity of glycerine and several volumes of water makes a compound that stiffens rapidly on cooling. Clay with linseed oil, sulphur, and asbestos; litharge and glycerine; and various other mixtures are useful as acid-proof cements. Most of these compounds may be classified under resinous cements, or those which soften by heat and harden when cold—e.g., sealing-wax, marine glue, shellac solutions; those in which adhesion results from the evaporation of the solvent employed—such cements being solutions of combinations in alcohol, benzine, chloroform, carbon bisulphide, or other hydrocarbon fluid; oleaginous cements, or compounds in which oil is the solvent principle; this, by absorbing oxygen, causes the cementing compound to exhibit adhesive properties. Compounds of red or white lead in linseed oil are typical of this class. Still another class of cements includes those of a gummy or gelatinous nature, there being two kinds—those which soften in water but not by heat (e.g. gum-arabic, dextrin, and gelatin glues) and those which are either gelatinized or dissolved in water or in aqueous solution, and harden through the absorption of the water by the materials cemented. Casein, albumen, and collodion also have cementing uses. Vegetable gums and oils are the cementing ingredients forming the base of nearly all paints, linseed oil being of chief importance because of its strong power of hardening by absorbing oxygen.

**Bibliography.**—Consult Redgrave's *Calcareous Cements, their Nature and Uses*; Butler's *Portland Cement*; Dibdin's *Lime, Mortar, and Cement*; Standage's *Cements, Pastes, Glues, and Gums*; Cummings' *American Cements*; Blount's *Cement* (1920); Eckels' *Cements, Limes, and Plasters* (2d ed. 1922).

**Cementation**, a process of converting (pure) wrought iron into steel by raising it to a white heat in contact with carbon. See **STEEL**.

**Cement Rock**, **WATER LIME**, or **HYDRAULIC LIMESTONE**, a variety of limestone containing siliceous clay as an impurity, making a mixture suitable for cement manufacture. The rock

is quarried in small blocks, burned in kilns by charging from above with coal, withdrawn at the bottom as clinker, and ground to a fine flour-like product that has the property of setting or hardening when mixed with water. This is the natural rock-cement as distinguished from Portland cement, which is made by mixing clay and lime artificially and then burning (see CEMENT). The output of natural rock-cement in the United States in 1923 was 1,271,674 barrels, valued at \$1,947,352. Minnesota is the leading producer.

**Cement Stones**, a group of rocks belonging to the lowest Carboniferous of Scotland. They pass down into the Upper Old Red Sandstone by means of the Ballagan Beds, while above them lie the Burdiehouse limestone and the oil shales group of the Calciferous Sandstone. They were partly deposited in lagoons and estuaries, and are a transition between the fresh-water deposits of the Old Red and the truly marine Carboniferous limestone. The town of Edinburgh is built on rocks which belong mostly to this group, and Arthur's seat is an ancient volcano of this epoch.

**Cemetery**, a portion of land set apart for the burial of the dead, the word being first applied to such places by the early Christians. In early times burial was usually made in tombs; later, prominent ecclesiastics were buried in or beneath the churches; then, as space in the churches was limited, came the custom of burying the dead in the surrounding yards. As population increased, the necessity arose of establishing cemeteries away from the centres of activity, and by 1860, in the United States, the practice of churchyard burial had been practically discontinued except in the smallest communities. In America, the greater number of cemeteries are owned and managed by the smaller cities, but the largest and best managed are usually controlled by private corporations.

Probably the most famous of modern cemeteries are the *Campo santo* in Pisa, Italy, and *Père Lachaise*, in Paris, France. The American cemeteries of Mount Auburn, near Boston, and Greenwood, New York City, are conspicuous for their beauty of plan and careful maintenance. In the United States, there are more than eighty national cemeteries, containing the graves of more than 360,000 American sailors and soldiers. The best known of these is that in Arlington, Va. See BURIAL; BURIAL CUSTOMS.

**Cenci**, chen'chē, BEATRICE (1577-99), a Roman lady of patrician birth. According to a story long accepted as true, her

father, an old man, after conceiving an incestuous passion for his daughter, was put to death by an assassin employed by his wife, his son Giacomo, and Beatrice. The conspirators were subsequently executed by order of Pope Clement VIII., who at the same time confiscated the property of the Cenci. This legend is the subject of a powerful tragedy by Shelley. Researches by Bertolotti, in the nineteenth century, cast serious doubts on the authenticity of the incidents related above. Consult that author's *Francesco Cenci e la sua famiglia* (1879).

**Ceneda**, Italy. See VITTORIO.

**Cenis**, MONT, mōn se-nē', a peak of the Alps (6,831 ft.), close to the Franco-Italian frontier. One of the great historic Alpine passes, it has been known since the fourth century. Until the nineteenth century it was crossed only by mule or sledge; in 1803-13 a carriage road over the pass was constructed by Napoleon, and in 1868-71 the Fell Railway, an experimental cogwheel railway, was built. On the completion of the Mont Cenis Tunnel (8 miles long) in 1871, a gigantic undertaking costing more than \$14,000,000, the Fell Railway was destroyed. Near the summit of the peak is a hospice founded in the ninth century and rebuilt by Napoleon, now occupied as barracks.

**Cenobites**. See CENOBITES.

**Cenomanni**, sen-ō-man'ī or sen-ō-mā'nē, or CENOMANI, a Celtic people of the Auleric nation of Gaul, who inhabited what is now the department of Sarthe. Their capital was Vindinum or Suindinum (Le Mans). A branch of the Cenomanni invaded Italy in the sixth century B.C., and occupied the left bank of the Po, between the Adda and the Adige, with Verona as their capital.

**Cenotaph**, sen-ō-tāf, usually the tomb or monument of one deceased but not interred there, originally employed in cases where the bodies of persons could not be recovered, such as death in foreign wars or by drowning.

**Cenozoid**. See TERTIARY.

**Cen'ser**, a metal vessel used in the Eastern, the Roman Catholic, and, occasionally, the Anglican church for burning incense during divine service. It is usually of brass or copper, bowl-shaped, and suspended on three chains, on which the cover can slide up and down. The vessel itself holds the charcoal and the incense; and the cover is perforated to allow the smoke to escape.

**Cen'sor**, the title of the two magistrates in ancient Rome who were highest in dignity, if not in power, whose duty it was primarily to take the census of the people, a part of the solemn

ceremony of purification performed every five years. This duty originally devolved upon the king, and then upon the consuls; but when, in 444 B.C., the military tribunate, open to plebeians, replaced the consulship, the senate instituted the censorship for the next year, confining it to patricians. The first plebeian elected to the office was C. Martius Rutilus, in 351 B.C.; in 339 B.C. the Publilian laws provided that at least one censor should be a plebeian, and in 131 B.C., for the first time, both were plebeians.

The power of the censors depended upon the fact that with them lay absolutely the classification of the citizens in their centuries and tribes, so that the enfranchisement both of individuals and of classes rested with them, as did the making up of the roll of senators and knights (they could degrade from or promote to these orders at their choice, until the legislation of Sulla in 81 B.C.), the general supervision of morals, and the administration of the state finances. In connection with their supervision of morals, they had the right of affixing a stigma (*nota censoria*) to the name of any man enrolled in their lists—a much-dreaded disgrace. They also endeavored to regulate the expenses and luxury of private life by many sumptuary laws. Their financial powers depended primarily on their making a census of property; they supervised, too, the administration of other branches of revenue, though they did not collect or expend the state income. A law enacted in 265 B.C. provided that no one should be elected censor a second time. The office disappeared with the republic.

**Cen'sorate**, MILITARY, a government department organized in time of war for the purpose of insuring secrecy and protection. It is usually headed by a chief censor, assisted by a supervisor and several subordinates. The duty of the censorate is to see that no information which might be of any assistance to the enemy is transmitted by means of letters, telegrams, or press articles. Modern newspaper methods have necessitated a more rigid and careful surveillance than was exercised in earlier times, and during the progress of armed conflicts the censorate is increasingly important.

**Censorship of the Drama**. Before the Reformation in England ecclesiastical ordinances regulated the stage, but in the reign of Elizabeth the state assumed control, and several acts were passed to prohibit plays objectionable to the government. In 1545 the duties of dramatic censor were allotted to the master of the revels,

with whom others were sometimes associated, and the duties afterward devolved (about 1624) on the Lord Chamberlain. All political allusions were forbidden, but in other directions the greatest license was allowed. The gathering forces of Puritanism consequently regarded the stage as an unclean thing, and when the English civil wars began (1624) the theatres were immediately closed. With the Restoration came the inevitable reaction. Fielding's plays, *Pasquin* (1736) and the *Historical Register* (1737), in which he freely travestied the political transactions of the day, and a scurrilous piece called *The Golden Rump*, attacking the ruling powers, led to an act (1737) which gave legal sanction to the customary censorship by the Lord Chamberlain. In 1843 a new Theatres Act was passed which repealed previous statutes, substituting new provisions but leaving the question of licensing plays in the hands of the Lord Chamberlain as theretofore.

In 1866 a select committee of the House of Commons reported that the discretion reposed in the Lord Chamberlain had been, on the whole, wisely exercised, stated that the censorship of plays had worked satisfactorily, and recommended its extension as far as possible to music hall performances. In 1892 another select committee of the House of Commons repeated and endorsed the opinions of their predecessors.

In 1909 an investigating committee, appointed in response to a petition from forty authors for the abolition of the censorship, reported a compromise. The censorship was retained in the hands of the Lord Chamberlain; but it was made optional to submit a play for license, and legal to perform an unlicensed play, whether it had been submitted or not, under the condition that it is subject to prosecution by the public prosecutor for any breach of morals or decorum. This clause gives practical independence of the censor, where that is desired, under conditions of production similar to those in the United States.

In France the state censorship of plays ceased in 1906. The only restraint upon a theatrical performance at present is exercised by the police authorities, who may, if they think a play dangerous to public morals, prosecute the manager of the theatre. In Denmark there is a censor of plays appointed by the Ministry of Justice, and in Holland the control of theatrical performances is vested in the burgomaster of each town. In Italy the province of the prefect of the province in which it is to be performed must be obtained for the pro-

duction of any opera or stage play.

In the *United States* the supervision of dramatic productions falls to the local police or the mayor or other officials issuing the licenses for theatres and dramatic productions. There has been much discussion on the subject, and various attempts have been made to establish a legal censorship of the drama, but without success. A law which permits public immorality to be suppressed if shown by any overt act seems to cover the ground to general satisfaction. The creation of the office of censor, therefore, seems unlikely, as long as the censorial powers now vested in public opinion continue to be exercised with a fair balance of good judgment.

**Censorship of the Press**, the official supervision of the publication of books, pamphlets, newspapers, and periodicals, with a view to preventing the printing and circulation of matter subversive of law or morals. Early in the sixteenth century Pope Alexander VI. issued a bull against unlicensed printing, probably the first example of the principle of censorship. All countries under the jurisdiction of the Roman Catholic Church accepted this injunction and to this day all books published within the Church's control are subjected to strict examination, being expurgated or suppressed if it is deemed necessary (see INDEX LIBRORUM PROHIBITORUM). In England the censorship of the press passed from the Church to the Crown and later to Parliament and was used to prevent the circulation of news thought dangerous to the body politic. Laws providing for licensing and censorship persisted and were enforced until 1693, when the last censorship act was abolished by legislative enactment. In France a strict censorship of the press was in force under the monarchy. It was abolished at the Revolution but revived during the Napoleonic period, when it reached extreme limits. In 1881 all restrictions on the French press, were virtually removed. In Germany the Resolutions of Carlsbad in 1819 provided for a rigid censorship of the press, but in 1850 the constitution of Prussia forbade such censorship and legislation in regard to the press was later vested in the Imperial Government. In the United States there has never been a true censorship of the press, although there are laws against libel and the publication of scandalous matter.

In its origin the theory of censorship of the press is that of protection of the weak against

pernicious or dangerous thought. In normal times this theory, while not abandoned, is usually held in abeyance but in times of revolution, warfare, or other disturbances, it comes to the front and is vigorously enforced. During the Great War a strict censorship was exercised in all countries, giving rise, as is inevitably the case, to a vast amount of criticism. The press practically everywhere acquiesced in the censorship although not in all cases approving it. See also FREEDOM OF THE PRESS.

**Census**, an enumeration of the people in a country or district. The word is a Latin one, originally applied to the functions which the Roman censors performed, of periodically enumerating the people. Only a few scattered notices of these enumerations remain. In Greece a census was established by Solon at Athens for the double purpose of facilitating taxation and classifying the citizens, and other ancient countries seem to have made similar enumerations for various purposes—military, financial, etc.

To Sweden is generally awarded the honor of the first modern census on something like a scientific basis, in 1749; but in the French colony of Canada, periodical enumerations of the people had been made during a century previous, and these were continued after Canada passed into British hands.

The first country of large area to provide for a periodical enumeration of its population was the United States, where the first census was taken in 1790. In 1753, a proposal to establish a census in England was rejected, but in 1801, and regularly since that date, a decennial census has been taken in that country, Denmark, Norway, and France also took their first censuses in 1801, but in France it was not until 1831 that any provision was made for its periodical recurrence. French and German censuses are now taken at five-year periods; while the United States, Canada, Great Britain and her colonies, Italy, Russia, Austria, Belgium, Norway, and India have a decennial census.

When census taking first became a governmental function, it was hardly more than an enumeration of population. Even at the present time, popular interest is confined largely to a consideration of the growth and distribution of population and to the sociological significance of these returns; while the results of inquiries of more recent addition, such as those relating to manufacturing, agriculture, mining, etc., are of less general interest, appealing rather to

special groups of the population.

**Population of the World.**—It has been estimated by S. N. D. North, former Director of the U. S. Census, that at least 700 millions of people are periodically enumerated, that 300 millions have been enumerated once or twice at irregular periods, and that the remaining 700 millions of the population of the globe have never been counted.

The population of the world, based on latest estimates for the various countries, and, where no estimates were available, on the latest census returns, was in 1920 1,748,000,000, distributed as follows:

North America.....	136,000,000
South America.....	64,000,000
Europe.....	476,000,000
Asia.....	921,000,000
Africa.....	142,000,000
Australia and Oceania.....	9,000,000
Total.....	1,748,000,000

Total..... 1,748,000,000

**Census of the United States.**—In the United States provision was made for the first census and a decennial census thereafter in the Constitution, Article 1, Section 2, which reads: 'Representatives and direct taxes shall be apportioned among the several States which may be included within this Union according to their respective numbers. . . . The actual enumeration shall be made within three years after the first meeting of the Congress of the United States and within every subsequent term of ten years, in such manner as they shall by law direct.' From being merely a basis for Congressional apportionment, however, the census has come in succeeding years to be a valuable inventory of national development and resources. In 1790 a single schedule, containing two or three inquiries with reference to color, sex, and age of each person enumerated, was used. The number and extent of the inquiries were steadily increased—particularly after 1850—until the censuses of 1880 and 1890, when the schedules used, particularly those relating to manufactures, became so complicated and so overloaded with inquiries that it was found advisable in subsequent censuses to narrow somewhat the scope of inquiries and simplify the schedules to a considerable extent.

In 1902 a permanent Census Bureau (see CENSUS, U. S. BUREAU OF) under the Department of the Interior was organized, to which bureau, during the intercensal period, have been assigned various lines of investigation formerly included within the scope of the decennial census. It is now possible, owing to the organization of the permanent bureau, to confine the regular

decennial census to a more limited field of investigation, making possible greater accuracy of enumeration than heretofore. Within the period of the census taking the personnel of the Census Bureau is enormously increased and the whole department operates on a different basis than during the intercensal period.

The census comprises four principal groups of subjects: population; agriculture, including irrigation and drainage; manufactures; and mines and quarries. The territory covered includes each State of the United States, the District of Columbia, Alaska, Hawaii, Porto Rico, Guam, Samoa and the Panama Canal Zone.

The information with reference to population and agriculture is secured by enumerators specially appointed for this task; while the information relative to manufactures, and mines and quarries, is, for the most part, collected by special agents appointed by the Director of the Census, or by employees of the permanent bureau especially detailed for that purpose. The enumeration of the population is taken as of January 1. It is usually provided that the decennial census period shall occupy three years, and that the reports shall be completed and published within that period.

The enormous task of counting a population of nearly 118,000,000 included within the United States and its dependencies demands a high degree of organization. The law provides for the appointment of an adequate number, usually between 300 and 400, of supervisors who have immediate charge of the enumerators in the several fields assigned to them, the supervisors being in turn directly responsible to the Director of the Census. The total number of enumerators required to take the census of 1920 was about 87,000.

Schedules for use in securing the desired information are prepared under the supervision of the Director of the Census and issued to the various enumerators. They comprise in general the following information:

**Population.**—Name; place of abode; relationship to head of family; color; sex; age; conjugal condition; place of birth; nationality or mother tongue, if of foreign birth; place of birth of parents; nationality or mother tongue of parents, if of foreign birth; number of years in the United States; citizenship; occupation; employer or employee; school attendance; literacy; tenure of home; deaf and dumb; statistics of inmates of institutions, as paupers, prisoners, the insane, and the blind.

**Agriculture.**—Name, color, and country of birth of each farm occupant; tenure and acreage of farm; acreage in woodland and character of timber; value of farm and improvements, and of farm implements; number and value of live-stock, and of domestic animals; acreage of crops for the current year; acreage and value of crops for the preceding year.

**Manufactures, and Mines and Quarries.**—Name and location of each establishment; character of organization (individual, co-operative, etc.); character of business, or kind of goods manufactured; amount of capital actually invested; number of proprietors, firm members, co-partners, stockholders and officers, with the amount of their salaries; number of employees, and amount of their wages; quantity and cost of material; amount of miscellaneous expenses; quality and value of products; time in operation during the current year; character and quantity of power used; character and number of mechanics employed.

The returns, before being tabulated, are carefully inspected for omissions, errors, and inconsistencies. The tabulation is then done by the use of punch cards, the facts ascertained regarding each person, farm, or establishment being recorded by punching holes in these cards. Card punching machines are used for this work. The cards for each locality are counted by means of machinery so devised as to register electrical contacts made through the punched holes, and the tabulated facts for each unit area are automatically recorded, thus avoiding errors which might result from recording the results by hand, and also expediting the work of tabulation.

The returns thus tabulated are analysed, and the reports embodying them prepared by qualified statisticians and economists. The results of the census are published from time to time in the shape of bulletins, and subsequently appear in permanent form in large quarto volumes.

The returns from the 1920 census show a population in Continental United States of 105,710,620, as compared with 91,972,266 in 1910, an increase of 14.9 per cent. Of this population 94,820,915, or 89.7 per cent., is white; 10,463,131, or 9.9 per cent., is Negro; 244,437, or .2 per cent., is Indian; 61,639, 0.05 per cent., is Chinese; 111,010 or 0.1 per cent., is Japanese, and the rest is scattering. In the last decade the white population has increased 16 per cent. and the negro 6.5 per cent. As compared

<sup>1</sup> Minus sign (-) denotes decrease.<sup>2</sup> 1912.<sup>3</sup> 1918.<sup>4</sup> 1903.<sup>5</sup> 1917.<sup>6</sup> 1911.

with the figures for 1910 the number of farms reported in 1920 showed an increase of 1.4 per cent., the total farm acreage an increase of 8.8 per cent. and the acreage of improved lands in farms an increase of 5.1 per cent. The value of all farm property showed an increase of 90.1 per cent. The number of manufacturing establishments in the United States increased 5.2 per cent. from 1914 to 1919, capital employed increased 95.1 per cent., salaries and wages increased 150.7 per cent., and value of products increased 157.4 per cent.

For statistics, see the ARTICLE UNITED STATES; see also POPULATION, and other articles under separate titles; CENSUS, U. S. BUREAU OF. Consult *The History and Growth of the U. S. Census* (U. S. Bureau of Publications, 1900); *The Story of the Census, 1790 to 1916* (U. S. Census Bureau, 1916).

**Census, U. S. Bureau of**, a bureau of the Department of Commerce, was created in 1902 as a branch of the Department of the Interior, was transferred to the Department of Commerce and Labor in 1903, and since 1913 has been a bureau of the Department of Commerce. Its primary function is the conduct of the comprehensive Federal decennial census of population, agriculture, manufacturing, and mines and quarries (see CENSUS), but it also conducts numerous other inquiries, notably decennial censuses of wealth, debt, and taxation, of religious bodies, of water transportation, of fisheries, and of dependent, defective, and delinquent classes; a quinquennial census of electrical industries; a biennial census of manufactures; annual compilation of statistics of births, deaths, marriages, and divorces, and of financial statistics of States and cities. It publishes quarterly data as to stocks of leaf tobacco held by manufacturers and dealers; issues periodical statistics of cotton production, consumption, and supply; collects current data (monthly or quarterly) relating to the production, supply, and sales of basic or key commodities, and publishes monthly a 'survey of current business.' In the year 1925 the Bureau will take for the first time a quinquennial census of agriculture. Heretofore this subject has been covered only once in ten years as a part of the decennial census of the United States.

The divisions of the Bureau and their functions are as follows: *Administrative Division*: General supervision of personnel; handling of general correspondence; distribution of publications; preparation of press summaries; and

other work not belonging especially to any other single division. *Population Division*: Collection of statistics relating to population (including occupations), religious bodies, defective, dependent, and delinquent classes in institutions, and marriages and divorces. *Division of Manufactures*: Collection of statistics pertaining to manufactures and to electrical industries (including electric light and power plants, street and electric railways, telegraphs and telephones, and electric fire-alarm and police-patrol signalling systems), and to mines, quarries, and oil and gas wells, water transportation, and fisheries (in cooperation with the Bureau of Fisheries). *Division of Vital Statistics*: Collection of statistics of births and deaths in States and cities having adequate registration systems, and preparation of special reports presenting particular phases of vital statistics, such as *Life Tables* and *Mortality from Cancer*. *Division of Statistics of Cities*: Collection of financial and general statistics of cities having more than 30,000 inhabitants; of financial statistics of States; and statistics of national wealth, public indebtedness, and taxation. *Division of Agriculture*: Collection of statistics relating to agriculture. *Division of Cotton and Tobacco Statistics*: Collection of current statistics relating to cotton ginned, consumed, imported, exported, and on hand, and number of active cotton spindles, and quantities of leaf tobacco held by manufacturers. *Geographer's Division*: Maintenance of records as to boundaries of supervisors' and enumerators' districts and creation of new districts where needed; maintenance of records as to changes in boundaries of countries, precincts, and municipalities; decennial preparation of *Statistical Atlas of the United States*; preparation of maps, charts, and diagrams illustrating statistics in census publications; searching of old census records for information in regard to ages and other data concerning individuals; and preparation of population estimates between census years.

**Cent**, a contraction of the Latin *centum*, 'a hundred,' and of the Latin *centesimus*, 'a hundredth part.'

A cent, in the United States, is the hundredth part of a dollar. In 1785 Congress adopted a resolution that the money unit of the United States be one dollar, and the smallest coin a copper one, of which there should be 200 in each dollar. The following year it provided for the coinage of half cents and cents of copper. In 1792 an act was passed providing for the purchase of 150

tons of copper for the coinage of cents and half cents of 264 and 132 grams respectively; these were reduced in 1793 to 208 and 104 grams, and a further reduction was made in 1796. Thereafter the 'copper' or cent remained unchanged, except in pattern, until 1857, no cents being coined in 1815 or 1835. In 1851 a three-cent piece of 75 per cent. silver and 25 per cent. copper was authorized; in 1857 the half cent was abolished and a smaller cent replaced the old one, which was in turn replaced, in 1864, by a bronze cent, 95 per cent. copper and 5 per cent. tin and zinc; a bronze two-cent piece was also authorized. An act of 1866 provided for a 5-cent piece, three fourths copper and one fourth nickel; in 1873 all cent pieces but the one, three, and five were discarded and in 1890 the three-cent piece was discontinued.

*Cent* is also used for the following coins: *Centavo*, the hundredth part of the Chilean peso, also of the Mexican peso or dollar. *Centena*, the hundredth part of the Bolivian dollar. *Centesimo*, the hundredth part of the Italian lira. *Centime*, the hundredth part of the franc in France, Belgium, Switzerland, etc. *Centimo*, the hundredth part of the Spanish real, the old unit of value in Spain. In Holland it is the hundredth part of the Dutch guilder.

**Centauræa**, *sen-tō-rē'a* or *sen-tō'ri-a*, a genus of annual and perennial plants of the order Compositæ, found chiefly in Mediterranean countries and Australia, but also in the temperate regions of Europe and America. The central florets are generally tubular and five cleft, and form a convex head, the outer sterile florets being larger and irregular. Among cultivated species is the Cornflower (q. v.) or Blue-bottle (*C. cyanus*), familiar to European cornfields, and popularly known in the United States as Bachelors' Button. A large-flowered variety (*C. montana*) is cultivated in gardens. The annual or biennial Sweet Sultan (*C. moschata*), with purple, white, or yellow flower heads and pleasant scent, is also an old garden favorite. See illustration on page 624.

**Cent'auris** ('bull-killers'), a wild race of men who in early times are said to have inhabited the forests and mountains of Thessaly, and whose chief occupation was bull-hunting. Earlier accounts represent them as huge savage men, but later legends picture them as monsters in which a human head and trunk were joined to the body and legs of a horse.

The Centauris were said to be the offspring of Ixion and a

cloud, and were celebrated in Greek mythology for their struggles with the Lapithæ (q. v.), and with Hercules. The most famous of their number was Chiron, the teacher of Achilles and other heroes. He was a wise and just man, but most of the Centaurs were cruel and lustful. Consult J. E. Harrison's *Prolegomena to Greek Religion*; J. C. Lawson's *Modern Greek Folklore and Ancient Greek Religion*.

**Centaurus**, a southern constellation mentioned by Aratus, and probably representative of the Centaur Chiron. It is situ-

bors, the intervening space being crossed by light in  $4\frac{1}{3}$  years. Their measurement in 1833 yielded to Henderson the first authentic result for the parallax of a star.

The  $\alpha$  Centauri system gained additional interest when, in 1917, it was discovered that a certain star of the eleventh magnitude was moving very nearly in the same direction and at the same speed as  $\alpha$  Centauri. This evidence was sufficient to warrant the belief that this faint star belongs, gravitationally, to the  $\alpha$  Centauri system, notwithstand-

It is, in fact, but 1/10,000 as bright as the sun. No other star is known to be as faint. The star has been fittingly named 'Proxima Centauri.'

Alpha and  $\beta$  Centauri, a white star of the first magnitude, are designated the 'Southern Pointers,' because they guide the eye to the Cross;  $\gamma$  Centauri is binary, the period of revolution being about 200 years. Nova Centauri rose abruptly to seventh magnitude in July, 1895, and was noted by Mrs. Fleming on the Arequipa plates when the object itself was already far advanced toward extinction. In Centaurus, too, is to be found Sir John Herschel's 'blue planetary' (N.G.C. 3918), a nebula resembling Uranus magnified.

**Cent'aur** (*Erythraea*), a genus of annual plants of the family Gentianaceæ. They are hardy little annuals native to Europe and Asia, and have showy pink or red flowers which are said to possess medicinal value. They are often planted in rockeries for ornamental purposes. The Common Centaury (*E. centaurium*) has been esteemed in medicine since the days of Dioscorides and Galen; and although no longer in the Pharmacopœia, its flower tops are still sometimes gathered and dried by country people in England and on the Continent. The allied *Sabbatia angularis*, known as Bitter Bloom or Rose Pink, enjoys similar repute in the United States and Canada.

**Cent'enary** (Lat. *centum*), a period of a hundred years, usually employed to signify the commemoration of an event, as the birth (sometimes the death) of a great man.

**Centennial Exhibition, International**, an international exposition of the industrial and fine arts, in celebration of the one hundredth anniversary of American independence, held at Philadelphia from May 10 to Nov. 10, 1876. The Exhibition was authorized by Congress in March, 1871, and President Grant then appointed the Centennial Commission, headed by Joseph R. Hawley (q. v.). This commission, in turn, appointed Alfred T. Goshorn to be the director general. To finance the Exhibition, Congress, the State of Pennsylvania, and the city of Philadelphia each appropriated \$1,500,000, while an additional sum of \$2,300,000 was raised by private subscription. Fairmont Park was selected as the site; and here a space of 236 acres was set apart for the purpose, on which more than 200 buildings were erected.

The most important of these buildings were the Main Building, 1,880 by 464 feet, in which were housed the manufacturing,

A Cluster of Centaureas including Cornflowers and Sweet Sultan

ated between Argo and Scorpio, and is traversed by the Milky Way. The chief star,  $\alpha$  Centauri, is a splendid binary, revolving in 79 years, at a mean distance twenty-four times that of the earth from the sun. The primary, which is fully twice as bright as Aldebaran, is stated by Sir David Gill to be a twin of our sun. It gives an identical spectrum, is of equal mass, and presumably of equal luminosity. Its companion is no less massive, but is much less bright. The pair are our nearest stellar neigh-

ing the great distance of over two degrees between it and the two major components. This angular separation corresponds, at the distance of  $\alpha$  Centauri, to a linear separation of about 10,000 times the distance from the earth to the sun. Definite proof of the relationship was furnished by the parallax measures which determined the distance of the faint star to be very slightly less than that of  $\alpha$  Centauri. Being very near and at the same time of small apparent brightness, it must be very faint intrinsically.

mining, and metallurgical exhibits, along with those showing the progress made in science and education; the Machinery Building, 1,402 by 360 feet; Agricultural Hall, 820 by 540 feet; Horticultural Hall, 383 by 193 feet; Memorial Hall, 365 by 210 feet, used as the art gallery, and now known as the Pennsylvania Museum of Industrial Art.

Besides the individual States, about fifty foreign countries sent exhibits. The total number of admissions was 9,910,966, including 8,004,000 paid admissions. On Pennsylvania Day (Sept. 28) 274,919 persons passed through the gates.

The Centennial Exhibition was not only the first great international exposition held in the United States, but it was one of the largest held anywhere. By many it is regarded as typifying the emergence of this country from its traditional isolation, and as a great concrete illustration of the nation's commercial and industrial importance. It not only served as an effective object lesson in showing the material progress of the nation, but it played an important part in unifying the different sections of the country by bringing together their diverse products, and thus making them familiar with the industrial characteristics of one another.

See EXHIBITIONS. A history of the Centennial Exhibition was issued in nine volumes in 1880 by the U. S. Department of State.

**Centennial State**, a popular name for Colorado, because it was admitted into the Union in the centennial year, 1876.

**Center**. See CENTRE.

**Centering**, the framework upon which an arch or vault of stone, brick, or iron is supported during its construction. The simplest form of centering is that used by masons and bricklayers for the arches of common windows and doors. This is merely a deal board of the required shape, upon the curved edge of which the bricks or stones of the arch are supported until they are keyed in.

In building bridges or other structures, where arches of great span are to be constructed, the centering is usually made of framed timbers, or timbers and iron combined. The arrangement of the timbers should be such that the strain upon each shall be mainly a thrust in the direction of its length, for if the strain were transverse, a comparatively slight force would snap it, and if a longitudinal pull, the whole structure would be no stronger than the joints holding the pieces of timber together. In arches of great span, a longitudinal pulling strain is almost inevitable

in some parts, as a beam of great length would bend to some extent under a thrusting strain. In such cases great skill and care are demanded in the designing and construction of the joints. As an arch is built from the piers toward the keystone, the weight upon the haunches during construction tends to push the crown upwards, and therefore the problem of designing a framed centering involves the resistance of this tendency, as well as the supporting of the weight of the materials. Occasionally, when a very great span is required, and the navigation will permit, piers are built on the bed of the river, or piles are driven into it, to support the centering directly, simplifying it, and at the same time facilitating a more rigid disposition than in centering supported only from the sides.

Cupolas, like those of the Pantheon and St. Peter's at Rome, St. Paul's in London, or the flat domes of the Turkish mosques, require very effective centerings. See CARPENTRY.

**Centerville**, city, Iowa, county seat of Appanoose county, on the Chicago, Rock Island, and Pacific, and the Chicago, Burlington, and Quincy Railroads; 72 miles southeast of Des Moines. It is a shipping point for live stock, lumber, coal, and limestone. There are railway repair shops, and manufactures of iron, lumber, flour, brick, and textiles. Pop. (1900) 5,256; (1910) 6,936.

**Centigrade**. See THERMOMETER.

**Centimetre**, a unit of length, the one-hundredth part of the metre, and equal to 0.3937 of an inch. It is one of the fundamental units of the c.g.s. (centimeter, gram, second) system of absolute units, much used for scientific purposes. See METRIC SYSTEM; C.G.S.

**Centipedes** (*Chilopoda*), a division of the Myriopoda, air-breathing arthropods, which in many points resemble insects, but have no wings, and have numerous legs. The myriapods include the millipedes (q. v.) as well as the centipedes; but neither of these terms gives an accurate description of the number of legs. Centipedes may have more or many less than a hundred legs. They are carnivorous, poisonous, with flat bodies, many-jointed feelers, toothed cutting mandibles, and two pairs of maxillæ. The poisonous action is due to the two poison claws, which are placed in the head region, and, in the case of tropical specimens, are capable of inflicting a severe and perhaps fatal bite.

Centipedes are darkness-loving animals, nocturnal in their food hunting, lurking under stones or

among rotten wood and the like during the day. Moving actively about at nights, feeling their way by means of their antennæ, which function as a blind man's staff, they light upon insects, worms, and other small animals, which they seize and kill with their poison-bearing appendages. Some forms can run with some rapidity, and wriggle about in curious serpent-like fashion.

Centipedes are usually divided into four classes, known as Scutigera, Lithobiidæ, Scolopendridæ, and Geophilidæ. The typical genus is *Geophilus*, found under stones and decaying wood in both America and Europe. *Scolopendra gigantea* is the Giant Centipede, found throughout tropical America. See MYRIPODA.

**Centivre**, SUSANNAH (1667-1723), English actress and dramatist, was the daughter of a Lincolnshire gentleman named Freeman. Her first drama, *The Perjured Husband*, was produced at Bath in 1700. She wrote eighteen other plays, of which the best known are *Love at a Venture*, *The Gamester*, *The Busybody*, *The Wonder*, and *A Bold Stroke for a Wife*. Her plays were collected in 1761; some of them still hold the stage, being interesting in plot and lively in dialogue.

**Centner** is, with metallurgists, a weight of 100 lbs. The German centner is 50 kilograms or 110¼ lbs. avoirdupois; the metric centner is 100 kilograms.

**Centò** (Lat. 'a patchwork garment'), a composition, generally poetical, composed of lines and phrases extracted from other works, and combined so as to convey a different meaning from the original—such, for example, as the *Centò Nuptialis* of Ausonius and the *Centò Virgilianus* of Proba Falconia, both constructed from Virgil. Thomas Watson's *Hecatompithia* (1582) contains a sonnet (No. 89) composed of 'sentences' from classical writers literally translated.

**Centò**, town and episcopal see, province Ferrara, Italy; 20 miles southwest of Ferrara, with which it is connected by canal. Rice and hemp are exported. Centò is the birthplace (1591) of the painter Il Guercino, who founded here an academy of painting. Pop. 25,000.

**Central America**, that portion of the American continent which lies between Mexico and South America and includes the states of Guatemala, Salvador, Honduras, Nicaragua, Costa Rica, and Panama (qq. v.), and the colony of British Honduras (q. v.).

**Physical Features**.—As a geographical division, Central America extends from the isthmus of

Tehuantepec to that of Panama, or perhaps to the Attrato valley in Colombia; for until the Tertiary period this area was divided into an archipelago by straits. The Sierra Madre de Chiapas extends across Guatemala, the northernmost state, and attains a height of nearly 10,000 feet, and mountains continue southward into Nicaragua. Volcanic rocks are widely distributed, especially in Nicaragua, Northern Costa Rica, and near the Pacific coast, where they form a cordillera, and rise to considerable heights, such as Acatenango in Guatemala (12,800 feet), and Irazu (11,200 feet) in Costa Rica. South of the Reventazon and the Rio Grande the Talamanca range culminates in the Chiriqui Grande, at a height of more than 12,400 feet.

As the line of greatest elevation lies much nearer the Pacific coast than the Atlantic, the rivers on the former slope are short. On the eastern side are the Belize River (270 miles) in British Honduras; the Motagua (260 miles) in Guatemala; the Ulua and Patuca in Honduras; the Rio Grande and San Juan, and the San Carlos, a tributary of the latter, in Nicaragua; and the Sarapigui, in Costa Rica; some of which are navigable by steamers. Largest of all is the Usumacinta, which rises in the western part of Guatemala, forms part of the boundary between that republic and Mexico, and traverses the Mexican States of Chiapas and Tabasco. The Wanks, or Segovia, separates Honduras from Nicaragua.

**Climate.**—In the *tierra caliente*, the low coast lands, the mean yearly temperature is from 80° to 73° F.; in the *tierra templada*, between 2,000 and 5,000 feet above sea-level, from 73° to 63°; and above the latter frosts occur. The rainfall is particularly heavy on the Atlantic slope. In British Honduras over 71 inches fall in the year, and in Alta Verapaz, Guatemala, about 180 inches, while San Salvador has only 54 inches. Still more striking is the contrast between Greytown (244 inches) and Rivas (69 inches).

**Flora and Fauna.**—The flora is that of tropical America. The woods contain mahogany and cedar, logwood, Brazil wood, and other dyeing materials; bombax, cocoa palms, and mangroves; fibres, winter's bark, sarsaparilla, vanilla, india-rubber; orchids and other beautiful flowers.

The fauna is as varied as the flora, and includes the puma, jaguar, tapir, manatee, monkeys, vultures, and birds of gorgeous plumage. Of the birds, two hundred and sixty species are pecu-

liar to Central America. Insects are numerous and troublesome.

**Peoples.**—The most important aborigines in Central America were the Maya Indians (see MAYA-QUICHE; MAYAS), whose influence extended into the present country of Mexico. The chief site of the Maya civilization, which was perhaps almost as advanced as that of the Incas of Peru (q. v.), was the peninsula of Yucatan. At the opening of the sixteenth century the Maya organization had disintegrated, the language had become a group of related dialects, while scattered over the region inhabited by the Mayas were the ruins of towns which had been the ancient centres of their culture. During the sixteenth century emigration from Spain to Central America began, and after the establishment of the independence of Central America, Europeans from other states than Spain settled there, while to certain sections colored people from the West Indies emigrated. The blood of these different peoples has mingled in a varying degree. The aboriginal element is probably the strongest in Guatemala. The present population is estimated at between 5,000,000 and 6,000,000.

**Commerce and Industry.**—All the republics of Central America, with the exception of Salvador, face both the Atlantic and the Pacific Oceans, the Atlantic side being especially bound to the United States by its transportation, trade, and financial interests. The United States is the chief buyer of Central American products and the principal source of supply of its imports, and American financial interests predominate in all the countries except British Honduras, where British capital is employed in the lumber industry, and in Guatemala, where German capital controls the coffee industry.

The exports of a tropical country are a fair index of its industrial life. Costa Rica and Honduras are banana states, Salvador and Guatemala coffee states, British Honduras a timber state, and Nicaragua a coffee and banana state. Other Central American exports include chicle, sugar in small quantities, hides, coconuts, rubber, balsam, and minerals. Except where foreign enterprise and capital have developed the countries, they are very backward, though they have great latent possibilities as a source of supply of tropical fruits and tropical woods.

Cotton goods constitute the first class of imports ranked according to value; while foodstuffs—notably flour, canned

meats, salt pork, canned fish, butter and butter substitutes, and canned vegetables—form the second group of importance among the imports of practically every state—and this in spite of the fact that the country is fully capable of producing its own food supply. Central America depends upon the United States and Europe, also, for practically all manufactured goods, though small shops manufacture shoes, furniture, hats, cigars, pottery, etc.

Modern methods of land transport are almost unknown except in ambitious paper projects. Here and there short railway lines serve local developments, such as banana plantations, but these are due almost entirely to foreign enterprise and capital. Wagon roads scarcely exist, and recourse is had to mule trains which move over difficult trails. Without traffic facilities much of the territory must continue to remain in an undeveloped state.

**History and Government.**—Central America was discovered by Columbus on his fourth voyage in 1502, was completely under Spanish control by 1524-5, and, with the exception of a region upon the Gulf of Belize of which the British secured control and which they still retain under the name of British Honduras, it remained in Spain's possession until 1821. In the latter part of that year, the five provinces of Guatemala, Nicaragua, Honduras, Costa Rica, and Salvador declared their intention to reject Spanish rule and to associate themselves with independent Mexico, and in 1824 a constituent assembly promulgated a constitution for the United Provinces of Central America, modelled upon the constitution of the United States. After a turbulent history of fifteen years, this confederation was dissolved, and the five sections of Central America framed distinct constitutions. In 1903 Panama declared its independence of Colombia and made the sixth of the present republics. In 1907, at the instance of the Presidents of the United States and Mexico, a conference of the Central American states was held at which various agreements were drawn up concerning the mutual relations between these states. Among these agreements was a treaty which provided for the adjudication of their disputes by a Central American court of justice.

Four of the existing constitutions of the Central American states have a family resemblance. The constitutions of Costa Rica, Salvador, Guatemala, and Honduras, framed from 1871 to 1904, make provision for executive,

**CENTRAL AMERICA**  
English Miles

judicial, and legislative departments. Each of these states has an elective president, whose substitute is a vice president, or a person designated by congress, and the legislature of each is unicameral. The four constitutions specifically provide for a cabinet, the members of which may attend the sessions of congress, and the final judicial authority is a supreme court. Salvador, Guatemala, and Honduras designate their administrative divisions as departments, while Costa Rica designates hers as provinces. The government of Nicaragua differs from the other Central American states in that the constitution, adopted in 1913, vests the legislative authority in a bicameral legislature composed of a chamber of deputies and a senate. Panama has a unicameral Chamber of Deputies and a president elected for four years. Despite the republican form of government, the presidents of the Central American republics have upon many occasions exercised autocratic power.

For a more detailed description of the various republics, see the separate articles on GUATEMALA; SALVADOR; HONDURAS; NICARAGUA; COSTA RICA; PANAMA.

**Bibliography.**—Consult H. H. Bancroft's *The History of Central America* (2 vols.); Fortier and Ficklen's *Mexico and Central America*; Rodríguez' *American Constitutions* (2 vols.); H. Beuchat's *Manuel d'Archéologie Américain* (1912); C. W. Derville-Fife's *Guatemala and the States of Central America* (1913); Johnston's *Pioneers in Tropical America* (1914); Shepherd's *Central and South America* (1914); Batres' *La America Central ante la historia* (1915); Koebel's *Central America* (1917); Carpenter's *The Land beyond Mexico* (1920); Sapper's *Mittel-America* (1921); Cunningham's *Gypsying through Central America* (1922); Landenberger's *Durch Central-Amerika* (1922).

**Central Asia**, that portion of Asiatic Russia lying to the southwest of Siberia and comprising Russian Turkestan, Transcaspia, and the Kirghiz Steppe territory. It includes the provinces of Akmolinsk, Fergana, Samarkand, Semipalatinsk, Semiryechensk, Syr Daria, Turgai, Transcaspia, and Uralsk (qq. v.), and covers a total area, exclusive of the Caspian Sea and the Sea of Aral, of 1,325,500 square miles. On the west it is bounded by the Caspian Sea and European Russia, on the east and southeast by mountain ranges which separate it from Eastern Turkestan and Mongolia, and on the south by Afghanistan and Persia.

The greater part of this area lies within the Aral-Caspian

basin, while highlands in the east and south divide the country almost equally with lowlands in the west and north. The latter fall in the neighborhood of the Caspian Sea below sea level, but a large proportion of the former rise to over 5,000 feet while some reach an altitude of more than 20,000 feet. Besides the Pamir plateau, itself a western outpost and knot of the Tibetan highland, Russian Central Asia includes the western Tian-Shan and its outliers, the Alai and Trans-Alai, the Alexander Mountains, the Tarbagatai Mountains, the Zungarian and Trans-Iliian Alatau, the Mugojar ridge, forming a continuation of the Urals, and some lesser ranges. Of rivers it has the Oxus or Amu Daria, the Jaxartes or Syr Daria, Zerafshan, and Murghab. The once great lakes, as those of Balkhash and Issik-kul (qq. v.), and the Sea of Aral, have shrunk in their dimensions, while others have completely disappeared, and much of the country in the mountains, as well as in the plains, is of the steppe character, but sparsely clothed with vegetation.

The climate shows a remarkable uniformity for so large an area. The average summer temperature ranges between 68° and 77° F., and the winter temperature from 50° to 23° F.

The population is composed, linguistically, of various races of the Turki stock, of Persians and other Iranians, of Galcha mountaineers, and of Russian Slavs (immigrants of recent date). Among the 5,500,000 of Turki peoples, Uzbegs of Bokhara, Khiva, and Khokand account for more than two-fifths, Kirghiz (of various denominations) for almost three-fifths; the remaining half-million or more are Turcomans. The Persians and Tajiks of Iranian stock, chiefly inhabiting the towns, and forming the mercantile and settled classes, number somewhat over a million. The Galcha highlanders probably do not exceed 300,000. Theoretically the native peoples are Mohammedans, but great religious laxity prevails.

**History.**—The earliest relations of Russia with Central Asia were with the khanate of Khiva. At the beginning of the seventeenth century the Tsar Michael Feodorovitch held communications with the khan relative to Cossack raids in Khivan territory, and in 1717 Peter the Great despatched a disastrous expedition to Khiva in a futile attempt to secure the submission of the khan as a vassal of Russia. At about the same time Russian dominion was successfully extended up the middle Irtysh by an expedition which founded Omsk, and in 1718 built the first

fortress at Semipalatinsk destined soon to become an important centre of trade with China and Central Asia. A fortification was established at Kansk two years later, and a line of fortified posts, constituting the southern border of Russian territory in Asia for more than a century, was soon constructed as far west as Orenburg. In 1732 the Kirghiz of the Middle and Little Hordes, who ranged over the western steppes, offered their submission to the Empress Anne; in 1803 the tribes of the Mangishlak peninsula, on the eastern side of the Caspian Sea, became Russian vassals, and in 1842 a treaty of friendship and alliance was concluded with the khan of Khiva. In 1831 a fortified settlement was established at Sergiopol, about 200 miles southwest of Semipalatinsk, and in 1844 the last of the Kirghiz Tartars submitted peacefully to Russian rule.

In 1847 a Russian fort was erected at the mouth of the Syr Daria, and in 1853 General Perovski pushed 280 miles up the river to the Khokand stronghold of Ak Mechet, which he stormed successfully and renamed Fort Perovski. The following year a Russian expedition penetrated the valley of the Ili, and a fort was built at Verni between Lakes Balkhash and Issik-kul, leaving, however, a gap of 500 miles between it and the last Russian outpost on the Syr Daria. To bridge this gap in 1864 a simultaneous advance was undertaken from the Ili basin on Aulie Ata, and from a base on the Syr Daria on Hazret-i-Turkestan. After successful attacks on these objectives, the two forces combined and stormed Chimkend, commanding, with Tashkend, the basin of the Middle Syr Daria. Tashkend was taken the following year, and Turkestan was constituted a frontier district with that city as its capital.

The Asiatics, however, were by no means crushed. Bokhara now joined Khokand, and more than 40,000 Uzbegs advanced on Tashkend; but were utterly routed by the Russians on May 20, 1866, at Irjai, close to the south bend of the Syr Daria. The capture of Khojend (June 6, 1866) and the invasion of Bokhara quickly followed, and on July 11, 1887, by imperial ukase, Turkestan, including all the conquests in Semiryechensk and the Syr Daria basin, was made a general governorship under Kauffmann, with its capital at Tashkend. The native spirit, however, was still unbroken, and on May 12, 1868, the united forces of Bokhara, Khiva, and Khokand, massed for attack on the left bank of the Zarafshan, were again routed by

Kauffmann 15 miles outside Samarkand. The city itself surrendered the following day (May 13), the emir of Bokhara's submission followed, and the province of Samarkand was incorporated with Turkestan.

The next stages of Russian conquest in Central Asia were marked by the conquest of Khiva which acknowledged the suzerainty of Russia in March, 1873; the conquest of Khokand (1876), which was annexed as a province of Turkestan under its ancient name Fergana in 1876; the conquest of the Turcoman country (1881-4), the occupation of the land between Merv and Penjdeh (1884-5), the de-

bank of the Hari Rud as far as the Zu-l-Fikar Pass and the valleys of the Badghis south and including the Penjdeh oasis. On July 12, 1892, the Afghans were routed at Somatash; the Russian outpost of Fort Pamir (Pamirski Post) was established (1893) in the heart of the mountain region; and on March 11, 1895, the treaty was signed by which all the Pamir north of the branch of the Oxus flowing from Sari-kul, or Lake Victoria, and a line drawn thence eastward to the Chinese frontier passed into the hands of Russia.

See BOKHARA; KHIVA; TRANS-CASPIAN RAILWAY; TRANS-CASPIAN TERRITORY; TURKESTAN,

Burlington and Quincy Railroads; 115 miles west of Omaha. Nebraska Central College is located here. Central City is a shipping point for live-stock. Pop. (1910) 2,428; (1920) 2,410.

**Central Falls**, city, Rhode Island, Providence county, on the Blackstone River and the New York, New Haven and Hartford Railroad; 6 miles north of Providence. It has a public library and city parks. Manufactures include machinery, cotton, woollen and silk goods, hair-cloth, glass, and leather. According to the Federal Census for 1919, industrial establishments number 67, products valued at \$22,628,477. Originally part of

limitation of the Russo-Afghan and Russo-Persian frontiers from the Caspian Sea to the Chinese border (1885-95), and the occupation and delimitation of the Pamir (1890-5). Skobelev effected the conquest of the Turcomans by storming the forts of Geok Tepe and Yangikala Dangel Tepe, the chief Turcoman strongholds, Jan. 1-24, 1881, and the submission of Merv (1884) completed the victory. The occupation of Sarakhs, Pul-i-khatun, the Zulfikar pass, and Pul-i-khisti followed in rapid succession (down to February, 1885); and on March 30, 1885, the Afghans were routed and driven out of the Penjdeh oasis. War with Britain almost resulted from this last action; but ultimately a frontier was peacefully agreed upon, Russia obtaining the right

RUSSIAN. Consult Lord Curzon's *Russia in Central Asia*; A. Krausse's *Russia in Asia*; F. H. Skrine and E. D. Ross' *The Heart of Asia*; H. Stumm's *Russia in Central Asia* (Eng. trans.); G. F. Wright's *Asiatic Russia* (2 vols.); S. Graham's *Through Russian Central Asia* (1916).

**Central City**, town, Kentucky, Muhlenberg county, on the Green River, and the Illinois Central, the Louisville and Nashville, and the Kentucky Midland Railroads; 35 miles northwest of Bowling Green. It is the centre of the coal-mining region of Western Kentucky. It has railway repair shops. Pop. (1910) 2,545; (1920) 3,108.

**Central City**, city, Nebraska, county seat of Merrick county, on the Platte River, and the Union Pacific and the Chicago,

Lincoln, Central Falls was separately incorporated in 1895. Pop. (1900), 18,167; (1910) 22,754; (1920) 24,174.

**Central Forces**. A force acting on a given body is said to be central when it always acts toward a fixed point or centre. The importance of this group of dynamical problems arises from the fact, established by Kepler and Newton, that the bodies constituting our solar system move under the influence of gravitational forces which pass very nearly through a definite point—the centre for the planets being approximately the centre of the sun, and the centre for each group of satellites being approximately the centre of the corresponding planet. It is found that calculations based on the assumption that the forces acting on the

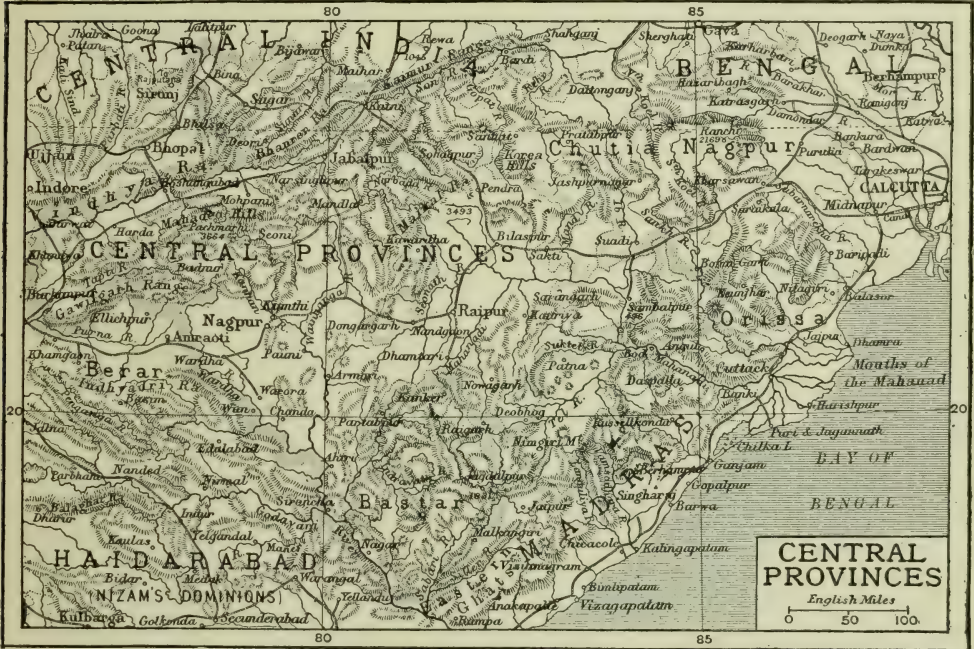

planets are towards one centre lead to results closely concordant with observation. Another simple example of an approximately central force is the case of a heavy body attached to one extremity of a string and set in rapid revolution round the other extremity, which is kept fixed. If we leave out of account for the moment the action of the body's own weight, we may regard it as acted upon by the tension of the string directed towards the fixed end. When a force acts upon a body, it causes acceleration, involving both change of speed and change of direction of

sion that each planet was acted upon by a central force directed towards the sun's centre. The reason why the forces dominating the motions of the planets and satellites of our solar system may be treated as central forces is that the mass of the sun is very great compared with the combined mass of the planets, and that each planet is much more massive than its attendant moons.

**Centralia**, city, Marion co., Ill., 60 m. E. by S. of St. Louis, a junction of three branches of the Ill. Cent., and on the Jacksonville and St. Louis, the Ill. S., and the S. R. Rs. Machine

tendency towards concentration of administrative power in the hands of the state or central authority, which tendency has steadily become more noteworthy as the conception of the function of the state has widened. The supremacy of the authority of the modern state is unquestioned; all rival local authorities have disappeared.

In the United States the term is also applied to the tendency to concentrate legislative power in the Federal Government with the consequent weakening of the position of the states. This tendency is especially apparent

motion; and in the case of a central force this acceleration must take place towards the centre. Hence there is no acceleration at right angles to the line joining the centre of force and the position occupied for the moment by the body. This condition leads, by simple dynamical considerations, to the statement of what is known as Kepler's law of equable description of areas. If we measure the area passed over by the line joining the centre of force and the body as the latter describes its path, we find that in all positions this area has the same value during the same interval of time. This law of planetary motion, established by Kepler after laborious calculations, led at once, according to Newton's principles of dynamics, to the conclu-

and repair shops of the Illinois Central R. R. are located here, and there are coal and iron mines. It is in the centre of a fruit-growing district, especially adapted to apples and strawberries. Pop. (1910) 9,680.

**Central India** is the official name applied to a group of feudatory or native states occupying that part of India N. of the Central Provinces, W. of Bengal, and S. of Rajputana and the United Provinces. The district is divided into two sections—*viz.* Bundelkhand in the W. and Baghelkhand in the E. The most important states are Bhopal, Gwalior, Indore, and Rewa. Area, 78,772 sq. m. Pop. (1901) 8,628,781.

**Centralization**, a term used in practical politics, as well as in political science, to indicate the

in matters relating to commerce. In the states legislative functions were originally extremely centralized, the local bodies having practically no independent legislative sphere. The administration, on the other hand, was extremely decentralized. In the last half century central control of local administration has been introduced in many states, particularly in the North and West. Thus the control of the educational system, originally purely a local matter, has in many states been vested in a state board. State control of the administration of charities is another indication of the same tendency. Further, the administrative functions which have developed recently, as the administration of labor laws, of laws regulating state

commerce, etc., have naturally been retained by the state. At present there is a widespread movement in favor of central supervision of local accounts. The movement in favor of municipal home rule, on the other hand, is part of a tendency towards decentralization of legislation.

**Central Provinces**, lying in the centre of the peninsula of India, are encircled on three sides by states under native rule. Their N. and N.E. limits are bordered by the large feudatories under the Central Indian Political Agency, and the S.W. by Berar and the dominions of the Nizam of Haiderabad. On the S.E., the N. districts of the Madras Presidency separate the Central Provinces from the Bay of Bengal. The Chota Nagpur division of Bengal touches the N.E. angle. Area, 86,459 sq. m. The principal rivers are the Nerbada, which traverses the N. districts from E. to W.; and on the W. side the Tapti, the Wardha, and the Waingunga—the first running W., the two others taking a S. direction. The S. extremity of the country is covered with wild, impenetrable jungle. The forest area is over 19,000 sq. m. Coal is found in the Nagpur division, the output in 1900 aggregating 131,584 tons. A prolific soil yields a rich harvest—cotton, tilly-seed, wheat, rice, grain, pulse, and linseed being the chief products. Cotton factories flourish in the Nagpur division. The Great Indian Peninsula Ry. skirts the N.E. and S.E. borders, and the Bengal-Nagpur line, running from W. to E., bisects the province. The province comprises four divisions—Narbada, Jabalpur, Nagpur, and Chattisgarh. The native states, of which Bastar is the largest, contain an area of 29,435 sq. m. and a pop. of 1,996,383. The bulk of the population is Hindu; there is a large number of Gonds (aborigines), and a fair percentage of Mohammedans. Successive seasons of drought and famine have greatly retarded the development of the country. Pop. (1901) 9,876,646 (4,855,984 males and 5,020,662 females).

**Central University of Kentucky.** A Presbyterian institution of learning at Danville, Ky., founded as Centre College in 1819. It comprises Centre College as its classical, scientific, and literary department, the Kentucky Theological Seminary at Louisville, the Hospital College of Medicine at Louisville, and the Louisville College of Dentistry. In 1905 the university had 1,168 students, 109 instructors, a library of 21,000 volumes, \$500,000 in productive funds, and an income of \$31,000.

**Centre, CANAL DU**, canal (constructed 1781-93), dep. Saône-et-Loire, France, joining the Saône and Loire. It begins at Châlon-sur-Saône, and extends to Digoin, on the Loire, a distance of 75 m.

**Centreboard**, shifting or drop keel used in small boats and racing craft, especially yachts and cat-boats. The centreboard passes through a slot in the bottom of the boat, and swings on a pivot, so that it can be hauled into its case or let down at will. Its object is to prevent a boat making leeway by offering great lateral resistance to the water. Folding centreboards are also used for small boats and canoes. Lee boards are a primitive device for adding keel depth to a boat, but they are only adapted for vessels with wall sides.

**Centre of Gravity**, also known as the centre of mass or centre of inertia, is that point in a body through which the weight of the body acts, and is such that if it is fixed the body will balance about it in any position. The conception is a simple one in the case of a body of invariable shape, but it may be extended by suitable definition to the case of any system of bodies under any conditions of mutual freedom or constraint. When the body is of a simple geometrical shape and of the same material throughout, there is no difficulty in calculating the position of the centre of gravity; and when it is of irregular shape, the position of the centre of gravity may be roughly estimated by suspending the body first by one point, and then by a second, and noting the position in the body of the vertical line through each point when it is the point of suspension: the meeting-point of these two lines is the centre of gravity. The centre of gravity of a body, or combination of bodies, has certain important dynamical properties. If a body be struck by a blow in a direction through the centre of gravity, the body will move away without rotation; but if the direction of the blow is not through the centre of gravity, the body will move off with combined translation and rotation.

In a strictly scientific sense, the term centre of gravity should be applied to that point (if it exist) towards which the gravitation attraction of the body on other bodies acts. Thus, two uniform spheres attract one another as if each were condensed in its centre. Their centres are, therefore, real centres of gravity. But cubes will not attract one another through definite fixed points within them. The cube of uniform material has not a true centre of gravity, but it has a true centre of mass. For the latter is ob-

tained by a definite process of averaging which leads always to a definite result, whatever the distribution of matter. In the case of bodies of finite size near the earth's surface, the particles composing the body are acted on by parallel forces due to the earth's attraction; and the process of finding the centre of mass is identical with the process of finding the resultant of these parallel forces. Hence such bodies are really acted on by a single force passing through the centre of mass, which is also a centre of gravity. Indeed, when a true centre of gravity does exist, it is coincident with the centre of mass; but although all distributions of matter have a centre of mass, comparatively few have a real centre of gravity. Bodies which have true centre of gravity, such as uniform spheres and other forms with particular distributions of density, are called centrobatic bodies.

The centre of gravity of a body, or system of bodies, tends to come to the lowest possible position consistent with the conditions of constraint imposed upon it. For example, let several balls of various sizes and weights be placed in a bowl. After rolling about for a short time, they will come to rest in such a position that the centre of gravity of the whole will come to its lowest possible position. Any slight displacement of the system of balls will cause the centre of gravity to rise. Work must be done against the earth's attraction in effecting this displacement, and the work done is measured by the whole weight multiplied by the height through which the centre of gravity is raised. In other words, we increase the potential energy of the system. When the centre of gravity reaches its lowest possible position consistent with the conditions, the potential energy has its minimum value. This particular case is an example of a general principle, that a material system is in stable equilibrium when the potential energy has a minimum value—i.e. such a value that any displacement causes an increase.

Centre of Oscillation.

**Centre of Oscillation.** Let a body with centres of mass

oscillate through small angles about a horizontal axis through any chosen point A. If A be taken very close to G, the rate of oscillation will be slow, because of the small leverage AG; and if A be taken very far away, again the rate of oscillation will be slow. There will evidently be some particular position for A—say K—which will give the most rapid oscillation. For every position of A further removed from G than this critical position K there will be a second position A', nearer to G, for which  $GA' \cdot GA = GK^2$ , and about which the body will oscillate in the same period. Not only so, but if we take C in AG produced such that  $GC = GA'$ , and set the body oscillating about an axis through C, exactly the same period of oscillation is obtained. This corresponding point C, situated in AG produced, is called the centre of oscillation relatively to A. If C is made the centre of suspension, A becomes the centre of oscillation. It can be shown that the body will oscillate in the same time as a simple pendulum of length AC.

**Centre of Percussion.** If a body be free to rotate about a given axis, and if it be struck in such a way that the blow does not produce pressure on the axis, then the direction of the blow passes through a point in the plane containing the axis and the centre of mass, which is known as the centre of percussion. This explains the fact that if some object be struck by a stick held in the hand a jar will be felt, unless the blow be made at the centre of percussion of the stick with regard to the hand. The centre of percussion with respect to any axis is the same point as the centre of oscillation.

**Centrifugal Force,** a term in dynamics somewhat misleading in its etymological meaning (L. *centrum*, 'the centre'; *fugere*, 'to flee'), but of great importance in its proper significance. To compel a body to move in a curve a force must be applied at right angles to the directions in which the body is moving. The sharper the curvature of the path in which the body is to move, the greater must be the force required; and the more rapid the motion of the body, the greater must be the deflecting force to make the body move in a path of given curvature. A stone whirled round at the end of a string is pulled in constantly by the tension of the string. Now, according to Newton's third law of motion, which is simply a concise expression of experience, to every action there is an equal and opposite reaction. The taut string pulls upon the fixed end in the direction of the stone: in this case the reaction

is particularly evident, and it is the recognition of the reaction which has suggested the idea of a centre-flying force. No doubt, before the foundations of dynamics were securely laid by Newton, the idea that a stone whirling round in a sling had an outward tendency was universally prevalent. As a matter of fact, the stone leaves the sling in the direction in which it was moving at the instant it got free. What we now understand by the term centrifugal force is the reaction to the force which is required to make the moving body describe a curved path. This is sometimes called the centripetal force (L. *centrum*, 'the centre'; and *petere* 'to seek'). Its measure is the same as that of the force required to cause this curvilinear motion—viz. the product of the square of the speed into the curvature of the path.

Centrifugal Force.

The principle of centrifugal force is used in many forms of mechanism, such as governors on steam-engines, rotary drying machines, cream separators, and centrifugal machines of various kinds. In drying machines, the wet material is placed in a rotating cylinder with perforated sides, through which the liquid escapes in virtue of centrifugal force. The action of the cream separator depends upon the fact that the cream is lighter, bulk for bulk, than the milk. Hence, for a given rate of rotation in a closed cylinder, the centrifugal tendency of the cream will be less. It will tend to accumulate in the centre, while the denser skim milk will be driven out to the sides.

**Centripetal Force.** See CENTRIFUGAL FORCE.

**Centumviri,** in ancient Rome a court of plebeian judges whose numbers varied from 100 to 180. They sat sometimes in sections (*consilia*), and sometimes as a body under the presidency of the prætor. Their jurisdiction originally extended to questions of status, quiritian ownership and succession, but latterly was confined largely to questions of succession. A spear, the special symbol of quiritian ownership, was erected in front of their court.

**Centurion,** a Roman officer of foot. The three principal divi-

sions of the legion, the *principes*, *hastati*, and *triarii*, each elected twenty centurions, of whom two were appointed to each of the thirty companies of foot into which the legion was divided. The first centurion chosen was a member of the council of war.

**Centuripe,** also until recently CENTORBE, tn., Sicily, prov. Catania, stands on the steep ridge (2,305 ft.) which parts the Simeto from the Salso, 28 m. by rail N.W. of Catania. It was one of the most prosperous of Sicilian towns under the Romans, but was destroyed by the Emperor Frederick II. in 1233. It has sulphur mines. Pop. (1901) 11,187.

**Century Magazine,** THE, an American monthly magazine, published in New York city, has existed under its present name since 1881. It was previously known as *Scribner's Magazine*. It has had many eminent contributors and has been a leader in the art of wood-engraving and color reproductions, and its illustrations have always been remarkable for their character and quality.

**Ceorl.** Originally the word meant a freeman who was not a thegn or of noble birth. The ceorl occupied an intermediate position between the thegn and the serf, and tended to be absorbed into one or other of these classes, generally into the lower. By the time of the Norman Conquest the progress of Anglo-Saxon economy towards feudalism had practically, except in the Eastern and Danish counties, caused the ceorl's disappearance, and the villen, whose position was also ambiguous, takes his place in the records.

**Ceos,** now ZEA or ZIA, an island in the Ægean Sea, one of the Cyclades, distinguished for its fertility and excellent climate.

**Cephalaspis,** one of the most remarkable of the many extraordinary fishes of the Old Red Sandstone. In Scotland several species have long been known from the sandstones of Arbroath. It has been recently found also near Oban and in Caithness. It occurs in Wales, Spitzbergen, and the Lower Devonian rocks of Gaspé, Canada. Its appearance must have been most uncouth, as it had a large, somewhat flattened head, covered by a bony shield, semicircular in outline, with the outer corners prolonged backwards into spinous prominences. The eyes were almost in the centre of this shield, placed close together, and quite small. The body was comparatively slender, and covered with elongated narrow scales in three rows on each side. The tail was of the heterocercal type, and just in front of it there was a small dorsal fin. The internal skeleton appears to have been cartilagi-

nous, and has not been preserved. Its systematic position is still a matter of controversy. See Dean's *Fishes, Living and Fossil* (1895); Ray Lankester's *Monograph of the Fishes of the Old Red Sandstone of Britain* (1868).

**Cephalhæmatoma**, a swelling caused by the effusion of blood under the pericranium of a newborn infant, due to pressure during birth. Sometimes, but rarely, the effusion takes place under the bone. The cephalhæmatoma is felt as an elastic, fluctuating, non-pulsating swelling, with a sharp edge of bone circumscribing it. Usually it becomes absorbed, and therefore should not be interfered with unless suppuration occurs. In the rare cases where cephalhæmatoma occurs under the bone, there is danger through pressure on the brain.

**Cephalic Index.** See ANTHROPOLOGY.

**Cephalochorda**, a name applied to a class of vertebrates which includes only Amphioxus, the lancelet, and its near allies. See AMPHIOXUS.

**Cephalodynia**, a term applied to pains in the head, and in particular to those of a rheumatic nature.

**Cephalædium**, Italy. See CEFALU.

**Cephalonia**, KEPHALONIA, or KEPHALLENTA, the Samos (*Samē*) of the *Odyssey*, is the largest of the seven Ionian Isles lying to the w. of the mainland of Greece, opposite the entrance to the Gulf of Lepanto. Its coast-line is deeply indented, and its surface is mountainous, the culminating point being Ainos (5,315 ft.), once crowned by a Temple of Jupiter. The vine and currant are cultivated largely, and wine, wheat, olive oil, and fruit are exported. Chief tn. Argostoli. Area, 302 sq. m. Pop. (1896) 83,363.

**Cephalopoda**, or CUTTLES, the highest class of Mollusca, including those forms in which the foot has grown up around the head and is split up into arms. Except in the pearly nautilus and the female argonaut, the living forms are without shells, but many retain in the 'cuttle-bone' what is believed to be the last remnant of the shell. In the extinct Ammonites the shell was large, and, as in the living nautilus, divided into chambers by septa. Its reduction in living cuttles is probably associated with increased rapidity of locomotion, the living forms being actively predaceous, swift-swimming animals entirely confined to the sea. Many cuttles creep about on the sea-bottom by means of their sucker-bearing arms, but all are capable of jerking themselves

swiftly backwards by means of the siphon or funnel. This is a tube (incomplete in Nautilus) communicating with the mantle cavity, by means of which water can be forcibly expelled from the cavity, the result being to drive the animal backwards. Except in Nautilus, there is an ink-bag, the contents of which the animals discharge into the surrounding water when alarmed, thus producing a cloud, under cover of which they may escape. Within the mantle-cavity lie the gills, two in number in all, save the nautilus, which has four. The mouth contains a strong, parrot-like beak, as well as a tooth-ribbon (radula). The nervous system is unusually well developed. Living cuttles may be classified as follows:—(1) Dibranchiata, including all living forms, save the pearly nautilus; divided into (a) those with eight arms, like Octopus (Octopoda), and (b) those with ten arms, like Sepia, Loligo, Spirula (Decapoda). (2) Tetrabranchiata, including the pearly nautilus, and many extinct forms.

Ammonite.

These extinct forms, known as Ammonites, were very numerous in the Mesozoic era of geologic time, and were so nearly confined to it that their remains form the most characteristic fossil type of that era. They developed rapidly in the Jurassic period especially, the succession of species exhibiting greater and greater complexity of suture or convolution of the partitions separating the series of chambers. The animal occupied only the outer chamber, each successive one representing stages of growth and abandonment. Minute subdivision of rock strata is sometimes possible by the aid of these forms. The later forms are less closely coiled and some related genera are straight. They declined rapidly in the Cretaceous time and became extinct at its close. Ammonites exhibit great variety of minor feature and size. Many are ornamented with ribs or knobs, and they are known to range from a fraction of an inch to 10 ft. in diameter. No more beautiful, interesting, and extensive series of fossil forms of any type of animals is known. See

Zittel's *Paleontology* (1900), and other text-books.

**Cepheus.** (1.) In Greek mythology, King of Ethiopia, husband of Cassiopeia, and father of Andromeda. (2.) An ancient Greek constellation, belonging to the legendary group connected with the fable of Andromeda. Its principal star, which is of 2.6 magnitude, will mark the pole some 5,600 years hence.

**Cephissus.** (1.) A river in ancient Greece, flowing partly in Phocis, partly in Bœotia, to Lake Copais. It is now called the Mavronero. (2.) The largest river (modern name, Sarantaporos) in Attica, rising on the w. of Mt. Pentelicon, and entering the sea near the bay of Phaleron.

**Cepit** (*'He took'*). Used in civil practice it is a form of replevin. In criminal practice it is a technical word employed in indictments for larceny.

**Ceram**, or SIRANG, an isl. of the Dutch E. Indies, one of the Moluccas; lies between New Guinea and Celebes. It is mountainous in the w. (8,000 ft.), with low plains in the s., and is connected by a very narrow isthmus with a smaller peninsula on the w. It produces sago, cloves, coconuts, rice, cocoa, and timber. Area, about 7,000 sq. m. Pop. estimated at 70,000 to 100,000.

**Ceramics.** See POTTERY.

**Cerargyrite**, horn silver, or silver chloride, AgCl, is a silver ore of considerable importance in certain mines. When pure it is transparent and resinous and may carry 75 per cent. of the metal. The largest masses are brought from Peru, Chili, and Mexico, where it occurs with native silver. Many silver mines of the United States produce this mineral, in Colo., Idaho, Nev., Utah, and others.

**Cerastes**, the genus to which the horned viper (*C. cornutus*) belongs. It occurs in N.E. Africa, extending into Palestine and Arabia. Another species (*C. vipera*) is believed to have been Cleopatra's 'asp.' Both are poisonous snakes, belonging to the family Viperidae.

**Cerasus**, a colony founded from Sinope; it lay on the n. coast of Pontus, on the s. shore of the Black Sea. From this place the cherry, as well as its name, was introduced into Europe. It fell into decay after the foundation of another city, also called Cerasus, but more commonly Pharnacia.

**Ceratodus**, a name applied to a genus of fishes which includes many fossil forms, and one (or two) living species (mud-fish) from Queensland rivers. The members of the genus belong to the Dipnoi, or double-breathers; and the living Ceratodus uses both its gills

CEPHALOPODS OR CUTTLES.

1. Common Mediterranean Octopus or 'poulpe' (*Octopus vulgaris*): A, suckers. 2. A Cuttle (*Rossia macrosoma*). 3. The Calamary (*Sepia officinalis*). 4. Shell of Pearly Nautilus (*Nautilus pompilius*). 5. An Ammonite (*Ammonites obtusus*). 6. Common Atlantic Squid (*Loligo vulgaris*). 7. Paper Nautilus (*Argonauta argo*).

and its lungs, or swim-bladder, as breathing organs. The latter is apparently functional chiefly during those periods of the year when the water becomes foul, owing to decaying vegetable matter, or is laden with sand. The body in *Ceratodus* is elongated and compressed, with a continuous vertical fin, and the paired fins are paddle-shaped. There are no external gills. The animal may reach a length of six feet.

**Ceraunii**, the Ceraunian Mountains. See ACROCERAUNIAN.

**Cerberus**, the hound that guarded the entrance to Hades, was (according to Hesiod) the offspring of Typhoeus and Echidna. He is usually represented with three heads, but sometimes with fifty or even a hundred. The story of how Hercules mastered him and brought him up to earth is told by Homer, Hesiod, and Virgil.

**Cercaria**, a stage in the life-history of the liver-fluke (*Distomum*). The cercaria is really the young fluke. It is furnished with a tail, by means of which it wriggles out of the body of its host, the water-snail, swims through the water, and becomes encysted on a blade of grass, losing the tail in the process. If eaten by a sheep, it becomes an adult liver-fluke. See LIVER-FLUKE.

**Cercyon**, son of Poseidon, and King of Eleusis; a cruel tyrant, who murdered all strangers by wrestling with them, until Theseus defeated him and slew him.

**Cerdic** (d. 534?), King of the West Saxons, the ancestor of all our kings except Canute, Hardicanute, the two Harolds, and William the Conqueror. He founded one of the greater Teutonic kingdoms in Britain, is said to have been ninth in descent from Woden, and to have landed probably in Hampshire (495). After allying himself with Aese and Aella (Ella), he inflicted severe defeats on the Britons, and in 519, with Cymric, he established the kingdom of the West Saxons. He conquered the Isle of Wight in 530. See *Anglo-Saxon Chronicle*.

**Cereals** include all grasses producing mealy seeds used for food. The term denotes the entire plant and also the grain by itself. The word cereals is derived from *ceralea*, meaning the offerings, consisting largely of wheat and barley, which were made to the Roman goddess Ceres, the mother of Proserpine. The principal cereal crops of the world, including corn, wheat, oats, barley, rye, and rice, have always and everywhere been cultivated to a much larger extent than other classes of crops, and have also been the most important source of food for man and the domestic animals. Their

culture antedates the history of civilization. Corn is a native of tropical America. The aborigines of North and South America cultivated it before the discovery by Columbus, and it is only since then that the plant has been introduced into other parts of the world. Teosinte and Job's tears are some of its nearest botanical relatives. The culture of wheat is very old, dating back in China to 2700 B.C. The plant is related to rye, barley, the cultivated rye grasses, and couch grass. Oats have not been cultivated as long as wheat, and they were not known to the ancients. The best known relative of the oat plant is tall oat grass. Barley was grown in ancient Egypt as a food for man and beast. In Europe it constituted the chief bread plant until the 16th century. Rye has not been grown as long as wheat and barley. It was unknown to the Egyptians and the Greeks. This crop furnishes the bread to a large portion of the peasant class of Europe. Rice is the principal food crop of Asia. It was grown in China 3,000 years before the Christian era and was introduced into Europe in the 15th century. The plant is a near relative of wild rice. The millets and the sorghums are also classed with the cereals. See F. L. Sargent's *Corn Plants, their Uses and Ways of Life*.

**Cerebellum**. See BRAIN.

**Cerebral Hemorrhage** is caused by rupture of a blood-vessel in the substance of the brain. See BRAIN; PARALYSIS.

**Cerebration** See PSYCHOLOGY.

**Cerebritis**, inflammation of the brain, commonly coincident with meningitis.

**Cerebro-spinal Fluid**, lymph lying between the coverings of the brain and the spinal cord—the dura mater being the outer, the pia mater the inner covering. Between the two lies a third membrane, the arachnoid, a delicate, weblike tissue. The cerebro-spinal fluid lies between the arachnoid and the pia mater. Some serous fluid, less in quantity than the cerebro-spinal, lies between the dura mater and the arachnoid. The cerebro-spinal fluid has free passage all over the brain and spinal cord, between the membranes, and probably acts as a buffer, or water-bed, to guard the brain and cord from the effects of concussion. It consists mostly of water, is slightly saline, varies in quantity, is most abundant in old people, and is rapidly restored if drained off. It is over-abundant in the morbid condition known as spina bifida, where it forms a tumor.

**Cerebro-spinal Meningitis**. See MENINGITIS.

**Cerebrum**. See BRAIN.

**Ceres**. See DEMETER.

**Ceres**, the first-known asteroid, was named after the tutelary goddess of Sicily by Giuseppe Piazzi, who discovered it on Jan. 1, 1801. The largest but not the brightest member of the group, its diameter measures 477 m. (Barnard), while its albedo of 0.18 implies a surface reflective of no more than 18 per cent. of the rays striking it. Its orbit has a mean radius of 257 million miles, and is traversed in a period of 4.6 years. It is nearly five times more eccentric than that of the earth, and is inclined  $10\frac{1}{2}^\circ$  to the ecliptic.

*Cereus Giganteus.*

**Cereus** is the genus of Cacti, including some of the largest members of the order; several of the species grow, indeed, to a great height. The best worth cultivating are the pink-flowered *C. fimbriatus*, about twenty feet in height; *C. flagelliformis*, with creeping stems and pink flowers; and the scarlet *C. speciosus*, which grows to about six feet high. This is the so-called torch thistle. Of the night-blooming varieties, the most notable are the climbing *C. grandiflorus*, which produces its lovely white, brown, and yellow flowers through the summer months. These, which reach about eight inches in diameter, begin to

open at about eight o'clock in the evening, and begin to close about two or three o'clock in the morning. During the time that they are expanded the flowers give out a pleasant fragrance of great penetration. There are also the larger-flowered, but less powerfully scented, *C. nycitcalus*, and the red, orange, and white *C. Macdonaldæ*. The Cereuses are not difficult to grow in a warm greenhouse, if only they receive plenty of air and light. In summer plenty of water should be given them, but in winter it should be given only in small quantities.

The giant cereus (*C. giganteus*) is a familiar object on the arid plains of the Southwest. It grows to a height of 60 ft., and resembles a gigantic tuning-fork at times, although it usually has several thick, ribbed, upright branches. It is studded with blossoms in spring, and in June the vari-colored, fleshy fruits, filled with a multitude of tiny black seeds, are ripe. The plant is known as 'pitahaya,' and the fruits form a staple food of the various Indian tribes in the regions where they grow.

**Cernigola**, tn. and episc. see, prov. Foggia, Italy, 22 m. S.E. of Foggia. Near by the French, under the Duc de Nemours, were defeated by the Spaniards, commanded by Gonsalvo da Cordova, in 1503. Pop. (1901) 32,028.

**Cerigo** (anc. *Cylhera*), isl., Greece, is the most southerly of the Ionian Is. It is very mountainous and little wooded. The principal crops are wheat, vines, olives, and cotton, and the pasturage is exceedingly good. Large numbers of sheep and goats are exported to Greece. The chief town is Capsali, at the S. end. The island was colonized by the Phœnicians, and was celebrated for the worship of Venus (Aphrodite), who was said to have risen out of the sea near this island. Area, 116 sq. m. Pop. 15,000.

**Cerithium**, a genus of gastropod mollusks. The shell is turreted and many-whorled, with a small aperture, and anterior and posterior canals, the latter being the less distinct of the two. The numerous species are widely distributed, but the most typical are tropical.

**Cerium** (Ce, 140) is an element found in a few rare minerals—e.g. cerite, orthite, and the Samarskite of North Carolina—along with similar elements, and silica. It is prepared by the electrolysis of its chloride as a steel-gray lustrous metal, but has its chief application in its oxide, which is an important ingredient of incandescent gas mantles.

**Cerro de Pasco**, mining tn., cap. dep. Yunin, in the highlands

of Peru, 120 m. N.E. of Callao. It has remarkably rich mines of silver and copper. Salt is obtained, and coal at a distance of a few miles. A new road from Oroya, 68 m., completes the rail connection with Lima. Alt. 14,270 ft. Pop. about 14,000.

**Cerro Gordo**, BATTLE OF, a battle of the Mexican War, fought on April 18, 1847, at the pass of Cerro Gordo, on the road connecting Vera Cruz and Jalapa, between about 8,500 Americans under Gen. Winfield Scott and about 12,000 Mexicans under Gen. Santa Anna. Though the Mexicans were superior in numbers to the Americans and occupied a position of extraordinary strength, they were defeated and driven in great disorder from the field, the American plan of battle being determined by a reconnaissance made by Capt. Robert E. Lee. The American loss in killed and wounded was about 430, that of the Mexicans probably about 1,000, though the exact number is unknown. In addition, about 3,000 Mexican prisoners were taken, including five generals: This was the first serious engagement, after the capture of Vera Cruz, in the Southern campaign, Gen. Scott proceeding from Cerro Gordo on his march to the city of Mexico.

**Cerro Largo**, dep. in N.E. of Uruguay, S. America, bounded on the N.W. by the Rio Negro, and on the E. by Brazil, covered with well-watered grassy downs, on which large herds of cattle are grazed. Its area is 5,753 sq. m., and pop. (1902) 37,979. The capital is Cerro Largo or Melo; pop. 8,000.

**Certaldo**, vil., prov. Florence, Italy, 18 m. S.W. of Florence; is the place where Boccaccio (born in 1313) lived and died (1375). Pop. (1901) 9,129.

**Certificate**, a writing which testifies that a certain thing has, or has not, taken place. Properly authenticated, it gives notice from one court to another of anything done therein, and is a judicial act. Certificates by certain officers may be used in evidence at a trial.

**Certified Check**, a check that has been presented at the bank upon which it is drawn and officially declared to be 'good.' This is done in writing, generally on the face of the instrument under the signature of some one in authority. It simply means that the drawer of the check has at the time the amount of the check on deposit in the bank. The effect of certification is to make the holder a new depositor to that amount, and the bank becomes liable to him.

**Certiorari**, a writ by which a superior court requires an inferior court to send to the former the record of some proceeding pending

in the latter. It lies in most of the states of the United States and in England, where it is issued out of the High Court. In 1891, when federal Circuit Courts of Appeal were established in the United States, a statute provided that a writ of certiorari might issue out of the Supreme Court to bring before it the records of the Circuit Court for review. U. S. Rev. St. 1 Supp. 903.

**Certosa di Pavia**, a Carthusian Monastery of Italy, 5 m. N. of Pavia, was begun in 1396 by Giovanni Galeazzo Visconti, Duke of Milan. The church has a profusely decorated façade (1473 onwards), one of the richest examples of Renaissance work in Italy, and inside is adorned with numerous fine pieces of sculpture, including the tombs of the founder, of Lodovico Moro and of his wife, Beatrice d'Este, as well as paintings by Borgognone, Solari, Luini, and others. A liqueur is manufactured in the monastery. The monastery was dissolved in 1866, and in 1891 was proclaimed a national monument of Italy. Close by, Francis I. of France was defeated and taken prisoner by the imperialists in 1525. See Beltrami's *La Certosa di Pavia* (1891).

**Cerumen** (Lat. *cera*, 'wax'), the yellow waxy substance secreted by certain glands in the outer ear, in the passage leading to the drum or tympanum. Its function is to catch solid foreign particles, and thus to guard the tympanum; but in cases of inflammation of the passage it is secreted in excess, and may then cause deafness by obstruction. It can be removed by dropping a little glycerine and water into the ear, to soften the wax, and by then syringing the ear with warm water.

**Cervantes-Saavedra**, MIGUEL DE (1547-1616), Spanish novelist, poet, and dramatist, born at Alcalá de Henares. He was educated under the famous humanist, Juan Lopez de Hoyos; but on the coming of Cardinal Giulio Acquaviva to Madrid (1568) to condole with Philip II. on the loss of his son Don Carlos, Cervantes was appointed to an office in the nuncio's household, and accompanied his master to Rome. Leaving this service (1576), for the next five years he lived the life of a soldier. In the naval battle of Lepanto (1571), he had his left hand permanently injured, gaining thus forever his glorious nickname of *el manco de Lepanto*. He continued fighting against the Turks until 1575, when he sailed from Naples to Spain; but he was captured at sea by pirates, and carried, with his brother Rodrigo, as a slave to Algiers. He remained in captivity for five years. His one solace in his slavery had been verse, and on his

return to Madrid (1582) from the campaign for the conquest of Portugal he settled down to a career of letters. In 1594 he was employed on the commission to enforce payment of overdue taxes in the province of Granada. A bill drawn by him in 1595 on account of his office was protested in Seville, and after a long and costly lawsuit he was cast into prison for the debt (1597). Released on bail, he remained in Seville as a commission agent until 1603, when the lawsuit being transferred to Valladolid, Cervantes had to go thither. Here a further misfortune befell him. His house in the Calle del Rastor was near the place where a noble, Gaspar de Ezpeleta, was mortally wounded by some unknown person on the night of June 27, 1605. Cervantes, attracted by the cries for aid, was found supporting the dying man when the watch arrived. He and his family were thrown into prison on suspicion, but after some delay they were declared innocent and released. The court being transferred to Madrid (1606), Cervantes again changed his residence, to end the lawsuit that had embittered his life. Here he lived for the next ten years in a dire struggle with poverty, until death released him in 1616. He was buried in the church of the Trinitarian nuns in Calle Cantaranas, afterwards the Calle de Lope de Vega.

His best-known and his own favorite poetical work is the *Galatea*, a pastoral narrative tale, first published in 1585. Although the prose of Cervantes has overshadowed his poetry, of which he was so proud, there are verses of great beauty in the *Galatea*, and in *El Viage al Parnaso*. As a dramatist Cervantes worked hard, but not successfully, though he himself thought highly of his plays. In the *Adjunto al Parnaso* he enumerates those of his dramas which he considers the best—among the number, *El Trato de Argel*, *La Numancia*, and *La Confusa*, of which the last named is perhaps the best.

It is, however, as a novelist that Cervantes has become immortal. Successive writers have endeavored to discover in *Don Quixote* a great political satire; but the truth of Cervantes's own assurance is now generally admitted, that his sole desire was to write an amusing book to give the *coup de grâce* to the absurd books of chivalry imitating Amadis that had done so much to pervert Spanish character. The book must have been begun later than 1591, but the suggestion that he wrote it in a jail in Argmasilla de Alba rests alone upon tradition and a conjectural interpretation of a remark made

by Cervantes in the prologue. In any case, it was famous in manuscript for some time before a license was granted (Sept. 26, 1604) to print the first part. The book seems to have been first sold at the beginning of the year 1605. Lope de Vega wrote slightly of it shortly before; but the public read it with avidity, five (or six, if there really was a Barcelona edition of 1605) editions appearing before the end of 1605. In 1614 a spurious second part was published, the work of an unknown author assuming the name of Alonso Fernandez de Avellaneda—an amusing book, but inferior to the work of Cervantes. The latter, stung to the quick by this piracy, hurried the conclusion of his own second part, in which he bitterly attacks Avellaneda. The genuine second part, with the exception of some of the concluding chapters, is, if anything, superior to the first.

In 1613 Cervantes issued his twelve *Novelas Exemplares* (Eng. trans. by MacColl, 1902, etc.)—short stories written at considerable intervals. They abound in wit and vivacity, rivalling even *Don Quixote* itself, and have maintained their popularity to the present day. Cervantes's last work was *Los Trabajos de Persiles y Sigismunda*, written in 1616, the dedication to the Count de Lemos being signed four days before the author's death (Apr. 23). In May, 1905, the tercentenary celebration of *Don Quixote* took place at Madrid.

The best bibliographical references in English to *Don Quixote* will be found in the introduction, by Mr. Fitzmaurice Kelly, to Mr. Ormsby's translation of the work (1901). A good Spanish bibliography of the whole of Cervantes's writings is that by Leopoldo Ruis y Llosellas (1895). The best Spanish biography of Cervantes is that by Fernandez de Navarrete (1819). The most scholarly edition of *Don Quixote* in Spanish has recently been published in London by Mr. J. Fitzmaurice Kelly (1892); and the biography (1892) by the same English scholar is also excellent, as is Mr. H. E. Watt's *Life of Cervantes* (1894).

**Cervera y Topete**, PASQUAL (1833-1909). Spanish admiral, was born of a wealthy family, at Jerez, prov. of Cadiz, Spain, and was educated (1848-51) at San Fernando. In the early part of his career, he distinguished himself in operations on the coast of Morocco (1859-60), in the early days of the first Cuban war (1868-78), and in the revolutionary struggles in Spain. He was regularly promoted and received numerous decorations, and in 1892 was Minister of Marine in Sagasta's cabinet. At the outbreak of the

Spanish-American War (1898) he sailed with secret orders to defend Spanish interests in Cuba in command of a squadron composed of the cruisers *Injania Maria Teresa*, *Cristóbal Colon*, *Almirante Oquendo*, and *Vizcaya*, accompanied by three torpedo-boat destroyers. He eluded the American fleet, reached Santiago on May 19, and was there blockaded by Admiral Sampson. Our naval forces failed to block the harbor by sinking the *Merrimac*, and on July 3 the Spanish fleet, compelled by public opinion in Spain, though against Cervera's better judgment, attempted an escape; but the ensuing naval action resulted in the destruction or capture of every Spanish ship, the death of one-third of their men, and the surrender of Cervera as prisoner of war. He was treated on his arrival in the U. S. with great distinction, and on his return to Spain at the close of the war was honorably acquitted by a formal court-martial.

**Cervetri**, or **CERVETERE**, vil., prov. Rome, Italy, 20 m. N.W. of Rome, occupies a corner inside the walls of the ancient Etruscan city of Cære, and is famous for its Etruscan graves, many of them hewn in the solid rock. The ancient city carried on an extensive commerce, and flourished down to the 13th century. See CÆRE.

**Cervidæ**, the deer family; one of the families included in the Pecora, or true ruminants. The family characteristics are that antlers are frequently, though not invariably, present in the male; that the upper canines, absent in sheep and ox, are here present, and may be large in the male; that at least the first molar tooth in each jaw retains the primitive short-crowned (brachyodont) condition; and that the lateral toes, the second and the fourth, are almost always present on both feet. In other respects deer resemble sheep and oxen, save in some minor points. The family Cervidæ is divided into two sub-families, the one including only the aberrant musk-deer (*Moschus*), the other the true deer, widely distributed over the globe, but absent from Africa and Australia.

**Cervin**, MONT. See MATTERHORN.

**Cesalpini**. See CAESALPINUS, ANDREAS.

**Cesarevitch**. See TSAR; also RACE MEETINGS.

**Cesari**, GIUSEPPE (1568-1640), called IL CAVALIERE D'ARPINO, enjoyed a great reputation as a painter at Rome; he was the rival of Carracci and Caravaggio. His paintings, though pleasing, lack accuracy and perspective. His best works are the death of Cicero, and a Roman battle scene.

**Cesarotti, MELCHIORE** (1730-1808), Italian writer, born at Padua, where he was appointed professor of Greek and Hebrew (1768), a position he held for the remainder of his life. Of his original works the most important is the *Saggio sulla Filosofia delle Lingue* (1785), in which he advocates a free development of language, in opposition to the tenets of the Della Cruscan Academy at Florence. As a translator, he attempted a prose version of the *Iliad*, followed by a long verse paraphrase, in 10 vols.; *La Morie d'Etiope*; and also rendered some of Voltaire's plays and Gray's *Elegy* (1772). But his great achievement is the translation (in blank verse) of Macpherson's *Ossian* (1763; complete ed. 1772), which aroused extraordinary interest in Italy, and exercised a great influence both there and in other countries, his introductory dissertation being translated into English and edited with notes by J. M'Arthur in 1806. See Lives by Barbieri (in the *Opere*, in 40 vols. 1800-13), by Maggi (Intro. to the *Opere Scelte*, 1820). See, too, Mazzoni's preface to the *Prose edite ed inedite* (1882).

**Cesena** (anc. *Cæsena*), tn. and episc. see, prov. Forlì, Italy, 17 m. N.W. of Rimini; has a cathedral, a citadel, and the valuable Malatesta library. The Popes Pius VI. (1717) and Pius VII. (1742) were born here. The place is famous for its wine and its hemp, and the people spin silk and mine sulphur. Here the French defeated the Austrians in 1815. Its history is alluded to by Dante (*Inferno*, xxvii. 52). Pop. (1901) 42,509.

**Cesnola, LUIGI PALMA DI, COUNT** (1832-1904), Italian-American archaeologist, was born at Rivarolo, near Turin, and was educated at the Royal Military Academy in the latter city. He fought in the war against Austria in 1848-49 and was a staff officer in the Crimean War. In 1860 he came to the U. S. and served with distinction on the Union side in the Civil War until 1863, when he was wounded and taken prisoner. In 1865 he was made a brevet brigadier-general, was naturalized, and appointed U. S. consul to Cyprus. He there spent ten years in a series of interesting excavations at Curium, Larnaca, and Dali. His collection of statuary, pottery, jewelry, and other objects of art was bought by the Metropolitan Museum of Art in New York city in 1873, where it is known as the Cesnola Collection. About 5,000 valuable objects were lost at sea near the coast of Syria while on their way to the U. S. in 1871, but the greater part of these were duplicates. Several foreign museums, as well as the

Smithsonian Institution at Washington, received gifts of art duplicates from Gen. Cesnola, and the Boston Museum bought a small collection. He was director and a trustee of the Metropolitan Museum from 1878 till his death. The genuineness of many of the articles he had collected was disputed for a time (1879), but the general worth of the collection was finally admitted, after a lawsuit in which the matter was thoroughly investigated. In 1880 Gen. Cesnola received the degree of LL.D. from Columbia University. He wrote *Cyprus, its Ancient Cities, Tombs, and Temples* (1878), a *Description of the Metropolitan Museum of Art* (1882), and an *Atlas of the Cesnola Collection* (1885), besides various pamphlets on art subjects. See *The Cesnola Collection of Cypriote Antiquities*, a 'summary' by John Taylor Johnston, President of the New York Metropolitan Museum of Art, in the 1878 edition of Cesnola's *Cyprus*.

**Cespedes, PABLO DE** (1536-1608), Spanish painter, architect, and poet, born at Cordova; in early life was distinguished as a scientist and linguist. Later on he devoted himself to sculpture and painting under Michael Angelo. His principal picture is the *Last Supper*, in Cordova Cathedral, of which he was appointed a prebendary (1577). See Tubino's *P. de Cespedes* (1868).

**Cespedes y Borgas, CARLOS MANUEL DE** (1819-74), Cuban patriot, was born at Bayamo, Cuba, received his education in Havana and in Spain, and was admitted to the bar at Madrid (1842). He was connected with General Prim's attempt against the Spanish Government (1844), and returned to Bayamo, where he chiefly lived, engaged in the practice of the law and literary work until the Cuban insurrection of 1868, which he inaugurated with a manifesto. The following year a Cuban Congress met at Guáimaro and Céspedes was elected President by acclamation, remaining at Guáimaro until 1870, when driven out by the Spaniards. After three years of struggle he lost his influence with the Cubans and was deposed from the presidency in 1873. The cause of his death has remained a mystery.

**Cessio Bonorum**. In civil law, a process whereby a debtor made an assignment for the benefit of his creditors. The debtor was then exempt from imprisonment.

**Cession** (Lat. *cessio*, 'surrender'), the formal transfer of territory from one state to another by the act of the state making the cession. Some deference is usually paid to the wishes of the inhabitants of the ceded

territory, but it is not a recognized rule of international law that the transfer must be with the consent of the people. Cessions are made by way of sale, exchange, or gift, or are exacted by a conqueror as a condition of peace.

The civil and political rights of the inhabitants of the ceded territory are usually determined by the treaty of cession. In the case of earlier cessions of territory to the United States, it was usually stipulated by the ceding nation that the inhabitants of such territory should as soon as possible be admitted to all the rights and immunities of citizens of the United States, and that in the meantime they should be maintained and protected in their liberty, property, and in the religion which they professed. The Treaty of Paris, under which the Philippines and Porto Rico were ceded by Spain, merely stipulated that the civil rights and political status of the inhabitants of the ceded territory should be determined by the Congress of the U. S. In the absence of express stipulations, the inhabitants change their allegiance and acquire a share in all the rights of their new state. At the same time they carry with them all their local obligations, local rights, and property. The new state is liable for the local debts of the ceded territory and those secured upon special revenues. There are instances where the new state has charged itself with a part of the general debt. Most treaties of cession contain a clause dealing with the question of debts. See CONQUEST; also Hall's and Wheaton's *International Law*.

**Cestoda**. See TAPEWORMS.

**Cestracion**, a genus of sharks of a somewhat primitive type. The living species, known as Port Jackson sharks, are confined to the Pacific Ocean; none exceed five feet in length.

**Cestui que Trust**. See TRUSTS.

**Cestum Veneris**, or VENUS'S GIRDLE, a beautiful marine organism belonging to the Ctenophora, remarkable for its elongated, ribbon-like form.

**Cestus**. (1.) Thongs of leather worn by Greek and Roman boxers on their hands; not like modern boxing-gloves, to soften their blows, but to make them more severe. They were often weighted with lead and iron. (2.) The magic girdle of Aphrodite (Venus), which caused its wearer to inspire love in all beholders. See *Iliad*, bk. xiv.

**Cetacea**, an order of marine mammals, including whales, dolphins, porpoises, and their allies. From fish they differ in their warm blood, four-chambered heart, air-breathing habit, and

many other characters; but they are very perfectly adapted for life in water. The body is spindle-shaped, the head is always large, and the tapering tail is furnished with powerful 'flukes,' which are the main agents of propulsion of the body. Hind limbs are entirely absent, and the fore limbs are converted into elongated paddles, without external traces of nails or fingers. Hairs are present only in the young, or are few in number and confined to the mouth region; the hairy coat is functionally replaced by the thick layer of blubber beneath the skin, which serves to retain the heat of the body. The nostrils open near the summit of the head in a single and double blowhole, the eye is small, there is no external ear, and the auditory aperture is minute. Of the many peculiarities of the skeleton, we can only mention that the bones are spongy and filled with oil, the neck short and stiff, the posterior portion of the vertebral column very freely movable, the skull greatly modified in association with the shifting backwards and upwards of the nostrils, while clavicles are absent, and the fore limbs curiously modified. Teeth may be present or absent, and in the latter case are functionally replaced by the horny plates or baleen of the whalebone whales. Though the stomach is complex, the animals are all carnivorous, the majority feeding on fish, cuttle-fish, crustaceans, or small marine organisms of various kinds. The cetaceans are very widely distributed—the majority in the sea, a few in the rivers of Asia and S. America. Their whole life is passed in the water, and they are absolutely helpless on land. In the sea the young are brought forth and reared, special structural adaptations making the process of lactation possible under water. In spite of this aquatic habit, whales are as purely air-breathers as the horse or the cow, and must of necessity rise periodically to the surface to breathe, an operation which is facilitated by the horizontally placed tail-flukes. The majority are gregarious, swimming in herds or schools; and the females exhibit great devotion to their young, of which only one is usually produced at a birth.

Living Cetacea are divided into two sharply contrasted sets—the toothed whales, or Odontoceti, and the whalebone whales, or Mysticoceti; but the presence or absence of teeth, the character

upon which the division is based, is only one of a number of differences between the two, differences especially marked in the structure of the skeleton. For toothed whales see articles CACHALOT, DOLPHIN, PORPOISE, BOTTLENOSE, NARWHALE; for whalebone whales see under that heading, also RIGHT WHALE, RORQUAL. Consult F. Beddard, *Book of Whales* (1900); F. Bullen, *Denizens of the Deep* (1904).

**Ceteosaurus** is the name given by Professor Owen to an extinct reptile of gigantic size, the remains of which have been found in the Oolitic strata of England. The head and neck were missing, but from the dimensions of the body it is inferred that the animal was not less than thirty-six feet in length and ten in height. The shoulder-blades are nearly five feet long. It belongs to the Dinosaurs, and is a member of the family of Atlantosaurs, which includes some of the largest animals known to have inhabited the globe. The shape of their teeth indicates that they lived on vegetable food. See Hutchinson's *Extinct Monsters* (1892), and Sir Richard Owen's *British Fossil Reptiles* (1849).

**Cetinje**. See CETTINJE.

**Cetotolites**, the tympanic and petrosal parts of the ear-bone of whales, are among the hardest and most durable of all organic structures, and are especially adapted for preservation in the fossil condition. They are not infrequent in the Pliocene beds of Great Britain, and much of our knowledge of extinct species of Cetacea is founded on them. To some extent they have been used as a source of superphosphates and artificial manures.

**Cette** (anc. *Setion*), seapt., dep. Hérault, France, 17 m. s.w. of Montpellier, at the meeting-point of the Canal du Midi with the Mediterranean. The town has a good harbor. The chief article of trade is wine. Cette is of Greek foundation, but it dates its rise only from the 17th century. It has sea-bathing and mineral springs. Pop. (1901) 33,246.

**Cettinje** (pron. *Settinya*), cap. of Montenegro, 12½ m. from Cattaro; the see of the metropolitan and the residence of the prince; has an arsenal, state library, national museum, theological seminary, girls' high school, and remains of an ancient monastery. Cettinje was burnt by the Turks, in 1683, 1714, and 1785. Pop. about 3,000.

**Cetus**, an ancient constellation to the south of Aries. Although

covering an expanse of sky 50° by 20°, it includes no star as bright as the second magnitude. Mira, in the neck of the Whale, is the first known periodical star. In one of its bright phases, on Aug. 13, 1596, it attracted the attention of David Fabricius, and was found to fluctuate in about 331 days from 1.7 to 9.5 magnitude. The constellation is crowded with 'white' nebulae, the most conspicuous among them being an elliptical formation discovered by Caroline Herschel in 1783, and resolved into a spiral in a photograph taken by Dr. Roberts, Dec. 25, 1899.

**Cetywayo**, or, more phonetically, KETSHWYO (c. 1836-84), son of the Zulu king Panda, whom he deposed in 1856. After defeating his brother Umbulazie, his succession was recognized by Natal, conditionally on his disbanding his formidable army and ceasing his sanguinary methods of government. The annexation of the Transvaal (1877) imposed upon Britain the necessity of enforcing these conditions; and the Isandhlwana disaster (1879), partially retrieved at Rorke's Drift, preceded the victory of Ulundi (1879). Cetywayo was captured by Major Marter (1879) and imprisoned at Cape Town. In 1882 he was brought to Britain, where mistaken public sympathy procured his restoration to a part of his country (1883). Soon after he was attacked and defeated by Usibepu, one of his ancient enemies, and Cetywayo was compelled to seek shelter in the native reserve.

**Ceuta**, fort. seapt. belonging to Spain, but situated at the E. extremity of the Moroccan peninsula which juts out N. towards Gibraltar. It answers to the ancient Abyla, one of the mythical Pillars of Hercules. Ceuta consists of an old town on the tongue of the peninsula, and a new town climbing up the hills behind. It is a bishop's see, and has a 15th century cathedral. The fortifications were greatly strengthened in the end of the 19th century, and it is now (1906) proposed to convert Ceuta into a first-class fortress, although it is to some extent commanded by Tetuan, 23 m. to the S. Under both Roman and Arab rule Ceuta was a busy centre of trade and industry. It was conquered by King João I. of Portugal in 1415, and passed to Spain in 1580. Pop. (1900) 13,269, embracing Spaniards (inclusive of garrison of 3,500, and 2,000 to 2,500 convicts), Moors, Negroes, Jews, and other races.

# APPENDIX OF PRONUNCIATION TO NELSON'S ENCYCLOPÆDIA.

## I. EXPLANATORY NOTE.

In the vocabulary of this Appendix the correct pronunciation is indicated of all titles which present any difficulty in that respect. Titles are omitted when the pronunciation is indicated by the spelling (as abatement, Adams, Aiken, Bates, etc.), or by connection with titles given in the Appendix.

A simple system of respelling is adopted based upon the usual values of the vowels and consonants in English; and such diacritical marks as are used are those in general use in school textbooks. The values of the symbols used are given in the accompanying Key, with explanations of the way to pronounce correctly the few foreign sounds which are not fairly well represented by English sounds. Except as otherwise noted in the Key, the letters used in respelling are to be given their ordinary English values. Further information as to the values of the letters in the alphabets of foreign languages will be found in the article on PRONUNCIATION in the Encyclopædia.

## II. KEY.

ā as in fate, rebate.  
 â as in care, mare, or as *ai* in fair, or as *e* in there  
 a (unmarked) as in fat, am.  
 ã as in arm, father.  
 ä as in ask.  
 a as in America.  
 ē as in me, evade.  
 e (unmarked) as in met, end.  
 e as in moment, maker.  
 I as in ice, mine.  
 i (unmarked) as in fit, it.  
 ō as in old, over, obey.  
 o (unmarked) as in nor, or as *a* in fall.  
 ô as in nor, or as *a* in fall.  
 oi as in boil, noise.  
 oo as in boot, fool, or as *u* in rude.  
 oo as in book, or as *u* in full, put.  
 ū as in mule, unite.

u (unmarked) as in but, up.  
 ū as in turn, burn, or as *e* in her, or as *i* in fir;  
 also for French *eu* and for German *ö*.  
 ũ for French *u* and German *ü*. This sound may  
 be imitated by pronouncing *e* as in Eng-  
 lish me and at the same time firmly round-  
 ing the lips as for pronouncing *oo* in fool.

y as in yet.  
 ch as in church.  
 ch as in German *ich*. This is the front palatal  
 continuant, and is pronounced with the  
 blade of the tongue raised almost to the  
 hard palate, producing a sound resembling  
 a strong pronunciation of the *h* in *hew*,  
 or the sound of *k* in *key* pronounced with-  
 out complete stoppage of the breath.  
 g as in go, girl.  
 h as in hit; also for Spanish *g* before *e* and *i*,  
 and for other foreign sounds which are  
 similar strong guttural fricatives.

hw as *wh* in when.  
 k as *ch* in Scotch loch, and German *ach*, or as *g* in  
 German *tag*, *berg*. This is the back pal-  
 atal, or guttural, continuant, and is pro-  
 nounced with the tongue raised almost to  
 the palate, producing a sound somewhat  
 resembling that made in clearing the  
 throat.

ñ is used to indicate a nasal pronunciation of  
 the preceding vowel, as in French *bon*.  
 The nasal vowels are pronounced some-  
 what as if blended with the sound of *ng* in  
 song, pronounced without the complete  
 closure for the *g*.

th as in thick, though.  
 th as in then, thus.  
 zh as *z* in azure, or as *s* in measure.  
 An apostrophe ['], when used, denotes an almost  
 complete elision of the vowel which it re-  
 places or indicates a syllabic consonant, as  
 in *tä'k'n* (taken), *spaz'm* (spasm).

## VOLUME II.—Bedmar to Ceuta.

Bedmar, bed-mär'.	Bègles, beg'l'.	Beilstein, bil'shtn.	Belfast, bel-fast' or bel- fast.
Bedouins, bed'oo-inz or -enz.	Begonia, bi-g'oni-a.	Beira, bä'e-rä.	Belfort, bel-för'.
Beelzebub, bë-el'zi-bub.	Beguines, beg'inz or bä- gën'.	Beirut, bä'rööt or bä-rööt'.	Belgæ, bel'jō.
Beerth, bë-ë'roth or bë'- röth.	Begum, bë'gum.	Beishehr Gol, bä-she'h'r göl.	Belgaum, bel-gä'oom.
Beers, bërz.	Behajim, bä'him.	Beissel, bi'sel.	Belgiojoso, bel-jō-yō'sō.
Beersheba, bë'er-shë'ba or bë-är'shë-ba.	Behemoth, bë-hë'moth or -mōth.	Beit-el-Fakih, bät'el-fä'- këh.	Belgium, bel'ji-um.
Beethoven, bä'tō-ven; Du. bät'hō-ven.	Behera, be-hä'rä.	Beja, bä'zhä.	Belgrade, bel-gräd'.
Beets, bäts.	Behistun, bä his-töon'.	Bejan, bë'jan.	Belgravia, bel-grä'vi-a.
Befana, bä-fä'nä.	Behm, bäm.	Bekaa, bë'kä.	Jelial, bë'li-al.
Beg, beg; Turk. bä.	Behmen, bä'men.	Beke, bëk.	Belinsky, be-lin'ski.
Begas, bä'gäs.	Behn, bän or ben.	Békés, bë'kësh.	Belisarius, bel-i-sä'ri-us.
Beghards, beg'ardz or beg- ardz'.	Behring, bë'ring; Danish hä'ring.	Bekker, bek'er.	Belize, bë-lëz'.
	Beijerland, bi'yer-länt.	Bela, bä'lo.	Beljame, bel-zhäm'.
	Beilan, bä-län'.	Belbeis, bel-bäs'.	Belknap, bel'näp.
			Belladonna, bel-a-don'a.
			Bellagio, bel-lä'jō.

- Bellahouston**, bel-*a*-hūōs'-t'n.  
**Bellaire**, bel-*är*'.  
**Bellamy**, bel-*a*-mi.  
**Bellarmino**, bel-*är*-mē'nō.  
**Bellary**, bē-lä'ri.  
**Bellatrix**, bel-*a*-tri'ks.  
**Bellay**, bel-*lä*'.  
**Belle Alliance**, bel-läl-i-äns'.  
**Bellefontaine**, bel-fon'-tän.  
**Bellefont**, bel-fon't'.  
**Belle Fourche**, bel föörsh'.

**Benham**, ben'äm.  
**Beni**, bā'nē'.  
**Benicia**, be-nish'i-a.  
**Beni-Hassan**, bā'nē-häs'-sä.n.  
**Benin**, ben-ēn'.  
**Beni-Saf**, bā'nē-säf'.  
**Beni-Suef**, bā'nē-swe'f'.  
**Benkovac**, ben'kö-väts.  
**Benkulen**, ben-kööl'en.  
**Ben Lomond**, ben lö'mund.  
**Ben Macdhui**, mak-döö'i.  
**Ben More**, mör.  
**Benne-oil**, ben'i.  
**Ben Nevis**, nē'vis or nev'-is.  
**Bennigsen**, ben'ig-sen.  
**Benoit**, be-nwä'.  
**Bensberg**, ben'berch.  
**Bentham**, ben'tam or ben'tham.  
**Benthamia**, ben-thä'mi-a.  
**Bentinck**, ben'tingk.  
**Benue**, ben-wē'.  
**Ben Venue**, ben ven'ü.  
**Benvenuto**, ben-vä-nöö'tō.  
**Benzaonine**, ben-zak'ö-nin or -nēn.  
**Benzaldehyde**, ben-zal'di-hid.  
**Benzine**, ben'zin or ben'zēn.  
**Benzoic**, ben-zō'ik.  
**Benzoin**, ben'zō-in; *colloq.* ben'zo'in.  
**Benzoline**, ben'zō-lin or -lēn.  
**Benzyl chloride**, ben'zil klö'rid or -rid.  
**Beograd**, be'ö-grät.  
**Beothy**, bē'ü-ti.  
**Beowulf**, bē'ö-wööl'f.  
**Berabra**, ber-ä'brä.  
**Beranger**, bā-rän-zhä'.  
**Berar**, ber-är.  
**Berat**, ber-ät'.  
**Berber**, bür'ber.  
**Berbera**, ber-bä'rä.  
**Berberidaceæ**, bür-ber-i-dä'si-ē.  
**Berbers**, bür'berz.  
**Berbice**, ber-bēs'.  
**Berchem**, berch'em.  
**Berchet**, bär'shä.  
**Berchta**, berch'tä.  
**Berdichev**, ber-dyē'chef.  
**Berdjansk**, ber-djänsk'.  
**Berea**, be-rē'a.  
**Bereg**, ber'eg.  
**Berendt**, bär'rent.  
**Berengar**, bär'en-gär.  
**Berengaria**, bā-ren-gä'r-ē-ä.  
**Berengarius**, ber-en-gä'ri-us or -gä'rē-öös.  
**Berenice**, ber-e-ni'sē.  
**Beresford**, ber'es-ferd.  
**Berezin**, ber yä'zēn.  
**Berezina**, ber-yä'zē-nä.  
**Berg**, berch.  
**Bergaigne**, ber-gä'ny'.  
**Bergamo**, bär'gä-mō.  
**Bergamot**, bür'ga-mot.  
**Bergen**, *Belgium*, berch'en; *Norway*, bär'gen.  
**Bergen-op-Zoom**, berch'en op-zōm'.  
**Bergen Point**, bür'gen.  
**Bergerac**, ber-zh'räk'.  
**Bergh**, bürg.  
**Berghaus**, berch'hous.  
**Bergk**, berk.  
**Bergman**, berch'män.  
**Bergmann**, berch'män.  
**Bergun**, ber'gün.  
**Berhampur**, bur'um-pöör or -pöör'.  
**Beriberi**, ber'i-ber'i.  
**Bering**, bē'ring; *Danish* bär'ring.  
**Bériot**, bā-rē-ō'.  
**Berja**, ber'hä.  
**Berkeley**, bürk'li; *in England* öften bärk'li.  
**Berkhamstead**, bürk-ham'sted or bärk-.  
**Berkshire**, bürk'shir; *in England* öften bärk'shir.  
**Berlad**, bür'lät.  
**Berlichingen**, ber'lich-ing-en.  
**Berlin**, bür-lin'; *Ger. pron.* ber-lēn.  
**Berliner**, bür-lin'er; *Ger. pron.* ber-lē'ner.  
**Berlioz**, ber-lē-ös'.  
**Bermejo**, ber-mä'hō.  
**Bermoodsey**, bür'mun-zil.  
**Bermuda**, ber-mü'dä.  
**Bermudez**, ber-möö'däs.  
**Bernadotte**, bür'na-dot; *Fr. pron.* ber-nä-dot'.  
**Bernard**, bür'närd or ber-närd'; *Fr. pron.* ber-när'.  
**Bernauer**, ber'nou-er.  
**Bernays**, bür'näs.  
**Bernburg**, bern'böörch.  
**Berne**, bern; *Eng.* bürn.  
**Berners**, bür'nerz.  
**Bernese Oberland**, ber-nēs' ö'ber-länd or ber-nēz'.  
**Bernhard**, bern'härt.  
**Bernhardt**, bern'härt; *Fr. pron.* ber-när'.  
**Berni**, ber'nē.  
**Bernicia**, ber-nish'i-a.  
**Bernina**, ber-nē'nä.  
**Bernini**, ber-nē'nē.  
**Bernoulli**, ber-nöö'yē.  
**Bernstein**, bern'shtin.  
**Bernstorff**, bern'störf.  
**Berœa**, ber-ē'a.  
**Berosus**, ber-ō'sus.  
**Berre**, ber.  
**Berri**, or **Berry**, ber-ē'.  
**Berruguete**, ber-röög-ä'tä.  
**Berryer**, ber-ē-ä'.  
**Bersaglieri**, bär-sä-lyer'ē.  
**Berseem**, ber-sēm'.  
**Berserks**, bür'serks.  
**Bert**, bär.  
**Berthelot**, ber'tlō'.  
**Berthier**, ber-tyä'.  
**Berthold von Regensburg**, ber'tölt fon räg-ens-böörch.  
**Berthollet**, ber-tō-lä'.  
**Bertholletia**, bür-thol-ē-shi-a.  
**Berthoud**, ber-töō'.  
**Bertilion**, ber-tē-yön'.  
**Bertin**, ber-tän'.  
**Bertrand**, ber-trän'.  
**Bertran de Born**, ber-trän'de böörn'.  
**Bervic**, ber-vēk'.  
**Berwick**, *tn. U. S.* bür'wik; *Eng.* ber'ik.  
**Beryl**, ber'il.  
**Beryllium**, be-ril'i-um.  
**Berzelius**, ber-zē'li-us; *Swedish* ber-zel'ē-öös.  
**Bes**, bäs.  
**Besançon**, be-zän-sön'.  
**Besant**, bez'ant and bē-sant'.  
**Besika**, be-sē'kä.  
**Beskid**, bes'kēd'.  
**Beskov**, bes'kov.  
**Bessarabia**, bes-a-rä'bi-a.  
**Bessarion**, bes-ä'ri-on.  
**Bessel**, bes'sel.  
**Bessels**, bes'sels.  
**Bessemer**, bes'si-mer.  
**Bessières**, be-syär'.  
**Bestiary**, bes'ti-ä-ri.  
**Besuki**, bā-zöök'ē.  
**Beta**, bē'ta or bät'a.  
**Betelgeux**, bel'ē-güx'.  
**Betel**, bē'tel.

- Betham-Edwards, beth'am.  
 Bethany, beth'a-ni.  
 Bethel, beth'el.  
 Bethesda, be-thez'da or be-thes'da.  
 Beth-horon, beth-hō'ron.  
 Bethlehem, beth'lē-hem or beth'lē-em.  
 Bethien, bet'len.  
 Bethphage, beth'fa-jē; or *as Eng.*, beth'fāj.  
 Bethsaida, beth-sā'i-dā.  
 Beth-shemesh, beth-shē'-mesh.  
 Bethune, French bā-tūn'; *Amer.* bē-thōon'.  
 Betony, bet'ō-ni.  
 Betsiboka, bet-si-bō'kā.  
 Betsileo, bet-si-lā'ō.  
 Bettelheim, bet'el-him.  
 Bettia, be-tē'a.  
 Bettinelli, bet-tē-nel'lē.  
 Betto, bet'tō.  
 Bettws-y-Coed, bet'ōōs-i-kō'ed or -koid'.  
 Betul, bā-tōōl'.  
 Betwa, bet'wā.  
 Beule, bēl.  
 Beust, boist.  
 Beuthen, boi'ten.  
 Beveland, bā-vē-lant.  
 Beveridge, bev'er-ij.  
 Beveziers, bā-v'zyār'.  
 Bevis, bē'vis.  
 Bewick, bū'ik.  
 Beyle, bē'l.  
 Beyrich, bē'rich.  
 Beyschlag, bē'shlāk.  
 Beza, bē'za.  
 Bezant, bē-zant'.  
 Béziers, bā-zyā'.  
 Béziqne, bā-zēk'.  
 Bezoar, bē'zōr.  
 Bezwada, bez-wā'da.  
 \*Bhavagad Gita, bag'a-vad gē'ta.  
 \*Bhagavatapurana, bā-ga-vat-a-pōō-rā'na.  
 \*Bhagirathi, bā-gē-rā'tē.

 Bijawar, bē-jō'er.
- Bijnaur, bij-nour'.  
 Bijouterie, bē-zhōō'tē-i; *F.* bē-zhōō-t'rē'.  
 Bikaner, bik-a-nēr'.  
 Bikelas, bē-kā'lās'.  
 Bikrampur, bik'rum-pōōr.  
 Bilaspur, bē-lās'pōōr.  
 Bilbao, bil-bā'ō.  
 Bilbilis, bil'bi-lis.  
 Bilderdijk, bil'der-dik or -dik'.  
 Bilin, bē-lēn'; *Bohem.* bē-lēn.  
 Billaud-Varenne, bē-yō'-vā-ren'.  
 Bille, bil'e.  
 Billiton, bil-i-ton'.  
 Billot, bē-yō'.  
 Billroth, bil'rōt.  
 Bilma, bil'mā.  
 Biloxi, bi-lok'si.  
 Bilse, bil'se.  
 Bima, bō'mā.  
 Bimpapatam, bim-li-pā-tām'.  
 Binan, bē-nyān'.  
 Binary, bi'nā-ri.  
 Binche, bānsh.  
 Bingen, bing'en.  
 Binger, bān-zhā'.  
 Bingerloch, bing'er-lok.  
 Bingham, bing'am.  
 Bintang, bin-tang'.  
 Binturong, bin'tōō-rong.  
 Biobio, bē'ō-bē'ō.  
 Bion, bi'on.  
 Biot, bi'yō.  
 Bir, bēr.  
 Birbhūm, bēr-bōōm'.  
 Birch-Pfeiffer, bērch'pff'er.  
 Birejik, bē-re-jēk'.  
 Birjand, bēr-jānd'.  
 Birkenfeld, bēr'ken-felt.  
 Birkenhead, bār'k' 'n-hed.  
 Birnam, bār'nām.  
 Birney, bār'ni.  
 Biron, bē'rōn; *French* bē-rōū'.  
 Birrell, bār'el.  
 Birs, bērs.  
 Biru, bē'rōō.  
 Bisacquino, bē-sāk-kwē-nō.  
 Bisceglie, bē-shāl'yā.  
 Bischof, bish'ōf.  
 Bisharin, bē-shā-rēn'.  
 Biskra, bis'krā.  
 Bismarck, *Ger.* bis'mārk; *tn. U. S.* biz'mārk.  
 Bismarckburg, bis'mārk-bōōrch.  
 Bismarck-Schönhausen, shūn'hōu-zen.  
 Bissagos, bi-sē'gōs.  
 Bisschop, bis'skop.  
 Bistritz, bis'trits.
- Bistritz-Nazzed, nās'sed.  
 Bisutun, bē-sōō-tōōn'.  
 Bithur, bē-tōōr'.  
 Bithynia, bi-thin'i-a.  
 Bitlis, bil-lēs'.  
 Bitonto, bē-ton'tō.  
 Bitsch, bich.  
 Bitterfeld, bit'er-felt.  
 Bitumen, bi-tū'men.  
 Biturcius, bi-tūr-i-jēz  
 Bituzius, bit'si-ōōs.  
 Biwa Lake, bē'wā.  
 Bixa Orellana, bik'sa ō-rel'a-na.  
 Biysk, bēsk.  
 Bizerta, bē-zer'ta.  
 Bizet, bē-zā'.  
 Björneborg, byār'ne-bōry'.  
 Björnson, byār'n'son.  
 Björnstjerna, byār'n-sher'nā.  
 Blackstone, blak'stōn; *in England*, -stun.  
 Blaeu, blou.  
 Blagodat, blā-gō-dāt'.  
 Blagoveshensk, blā-gō-vyesh'chensk.  
 Blanc, Mont, mōū blān.  
 Blanche, Dent, dān blānsh.  
 Blankenberge, blāng'ken-ber-ge.  
 Blankenburg, blāng'ken-bōōrch.  
 Blanqui, blān-kē'.  
 Blantyre, blan-tir'.  
 Blasius, blā'zi-us.  
 Blass, blās.  
 Blavatski, blā-vāt'ski.  
 Bleek, blāk.  
 Bleiberg, blē'berch.  
 Bleibtreu, blēp'troi.  
 Bleding, blā'king-e.  
 Blemmyes, blem'i-ēz.  
 Blenheim, blen'im.  
 Blennerhasset, blen-er-has'et.  
 Bles, bles.  
 Blicher, blich'er.  
 Blida, blē'dā or blē-dā'.  
 Bligh, bli.  
 Blind (Karl), blint.  
 Bloch, blok.  
 Bloemfontein, blōōm'fontin'.  
 Blois, blwā.  
 Blok, blok.  
 Blomfield, blum'fēld or blōōm'fēld.  
 Blommaert, blom'ärt.  
 Blondel, blon-del' or blōn-del'.  
 Blondin, blōn-dān'; *Anglicized*, blōn'din.  
 Bloomfield-Zeisler, tsē'sler.  
 Blouet, blōō-ē'.

\* In Sanskrit and modern East Indian names *bh* is pronounced, by natives and by students of these languages, as *b* followed by a strong aspirate, somewhat as *bh* in *cabhorse*, but the *h* is omitted in pronunciation by most English-speaking people, even in India.

- Blount**, blunt.  
**Blowitz**, blō'vits.  
**Bloxwich**, bluk'sich.  
**Blücher**, blüch'er or blōō'-ker.  
**Blum**, blōōm.  
**Blumenbach**, blōō'men-bāk.  
**Blumenthal**, blōō'men-tāl.  
**Bluntschli**, blōōnt'shli.  
**Boabdil**, bō-āb-dēl'.  
**Boadicea**, bō-a-di-sē'a.  
**Boanerges**, bō-a-nūr'jēz.  
**Boas**, bō'ās.

**Boito**, boi'tō.  
**Bojador**, boj-a-dōr'; *Port. pron.*, bō-zhā-dōr'.  
**Boke**, bō'kā.  
**Bokelmann**, bō'kel-mān.  
**Bokhara**, bō-kā'rā.  
**Bol**, bōl.  
**Bolama**, bō-lā'ma.  
**Bolan Pass**, bō-lān'.  
**Bolaram**, bō-lā'ram.  
**Bolbec**, bol-bek'.  
**Bol**, bōl.  
**Boldredwood**, bōl'd'r-wōōd.  
**Bolero**, bō-lā'rō.  
**Bo-le'tus**.  
**Boleyn**, bōōl'in.  
**Bolgary**, bol-gā'ri.  
**Bolingbroke**, bol'in(g)-brōōk or bō'ling-brōk; formerly bōōl'ing-brōōk.  
**Bolintineanu**, bō-lēn-tē-ne-ān'.  
**Boliviar**, bol'i-var; *Span. pron.* bō-lē'vār.  
**Bolivia**, bō-liv'i-a; *Span. pron.* bō-lē'vyā.  
**Bolkhov**, bol-kōf'.  
**Bol'landists**.  
**Bolles**, bōlz.  
**Bologna**, bō-lōn'yā.  
**Bologoi**, bō-lō-goi'.  
**Bolor-tagh**, bō-lōr'tāg'.  
**Bolsena**, bol-sā'nā.  
**Bolsover**, bōl'sō-ver; *locally commonly*, bou'zer.  
**Bolton**, bōl'tun.
- Boma**, bō'mā.  
**Bomarsund**, bō'mār-sōōnd' or -sōōn'.  
**Bomba**, bom'bā.  
**Bombardon**, bom-bār'dun.  
**Bombazine**, bom'ba-zēn or bum'-.  
**Bombetoka**, bom-be-tō'ka.  
**Bom Fim**, bōn fēn.  
**Bommelō**, bom'el-ū'.  
**Bomvanaland**, bom-vā'nā-lānt.  
**Bō'na De'a**.  
**Bonai**, bō-nā'i.  
**Bonaire**, bō-nār'.  
**Bonald**, bō-nāl'.  
**Bonar**, bon'ar.  
**Bonaventura**, bō-nā-ven-tōō'rā.  
**Bonchamp**, bōn-shān'.  
**Bonde**, bon'de; *pl.* būn'der.  
**Bondeno**, bon-dā'nō.  
**Bondi**, bon'dē.  
**Bondu**, bon-dōō'.  
**Bonduku**, bon-dōō'kōō.  
**Bonga**, bong'ā or bon-gā'.  
**Bon-gar'dia**.  
**Bon Gaultier**, bon gōl'ti-er.  
**Bonghi**, bong'gē.  
**Bongo**, bong'ō; *Phil. Islds.* bong'ō.  
**Bonham**, bon'am.  
**Bonhear**, bō-nūr'.  
**Boni**, bō'nē.  
**Boniface**, bon'i-fās; *Fr. pron.* bō-nē-fās'.  
**Bonifacio**, bō-nē-fā'chō.  
**Bonington**, bon'ing-tun.  
**Bonin Islands**, bō-nēn'.  
**Bonito**, bō-nē'tō.  
**Bonivard**, bō-nē-vār'.  
**Bonnat**, bō-nā'.  
**Bonneval**, bon-vāl'.  
**Bonomi**, bō-nō'mi.  
**Bononia**, bō-nō'nyā.  
**Bonpland**, bōn-plān'.  
**Bonsignori**, bon-sē-nyō'rē.  
**Bonstetten**, bon'stet-en.  
**Bonvalot**, bōn-vā-lō'.  
**Bonvin**, bōn-vañ'.  
**Bonze**, bonz or bon'ze.  
**Boom**, *tn. Belgium*, bōm.  
**Boorde**, Borde, bōrd.  
**Boötes**, bō-ō'tēz.  
**Booth**, bōōth (*not* bōōth).  
**Boothby**, bōōth'bi.  
**Boothia Felix**, bōō'thi-a fē'liks.  
**Bootle-cum-Linacre**, bōō't'l-kum-lin'a-ker.  
**Bō'ra**.  
**Boracic**, bō-ras'ik.  
**Borās**, bōō'rōs or bōō'rōs.  
**Borchrevink**, bōrch'gre-vingk.  
**Borda**, bōr-dā'.  
**Bordeaux**, bōr-dō'.  
**Bordelais**, bōr-dā'.  
**Bordereau**, bōr-d'rō'.  
**Bordighera**, bōr-dē-gā'rā.
- Bordone**, bōr-dō'nā.  
**Bō're-as**.  
**Bore'cole'**.  
**Borelli**, bō-rel'lē.  
**Borga**, bōr'gō.  
**Borgerhout**, bōr'ger-houk.  
**Borghese**, bōr-gā'sā.  
**Borghesi**, bōr-gā'sē.  
**Borgia**, bōr'jā.  
**Borgne**, bōrn.  
**Borgo**, bōr'gō.  
**Borgognone**, bōr-gō-nyō'-nā.  
**Borgomanero**, bōr-gō-mā-nā'rō.  
**Borgu**, bōr-gōō'.  
**Boris Godunov**, bō'ris god-ōō-nōf'.  
**Borisoglebsk**, bor-ē-so-glyepsk'.  
**Borisov**, bō-rē'sof.  
**Borisovka**, bō-rē-sof'kā.  
**Börjesson**, būr'yēs-on.  
**Borkum**, bōr'kōōm.  
**Borlase**, bōr'lās.  
**Bormann**, bōr'mān.  
**Bormio**, bōr'myō.  
**Börne**, būr'ne.  
**Bornholm**, born'holm.  
**Bornu**, bōr-nōō'.  
**Boro-Budur**, bō'rō-bōō-dōōr'.  
**Borodino**, bor-o-dyē-nō'; *commonly Anglicized*, bor-ō-dē'nō.  
**Bororos**, bō-rō'rōs.  
**Borroean Islands**, bor-rō-mē'an or -mā'an.  
**Borromeo**, bōr-rō-mā'ō.  
**Borrowstounness**, bur-ustō-nēs'; *commonly abbreviated*, bō-nēs'.  
**Borsna**, bōrz'nā or bōrz-nā'.  
**Borsod**, bōr'shōd.  
**Borszek**, bōr'sāk.  
**Bory de Saint Vincent**, bō-rē' de sañ vañ-sān'.  
**Boryslaw**, bō'rē-slāf or bō-ris'lāf.  
**Borysthenes**, bō-ris'thi-nēz.  
**Borzhom**, bōr-zhom'.  
**Borzi**, bōr'zoi.  
**Bosboom-Toussaint**, bos'-bōm-tōō-sān'.  
**Boscán-Almogaver**, bōs-kān'āl-mō-gā-vār'.  
**Boscawen**, bos'ka-wen.  
**Bosch**, bos.  
**Bosco Reale**, bos'kō rā-ā-lā.  
**Boscovich**, bos'kō-vich.  
**Bosio**, bōz'yō.  
**Boşjesman**, bos'yēs-man.  
**Bosna**, bos'nā or hoz'na.  
**Bosna Serai**, bos'nā ser-ī'.  
**Bosnia**, boz'ni-a.  
**Bosporus**, bos'pō-rus.  
**Bosquet**, bos-kā'.  
**Bosruck**, bos'rōōk.  
**Bossuet**, bo-swā'.

- Bossut**, bo-sü'.  
**Boström**, bō'strām.  
**Boswell**, boz'wel.  
**Bös z ör mén y'**, büs'är-män-y'.  
**Both**, böt.  
**Botha**, böt'ä.  
**Bothnia**, both'ni-a.  
**Both'ri-o-ceph'a-lus**.  
**Botocudos**, bō-tō-kōō'dōz.  
**Botoné**, botō'ō-nä.  
**Botosani**, bō-tō-shä'ni or shä'ny'.  
**Botrychium**, bō-trik'i-um.  
**Botta**, bot'tä.  
**Bottesini**, bot-tä-zē'nē.  
**Botticelli**, bot-tē-chel'lē.  
**Böttiger**, büt'ē-ger.  
**Bottini**, bot-tē'nē.  
**Botrop**, bot'rop.  
**Boucher**, bōō-shä'.  
**Boucher Creveœur de Perthes**, krev-kür' de pert.  
**Bouches-du-Rhône**, bōōsh'dü-rōn'.

 Brody, bro'di.  
 Brodzinski, brod-zin'ski.  
 Broglie, bro'ê-y'.  
 Bromberg, brom'berch.  
 Bromellaceæ, brô-mel-i-â'-si-ê.  
 Bromine, brô'min or brô'mên.  
 Bromley, brum'li.  
 Bromsgrove, brumz'grôv.  
 Bromwich, brum'ich.  
 Bronchi, brong'ki.  
 Bröndsted, brân'sted.  
 Brongiart, brôn-nyâr'.  
 Brontë, bron'tâ.  
 Brontë, bron'tâ.  
 Brontotheriidae, bron-tô-the-ri-i-dê.  
 Bronzino, bron-dzê'nô.  
 Brooch, brôch or brôoch.  
 Brookline, brook'lin.  
 Brosböhl, bros-bûl'.  
 Broschi, brô'skê.  
 Brough, bruf.  
 Brougham, broöm, brôô'-am, or brô'am.  
 Broughton, brôuntun.  
 Broughty-Ferry, brô'ti.  
 Broussais, brôô-sâ'.
- Brouwer, brou'er.  
 Brownell, brou-nel'.  
 Brown-Séquard, broun-sâ-kâr'.  
 Bruay, brü-â'.  
 Brucea, brôô'si-a.  
 Bruch, brôök.  
 Bruchsal, brôök'sâl.  
 Brucine, brôô'sin or brôô'sên.  
 Brucker, brôök'er.  
 Brückner, brük'ner.  
 Brudenell, brôô'de-nel.  
 Brüdergemeinde, brü'der-ge-mêin'de.  
 Brüderhof, brü'der-hôf.  
 Bruerys, brü-es'.  
 Bruges, brôô'jiz; *Fr. pron.* brüzhi.  
 Brugsch, brôöksh.  
 Bruhl, brôöl.  
 Brulov, brôô'lof.  
 Brumaire, brü-mâr'.  
 Brunanburh, brôô'nan-bôörk.  
 Brunck, brôöngk.  
 Brun-du'si-um.  
 Brune, brün.  
 Brunei, brôô-ni'.  
 Brunel, brôô-nel'; *F. pron.* brü-nel'.  
 Brunelleschi, brôô-nel-les'kê.  
 Brunetière, brün-tyâr'.  
 Brunhilda, brôn-hil'dâ.  
 Bruni, *Ital.* brôô'nê; (*island*) brôô-ni'.  
 Brünig Pass, brü'nic'h.  
 Brünn, brün.  
 Brunne, brun.  
 Brunnen, brôn'en.  
 Brunner, brôôn'er.  
 Brünnow, brü'nô.  
 Brunsbüttel, brôons'bôöt-el.  
 Brusa, brôô'sâ.  
 Brütt, brüt.  
 Brut'iti-um.  
 Brüz, brüks.  
 Bruxelles, brü-sel' or brüks-el'.  
 Bry, brê.  
 Bryansk, bryânsk.  
 Brydges, brij'iz.  
 Bryennios, brê-en'ni-os.  
 Bryn Mawr College, brin-mâr'.  
 Bryony, bri'ô-ni.  
 Bryozoa, bri-ô-zô'a.  
 Bryum, bri'um.  
 Brzesc, bzheshtsh.  
 Brzezany, bzhe-zhâ'ni.  
 Buache, bü-âsh'.  
 Bubastis, bü-bas'tis.  
 Bubonic Plague, bü-bon'ik.  
 Bucaramanga, brôô-kâ-râ-mânz'gâ.  
 Buccinator, buk'si-nâ-ter.  
 Buccinum, buk'si-num.
- Buccleuch, buk-klôô'.  
 Bucentaur, bü-sen'tôr.  
 Bucephala, bü-sel'a-la.  
 Bucephalus, bü-sel'a-lus.  
 Bucer (*Lat. form.*), *Ger. pron.* bôôt'ser; *Eng. pron.* bü'ser; *Ger. form.* But-zer, bôôt'ser.  
 Buch, bôök.  
 Buchan, buk'an.  
 Buchanan, buk-an'an or bü-kan'an.  
 Buchanites, buk'an-its.  
 Buchan Ness, buk'an nes'.  
 Bucharest, bôô-ka-rest'.  
 Bucher, bôök'er.  
 Buchez, bü-shâ'.  
 Büchner, büch'ner.  
 Bucht College, buk'tel.  
 Buckingham, buk'ing-am.  
 Budæus, bü-dê'us; *Fr. form.* Budé, bü-dâ'.  
 Budapest, bôô'dâ-pest'; *Hung. pron.* -pesht.  
 Budaun, bôô-dâ-ôn'.  
 Buddha, bôô'dâ.  
 Buddh Gaya, gâ'yâ.  
 Buddhism, bôô'diz'm.  
 Budgetiger, buj'er-l-gâr'.  
 Budissin, bôô'dis-sin.  
 Budrum, bôôd-rôôm'.  
 Budur, bôô-dôör'.  
 Budweis, bôô'vîs.  
 Buell, bü-el.  
 Buenaventura, bwâ'nâ-ven-tôör-â.  
 Buenavista, bwâ-nâ-vê-s-tâ.  
 Buen Ayre, bwen'yâ.  
 Buenos Ayres, *Sp. pron.* bwâ'nôs'yâs.  
 Buer, bôör.  
 Buffon, buf'un; *F. pron.* bü-fôn'.  
 Buford, bü'ferd.  
 Buga, bôô'gâ.  
 Bugasôn, bôô-gâ-sôn'.  
 Bugeaudela Piconnerie, bü-zhô'd'â-lâ pê-kôn-rê'.  
 Bugenhagen, bôô'gen-hâ-gen.  
 Bugge, bôô'gê.  
 Buguruslan, bôô'gôö-roös-lân'.  
 Buhi, bôô'hê.  
 Buhl work, bôöl or büll.  
 Buhrstone, bü'r'stôn.  
 Buiten-zorg, böi'ten-zorch'.  
 Bukhara, bôô-kâ'râ.  
 Bukharest, bôô-kâ-rest'.  
 Bukkefjord, bôök'e-fyör.  
 Buknfjord, bôök'n-fyör.  
 Bukowina, bôô-kô-vê'nâ.  
 Bulacán, bôô-lâ-kân'.  
 Bulan, bôô'lân.  
 Bulandshahr, bôô-land-shâ'h'r.  
 Bulbul, bôöl'bôöl.  
 Buldana, bôöl-dâ'nâ.
- Bulfinch, bôö'fîch.  
 Bulgaria, bôöl-gâ'ri-a.  
 Bulgarian, bôöl-gâ'rin.  
 Bulkeley, bulk'li.  
 Bullen, bôöl'en.  
 Buller, bôöl'er.  
 Bullinger, bôöl'ing-er.  
 Bulnes, bôöl'näs.  
 Bülow, bü'lo.  
 Bulsar, bul-sâr'.  
 Bulthaupt, bôöl'thoupt.  
 Bulti, bul'tê.  
 Buluwayo, bôô-lôö-wâ'yô.  
 Bulwer, bôöl'wer.  
 Buncombe, bung'kum.  
 Bundelkhand, bun-del-kand'.  
 Bunder, or Bandar, Abbas, bun'der äb'bäs.  
 Bundesrath, böön'des-rät.  
 Bundheim, böönt'hîm.  
 Bundi, böön'dê.  
 Bunsen, böön'sên.  
 Bunter, böön'ter.  
 Bunzlau, böönts'lou.  
 Buol-Schauenstein, bôô'-ôl-shou'en-shtîn.  
 Buonaparte, bö'na-pâr't; *It.* bwô-nâ-pâr'tâ.  
 Buonarroti, bwô-nâr-rô'tê.  
 Buonvicino, bwôn-vê-chê'nô.  
 Buoy, boi.  
 Buoyancy, böi'an-si.  
 Buprestis, bü-pres'tis.  
 Burbage, bûr'bij.  
 Burchiello, böör-kyel'lo.  
 Burckhardt, böörk'hârt, *Eng.* bürk'hârt.  
 Burdekin, bürd'ik-in.  
 Burdett, bürd-et'.  
 Burdett-Countts, bürd-et'-kôöts' or bürd-et'.  
 Burdette, bürd-et'.  
 Burdwan, bürd-wân'.  
 Bure, bü.  
 Bureaucracy, bü-rô'kra-si or bü-rok'ta-si.  
 Buren, bü'ren.  
 Burette, böö-ret'.  
 Burg, böörch.  
 Burgas, böör'-gâs'.  
 Burgdorf, böörch'dôrf.  
 Burgee, bü'rjê.  
 Bürger, bürch'er.  
 Bürger, böör'ger.  
 Burgers, böör'gers.  
 Burgeess, bü'rjes.  
 Burghers, bürg'erz.  
 Burghley, bürl'i.  
 Burgkmaier, böörch'mir.  
 Burgos, böör'gôs.  
 Burgoyne, bürgoin'.  
 Burgrave, bürg'räv.  
 Burgundii, bürg-un'di.  
 Burgundy, bürg-un-di.  
 Burhanpur, böör-hân'pöör.  
 Buriat, böör'ri-âts.

- Buridan**, būr'i-dan; *Fr.* bū-rē-dān'.  
**Burin**, bū'r'in.  
**Buriti**, būō-rē'tē.  
**Burleigh**, būr'li.  
**Burlingame**, būr'ling-gām.  
**Burlus**, būōr'lus.  
**Burmänn**, bur'män.  
**Burmeister**, būōr'mis-ter.  
**Burnaby**, būr'na-bi.  
**Burnand**, būr'nand.  
**Burne-Jones**, būrn'jonz'.  
**Burnell**, būr'nel.  
**Burnes**, būrnz.  
**Burnet**, būr'net.  
**Burnett**, būr-net'.  
**Burnouf**, būr-nōōf'.  
**Burntisland**, būrnt'yl'land; *locally, commonly* brunt'yl'land.  
**Burra**, bur'a.  
**Burrage**, būr'ij.  
**Burrard Inlet**, bur'ärd.  
**Burrell**, būr'el.  
**Burriana**, būōr-rē-ä'nä.  
**Bursar**, būr'sär.  
**Burschenschaft**, būōrsh'en-shäfft.  
**Bursitis**, būr-si'tis.  
**Burslem**, būrs'lem.  
**Burstenbinder**, būōr'sten-bin-der.  
**Burtscheid**, būōrt'shīt.  
**Buru**, būōr'roō.  
**Burujiird**, būō-rōō-jērd'.  
**Bury**, ber'i.  
**Busa**, būō'sä.  
**Bushy**, buz'bi.  
**Busch**, būōsh.  
**Büsching**, būsh'ing.  
**Büschmann**, būōsh'män.  
**Bushire**, būō-shēr'.  
**Busiris**, bū-si'ris.  
**Buskerud**, būōs'ke-rōōd.  
**Busra**, bus'ra.  
**Bussa**, būōs'ä.  
**Bussanga**, būō-säng'gä.  
**Bussey**, bus'i.  
**Bussora**, būōs'ō-rä.  
**Busto Arsizio**, būōs'tō ärsēd'zi-ō.  
**Busuanga**, būō-swäng'ä.  
**Butan**, būō-tän'.  
**Butane**, bū'tän.  
**Bute**, būt.  
**Butea**, bū'tē-a.  
**Buto**, bū'tō.  
**Butomus**, bū'tō-mus.  
**Butte**, būt.  
**Butian**, būō-tōō'an.  
**Buturlinovka**, būō-tōōr-lē-nōf'kä.  
**Butyl**, bū'til.  
**Butyric**, bū-tir'ik.  
**Buxar**, buks-är'.  
**Buxtorf**, būōks'tōrf.  
**Buy-Ballot**, bois-bä-lō'.  
**Buzeu**, būō'ze-ōō.  
**Buzuluk**, būō-zōō-lōōk'.  
**Byblos**, bib'los.
- Byker**, bi'ker.  
**Bylazora**, bil-a-zō'ra.  
**Bylini**, bi-lē'nē.  
**Byng**, bing.  
**Byrd**, būrd.  
**Byrgius**, būr'ji-us.  
**Byrlaw**, būr'lō.  
**Byrnie**, būr'ni.  
**Byssus**, bis'us.  
**Byström**, bū'strūm.  
**Byzantine**, bi-zan'tin or biz'an-.  
**Byzantium**, bi-zan'shi-um.
- Caaba**, kä'a-bä.  
**Caacate**, kä-ä-kä-tä'.  
**Caacati**, kä-ä-kä-tē'.  
**Caal'ing Whale**, kö'ing or kä'ing.  
**Caazapá**, kä-ä-sä-pä'.  
**Cabal**, kä-bal'.  
**Caballero**, kä-väl-yä'rō.  
**Cabanatuan**, kä-vä-nä-tōō'an.  
**Cabanel**, kä-bä-nel'.  
**Cabanis**, kä-bä-nēs'.  
**Cabatán**, kä-vä-tōō'an.  
**Cabbala**, kä-b'ä-lä.  
**Cabeiri**, kä-bi'ri.  
**Cabes**, kä'bes.  
**Cabet**, kä-bä'.  
**Cabinda**, kä-bēn'dä.  
**Cabiri**, kä-bi'ri.  
**Cabut**, kä-but'.  
**Cabra**, kä'brä.  
**Cabral**, kä-bräl'.  
**Cabrera**, kä-brä'rä.  
**Cabul**, kä'bōōl or kä-bōōl'.  
**Cabúyao**, kä-vōō'yä-ō.  
**Cacao**, kä-kä'ō.  
**Caccini**, kä-t-chē'nē.  
**Caceres**, kä'thäs-räs.  
**Cachalot**, kash'a-lot.  
**Cachar Plains**, kä-chär'.  
**Cache**, käsh.  
**Cacheo**, kä-shä'ō.  
**Cachet**, kä-shä'.  
**Cachexia**, kä-kek'si-a.  
**Cachoeira**, kä-shwä'ē-rä.  
**Cacholong**, kash'ō-long.  
**Cacique**, kä-sēk'.  
**Cacodemon**, käk-ō-dē'mon.  
**Cacodyl**, käk'ō-dil.  
**Cacomistle**, käk'ō-mis'l.  
**Cacus**, kä'kus.  
**Cada Mosto**, kä'dä mos'tō.  
**Cadell**, kä-del'.  
**Cadenabbia**, kä-dē-näb-byä.  
**Cadenus**, kä-dē'nus.  
**Cadenza**, kä-den'za; *It.* kä-dän'tsä'.  
**Cader Idris**, käd'er id'ris.  
**Cadi**, kä'dē, kä'di.  
**Cadillac**, *tn. U. S.* käd'i-lak; *Fr.* kä-dē-yak'.  
**Cadiz**, *tn. U. S.* käd'iz; *tn. Spain* kä'diz, *Sp.* kä'dēth.  
**Cadmium**, käd'mi-um.  
**Cadogan**, kä-dug'an.
- Cadoudal**, kä-dōō-däl'.  
**Cadoxton**, kä-duks'tun.  
**Caduceus**, kä-dū'si-us.  
**Cæcilus Statius**, sē-sil'i-us stä'shi-us.  
**Cæcum**, sē'kum.  
**Cædmon**, käd'mun.  
**Cæen**, kään; *Eng.* kä'en.  
**Cære**, sē'rē.  
**Cærlaveroock**, kär-lav'e-ruk.  
**Cærléon**, kär-lē'un.  
**Cærmårthen**, kär-mär'thēn.  
**Cærwent**, kär'went.  
**Cæsalpinia**, ses-al-pin'i-a or sez-.  
**Cæsalpinus**, ses-al-pi'nus.  
**Cæsarea**, ses-a-rē'a or sez-.  
**Cæsarean**, ses-zä'ri-an.  
**Cæsena**, sē-sē'na.  
**Cæsium**, sē'zi-um.  
**Café**, kä-fä'.  
**Caffeine**, kä-fē'in.  
**Caffraria**, kä-frä'ri-a.  
**Cagayan**, kä-gä-yän'.  
**Cagli**, käl'yē.  
**Cagliari**, käl-yä'rē.  
**Cagliostro**, käl-yōs'trō.  
**Cagnola**, kän-yō'lä.  
**Cagots**, kä-gō'.  
**Caguas**, kä'gwäs.  
**Cahors**, kä-ör'.  
**Caibarién**, kä-bä-rē-än'.  
**Caicos**, kä'kōs.  
**Caillaud**, kä-yō'.  
**Caiman**, kä'män.  
**Cainites**, kän'tts.  
**Ça ira**, sä' ē-rä'.  
**Çaird**, kärd.  
**Cairn**, kärn or kärn.  
**Cairnes**, kärnz or kärnz.  
**Cairngorm**, kärn'gōrm' or kärn'.  
**Cairns**, kärnz or kärnz.  
**Cairo**, *tn. U. S.* kä'rō; *tn. Egypt* kä'irō.  
**Cairolí**, kä-rō'le.  
**Caisson**, kä'sun.  
**Caithness**, käth'nes.  
**Caius**, kēz; *Lat.* kä'yus.  
**Caivano**, kä-vi-vänō.  
**Caix**, kä-ēks.  
**Çajabamba**, kä-hä-bäm'bä.  
**Çajamarca**, kä-hä-mär'kä.  
**Çajatambo**, kä-hä-täm'bō.  
**Çajeput Tree**, käj'e-put.  
**Çajetan**, käj'e-tan.  
**Calabar**, kal'a-bär.  
**Calabria**, kä-lä'bri-a; *It.* kä-lä'brē-ä.  
**Caladium**, kä-lä'di-um.  
**Calafatu**, kä-lä-fät'.  
**Calahorra**, kä-lä-ō'rä.  
**Calais**, *tn. U. S.* kal'is; *Fr.* kä lä'.  
**Calamander**, kal'a-man-der.  
**Calamba**, kä-läm'bä.  
**Calame**, kä-läm'.
- Calamianes**, kä'lä-mē-ä'näs.  
**Calamine**, kal'a-min or m'in.  
**Calamy**, kal'a-mi.  
**Calandrinia**, kal-an-drim'i-a.  
**Calanthé**, ka-lan'thē.  
**Calapán**, kä-lä-pän'.  
**Calarasi**, kä-lä-räsē.  
**Calas**, kä-läs'.  
**Calasiao**, kä-lä-sē-ä'ō.  
**Calatafimi**, kä-lä'tä-fē'mē.  
**Calatayud**, kä-lä-tä-yōōth'.  
**Calaveras**, kä-lä-vä'räs.  
**Calbayog**, käl-bä'yōg.  
**Calcaire Grossier**, käl-kär'grō-syä'.  
**Calcareous**, kal-kä'ri-us.  
**Calcasieu**, käl'ka-shōō.  
**Calceola**, käl-sē'ō-lä.  
**Calceolaria**, kal'sē-ō-lä-ri-a.  
**Calchas**, kal'kas.  
**Calciferous**, kal-sif'er-us.  
**Calcutta**, kal-kut'a.  
**Caldecott**, kö'l'de-kut.  
**Caldera**, käl-dä'rä.  
**Calderon**, (P. H.) kö'l'de-run; *Fr.* kä-dä-rōn'.  
**Calderon de la Barca**, kal'de-run; *Sp.* käl-dä-rōn'dä lä bär'kä.  
**Calderwood**, kö'l'der-woōd.  
**Caldicott**, kö'l'di-kut.  
**Coldwell**, köld'wel.  
**Calends**, kal'endz.  
**Calendula**, kä-len'dū-lä.  
**Calepino**, kä-lä-pē'nō.  
**Calgary**, kal'gä-ri.  
**Calhoun**, kal-hōōn'.  
**Calli**, kä-lē'.  
**Calibo**, kä-lē'vō.  
**Calif, Califate**, kä'lif, kä-lifät.  
**Caligraphy**, kä-lig'ra-fi.  
**Caligula**, kä-lig'ū-lä.  
**Caliph**, kä'lif.  
**Calippus**, kä-lip'us.  
**Calisthenics**, kal-is-then'iks.  
**Calixtus**, kä-lik'stus.  
**Calla**, kal'a.  
**Callao**, käl-yä'ō.  
**Callicott**, kö'l'kut.  
**Callias**, kal'i-as.  
**Callimachus**, kä-lim'a-kus.  
**Callinus**, kä-lif'nus.  
**Calliope**, kä-lif'ō-pē.  
**Callisthenes**, kä-lis'thi-nēz.  
**Callisto**, kä-lis'tō.  
**Callistratus**, kä-lis'tra-tus.  
**Callot**, kä-lō'.  
**Calluna**, kä-lū'na.  
**Calmar**, kal'mär.  
**Calmet**, käl-mä'.  
**Calochortus**, kä-lō-kōr'tus.  
**Calomarde**, kä-lō-mär'dä.  
**Calonne**, kä-lōn'.  
**Calophyllum**, kä-lō-fl'um.

**Caulaincourt**, kó-la-n-kóór'.  
**Caulopteris**, kó-lop'ter-is.  
**Cauquenes**, kou-ká'nás.  
**Caura**, kou'rá.  
**Caus**, **Caux**, **Caulx**, kó.  
**Causalgia**, kóz-ál'ji-a.  
**Causerie**, kóz-ré' or kóz'ré'.  
**Causages**, kós.  
**Cautin**, kou-tén'.  
**Cautio**, kó'shi-ó.  
**Cauto River**, kou'tó.  
**Cauvery**, kó'ver-l.  
**Cavadei Tirreni**, ká'vá-dá'é té'r-rá'né.  
**Cavaignac**, ká-vá-nyák'.  
**Cavaillon**, ká-vá-yón'.  
**Cavalcanti**, ká-vál-kán'té.  
**Cavalcasselle**, ká-vál-ká-sel'lá.  
**Cavalla**, ká-vál'lá.  
**Cavalotti**, ká-vá-lot'té.  
**Cavan**, kav'an.  
**Cavatina**, ká-vá-té'ná.  
**Caveat**, ká'vi-at.  
**Caveat Emptor**, emp'tor.  
**Cavedone**, ká-vá-dó'ná.  
**Caven**, ká'ven.  
**Cavendish**, kav'en-dish or kan'dish.  
**Caviare**, kav-i-ár' or ká-vyár'.  
**Cavité**, ká-vé-tá'.
- Cavour**, ká-vóór'.  
**Cawdor**, kó'dor.  
**Cawnpur**, kón'póór.  
**Caxamarca**, ká-há-már'ká.  
**Caxiás**, ká-shé-ásh'.  
**Cayambe**, kí-ám'bá or kí-ám-bá'.  
**Cayenne**, ká-en' or kí-en'.  
**Cayes**, aux, ó ká'.  
**Caylus**, ká-lús'.  
**Cayman**, ká'mán.  
**Caymans**, kí-mánz'.  
**Cayor**, kí-ór'.  
**Cayster**, ká-is'ter.  
**Cayuga**, ká-yóó'ga.  
**Cayvan**, ka-ván'.  
**Cazin**, ká-za'n'.  
**Ceada**, ke-ád'dá.  
**Cean-Bermudez**, thá'an-ber-móó'dáth.  
**Ceará**, sá-á-rá'.  
**Ceará Mirim**, mé-réá'.  
**Cebes**, sé'béz.  
**Cebidae**, seb'i-dé.  
**Cebú**, sá-bóó'; *Span. pron.* thá-vóó'.  
**Cecchi**, chek'ké.  
**Cech**, chech.  
**Cecidomyia**, ses-i-dó-mí'i-a.  
**Cecil**, ses'il or sis'il.  
**Cecilia**, sé-sil'i-a.  
**Cecropia**, sé-kró'pi-a.  
**Cecrops**, sé'krops.  
**Cedula**, sed'ú-lá; *Span. pron.* thá'dóó-lá.  
**Cefalu**, chá-fá-lóó'.  
**Ceglie**, chá'lyá.  
**Cehagin**, thá-á-hén'.  
**Celakovsky**, chel'á-kof-ské.  
**Celandine**, sel'an-dín or -dín.  
**Celano**, chá-lá'nó.  
**Celaya**, sá-lá'yá.  
**Celebes**, sé-lé-béz.  
**Céleste**, sá-les't'.  
**Celestina**, *Span. pron.* thá-les-té'ná.  
**Celestine (Pope)**, sel'es-tín or -tín; *min.*, -tín.  
**Celestines**, sel'es-tínz or sé-les'tínz.  
**Celestite**, sel'es-tít.  
**Celibacy**, sel'i-bá-si or sé-lib'a-si.  
**Celina**, sé-lí'na.  
**Cellarius**, tsel-á-rí-óós.  
**Celle**, tsel'é.  
**Cellini**, chel-lé'né.  
**Cello**, chel'ó.  
**Cellulitis**, sel-ú-lítis.  
**Celluloid**, sel'ú-loid.  
**Cellulose**, sel'ú-los.  
**Celosia**, sel-ó'si-a or -shi-a.  
**Celsius**, sel'si-us or -shi-us.  
**Celsus**, sel'sus.  
**Celtiberi**, sel-ti-bé'ri.  
**Cenci**, chen'ché.  
**Ceneda**, chá-ná-dá.
- Cenis, Mont**, móh se-né'.  
**Cenobites**, sen'ó-bítis or sé'nó-ó.  
**Cenomanni**, sen-ó-man'tor sen-ó-má'né.  
**Cenotaph**, sen'ó-táf.  
**Centaurea**, sen-tó-ré'a or sen-tó'ri-a.  
**Centauri**, sen-tó'ré.  
**Centaurus**, sen-tó'rús.  
**Centimetre**, sen'ti-mé-ter.  
**Centlivre**, sent-liv'er or -lé'ver.  
**Cento**, chen'tó.  
**Centralia**, sen-trá'li-a.  
**Centre**, *F. pron.* sán'tr'.  
**Centrifugal**, sen-trif'ú-gal.  
**Centripetal**, sen-trip'i-tal.  
**Centumviri**, sen-tum'vi-ri.  
**Centuripe, Centorbe**, chen-tóó'ré-pá, chen-tór'bá.  
**Ceorl**, keórl or cherl.  
**Ceos**, sé'ós.  
**Cephalaspis**, sef-a-las'pis.  
**Cephalhaematoma**, sef'al-hé-ma-tó'ma.  
**Cephalochorda**, sef'a-ló-kór'da.  
**Cephalodysia**, sef'a-ló-dín'i-a.  
**Cephaloedium**, sef-a-lé'di-um.  
**Cephalonia**, sef-a-ló'ni-a.  
**Cephalopoda**, sef-a-lop'ó-da or sef'a-ló-pó'da.  
**Cepheus**, sé'ffis.  
**Cephius**, sé-fis'us.  
**Ceram**, se-rán'.  
**Ceramics**, sé-ram'iks; *ké*, when written with *k*.  
**Cerargyrite**, sé-rár'ji-rit.  
**Cerastes**, sé-ras'téz.  
**Cerasus**, ser'a-sus.  
**Ceratodus**, ser-a-tó'dús.  
**Ceraunii**, sé-ró'ni-i.  
**Cerberus**, sér'ber-us.  
**Cercaria**, sér-ká'ri-a.  
**Cercyon**, sér'si-on.  
**Cerdic**, kúr'dik or sér'dik.  
**Cerebritis**, ser-i-brítis.  
**Cerebrum**, sér'i-brum.  
**Ceres**, sé'réz.  
**Cereus**, sé'rús or sé'ré us.  
**Cerignola**, chá-ré-nyó'lá.  
**Cerigo**, cher'é-gó.  
**Cerithium**, se-rith'i-um.  
**Cerium**, sé'ri-um.  
**Cerro de Pasco**, ser'ró dá pás'kó.  
**Cerro Gordo**, gó'r'dó.  
**Cerro Largo**, lár'gó.  
**Certaldo**, cher-tá'l'dó.  
**Certiorari**, sér'shi-ó-rá'ri.  
**Certosa di Pavia**, cher-tózá dé pá've-á.  
**Cerumen**, sé-roo'men.  
**Cervantes - Saavedra**, ther-ván'tás sá'á-vá'drá.

<b>Cervera y Topete</b> , ther- vā'rā ē tō-pā'tā.	<b>Cesari</b> , chā'zā-rē.	<b>Ces-to'da</b> .	<b>Cetinje</b> , chet'ēn-ya.
